This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this software or related documentation is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, duplication, disclosure, modification, and adaptation shall be subject to the restrictions and license terms set forth in the applicable Government contract, and, to the extent applicable by the terms of the Government contract, the additional rights set forth in FAR 52.227-19, Commercial Computer Software License (December 2007). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

This software is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications which may create a risk of personal injury. If you use this software in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure the safe use of this software. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software in dangerous applications.

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

This software and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Documentation of CTX_THES 13-2

14 CTX_ULEXER

Documentation of CTX_ULEXER 14-2

15 DBMS_ADDM

Using DBMS_ADDM 15-2
- Security Model 15-3

Summary of DBMS_ADDM Subprograms 15-4
- ANALYZE_DB Procedure 15-5
- ANALYZE_INST Procedure 15-6
- ANALYZE_PARTIAL Procedure 15-7
- DELETE Procedure 15-8
- DELETE_FINDING_DIRECTIVE Procedure 15-9
- DELETE_PARAMETER_DIRECTIVE Procedure 15-10
- DELETE_SEGMENT_DIRECTIVE Procedure 15-11
- DELETE_SQL_DIRECTIVE Procedure 15-12
- GET_ASH_QUERY Function 15-13
- GET_REPORT Function 15-14
- INSERT_FINDING_DIRECTIVE Procedure 15-15
- INSERT_PARAMETER_DIRECTIVE Procedure 15-16

INSERT_SEGMENT_DIRECTIVE Procedure 15-17
INSERT_SQL_DIRECTIVE Procedure 15-19

16 DBMS_ADVANCED_REWRITE

Using DBMS_ADVANCED_REWRITE 16-2
Security Model 16-3
Summary of DBMS_ADVANCED_REWRITE Subprograms 16-4
ALTER_REWRITE_EQUIVALENCE Procedure 16-5
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure 16-6
DECLARE_REWRITE_EQUIVALENCE Procedures 16-7
DROP_REWRITE_EQUIVALENCE Procedure 16-9
VALIDATE_REWRITE_EQUIVALENCE Procedure 16-10

17 DBMS_ADVISOR

Using DBMS_ADVISOR 17-2
Deprecated Subprograms 17-3
Security Model 17-4
Summary of DBMS_ADVISOR Subprograms 17-5
ADD_SQLWKLD_REF Procedure 17-8
ADD_SQLWKLD_STATEMENT Procedure 17-9
ADD_STS_REF Procedure 17-12
CANCEL_TASK Procedure 17-13
COPY_SQLWKLD_TO_STS Procedure 17-14
CREATE_FILE Procedure 17-15
CREATE_OBJECT Procedure 17-16
CREATE_SQLWKLD Procedure 17-18
CREATE_TASK Procedures 17-19
DELETE_SQLWKLD Procedure 17-21
DELETE_SQLWKLD_REF Procedure 17-22
DELETE_SQLWKLD_STATEMENT Procedures 17-23
DELETE_STS_REF Procedure 17-24
DELETE_TASK Procedure 17-25
EXECUTE_TASK Procedure 17-26
GET_REC_ATTRIBUTES Procedure 17-28
GET_TASK_REPORT Function 17-29
GET_TASK_SCRIPT Function 17-30
IMPLEMENT_TASK Procedure 17-32
IMPORT_SQLWKLD_SCHEMA Procedure 17-33
IMPORT_SQLWKLD_SQLCACHE Procedure 17-35
IMPORT_SQLWKLD_STS Procedure 17-37
IMPORT_SQLWKLD_SUMADV Procedure 17-39
IMPORT_SQLWKLD_USER Procedure 17-41
INTERRUPT_TASK Procedure 17-43
MARK_RECOMMENDATION Procedure 17-44
QUICK_TUNE Procedure 17-45
RESET_SQLWKLD Procedure 17-46
RESET_TASK Procedure 17-47

SET_DEFAULT_SQLWKLD_PARAMETER Procedures 17-48
SET_DEFAULT_TASK_PARAMETER Procedures 17-49
SET_SQLWKLD_PARAMETER Procedures 17-50
SET_TASK_PARAMETER Procedure 17-51
TUNE_MVIEW Procedure 17-64
UPDATE_OBJECT Procedure 17-66
UPDATE_REC_ATTRIBUTES Procedure 17-68
UPDATE_SQLWKLD_ATTRIBUTES Procedure 17-70
UPDATE_SQLWKLD_STATEMENT Procedure 17-71
UPDATE_TASK_ATTRIBUTES Procedure 17-73

18 DBMS_ALERT

Using DBMS_ALERT 18-2
Overview 18-3
Security Model 18-4
Constants 18-5
Restrictions 18-6
Exceptions 18-7
Operational Notes 18-8
Examples 18-10
Summary of DBMS_ALERT Subprograms 18-11
REGISTER Procedure 18-12
REMOVE Procedure 18-13
REMOVEALL Procedure 18-14
SET_DEFAULTS Procedure 18-15
SIGNAL Procedure 18-16
WAITANY Procedure 18-17
WAITONE Procedure 18-18

19 DBMS_APPLICATION_INFO

Using DBMS_APPLICATION_INFO 19-2
Overview 19-3
Security Model 19-4
Operational Notes 19-5
Summary of DBMS_APPLICATION_INFO Subprograms 19-6
READ_CLIENT_INFO Procedure 19-7
READ_MODULE Procedure 19-8
SET_ACTION Procedure 19-9
SET_CLIENT_INFO Procedure 19-10
SET_MODULE Procedure 19-11
SET_SESSION_LONGOPS Procedure 19-12

20 DBMS_APPLY_ADM

Using DBMS_APPLY_ADM 20-2
Overview 20-3
Operational Notes 20-4

Summary of DBMS_APPLY_ADM Subprograms 20-5
ADD_STMT_HANDLER Procedure 20-7
ALTER_APPLY Procedure 20-9
COMPARE_OLD_VALUES Procedure 20-14
CREATE_APPLY Procedure 20-16
CREATE_OBJECT_DEPENDENCY Procedure 20-23
DELETE_ALL_ERRORS Procedure 20-24
DELETE_ERROR Procedure 20-25
DROP_APPLY Procedure 20-26
DROP_OBJECT_DEPENDENCY Procedure 20-27
EXECUTE_ALL_ERRORS Procedure 20-28
EXECUTE_ERROR Procedure 20-29
GET_ERROR_MESSAGE Function 20-32
REMOVE_STMT_HANDLER 20-33
SET_CHANGE_HANDLER Procedure 20-34
SET_DML_HANDLER Procedure 20-37
SET_ENQUEUE_DESTINATION Procedure 20-42
SET_EXECUTE Procedure 20-44
SET_GLOBAL_INSTANTIATION_SCN Procedure 20-46
SET_KEY_COLUMNS Procedures 20-48
SET_PARAMETER Procedure 20-50
SET_SCHEMA_INSTANTIATION_SCN Procedure 20-58
SET_TABLE_INSTANTIATION_SCN Procedure 20-61
SET_UPDATE_CONFLICT_HANDLER Procedure 20-63
SET_VALUE_DEPENDENCY Procedure 20-66
START_APPLY Procedure 20-67
STOP_APPLY Procedure 20-68

21 DBMS_AQ

Using DBMS_AQ 21-2
Constants 21-3
Data Structures 21-5
Operational Notes 21-8
Summary of DBMS_AQ Subprograms 21-9
BIND_AGENT Procedure 21-10
DEQUEUE Procedure 21-11
DEQUEUE_ARRAY Function 21-14
ENQUEUE Procedure 21-16
ENQUEUE_ARRAY Function 21-18
LISTEN Procedures 21-19
POST Procedure 21-21
REGISTER Procedure 21-22
UNBIND_AGENT Procedure 21-23
UNREGISTER Procedure 21-24

22 DBMS_AQADM

Using DBMS_AQADM 22-2

Constants ... 22-3
Subprogram Groups ... 22-4
Queue Table Subprograms ... 22-5
Privilege Subprograms ... 22-6
Queue Subprograms ... 22-7
Subscriber Subprograms ... 22-8
Notification Subprograms ... 22-9
Propagation Subprograms ... 22-10
Oracle Streams AQ Agent Subprograms ... 22-11
Alias Subprograms ... 22-12
Summary of DBMS_AQADM Subprograms ... 22-13
ADD_ALIAS_TO_LDAP Procedure ... 22-15
ADD_SUBSCRIBER Procedure ... 22-16
ALTER_AQ_AGENT Procedure ... 22-17
ALTER_PROPAGATION_SCHEDULE Procedure ... 22-18
ALTER_QUEUE Procedure ... 22-19
ALTER_QUEUE_TABLE Procedure ... 22-20
ALTER_SUBSCRIBER Procedure ... 22-21
CREATE_AQ_AGENT Procedure ... 22-22
CREATE_NP_QUEUE Procedure ... 22-23
CREATE_QUEUE Procedure ... 22-24
CREATE_QUEUE_TABLE Procedure ... 22-26
DEL_ALIAS_FROM_LDAP Procedure ... 22-29
DISABLE_DB_ACCESS Procedure ... 22-30
DISABLE_PROPAGATION_SCHEDULE Procedure ... 22-31

ENABLE_DB_ACCESS Procedure ... 22-35
ENABLE_JMS_TYPES Procedure ... 22-36
ENABLE_PROPAGATION_SCHEDULE Procedure ... 22-37
GET_WATERMARK Procedure ... 22-38
GRANT_QUEUE_PRIVILEGE Procedure ... 22-39
GRANT_SYSTEM_PRIVILEGE Procedure ... 22-40
MIGRATE_QUEUE_TABLE Procedure ... 22-41
PURGE_QUEUE_TABLE Procedure ... 22-42
QUEUE_SUBSCRIBERS Function ... 22-44
REMOVE_SUBSCRIBER Procedure ... 22-45
REVOKE_QUEUE_PRIVILEGE Procedure ... 22-46
REVOKE_SYSTEM_PRIVILEGE Procedure ... 22-47
SCHEDULE_PROPAGATION Procedure ... 22-48
SET_WATERMARK Procedure ... 22-50
START_QUEUE Procedure ... 22-51
STOP_QUEUE Procedure ... 22-52
UNSCHEDULE_PROPAGATION Procedure ... 22-53
VERIFY_QUEUE_TYPES Procedure ... 22-54

23 DBMS_AQELM

Summary of DBMS_AQELM Subprograms 23-2
SET_MAILHOST Procedure 23-3
SET_MAILPORT Procedure 23-4
SET_SENDFROM Procedure 23-5

24 DBMS_AQIN

Using DBMS_AQIN 24-2
Overview 24-3

25 DBMS_ASSERT

Using DBMS_ASSERT 25-2
Operational Notes 25-3
Summary of DBMS_ASSERT Subprograms 25-4
ENQUOTE_LITERAL Function 25-5
ENQUOTE_NAME Function 25-6
NOOP Functions 25-7
QUALIFIED_SQL_NAME Function 25-8
SCHEMA_NAME Function 25-9
SIMPLE_SQL_NAME Function 25-10
SQL_OBJECT_NAME Function 25-11

26 DBMS_AUDIT_MGMT

Using DBMS_AUDIT_MGMT 26-2
Overview 26-3
Security Model 26-4
Constants 26-5
Views 26-7
Subprogram Groups 26-8
Audit Trail Management Subprograms 26-9
Audit Trail Cleanup Subprograms 26-10
Summary of DBMS_AUDIT_MGMT Subprograms 26-11
CLEAN_AUDIT_TRAIL Procedure 26-12
CLEAR_AUDIT_TRAIL_PROPERTY Procedure 26-14
CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure 26-16
CREATE_PURGE_JOB Procedure 26-17
DEINIT_CLEANUP Procedure 26-19
DROP_PURGE_JOB Procedure 26-20
GET_AUDIT_COMMIT_DELAY Function 26-21
INIT_CLEANUP Procedure 26-22
IS_CLEANUP_INITIALIZED Function 26-24
SET_AUDIT_TRAIL_LOCATION Procedure 26-25
SET_AUDIT_TRAIL_PROPERTY Procedure 26-27
SET_LAST_ARCHIVE_TIMESTAMP Procedure 26-30
SET_PURGE_JOB_INTERVAL Procedure 26-32
SET_PURGE_JOB_STATUS Procedure 26-33

27 DBMS_AUTO_TASK_ADMIN

Using DBMS_AUTO_TASK_ADMIN 27-2
Constants 27-3
Summary of DBMS_AUTO_TASK_ADMIN Subprograms 27-4
DISABLE Procedures 27-5
ENABLE Procedures 27-6
GET_CLIENT_ATTRIBUTES Procedure 27-7
GET_P1_RESOURCES Procedure 27-8
OVERRIDE_PRIORITY Procedures 27-9
SET_CLIENT_SERVICE Procedure 27-10
SET_P1_RESOURCES Procedure 27-11

28 DBMS_AUTO_TASK_IMMEDIATE

Summary of DBMS_AUTO_TASK_IMMEDIATE Subprograms 28-2
GATHER_OPTIMIZER_STATS Procedure 28-3

29 DBMS_AW_STATS

Using DBMS_AW_STATS 29-2
Summary of DBMS_AW_STATS Subprograms 29-3
ANALYZE Procedure 29-4
CLEAR Procedure 29-7

30 DBMS_CAPTURE_ADM

Summary of DBMS_CAPTURE_ADM Subprograms 30-2
ABORT_GLOBAL_INSTANTIATION Procedure 30-4
ABORT_SCHEMA_INSTANTIATION Procedure 30-5
ABORT_SYNC_INSTANTIATION Procedure 30-6
ABORT_TABLE_INSTANTIATION Procedure 30-7
ALTER_CAPTURE Procedure 30-8
ALTER_SYNC_CAPTURE Procedure 30-13
BUILD Procedure 30-15
CREATE_CAPTURE Procedure 30-16
CREATE_SYNC_CAPTURE Procedure 30-26
DROP_CAPTURE Procedure 30-28
INCLUDE_EXTRA_ATTRIBUTE Procedure 30-30
PREPARE_GLOBAL_INSTANTIATION Procedure 30-32
PREPARE_SCHEMA_INSTANTIATION Procedure 30-33
PREPARE_SYNC_INSTANTIATION Function 30-34
PREPARE_TABLE_INSTANTIATION Procedure 30-35
SET_PARAMETER Procedure 30-36
START_CAPTURE Procedure 30-41
STOP_CAPTURE Procedure 30-42

31 DBMS_CDC_PUBLISH

Using DBMS_CDC_PUBLISH 31-2

Overview 31-3
Deprecated Subprograms 31-4
Security Model 31-5
Views 31-6
Summary of DBMS_CDC_PUBLISH Subprograms 31-7
ALTER_AUTOLOG_CHANGE_SOURCE Procedure 31-8
ALTER_CHANGE_SET Procedure 31-10
ALTER_CHANGE_TABLE Procedure 31-13
ALTER_HOTLOG_CHANGE_SOURCE Procedure 31-16
CREATE_AUTOLOG_CHANGE_SOURCE Procedure 31-18
CREATE_CHANGE_SET Procedure 31-20
CREATE_CHANGE_TABLE Procedure 31-23
CREATE_HOTLOG_CHANGE_SOURCE Procedure 31-27
DROP_CHANGE_SET Procedure 31-29
DROP_CHANGE_SOURCE Procedure 31-30
DROP_CHANGE_TABLE Procedure 31-31
DROP_SUBSCRIPTION Procedure 31-32
GET_DDLOPER Function 31-33
PURGE Procedure 31-34
PURGE_CHANGE_SET Procedure 31-35
PURGE_CHANGE_TABLE Procedure 31-36

32 DBMS_CDC_SUBSCRIBE

Using DBMS_CDC_SUBSCRIBE 32-2
Overview 32-3
Deprecated Subprograms 32-5
Security Model 32-6
Views 32-7
Summary of DBMS_CDC_SUBSCRIBE Subprograms 32-8
ACTIVATE_SUBSCRIPTION Procedure 32-9
CREATE_SUBSCRIPTION Procedure 32-10
DROP_SUBSCRIPTION Procedure 32-12
EXTEND_WINDOW Procedure 32-13
PURGE_WINDOW Procedure 32-15
SUBSCRIBE Procedure 32-16

33 DBMS_COMPARISON

Using DBMS_COMPARISON 33-2
Overview 33-3
Security Model 33-5
Constants 33-6
Views 33-8
Operational Notes 33-9
Data Structures 33-13
COMPARISON_TYPE Record Type 33-14
Summary of DBMS_COMPARISON Subprograms 33-15
COMPARE Function 33-16

CONVERGE Procedure 33-18
CREATE_COMPARISON Procedure 33-20
DROP_COMPARISON Procedure 33-24
PURGE_COMPARISON Procedure 33-25
RECHECK Function 33-26

34 DBMS_COMPRESSION

Using DBMS_COMPRESSION 34-2
Overview 34-3
Security Model 34-4
Constants 34-5
Views 34-6
Summary of DBMS_COMPRESSION Subprograms 34-7
GET_COMPRESSION_RATIO Procedure 34-8
GET_COMPRESSION_TYPE Function 34-9

35 DBMS_CONNECTION_POOL

Summary of DBMS_CONNECTION_POOL Subprograms 35-2
ALTER_PARAM Procedure 35-3
CONFIGURE_POOL Procedure 35-4
START_POOL Procedure 35-6
STOP_POOL Procedure 35-7
RESTORE_DEFAULTS Procedure 35-8

36 DBMS_CQ_NOTIFICATION

Using DBMS_CQ_NOTIFICATION 36-2
Overview 36-3
Security Model 36-4
Constants 36-5
Operational Notes 36-7
Examples 36-8
Data Structures 36-15
CQ_NOTIFICATION$_DESCRIPTOR Object Type 36-16
CQ_NOTIFICATION$_QUERY Object Type 36-17
CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type 36-18
CQ_NOTIFICATION$_TABLE Object Type 36-19
CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type 36-20
CQ_NOTIFICATION$_ROW Object Type 36-21
CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type 36-22
CQ_NOTIFICATION$_REG_INFO Object Type 36-23
Summary of DBMS_CQ_NOTIFICATION Subprograms 36-26
CQ_NOTIFICATION_QUERYID Function 36-27
DEREGISTER Procedure 36-28
ENABLE_REG Procedure 36-29
NEW_REG_START Function 36-30
REG_END Procedure 36-31

37 DBMS_CRYPTO

Using the DBMS_CRYPTO Subprograms 37-2
Overview 37-3
Security Model 37-4
Types 37-5
Algorithms 37-6
Restrictions 37-8
Exceptions 37-9
Operational Notes 37-10
Examples 37-12
Summary of DBMS_CRYPTO Subprograms 37-13
DECRYPT Function 37-14
DECRYPT Procedures 37-15
ENCRYPT Function 37-16
ENCRYPT Procedures 37-17
HASH Function 37-18
MAC Function 37-19
RANDOMBYTES Function 37-20
RANDOMINTEGER Function 37-21
RANDOMNUMBER Function 37-22

38 DBMS_CSX_ADMIN

Using DBMS_CSX_ADMIN 38-2
Overview 38-3
Constants 38-4
Examples 38-5
Summary of DBMS_CSX_ADMIN 38-6
COPYDEFAULTTOKENTABLESET Procedure 38-7
GETTOKENTABLEINFO Procedure & Function 38-8
GETTOKENTABLEINFOBYTABLESPACE Procedure 38-9
NAMESPACEIDTABLE Function 38-10
PATHIDTABLE Function 38-11
QNAMEIDTABLE Function 38-12
REGISTERTOKENTABLESET Procedure 38-13

39 DBMS_CUBE

Using DBMS_CUBE 39-2
Using SQL Aggregation Management 39-3
Subprograms in SQL Aggregation Management 39-4
Requirements for the Relational Materialized View 39-5
Permissions for Managing and Querying Cube Materialized Views 39-6
Example of SQL Aggregation Management 39-7
Upgrading Metadata From OLAP 10*g* to OLAP 11*g* 39-11
Summary of DBMS_CUBE Subprograms 39-13
BUILD Procedure 39-14
CREATE_MVIEW Function 39-21

DERIVE_FROM_MVIEW Function 39-26
DROP_MVIEW Procedure 39-28
EXPORT_XML Procedure 39-30
EXPORT_XML_TO_FILE Procedure 39-32
IMPORT_XML Procedure 39-35
INITIALIZE_CUBE_UPGRADE Procedure 39-37
REFRESH_MVIEW Procedure 39-39
VALIDATE_XML Procedure 39-41

40 DBMS_CUBE_ADVISE

Summary of DBMS_CUBE_ADVISE Subprograms 40-2
MV_CUBE_ADVICE Function 40-3
SET_CNS_EXCEPTION_LOG Procedure 40-6
TRACE Procedure 40-7

41 DBMS_CUBE_LOG

Using DBMS_CUBE_LOG 41-2
Creating Cube Logs 41-4
Cube Build Log 41-5
Cube Dimension Compile Log 41-7
Cube Operations Log 41-8
Cube Rejected Records Log 41-9
Summary of DBMS_CUBE_LOG Subprograms 41-10
DEFAULT_NAME Function 41-12
DISABLE Procedure 41-13
ENABLE Procedure 41-14
FLUSH Procedure 41-16
GET_LOG Procedure 41-17
GET_LOG_SPEC Function 41-19
GET_PARAMETER Function 41-20
LEVEL_HIGH Function 41-21
LEVEL_HIGHEST Function 41-22
LEVEL_LOW Function 41-23
LEVEL_LOWEST Function 41-24
LEVEL_MEDIUM Function 41-25
SET_LOG_SPEC Procedure 41-26
SET_PARAMETER Procedure 41-27
TABLE_CREATE Procedure 41-29
TARGET_FILE Function 41-30
TARGET_LOB Function 41-31
TARGET_TABLE Function 41-32
TARGET_TRACE Function 41-33
TYPE_BUILD Function 41-34
TYPE_DIMENSION_COMPILE Function 41-35
TYPE_OPERATIONS Function 41-36
TYPE_REJECTED_RECORDS Function 41-37
VERSION Function 41-38

42 DBMS_DATA_MINING

Using DBMS_DATA_MINING 42-2
Overview 42-3
Mining Model Objects 42-5
Deprecated Subprograms 42-7
Mining Functions 42-8
Model Settings 42-9
Data Types 42-19
Summary of DBMS_DATA_MINING Subprograms 42-22
ADD_COST_MATRIX Procedure 42-24
ALTER_REVERSE_EXPRESSION Procedure 42-26
APPLY Procedure 42-28
COMPUTE_CONFUSION_MATRIX Procedure 42-32
COMPUTE_LIFT Procedure 42-38
COMPUTE_ROC Procedure 42-43
CREATE_MODEL Procedure 42-48
DROP_MODEL Procedure 42-52
EXPORT_MODEL Procedure 42-53
GET_ASSOCIATION_RULES Function 42-56
GET_DEFAULT_SETTINGS Function 42-59
GET_FREQUENT_ITEMSETS Function 42-60
GET_MODEL_COST_MATRIX Function 42-62
GET_MODEL_DETAILS_ABN Function 42-64
GET_MODEL_DETAILS_AI Function 42-66
GET_MODEL_DETAILS_GLM Function 42-67
GET_MODEL_DETAILS_GLOBAL Function 42-70
GET_MODEL_DETAILS_KM Function 42-73
GET_MODEL_DETAILS_NB Function 42-76
GET_MODEL_DETAILS_NMF Function 42-78
GET_MODEL_DETAILS_OC Function 42-79
GET_MODEL_DETAILS_SVM Function 42-82
GET_MODEL_DETAILS_XML Function 42-84
GET_MODEL_SETTINGS Function 42-86
GET_MODEL_SIGNATURE Function 42-87
GET_MODEL_TRANSFORMATIONS Function 42-89
GET_TRANSFORM_LIST Procedure 42-90
IMPORT_MODEL Procedure 42-91
RANK_APPLY Procedure 42-94
REMOVE_COST_MATRIX Procedure 42-97
RENAME_MODEL Procedure 42-98

43 DBMS_DBFS_CONTENT

Using DBMS_DBFS_CONTENT 43-2
Overview 43-3
Security Model 43-4
Constants 43-5
Exceptions 43-18

Operational Notes 43-19
Data Structures 43-23
FEATURE_T Record Type 43-24
MOUNT_T Record Type 43-25
PATH_ITEM_T Record Type 43-26
PROP_ITEM_T Record Type 43-28
PROPERTY_T Record Type 43-29
STORE_T Record Type 43-30
FEATURES_T Table Type 43-31
MOUNTS_T Table Type 43-32
PATH_ITEMS_T Table Type 43-33
PROP_ITEMS_T Table Type 43-34
PROPERTIES_T Table Type 43-35
STORES_T Table Type 43-36
Summary of DBMS_DBFS_CONTENT Subprograms 43-37
CHECKACCESS Function 43-40
CHECKSPI Functions and Procedures 43-41
CREATEDIRECTORY Procedures 43-42
CREATEFILE Procedures 43-43
CREATELINK Procedures 43-44
CREATEREFERENCE Procedures 43-45
DECODEFEATURES Function 43-46
DELETECONTENT Procedure 43-47
DELETEDIRECTORY Procedure 43-48
DELETEFILE Procedure 43-49
FEATURENAME Function 43-50
FLUSHSTATS Function 43-51
GETDEFAULTACL Procedure 43-52
GETDEFAULTASOF Procedure 43-53
GETTDEFAULTCONTEXT Procedure 43-54
GETDEFAULTOWNER Procedure 43-55
GETDEFAULTPRINCIPAL Procedure 43-56
GETFEATURESBYMOUNT Function 43-57
GETFEATURESBYNAME Function 43-58
GETFEATURESBYPATH Function 43-59
GETPATH Procedures 43-60
GETPATHBYMOUNTID Function 43-63
GETPATHBYSTOREID Function 43-64
GETPATHNOWAIT Procedures 43-65
GETSTOREBYMOUNT Function 43-67

SETSTOREPROPERTY Procedure 45-23
STOREPUSH Procedure 45-26

46 DBMS_DBFS_SFS

Using DBMS_DBFS_SFS 46-2
Overview 46-3
Security Model 46-4
Constants 46-5

Summary of DBMS_DBFS_SFS Subprograms 46-6
CREATEFILESYSTEM Procedure 46-7
CREATESTORE Procedure 46-9
DROPFILESYSTEM Procedures 46-10
INITFS Procedure 46-11

47 DBMS_DATA_MINING_TRANSFORM

Using DBMS_DATA_MINING_TRANSFORM 47-2
Data Transformation with Oracle Data Mining 47-3
Types of Transformations 47-4
The DBMS_DATA_MINING_TRANSFORM Framework 47-6
Data Types 47-7
Summary of DBMS_DATA_MINING_TRANSFORM Subprograms 47-9
CREATE_BIN_CAT Procedure 47-11
CREATE_BIN_NUM Procedure 47-12
CREATE_CLIP Procedure 47-13
CREATE_COL_REM Procedure 47-14
CREATE_MISS_CAT Procedure 47-15
CREATE_MISS_NUM Procedure 47-16
CREATE_NORM_LIN Procedure 47-17
DESCRIBE_STACK Procedure 47-18
GET_EXPRESSION Function 47-19
INSERT_AUTOBIN_NUM_EQWIDTH Procedure 47-20
INSERT_BIN_CAT_FREQ Procedure 47-22
INSERT_BIN_NUM_EQWIDTH Procedure 47-24
INSERT_BIN_NUM_QTILE Procedure 47-26
INSERT_BIN_SUPER Procedure 47-28
INSERT_CLIP_TRIM_TAIL Procedure 47-29
INSERT_CLIP_WINSOR_TAIL Procedure 47-31
INSERT_MISS_CAT_MODE Procedure 47-33
INSERT_MISS_NUM_MEAN Procedure 47-34
INSERT_NORM_LIN_MINMAX Procedure 47-35
INSERT_NORM_LIN_SCALE Procedure 47-36
INSERT_NORM_LIN_ZSCORE Procedure 47-37
SET_EXPRESSION Procedure 47-38
SET_TRANSFORM Procedure 47-39
STACK_BIN_CAT Procedure 47-40
STACK_BIN_NUM Procedure 47-43
STACK_CLIP Procedure 47-46
STACK_COL_REM Procedure 47-48
STACK_MISS_CAT Procedure 47-49
STACK_MISS_NUM Procedure 47-51
STACK_NORM_LIN Procedure 47-53
XFORM_BIN_CAT Procedure 47-55
XFORM_BIN_NUM Procedure 47-57
XFORM_CLIP Procedure 47-60
XFORM_COL_REM Procedure 47-62

XFORM_EXPR_NUM Procedure 47-63
XFORM_EXPR_STR Procedure 47-65
XFORM_MISS_CAT Procedure 47-66
XFORM_MISS_NUM Procedure 47-67
XFORM_NORM_LIN Procedure 47-68
XFORM_STACK Procedure 47-70

48 DBMS_DATAPUMP

Using DBMS_DATAPUMP 48-2
Overview 48-3
Security Model 48-4
Constants 48-5
Data Structures 48-6
Data Structures - Object Types 48-7
Summary of DBMS_DATAPUMP Subprograms 48-12
ADD_FILE Procedure 48-13
ATTACH Function 48-16
DATA_FILTER Procedures 48-18
DATA_REMAP Procedure 48-21
DETACH Procedure 48-23
GET_DUMPFILE_INFO Procedure 48-24
GET_STATUS Procedure 48-26
LOG_ENTRY Procedure 48-29
METADATA_FILTER Procedure 48-30
METADATA_REMAP Procedure 48-33
METADATA_TRANSFORM Procedure 48-36
OPEN Function 48-39
SET_PARALLEL Procedure 48-42
SET_PARAMETER Procedures 48-44
START_JOB Procedure 48-53
STOP_JOB Procedure 48-55
WAIT_FOR_JOB Procedure 48-57

49 DBMS_DB_VERSION

Using DBMS_DB_VERSION 49-2
Overview 49-3
Constants 49-4
Examples 49-5

50 DBMS_DDL

Using DBMS_DDL 50-2
Deprecated Subprograms 50-3
Security Model 50-4
Operational Notes 50-5
Summary of DBMS_DDL Subprograms 50-6
ALTER_COMPILE Procedure 50-7

ALTER_TABLE_NOT_REFERENCEABLE Procedure 50-8
ALTER_TABLE_REFERENCEABLE Procedure 50-9
CREATE_WRAPPED Procedures 50-10
IS_TRIGGER_FIRE_ONCE Function 50-12
SET_TRIGGER_FIRING_PROPERTY Procedures 50-13
WRAP Functions 50-15

51 DBMS_DEBUG

Using DBMS_DEBUG 51-2
Overview 51-3
Constants 51-4
Variables 51-5
Exceptions 51-6
Operational Notes 51-8
Data Structures 51-15
BREAKPOINT_INFO Record Type 51-16
PROGRAM_INFO Record Type 51-17
RUNTIME_INFO Record Type 51-18
BACKTRACE_TABLE Table Type 51-19
BREAKPOINT_TABLE Table Type 51-20
INDEX_TABLE Table Type 51-21
VC2_TABLE Table Type 51-22
Summary of DBMS_DEBUG Subprograms 51-23
ATTACH_SESSION Procedure 51-25
CONTINUE Function 51-26
DEBUG_OFF Procedure 51-27
DEBUG_ON Procedure 51-28
DELETE_BREAKPOINT Function 51-29
DELETE_OER_BREAKPOINT Function 51-30
DETACH_SESSION Procedure 51-31
DISABLE_BREAKPOINT Function 51-32
ENABLE_BREAKPOINT Function 51-33
EXECUTE Procedure 51-34
GET_INDEXES Function 51-36
GET_MORE_SOURCE Procedure 51-37
GET_LINE_MAP Function 51-38
GET_RUNTIME_INFO Function 51-39
GET_TIMEOUT_BEHAVIOUR Function 51-40
GET_VALUE Function 51-41
INITIALIZE Function 51-43
PING Procedure 51-45
PRINT_BACKTRACE Procedure 51-46
PRINT_INSTANTIATIONS Procedure 51-47
PROBE_VERSION Procedure 51-48
SELF_CHECK Procedure 51-49
SET_BREAKPOINT Function 51-50
SET_OER_BREAKPOINT Function 51-51

SET_TIMEOUT Function 51-52
SET_TIMEOUT_BEHAVIOUR Procedure 51-53
SET_VALUE Function 51-54
SHOW_BREAKPOINTS Procedures 51-56
SHOW_FRAME_SOURCE Procedure 51-57
SHOW_SOURCE Procedures 51-58
SYNCHRONIZE Function 51-60
TARGET_PROGRAM_RUNNING Procedure 51-61

52 DBMS_DEFER

Documentation of DBMS_DEFER 52-2

53 DBMS_DEFER_QUERY

Documentation of DBMS_DEFER_QUERY 53-2

54 DBMS_DEFER_SYS

Documentation of DBMS_DEFER_SYS 54-2

55 DBMS_DESCRIBE

Using DBMS_DESCRIBE 55-2
Overview 55-3
Security Model 55-4
Types 55-5
Exceptions 55-6
Examples 55-7
Summary of DBMS_DESCRIBE Subprograms 55-10
DESCRIBE_PROCEDURE Procedure 55-11

56 DBMS_DG

Using DBMS_DG 56-2
Summary of the DBMS_DG Subprogram 56-3
INITIATE_FS_FAILOVER Procedure 56-4

57 DBMS_DIMENSION

Using DBMS_DIMENSION 57-2
Security Model 57-3
Summary of DBMS_DIMENSION Subprograms 57-4
DESCRIBE_DIMENSION Procedure 57-5
VALIDATE_DIMENSION Procedure 57-6

58 DBMS_DST

Using DBMS_DST 58-2
Overview 58-3
Security Model 58-4

Views ... 58-5
Summary of DBMS_DST Subprograms ... 58-6
BEGIN_PREPARE Procedure ... 58-7
BEGIN_UPGRADE Procedure ... 58-8
CREATE_AFFECTED_TABLE Procedure ... 58-9
CREATE_ERROR_TABLE Procedure ... 58-10

GET_ALL_DAD_MAPPINGS Procedure ... 60-18
GET_ALL_GLOBAL_ATTRIBUTES Procedure ... 60-19
GET_DAD_ATTRIBUTE Function ... 60-20
GET_DAD_LIST Procedure ... 60-21
GET_GLOBAL_ATTRIBUTE Function ... 60-22

MAP_DAD Procedure 60-23
SET_DAD_ATTRIBUTE Procedure 60-24
SET_GLOBAL_ATTRIBUTE Procedure 60-26
UNMAP_DAD Procedure 60-27

61 DBMS_ERRLOG

Using DBMS_ERRLOG 61-2
Security Model 61-3
Summary of DBMS_ERRLOG Subprograms 61-4
CREATE_ERROR_LOG Procedure 61-5

62 DBMS_EXPFIL

Summary of Expression Filter Subprograms 62-2
ADD_ELEMENTARY_ATTRIBUTE Procedures 62-3
ADD_FUNCTIONS Procedure 62-6
ASSIGN_ATTRIBUTE_SET Procedure 62-8
BUILD_EXCEPTIONS_TABLE Procedure 62-10
CLEAR_EXPRSET_STATS Procedure 62-11
COPY_ATTRIBUTE_SET Procedure 62-12
CREATE_ATTRIBUTE_SET Procedure 62-13
DEFAULT_INDEX_PARAMETERS Procedure 62-15
DEFAULT_XPINDEX_PARAMETERS Procedure 62-17
DEFRAG_INDEX Procedure 62-19
DROP_ATTRIBUTE_SET Procedure 62-20
GET_EXPRSET_STATS Procedure 62-21
GRANT_PRIVILEGE Procedure 62-22
INDEX_PARAMETERS Procedure 62-23
MODIFY_OPERATOR_LIST Procedure 62-25
REVOKE_PRIVILEGE Procedure 62-26
SYNC_TEXT_INDEXES Procedure 62-27
UNASSIGN_ATTRIBUTE_SET Procedure 62-28
VALIDATE_EXPRESSIONS Procedure 62-29
XPINDEX_PARAMETERS Procedure 62-30

63 DBMS_FGA

Using DBMS_FGA 63-2
Security Model 63-3
Operational Notes 63-4
Summary of DBMS_FGA Subprograms 63-5
ADD_POLICY Procedure 63-6
DISABLE_POLICY Procedure 63-11
DROP_POLICY Procedure 63-12
ENABLE_POLICY Procedure 63-13

64 DBMS_FILE_GROUP

Using DBMS_FILE_GROUP 64-2

Overview 64-3
Constants 64-4
Summary of DBMS_FILE_GROUP Subprograms 64-5
ADD_FILE Procedure 64-6
ALTER_FILE Procedure 64-8
ALTER_FILE_GROUP Procedure 64-10
ALTER_VERSION Procedure 64-12
CREATE_FILE_GROUP Procedure 64-14
CREATE_VERSION Procedure 64-16
DROP_FILE_GROUP Procedure 64-17
DROP_VERSION Procedure 64-18
GRANT_OBJECT_PRIVILEGE Procedure 64-19
GRANT_SYSTEM_PRIVILEGE Procedure 64-20
PURGE_FILE_GROUP Procedure 64-21
REMOVE_FILE Procedure 64-22
REVOKE_OBJECT_PRIVILEGE Procedure 64-23
REVOKE_SYSTEM_PRIVILEGE Procedure 64-24

65 DBMS_FILE_TRANSFER

Using DBMS_FILE_TRANSFER 65-2
Operating Notes 65-3
Summary of DBMS_FILE_TRANSFER Subprograms 65-4
COPY_FILE Procedure 65-5
GET_FILE Procedure 65-7
PUT_FILE Procedure 65-9

66 DBMS_FLASHBACK

Using DBMS_FLASHBACK 66-2
Overview 66-3
Security Model 66-4
Types 66-5
Exceptions 66-6
Operational Notes 66-7
Examples 66-8
Summary of DBMS_FLASHBACK Subprograms 66-11
DISABLE Procedure 66-12
ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure 66-13
ENABLE_AT_TIME Procedure 66-14
GET_SYSTEM_CHANGE_NUMBER Function 66-15
TRANSACTION_BACKOUT Procedures 66-16

67 DBMS_FLASHBACK_ARCHIVE

Using DBMS_FLASHBACK_ARCHIVE 67-2
Overview 67-3
Security Model 67-4
Examples 67-5

Summary of DBMS_FLASHBACK_ARCHIVE Subprograms 67-7
DISASSOCIATE_FBA Procedure 67-8
REASSOCIATE_FBA Procedure 67-9

68 DBMS_FREQUENT_ITEMSET

Summary of DBMS_FREQUENT_ITEMSET Subprograms 68-2
FI_HORIZONTAL Function 68-3
FI_TRANSACTIONAL Function 68-5

69 DBMS_HM

Using DBMS_HM 69-2
Security Model 69-3
Summary of DBMS_HM Subprograms 69-4
GET_RUN_REPORT Function 69-5
RUN_CHECK Procedure 69-6

70 DBMS_HPROF

Summary of DBMS_HPROF Subprograms 70-2
ANALYZE Function 70-3
START_PROFILING Procedure 70-5
STOP_PROFILING Procedure 70-6

71 DBMS_HS_PARALLEL

Using DBMS_HS_PARALLEL 71-2
Summary of DBMS_HS_PARALLEL Subprograms 71-3
CREATE_OR_REPLACE_VIEW 71-4
CREATE_TABLE_TEMPLATE 71-6
DROP_VIEW 71-7
LOAD_TABLE 71-8

72 DBMS_HS_PASSTHROUGH

Using DBMS_HS_PASSTHROUGH 72-2
Overview 72-3
Operational Notes 72-4
Summary of DBMS_HS_PASSTHROUGH Subprograms 72-5
BIND_INOUT_VARIABLE Procedure 72-6
BIND_INOUT_VARIABLE_RAW Procedure 72-7
BIND_OUT_VARIABLE Procedure 72-8
BIND_OUT_VARIABLE_RAW Procedure 72-9
BIND_VARIABLE Procedure 72-10
BIND_VARIABLE_RAW Procedure 72-11
CLOSE_CURSOR Procedure 72-12
EXECUTE_IMMEDIATE Procedure 72-13
EXECUTE_NON_QUERY Function 72-14
FETCH_ROW Function 72-15

GET_VALUE Procedure 72-16
GET_VALUE_RAW Procedure 72-17
OPEN_CURSOR Function 72-18
PARSE Procedure 72-19

73 DBMS_JAVA

Documentation of DBMS_JAVA 73-2

74 DBMS_IOT

Summary of DBMS_IOT Subprograms 74-2
BUILD_CHAIN_ROWS_TABLE Procedure 74-3
BUILD_EXCEPTIONS_TABLE Procedure 74-4

75 DBMS_JOB

Using DBMS_JOB 75-2
Security Model 75-3
Operational Notes 75-4
Summary of DBMS_JOB Subprograms 75-6
BROKEN Procedure 75-7
CHANGE Procedure 75-8
INSTANCE Procedure 75-9
INTERVAL Procedure 75-10
NEXT_DATE Procedure 75-11
REMOVE Procedure 75-12
RUN Procedure 75-13
SUBMIT Procedure 75-14

LOADCLOBFROMFILE Procedure 79-61
LOADFROMFILE Procedure 79-65
MOVE_TO_DBFS_LINK Procedures 79-67
OPEN Procedures 79-68
READ Procedures 79-70
SET_DBFS_LINK Procedures 79-72
SETCONTENTTYPE Procedure 79-73

SETOPTIONS Procedures 79-74
SUBSTR Functions 79-75
TRIM Procedures 79-77
WRITE Procedures 79-79
WRITEAPPEND Procedures 79-81

80 DBMS_LOCK

Using DBMS_LOCK 80-2
Overview 80-3
Security Model 80-4
Constants 80-5
Rules and Limits 80-6
Operational Notes 80-7
Summary of DBMS_LOCK Subprograms 80-8
ALLOCATE_UNIQUE Procedure 80-9
CONVERT Function 80-11
RELEASE Function 80-12
REQUEST Function 80-13
SLEEP Procedure 80-14

81 DBMS_LOGMNR

Using DBMS_LOGMNR 81-2
Overview 81-3
Security Model 81-4
Constants 81-5
Views 81-7
Operational Notes 81-8
Summary of DBMS_LOGMNR Subprograms 81-9
ADD_LOGFILE Procedure 81-10
COLUMN_PRESENT Function 81-12
END_LOGMNR Procedure 81-14
MINE_VALUE Function 81-15
REMOVE_LOGFILE Procedure 81-17
START_LOGMNR Procedure 81-18

82 DBMS_LOGMNR_D

Using DBMS_LOGMNR_D 82-2
Overview 82-3
Security Model 82-4
Summary of DBMS_LOGMNR_D Subprograms 82-5
BUILD Procedure 82-6
SET_TABLESPACE Procedure 82-9

83 DBMS_LOGSTDBY

Using DBMS_LOGSTDBY 83-2
Overview 83-3

Operational Notes 83-4
Summary of DBMS_LOGSTDBY Subprograms 83-5
APPLY_SET Procedure 83-7
APPLY_UNSET Procedure 83-10
BUILD Procedure 83-11
INSTANTIATE_TABLE Procedure 83-12
IS_APPLY_SERVER Function 83-14
MAP_PRIMARY_SCN Function 83-15
PREPARE_FOR_NEW_PRIMARY Procedure 83-16
PURGE_SESSION Procedure 83-18
REBUILD Procedure 83-19
SET_TABLESPACE Procedure 83-20
SKIP Procedure 83-21
SKIP_ERROR Procedure 83-29
SKIP_TRANSACTION Procedure 83-33
UNSKIP Procedure 83-35
UNSKIP_ERROR Procedure 83-37
UNSKIP_TRANSACTION Procedure 83-39

84 DBMS_METADATA

Using DBMS_METADATA 84-2
Overview 84-3
Security Model 84-4
Rules and Limits 84-5
Data Structures - Object and Table Types 84-6
Subprogram Groupings 84-8
Subprograms for Retrieving Multiple Objects From the Database 84-9
Subprograms for Submitting XML to the Database 84-10
Summary of All DBMS_METADATA Subprograms 84-11
ADD_TRANSFORM Function 84-12
CLOSE Procedure 84-16
CONVERT Functions and Procedures 84-17
FETCH_xxx Functions and Procedures 84-19
GET_xxx Functions 84-22
GET_QUERY Function 84-26
OPEN Function 84-27
OPENW Function 84-33
PUT Function 84-34
SET_COUNT Procedure 84-36
SET_FILTER Procedure 84-37
SET_PARSE_ITEM Procedure 84-47
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures 84-50

85 DBMS_METADATA_DIFF

Browsing APIs for Fetching and Comparing Objects 85-2
Summary of DBMS_METADATA_DIFF Subprograms 85-4
OPENC Function 85-5

ADD_DOCUMENT Procedure 85-6
FETCH_CLOB Functions and Procedures 85-7
CLOSE Procedure 85-8

86 DBMS_MGD_ID_UTL

Using DBMS_MGD_ID_UTL 86-2
Constants 86-3
Exceptions 86-4
Summary of DBMS_MGD_ID_UTL Subprograms 86-5
ADD_SCHEME Procedure 86-6
CREATE_CATEGORY Function 86-10

ALTER_SUBSCRIBER Procedure 87-27
CLEANUP_GATEWAY Procedures 87-29

CREATE_AGENT Procedure 87-32
CREATE_JOB Procedure 87-34
CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous 87-38
CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ 87-39
DB_CONNECT_INFO Procedure 87-40
DISABLE_JOB Procedure 87-41
DISABLE_PROPAGATION_SCHEDULE Procedure 87-42
ENABLE_JOB Procedure 87-43
ENABLE_PROPAGATION_SCHEDULE Procedure 87-44
REGISTER_FOREIGN_QUEUE Procedure 87-45
REMOVE_AGENT Procedure 87-46
REMOVE_JOB Procedure 87-47
REMOVE_MSGSYSTEM_LINK Procedure 87-48
REMOVE_OPTION Procedure 87-49
REMOVE_SUBSCRIBER Procedure 87-51
RESET_JOB Procedure 87-52
RESET_SUBSCRIBER Procedure 87-53
SCHEDULE_PROPAGATION Procedure 87-54
SET_LOG_LEVEL Procedures 87-56
SET_OPTION Procedure 87-57
SHUTDOWN Procedures 87-59
STARTUP Procedures 87-60
UNREGISTER_FOREIGN_QUEUE Procedure 87-61
UNSCHEDULE_PROPAGATION Procedure 87-62

88 DBMS_MGWMSG

Using DBMS_MGWMSG 88-2
Security Model 88-3
Constants 88-4
Types 88-6
Summary of DBMS_MGWMSG Subprograms 88-21
LCR_TO_XML Function 88-22
NVARRAY_ADD Procedure 88-23
NVARRAY_FIND_NAME Function 88-24
NVARRAY_FIND_NAME_TYPE Function 88-25
NVARRAY_GET Function 88-26
NVARRAY_GET_BOOLEAN Function 88-27
NVARRAY_GET_BYTE Function 88-28
NVARRAY_GET_DATE Function 88-29
NVARRAY_GET_DOUBLE Function 88-30
NVARRAY_GET_FLOAT Function 88-31
NVARRAY_GET_INTEGER Function 88-32
NVARRAY_GET_LONG Function 88-33
NVARRAY_GET_RAW Function 88-34
NVARRAY_GET_SHORT Function 88-35
NVARRAY_GET_TEXT Function 88-36
XML_TO_LCR Function 88-37

89 DBMS_MONITOR

Summary of DBMS_MONITOR Subprograms 89-2
CLIENT_ID_STAT_DISABLE Procedure 89-3
CLIENT_ID_STAT_ENABLE Procedure 89-4
CLIENT_ID_TRACE_DISABLE Procedure 89-5
CLIENT_ID_TRACE_ENABLE Procedure 89-6
DATABASE_TRACE_DISABLE Procedure 89-7
DATABASE_TRACE_ENABLE Procedure 89-8
SERV_MOD_ACT_STAT_DISABLE Procedure 89-9
SERV_MOD_ACT_STAT_ENABLE Procedure 89-10
SERV_MOD_ACT_TRACE_DISABLE Procedure 89-12
SERV_MOD_ACT_TRACE_ENABLE Procedure 89-13
SESSION_TRACE_DISABLE Procedure 89-15
SESSION_TRACE_ENABLE Procedure 89-16

90 DBMS_MVIEW

Using DBMS_MVIEW 90-2
Operational Notes 90-3
Rules and Limits 90-4
Summary of DBMS_MVIEW Subprograms 90-5
BEGIN_TABLE_REORGANIZATION Procedure 90-6
END_TABLE_REORGANIZATION Procedure 90-7
ESTIMATE_MVIEW_SIZE Procedure 90-8
EXPLAIN_MVIEW Procedure 90-9
EXPLAIN_REWRITE Procedure 90-10
I_AM_A_REFRESH Function 90-12
PMARKER Function 90-13
PURGE_DIRECT_LOAD_LOG Procedure 90-14
PURGE_LOG Procedure 90-15
PURGE_MVIEW_FROM_LOG Procedure 90-16
REFRESH Procedures 90-17
REFRESH_ALL_MVIEWS Procedure 90-19
REFRESH_DEPENDENT Procedures 90-20
REGISTER_MVIEW Procedure 90-22
UNREGISTER_MVIEW Procedure 90-24

91 DBMS_NETWORK_ACL_ADMIN

Using DBMS_NETWORK_ACL_ADMIN 91-2
Examples 91-3
Summary of DBMS_NETWORK_ACL_ADMIN Subprograms 91-5
ADD_PRIVILEGE Procedure 91-6
ASSIGN_ACL Procedure 91-8
ASSIGN_WALLET_ACL Procedure 91-10
CHECK_PRIVILEGE Function 91-11
CHECK_PRIVILEGE_ACLID Function 91-12
CREATE_ACL Procedure 91-13

DELETE_PRIVILEGE Procedure 91-14
DROP_ACL Procedure 91-15
UNASSIGN_ACL Procedure 91-16
UNASSIGN_WALLET_ACL Procedure 91-17

92 DBMS_NETWORK_ACL_UTILITY

Using DBMS_NETWORK_ACL_UTILITY 92-2
Examples 92-3
Summary of DBMS_NETWORK_ACL_UTILITY Subprograms 92-4
CONTAINS_HOST Function 92-5
DOMAIN_LEVEL Function 92-6
DOMAINS Function 92-7
EQUALS_HOST Function 92-8

93 DBMS_OBFUSCATION_TOOLKIT

Using DBMS_OBFUSCATION_TOOLKIT 93-2
Overview 93-3
Security Model 93-4
Operational Notes 93-5
Summary of DBMS_OBFUSCATION Subprograms 93-7
DES3DECRYPT Procedures and Functions 93-8
DES3ENCRYPT Procedures and Functions 93-10
DES3GETKEY Procedures and Functions 93-12
DESDECRYPT Procedures and Functions 93-13
DESENCRYPT Procedures and Functions 93-15
DESGETKEY Procedures and Functions 93-17
MD5 Procedures and Functions 93-18

94 DBMS_ODCI

Summary of DBMS_ODCI Subprograms 94-2
ESTIMATE_CPU_UNITS Function 94-3

95 DBMS_OFFLINE_OG

Documentation of DBMS_OFFLINE_OG 95-2

96 DBMS_OUTLN

Using DBMS_OUTLN 96-2
Overview 96-3
Security Model 96-4
Summary of DBMS_OUTLN Subprograms 96-5
CLEAR_USED Procedure 96-6
CREATE_OUTLINE Procedure 96-7
DROP_BY_CAT Procedure 96-8
DROP_UNUSED Procedure 96-9
EXACT_TEXT_SIGNATURES Procedure 96-10

UPDATE_BY_CAT Procedure 96-11
UPDATE_SIGNATURES Procedure 96-12

97 DBMS_OUTPUT

Using DBMS_OUTPUT 97-2
Overview 97-3
Security Model 97-4
Operational Notes 97-5
Exceptions 97-6
Rules and Limits 97-7
Examples 97-8
Data Structures 97-11
CHARARR Table Type 97-12
DBMSOUTPUT_LINESARRAY Object Type 97-13
Summary of DBMS_OUTPUT Subprograms 97-14
DISABLE Procedure 97-15
ENABLE Procedure 97-16
GET_LINE Procedure 97-17
GET_LINES Procedure 97-18
NEW_LINE Procedure 97-19
PUT Procedure 97-20
PUT_LINE Procedure 97-21

98 DBMS_PARALLEL_EXECUTE

Using DBMS_PARALLEL_EXECUTE 98-2
Overview 98-3
Security Model 98-4
Constants 98-5
Views 98-6
Exceptions 98-7
Examples 98-8
Summary of DBMS_PARALLEL_EXECUTE Subprograms 98-11
ADM_DROP_CHUNKS Procedure 98-12
ADM_DROP_TASK Procedure 98-13
ADM_TASK_STATUS Procedure 98-14
ADM_STOP_TASK Procedure 98-15
CREATE_TASK Procedure 98-16
CREATE_CHUNKS_BY_NUMBER_COL Procedure 98-17
CREATE_CHUNKS_BY_ROWID Procedure 98-18
CREATE_CHUNKS_BY_SQL Procedure 98-19
DROP_TASK Procedure 98-20
DROP_CHUNKS Procedure 98-21
GENERATE_TASK_NAME Function 98-22
GET_NUMBER_COL_CHUNK Procedure 98-23
GET_ROWID_CHUNK Procedure 98-24
PURGE_PROCESSED_CHUNKS Procedure 98-25
RESUME_TASK Procedures 98-26

RUN_TASK Procedure 98-28
SET_CHUNK_STATUS Procedure 98-30
STOP_TASK Procedure 98-31
TASK_STATUS Procedure 98-32

99 DBMS_PCLXUTIL

Using DBMS_PCLXUTIL 99-2
Overview 99-3
Security Model 99-4
Operational Notes 99-5
Rules and Limits 99-6
Summary of DBMS_PCLXUTIL Subprograms 99-7
BUILD_PART_INDEX Procedure 99-8

100 DBMS_PIPE

Using DBMS_PIPE 100-2
Overview 100-3
Security Model 100-4
Constants 100-5
Operational Notes 100-6
Exceptions 100-8
Examples 100-9
Summary of DBMS_PIPE Subprograms 100-18
CREATE_PIPE Function 100-19
NEXT_ITEM_TYPE Function 100-21
PACK_MESSAGE Procedures 100-22
PURGE Procedure 100-24
RECEIVE_MESSAGE Function 100-25
RESET_BUFFER Procedure 100-27
REMOVE_PIPE Function 100-28
SEND_MESSAGE Function 100-29
UNIQUE_SESSION_NAME Function 100-31
UNPACK_MESSAGE Procedures 100-32

101 DBMS_PREDICTIVE_ANALYTICS

Using DBMS_PREDICTIVE_ANALYTICS 101-2
Overview 101-3
Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms 101-4
EXPLAIN Procedure 101-5
PREDICT Procedure 101-7
PROFILE Procedure 101-9

102 DBMS_PREPROCESSOR

Using DBMS_PREPROCESSOR 102-2
Overview 102-3
Operating Notes 102-4

Data Structures ... 102-5
SOURCE_LINES_T Table Type ... 102-6
Summary of DBMS_PREPROCESSOR Subprograms ... 102-7
GET_POST_PROCESSED_SOURCE Functions ... 102-8
PRINT_POST_PROCESSED_SOURCE Procedures ... 102-10

103 DBMS_PROFILER

Using DBMS_PROFILER ... 103-2
Overview ... 103-3
Security Model ... 103-5
Operational Notes ... 103-6
Exceptions ... 103-8
Summary of DBMS_PROFILER Subprograms ... 103-9
FLUSH_DATA Function and Procedure ... 103-10
GET_VERSION Procedure ... 103-11
INTERNAL_VERSION_CHECK Function ... 103-12
PAUSE_PROFILER Function and Procedure ... 103-13
RESUME_PROFILER Function and Procedure ... 103-14
START_PROFILER Functions and Procedures ... 103-15
STOP_PROFILER Function and Procedure ... 103-16

104 DBMS_PROPAGATION_ADM

Summary of DBMS_PROPAGATION_ADM Subprograms ... 104-2
ALTER_PROPAGATION Procedure ... 104-3
CREATE_PROPAGATION Procedure ... 104-5
DROP_PROPAGATION Procedure ... 104-8
START_PROPAGATION Procedure ... 104-10
STOP_PROPAGATION Procedure ... 104-11

105 DBMS_RANDOM

Using DBMS_RANDOM ... 105-2
Security Model ... 105-3
Operational Notes ... 105-4
Summary of DBMS_RANDOM Subprograms ... 105-5
INITIALIZE Procedure ... 105-6
NORMAL Function ... 105-7
RANDOM Procedure ... 105-8
SEED Procedures ... 105-9
STRING Function ... 105-10
TERMINATE Procedure ... 105-11
VALUE Functions ... 105-12

106 DBMS_RECTIFIER_DIFF

Documentation of DBMS_RECTIFIER_DIFF ... 106-2

107 DBMS_REDEFINITION

Using DBMS_REDEFINITION 107-2
Overview 107-3
Constants 107-4
Operational Notes 107-5
Rules and Limits 107-6
Summary of DBMS_REDEFINITION Subprograms 107-7
ABORT_REDEF_TABLE Procedure 107-8
CAN_REDEF_TABLE Procedure 107-9
COPY_TABLE_DEPENDENTS Procedure 107-10
FINISH_REDEF_TABLE Procedure 107-12
REGISTER_DEPENDENT_OBJECT Procedure 107-13
START_REDEF_TABLE Procedure 107-14
SYNC_INTERIM_TABLE Procedure 107-15
UNREGISTER_DEPENDENT_OBJECT Procedure 107-16

108 DBMS_REFRESH

Documentation of DBMS_REFRESH 108-2

109 DBMS_REPAIR

Using DBMS_REPAIR 109-2
Overview 109-3
Security Model 109-4
Constants 109-5
Operating Notes 109-6
Exceptions 109-7
Examples 109-8
Summary of DBMS_REPAIR Subprograms 109-9
ADMIN_TABLES Procedure 109-10
CHECK_OBJECT Procedure 109-11
DUMP_ORPHAN_KEYS Procedure 109-13
FIX_CORRUPT_BLOCKS Procedure 109-14
ONLINE_INDEX_CLEAN Function 109-15
REBUILD_FREELISTS Procedure 109-16
SEGMENT_FIX_STATUS Procedure 109-17
SKIP_CORRUPT_BLOCKS Procedure 109-18

110 DBMS_REPCAT

Documentation of DBMS_REPCAT 110-2

111 DBMS_REPCAT_ADMIN

Documentation of DBMS_REPCAT_ADMIN 111-2

112 DBMS_REPCAT_INSTANTIATE

Documentation of DBMS_REPCAT_INSTANTIATE 112-2

113 DBMS_REPCAT_RGT

Documentation of DBMS_REPCAT_RGT 113-2

114 DBMS_REPUTIL

Documentation of DBMS_REPUTIL 114-2

115 DBMS_RESCONFIG

Using DBMS_RESCONFIG 115-2
Overview 115-3
Summary of DBMS_RESCONFIG Subprograms 115-4
ADDREPOSITORYRESCONFIG Procedure 115-5
ADDRESCONFIG Procedure 115-6
APPENDRESCONFIG Procedure 115-7
DELETEREPOSITORYRESCONFIG Procedure 115-8
DELETERESCONFIG Procedures 115-9
GETLISTENERS Function 115-10
GETREPOSITORYRESCONFIG Function 115-11
GETREPOSITORYRESCONFIGPATHS Function 115-12
GETRESCONFIG Function 115-13
GETRESCONFIGPATHS Function 115-14
PATCHREPOSITORYRESCONFIGLIST Procedure 115-15

116 DBMS_RESOURCE_MANAGER

Using DBMS_RESOURCE_MANAGER 116-2
Deprecated Subprograms 116-3
Security Model 116-4
Constants 116-5
Summary of DBMS_RESOURCE_MANAGER Subprograms 116-7
CALIBRATE_IO Procedure 116-9
CLEAR_PENDING_AREA Procedure 116-12
CREATE_CATEGORY Procedure 116-13
CREATE_CONSUMER_GROUP Procedure 116-14
CREATE_PENDING_AREA Procedure 116-15
CREATE_PLAN Procedure 116-17
CREATE_PLAN_DIRECTIVE Procedure 116-18
CREATE_SIMPLE_PLAN Procedure 116-22
DELETE_CATEGORY Procedure 116-24
DELETE_CONSUMER_GROUP Procedure 116-25
DELETE_PLAN Procedure 116-26
DELETE_PLAN_CASCADE Procedure 116-27
DELETE_PLAN_DIRECTIVE Procedure 116-28
SET_CONSUMER_GROUP_MAPPING Procedure 116-29
SET_CONSUMER_GROUP_MAPPING_PRI Procedure 116-30
SET_INITIAL_CONSUMER_GROUP Procedure 116-31
SUBMIT_PENDING_AREA Procedure 116-32
SWITCH_CONSUMER_GROUP_FOR_SESS Procedure 116-33

SWITCH_CONSUMER_GROUP_FOR_USER Procedure 116-34
SWITCH_PLAN Procedure 116-35
UPDATE_CATEGORY Procedure 116-36
UPDATE_CONSUMER_GROUP Procedure 116-37
UPDATE_PLAN Procedure 116-38
UPDATE_PLAN_DIRECTIVE Procedure 116-39
VALIDATE_PENDING_AREA Procedure 116-43

117 DBMS_RESOURCE_MANAGER_PRIVS

Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms 117-2
GRANT_SWITCH_CONSUMER_GROUP Procedure 117-3
GRANT_SYSTEM_PRIVILEGE Procedure 117-4
REVOKE_SWITCH_CONSUMER_GROUP Procedure 117-5
REVOKE_SYSTEM_PRIVILEGE Procedure 117-6

118 DBMS_RESULT_CACHE

Using DBMS_RESULT_CACHE 118-2
Constants 118-3
Summary of DBMS_RESULT_CACHE Subprograms 118-4
BYPASS Procedure 118-5
FLUSH Function & Procedure 118-6
INVALIDATE Functions & Procedures 118-7
INVALIDATE_OBJECT Functions & Procedures 118-8
MEMORY_REPORT Procedure 118-9
STATUS Function 118-10

119 DBMS_RESUMABLE

Using DBMS_RESUMABLE 119-2
Operational Notes 119-3
Summary of DBMS_RESUMABLE Subprograms 119-4
ABORT Procedure 119-5
GET_SESSION_TIMEOUT Function 119-6
GET_TIMEOUT Function 119-7
SET_SESSION_TIMEOUT Procedure 119-8
SET_TIMEOUT Procedure 119-9
SPACE_ERROR_INFO Function 119-10

120 DBMS_RLMGR

Summary of Rules Manager Subprograms 120-2
ADD_ELEMENTARY_ATTRIBUTE Procedures 120-4
ADD_EVENT Procedure 120-7
ADD_FUNCTIONS Procedure 120-9
ADD_RULE Procedure 120-10
CONDITION_REF Function 120-12
CONSUME_EVENT Function 120-13
CONSUME_PRIM_EVENTS Function 120-15

CREATE_CONDITIONS_TABLE Procedure 120-17
CREATE_EVENT_STRUCT Procedure 120-19
CREATE_EXPFIL_INDEXES Procedure 120-20
CREATE_INTERFACE Procedure 120-22
CREATE_RULE_CLASS Procedure 120-24
DELETE_RULE Procedure 120-28
DROP_CONDITIONS_TABLE Procedure 120-29
DROP_EVENT_STRUCT Procedure 120-30

EXTEND_EVENT_STRUCT Procedure 120-34
GET_AGGREGATE_VALUE Function 120-35
GRANT_PRIVILEGE Procedure 120-37
PROCESS_RULES Procedure 120-38
PURGE_EVENTS Procedure 120-40
RESET_SESSION Procedure 120-41
REVOKE_PRIVILEGE Procedure 120-42
SYNC_TEXT_INDEXES Procedure 120-43

121 DBMS_RLS

Using DBMS_RLS 121-2
Overview 121-3
Security Model 121-4
Operational Notes 121-5
Summary of DBMS_RLS Subprograms 121-6
ADD_GROUPED_POLICY Procedure 121-7
ADD_POLICY Procedure 121-9
ADD_POLICY_CONTEXT Procedure 121-13
CREATE_POLICY_GROUP Procedure 121-14
DELETE_POLICY_GROUP Procedure 121-15
DISABLE_GROUPED_POLICY Procedure 121-16
DROP_GROUPED_POLICY Procedure 121-17
DROP_POLICY Procedure 121-18
DROP_POLICY_CONTEXT Procedure 121-19
ENABLE_GROUPED_POLICY Procedure 121-20
ENABLE_POLICY Procedure 121-21
REFRESH_GROUPED_POLICY Procedure 121-22
REFRESH_POLICY Procedure 121-23

122 DBMS_ROWID

Using DBMS_ROWID 122-2
Security Model 122-3
Types 122-4
Exceptions 122-6
Operational Notes 122-7
Examples 122-8

Summary of DBMS_ROWID Subprograms 122-9
ROWID_BLOCK_NUMBER Function 122-10
ROWID_CREATE Function 122-11
ROWID_INFO Procedure 122-12
ROWID_OBJECT Function 122-13
ROWID_RELATIVE_FNO Function 122-14
ROWID_ROW_NUMBER Function 122-15
ROWID_TO_ABSOLUTE_FNO Function 122-16
ROWID_TO_EXTENDED Function 122-17
ROWID_TO_RESTRICTED Function 122-19
ROWID_TYPE Function 122-20
ROWID_VERIFY Function 122-21

123 DBMS_RULE

Using DBMS_RULE 123-2
Security Model 123-3
Summary of DBMS_RULE Subprograms 123-4
CLOSE_ITERATOR Procedure 123-5
EVALUATE Procedures 123-6
GET_NEXT_HIT Function 123-10

124 DBMS_RULE_ADM

Using DBMS_RULE_ADM 124-2
Security Model 124-3
Summary of DBMS_RULE_ADM Subprograms 124-4
ADD_RULE Procedure 124-5
ALTER_EVALUATION_CONTEXT Procedure 124-7
ALTER_RULE Procedure 124-10
CREATE_EVALUATION_CONTEXT Procedure 124-12
CREATE_RULE Procedure 124-14
CREATE_RULE_SET Procedure 124-16
DROP_EVALUATION_CONTEXT Procedure 124-17
DROP_RULE Procedure 124-18
DROP_RULE_SET Procedure 124-19
GRANT_OBJECT_PRIVILEGE Procedure 124-20
GRANT_SYSTEM_PRIVILEGE Procedure 124-22
REMOVE_RULE Procedure 124-24
REVOKE_OBJECT_PRIVILEGE Procedure 124-26
REVOKE_SYSTEM_PRIVILEGE Procedure 124-27

SET_EDITION_DEFERRED Procedure 128-29
SET_IDENTIFIER Procedure 128-30
SET_NLS Procedure 128-31
SET_ROLE Procedure 128-32
SET_SQL_TRACE Procedure 128-33
SWITCH_CURRENT_CONSUMER_GROUP Procedure 128-34
UNIQUE_SESSION_ID Function 128-36

129 DBMS_SHARED_POOL

Using DBMS_SHARED_POOL 129-2
Overview 129-3
Operational Notes 129-4
Summary of DBMS_SHARED_POOL Subprograms 129-5
ABORTED_REQUEST_THRESHOLD Procedure 129-6
KEEP Procedure 129-7
PURGE Procedure 129-9

SIZES Procedure 129-10
UNKEEP Procedure 129-11

130 DBMS_SPACE

Using DBMS_SPACE 130-2
Security Model 130-3
Data Structures 130-4
CREATE_TABLE_COST_COLINFO Object Type 130-5
ASA_RECO_ROW Record Type 130-6
ASA_RECO_ROW_TB Table Type 130-7
Summary of DBMS_SPACE Subprograms 130-8
ASA_RECOMMENDATIONS Function 130-9
CREATE_INDEX_COST Procedure 130-10
CREATE_TABLE_COST Procedures 130-11
FREE_BLOCKS Procedure 130-13
ISDATAFILEDROPPABLE_NAME Procedure 130-15
OBJECT_DEPENDENT_SEGMENTS Function 130-16
OBJECT_GROWTH_TREND Function 130-18
SPACE_USAGE Procedures 130-20
UNUSED_SPACE Procedure 130-23

131 DBMS_SPACE_ADMIN

Using DBMS_SPACE_ADMIN 131-2
Security Model 131-3
Constants 131-4
Operational Notes 131-6
Summary of DBMS_SPACE_ADMIN Subprograms 131-7
ASSM_SEGMENT_VERIFY Procedure 131-8
ASSM_TABLESPACE_VERIFY Procedure 131-10
SEGMENT_CORRUPT Procedure 131-11
SEGMENT_DROP_CORRUPT Procedure 131-12
SEGMENT_DUMP Procedure 131-13
SEGMENT_VERIFY Procedure 131-14
TABLESPACE_FIX_BITMAPS Procedure 131-15
TABLESPACE_FIX_SEGMENT_STATES Procedure 131-16
TABLESPACE_MIGRATE_FROM_LOCAL Procedure 131-17
TABLESPACE_MIGRATE_TO_LOCAL Procedure 131-18
TABLESPACE_REBUILD_BITMAPS Procedure 131-19
TABLESPACE_REBUILD_QUOTAS Procedure 131-20
TABLESPACE_RELOCATE_BITMAPS Procedure 131-21
TABLESPACE_VERIFY Procedure 131-22

132 DBMS_SPM

Using DBMS_SPM 132-2
Overview 132-3
Security Model 132-4

Constants 132-5
Examples 132-6
Data Structures 132-7
NAMELIST Table Type 132-8
Summary of DBMS_SPM Subprograms 132-9
ALTER_SQL_PLAN_BASELINE Function 132-10
CONFIGURE Procedure 132-12
CREATE_STGTAB_BASELINE Procedure 132-13
DROP_SQL_PLAN_BASELINE Function 132-14
EVOLVE_SQL_PLAN_BASELINE Function 132-15
LOAD_PLANS_FROM_CURSOR_CACHE Functions 132-17
LOAD_PLANS_FROM_SQLSET Function 132-19
MIGRATE_STORED_OUTLINE Functions 132-20
PACK_STGTAB_BASELINE Function 132-22
UNPACK_STGTAB_BASELINE Function 132-23

133 DBMS_SQL

Using DBMS_SQL 133-2
Overview 133-3
Security Model 133-4
Constants 133-5
Exceptions 133-6
Operational Notes 133-7
Examples 133-12
Data Structures 133-25
DESC_REC Record Type 133-26
DESC_REC2 Record Type 133-27
DESC_REC3 Record Type 133-28
BFILE_TABLE Table Type 133-29
BINARY_DOUBLE_TABLE Table Type 133-30
BINARY_FLOAT_TABLE Table Type 133-31
BLOB_TABLE Table Type 133-32
CLOB_TABLE Table Type 133-33
DATE_TABLE Table Type 133-34
DESC_TAB Table Type 133-35
DESC_TAB2 Table Type 133-36
DESC_TAB3 Table Type 133-37
INTERVAL_DAY_TO_SECOND_TABLE Table Type 133-38
INTERVAL_YEAR_TO_MONTH_TABLE Table Type 133-39
NUMBER_TABLE Table Type 133-40
TIME_TABLE Table Type 133-41
TIME_WITH_TIME_ZONE_TABLE Table Type 133-42
TIMESTAMP_TABLE Table Type 133-43
TIMESTAMP_WITH_LTZ_TABLE Table Type 133-44
TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type 133-45
UROWID_TABLE Table Type 133-46
VARCHAR2_TABLE Table Type 133-47

VARCHAR2A Table Type 133-48
VARCHAR2S Table Type 133-49
Summary of DBMS_SQL Subprograms 133-50
BIND_ARRAY Procedures 133-52
BIND_VARIABLE Procedures 133-55
CLOSE_CURSOR Procedure 133-57
COLUMN_VALUE Procedure 133-58
COLUMN_VALUE_LONG Procedure 133-61
DEFINE_ARRAY Procedure 133-62
DEFINE_COLUMN Procedures 133-65
DEFINE_COLUMN_CHAR Procedure 133-67
DEFINE_COLUMN_LONG Procedure 133-68
DEFINE_COLUMN_RAW Procedure 133-69
DEFINE_COLUMN_ROWID Procedure 133-70
DESCRIBE_COLUMNS Procedure 133-71
DESCRIBE_COLUMNS2 Procedure 133-72
DESCRIBE_COLUMNS3 Procedure 133-73
EXECUTE Function 133-75
EXECUTE_AND_FETCH Function 133-76
FETCH_ROWS Function 133-77
IS_OPEN Function 133-78
LAST_ERROR_POSITION Function 133-79
LAST_ROW_COUNT Function 133-80
LAST_ROW_ID Function 133-81
LAST_SQL_FUNCTION_CODE Function 133-82
OPEN_CURSOR Function 133-83
PARSE Procedures 133-84
TO_CURSOR_NUMBER Function 133-87
TO_REFCURSOR Function 133-89
VARIABLE_VALUE Procedures 133-91

134 DBMS_SQLDIAG

Using DBMS_SQLDIAG 134-2
Overview 134-3
Constants 134-5
Examples 134-8
Summary of DBMS_SQLDIAG Subprograms 134-9
ACCEPT_SQL_PATCH Function & Procedure 134-11
ALTER_SQL_PATCH Procedure 134-13
CANCEL_DIAGNOSIS_TASK Procedure 134-14
CREATE_DIAGNOSIS_TASK Functions 134-15
CREATE_STGTAB_SQLPATCH Procedure 134-17
DROP_DIAGNOSIS_TASK Procedure 134-18
DROP_SQL_PATCH Procedure 134-19
EXECUTE_DIAGNOSIS_TASK Procedure 134-20
EXPLAIN_SQL_TESTCASE Function 134-21
EXPORT_SQL_TESTCASE Procedures 134-22

EXPORT_SQL_TESTCASE_DIR_BY_INC Function 134-25
EXPORT_SQL_TESTCASE_DIR_BY_TXT Function 134-26
GET_FIX_CONTROL Function 134-27
GET_SQL Function 134-28
IMPORT_SQL_TESTCASE Procedures 134-29
INCIDENTID_2_SQL Procedure 134-31
INTERRUPT_DIAGNOSIS_TASK Procedure 134-32
LOAD_SQLSET_FROM_TCB Function 134-33
PACK_STGTAB_SQLPATCH Procedure 134-34
REPORT_DIAGNOSIS_TASK Function 134-35
RESET_DIAGNOSIS_TASK Procedure 134-36
RESUME_DIAGNOSIS_TASK Procedure 134-37
SET_DIAGNOSIS_TASK_PARAMETER Procedure 134-38
UNPACK_STGTAB_SQLPATCH Procedure 134-39

135 DBMS_SQLPA

Using DBMS_SQLPA 135-2
Overview 135-3
Security Model 135-4
Summary of DBMS_SQLPA Subprograms 135-5
CANCEL_ANALYSIS_TASK Procedure 135-6
CREATE_ANALYSIS_TASK Functions 135-7
DROP_ANALYSIS_TASK Procedure 135-10
EXECUTE_ANALYSIS_TASK Function & Procedure 135-11

Index

Preface

This Preface contains these topics:

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

Oracle Database PL/SQL Packages and Types Reference is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming:

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible to all users, including users that are disabled. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at `http://www.oracle.com/accessibility/`.

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

Deaf/Hard of Hearing Access to Oracle Support Services

To reach Oracle Support Services, use a telecommunications relay service (TRS) to call Oracle Support at 1.800.223.1711. An Oracle Support Services engineer will handle technical issues and provide customer support according to the Oracle service request process. Information about TRS is available at http://www.fcc.gov/cgb/consumerfacts/trs.html, and a list of phone numbers is available at http://www.fcc.gov/cgb/dro/trsphonebk.html.

Related Documents

For more information, see the following documents:

- *Oracle Database Advanced Application Developer's Guide*
- *Oracle Database PL/SQL Language Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at

`https://oraclestore.oracle.com/OA_HTML/ibeCZzpHome.jsp`

To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN). You must register online before using OTN; registration is free and can be done at

`http://otn.oracle.com/membership/`

If you already have a username and password for OTN, then you can go directly to the documentation section of the OTN Web site at

`http://otn.oracle.com/documentation/`

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

Convention	Meaning	Example
Bold	Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.	When you specify this clause, you create an **index-organized table**.
Italics	Italic typeface indicates book titles or emphasis.	*Oracle Database Concepts* Ensure that the recovery catalog and target database do *not* reside on the same disk.

Convention	Meaning	Example
UPPERCASE monospace (fixed-width) font	Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.	You can specify this clause only for a NUMBER column. You can back up the database by using the BACKUP command. Query the TABLE_NAME column in the USER_TABLES data dictionary view. Use the DBMS_STATS.GENERATE_STATS procedure.
lowercase monospace (fixed-width) font	Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values. *Note:* Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.	Enter sqlplus to start SQL*Plus. The password is specified in the orapwd file. Back up the datafiles and control files in the /disk1/oracle/dbs directory. The department_id, department_name, and location_id columns are in the hr.departments table. Set the QUERY_REWRITE_ENABLED initialization parameter to true. The JRepUtil class implements these methods.
lowercase italic monospace (fixed-width) font	Lowercase italic monospace font represents placeholders or variables.	You can specify the *parallel_clause*. Run *old_release*.SQL where *old_release* refers to the release you installed prior to upgrading.

Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

Convention	Meaning	Example
[ ]	Anything enclosed in brackets is optional.	DECIMAL (*digits* [, *precision*])
{ }	Braces are used for grouping items.	{ENABLE | DISABLE}
|	A vertical bar represents a choice of two options.	{ENABLE | DISABLE} [COMPRESS | NOCOMPRESS]
...	Ellipsis points mean repetition in syntax descriptions. In addition, ellipsis points can mean an omission in code examples or text.	CREATE TABLE ... AS *subquery*; SELECT *col1*, *col2*, ... , *coln* FROM employees;
Other symbols	You must use symbols other than brackets ([ ]), braces ({ }), vertical bars (|), and ellipsis points (...) exactly as shown.	acctbal NUMBER(11,2); acct CONSTANT NUMBER(4) := 3;
Italics	Italicized text indicates placeholders or variables for which you must supply particular values.	enter *password* DB_NAME = *database_name*

Convention	Meaning	Example

UPPERCASE	Uppercase typeface indicates elements supplied by the system. We show these terms in uppercase in order to distinguish them from terms you define. Unless terms appear in brackets, enter them in the order and with the spelling shown. Because these terms are not case sensitive, you can use them in either UPPERCASE or lowercase.	`SELECT last_name, employee_id FROM employees;`
		`SELECT * FROM USER_TABLES;`
		`DROP TABLE hr.employees;`

lowercase	Lowercase typeface indicates user-defined programmatic elements, such as names of tables, columns, or files.
	Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.
		`SELECT last_name, employee_id FROM employees;`
		`sqlplus hr/hr`
		`CREATE USER mjones IDENTIFIED BY ty3MU9;`

1

What's New in PL/SQL Packages and Types Reference?

The following sections describe the new documentation for Oracle Database 11*g* Release 1 (11.1) and Release 2 (11.2):

- New Packages
- Updated Packages
- New Types
- Updated Types

New Packages

- APEX_CUSTOM_AUTH

Introduction to Oracle Supplied PL/SQL Packages & Types

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
     WHERE Owner IN (
       'SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP',
       'LOGSTDBY_ADMINISTRATOR', 'ORDSYS',
       'ORDPLUGINS', 'OEM_MONITOR', 'MDSYS', 'LBACSYS',
       'DMSYS', 'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER',
       'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MDDATA',
       'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
     AND Object_Type IN ('PACKAGE', 'TYPE')
     ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- Package Overview
- Summary of Oracle Supplied PL/SQL Packages and Types

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for information on how to create your own packages

Package Overview

A *package* is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

Packages have many advantages over standalone procedures and functions. For example, they:

- Let you organize your application development more efficiently.
- Let you grant privileges more efficiently.
- Let you modify package objects without recompiling dependent schema objects.
- Enable Oracle to read multiple package objects into memory at once.
- Let you *overload* procedures or functions. Overloading means creating multiple procedures with the same name in the same package, each taking arguments of different number or datatype.
- Can contain global variables and cursors that are available to all procedures and functions in the package.

Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```
CREATE PACKAGE name AS  -- specification (visible part)
   -- public type and item declarations
   -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
   -- private type and item declarations
   -- subprogram bodies
[BEGIN
   -- initialization statements]
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have `EXECUTE` privileges on the function. To select from a view defined with a PL/SQL function, you must have `SELECT` privileges on the view. No separate `EXECUTE` privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

Creating New Packages

To create packages and store them permanently in an Oracle database, use the `CREATE PACKAGE` and `CREATE PACKAGE BODY` statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:

1. Create the package specification with the `CREATE PACKAGE` statement.

   You can declare program objects in the package specification. Such objects are called *public* objects. Public objects can be referenced outside the package, as well as by other objects in the package.

   Note: It is often more convenient to add the `OR REPLACE` clause in the `CREATE PACKAGE` statement. But note that `CREATE PACKAGE` warns you if you are about to overwrite an existing package with the same name while `CREATE OR REPLACE just` overwrites it with no warning.

2. Create the package body with the `CREATE PACKAGE BODY` statement.

   You can declare and define program objects in the package body.

   - You must define public objects declared in the package specification.
   - You can declare and define additional package objects, called *private* objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

     See Also:

     - *Oracle Database PL/SQL Language Reference*
     - *Oracle Database Advanced Application Developer's Guide*for more information on creating new packages
     - *Oracle Database Concepts*

     for more information on storing and executing packages

Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.

Creating a New Package: Example

The following example shows a package specification for a package named EMPLOYEE_MANAGEMENT. The package contains one stored function and two stored procedures.

```
CREATE PACKAGE employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER;
   PROCEDURE fire_emp (emp_id NUMBER);
   PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;
```

The body for this package defines the function and the procedures:

```
CREATE PACKAGE BODY employee_management AS
   FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
      mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
      deptno NUMBER) RETURN NUMBER IS
```

The function accepts all arguments for the fields in the employee table except for the employee number. A value for this field is supplied by a sequence. The function returns the sequence number generated by the call to this function.

```
       new_empno    NUMBER(10);

   BEGIN
      SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
      INSERT INTO emp VALUES (new_empno, name, job, mgr,
         hiredate, sal, comm, deptno);
      RETURN (new_empno);
   END hire_emp;

   PROCEDURE fire_emp(emp_id IN NUMBER) AS
```

The procedure deletes the employee with an employee number that corresponds to the argument emp_id. If no employee is found, then an exception is raised.

```
   BEGIN
      DELETE FROM emp WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
      raise_application_error(-20011, 'Invalid Employee
         Number: ' || TO_CHAR(emp_id));
   END IF;
END fire_emp;

PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
```

The procedure accepts two arguments. Emp_id is a number that corresponds to an employee number. Sal_incr is the amount by which to increase the employee's salary.

```
   BEGIN

   -- If employee exists, then update salary with increase.

      UPDATE emp
         SET sal = sal + sal_incr
         WHERE empno = emp_id;
      IF SQL%NOTFOUND THEN
         raise_application_error(-20011, 'Invalid Employee
```

```
            Number: ' || TO_CHAR(emp_id));
      END IF;
   END sal_raise;
END employee_management;
```

Note: If you want to try this example, then first create the sequence number `emp_sequence`. You can do this using the following SQL*Plus statement:

```
SQL> CREATE SEQUENCE emp_sequence
   > START WITH 8000 INCREMENT BY 10;
```

Referencing Package Contents

To reference the types, items, and subprograms declared in a package specification, use the dot notation. For example:

```
package_name.type_name
package_name.item_name
package_name.subprogram_name
```

Summary of Oracle Supplied PL/SQL Packages and Types

Table 1–1 lists the supplied PL/SQL server packages. These packages run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

Caution:

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.

Table 1–1 Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
APEX_CUSTOM_AUTH	Provides an interface for authentication and session management
APEX_APPLICATION	Enables users to take advantage of global variables
APEX_ITEM	Enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page
APEX_UTIL	Provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users
CTX_ADM	Lets you administer servers and the data dictionary
CTX_CLS	Lets you generate CTXRULE rules for a set of documents
CTX_DDL	Lets you create and manage the preferences, section lists and stopgroups required for Text indexes
CTX_DOC	Lets you request document services
CTX_OUTPUT	Lets you manage the index log
CTX_QUERY	Lets you generate query feedback, count hits, and create stored query expressions
CTX_REPORT	Lets you create various index reports
CTX_THES	Lets you to manage and browse thesauri
CTX_ULEXER	For use with the user-lexer
DBMS_ADVANCED_REWRITE	Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite
DBMS_ADVISOR	Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements
DBMS_ALERT	Provides support for the asynchronous notification of database events

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_APPLICATION_INFO	Lets you register an application name with the database for auditing or performance tracking purposes
DBMS_APPLY_ADM	Provides administrative procedures to start, stop, and configure an apply process
DBMS_AQ	Lets you add a message (of a predefined object type) onto a queue or to dequeue a message
DBMS_AQADM	Lets you perform administrative functions on a queue or queue table for messages of a predefined object type
DBMS_AQELM	Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP
DBMS_AQIN	Plays a part in providing secure access to the Oracle JMS interfaces
DBMS_ASSERT	Provides an interface to validate properties of the input value
DBMS_AUTO_TASK_ADMIN	Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls
DBMS_AW_STATS	Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions
DBMS_CAPTURE_ADM	Describes administrative procedures to start, stop, and configure a capture process; used in Streams
DBMS_CDC_PUBLISH	Identifies new data that has been added to, modified, or removed from, relational tables and publishes the changed data in a form that is usable by an application
DBMS_CDC_SUBSCRIBE	Lets you view and query the change data that was captured and published with the DBMS_LOGMNR_CDC_PUBLISH package
DBMS_COMPARISON	Provides interfaces to compare and converge database objects at different databases
DBMS_CONNECTION_POOL	Provides an interface to manage the Database Resident Connection Pool
DBMS_CQ_NOTIFICATION	Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.
DBMS_CRYPTO	Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms
DBMS_CSX_ADMIN	Provides an interface to customize the setup when transporting a tablespace containing binary XML data
DBMS_CUBE	Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying
DBMS_CUBE_ADVISE	Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite
DBMS_DATA_MINING	Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_DATA_MINING_TRANSFORM	Provides subroutines that can be used to prepare data for Oracle Data Mining
DBMS_DATAPUMP	Lets you move all, or part of, a database between databases, including both data and metadata
DBMS_DB_VERSION	Specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions
DBMS_DDL	Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs
DBMS_DEBUG	Implements server-side debuggers and provides a way to debug server-side PL/SQL program units
DBMS_DEFER	Provides the user interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DEFER_QUERY	Permits querying the deferred remote procedure calls (RPC) queue data that is not exposed through views. Requires the Distributed Option.
DBMS_DEFER_SYS	Provides the system administrator interface to a replicated transactional deferred remote procedure call facility. Requires the Distributed Option.
DBMS_DESCRIBE	Describes the arguments of a stored procedure with full name translation and security checking
DBMS_DG	Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover
DBMS_DIMENSION	Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition
DBMS_DISTRIBUTED_TRUST_ADMIN	Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted
DBMS_EPG	Implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener
DBMS_ERRLOG	Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back
DBMS_EXPFIL	Contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter
DBMS_FGA	Provides fine-grained security functions
DBMS_FILE_GROUP	One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories
DBMS_FILE_TRANSFER	Lets you copy a binary file within a database or to transfer a binary file between databases

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_FLASHBACK	Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN)
DBMS_FREQUENT_ITEMSET	Enables frequent itemset counting
DBMS_HM	Contains constants and procedure declarations for health check management
DBMS_HPROF	Provides an interface for profiling the execution of PL/SQL applications
DBMS_HS_PARALLEL	Enables parallel processing for heterogeneous targets access
DBMS_HS_PASSTHROUGH	Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems
DBMS_IOT	Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command
DBMS_JAVA	Provides a PL/SQL interface for accessing database functionality from Java
DBMS_JOB	Schedules and manages jobs in the job queue
DBMS_LDAP	Provides functions and procedures to access data from LDAP servers
DBMS_LDAP_UTL	Provides the Oracle Extension utility functions for LDAP
DBMS_LIBCACHE	Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution
DBMS_LOB	Provides general purpose routines for operations on Oracle Large Object (LOBs) datatypes - BLOB, CLOB (read/write), and BFILEs (read-only)
DBMS_LOCK	Lets you request, convert and release locks through Oracle Lock Management services
DBMS_LOGMNR	Provides functions to initialize and run the log reader
DBMS_LOGMNR_D	Queries the dictionary tables of the current database, and creates a text based file containing their contents
DBMS_LOGSTDBY	Describes procedures for configuring and managing the logical standby database environment
DBMS_METADATA	Lets callers easily retrieve complete database object definitions (metadata) from the dictionary
DBMS_MGD_ID_UTL	Provides a set of utility subprograms
DBMS_MGWADM	Describes the Messaging Gateway administrative interface; used in Advanced Queuing
DBMS_MGWMSG	Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.
DBMS_MONITOR	Let you use PL/SQL for controlling additional tracing and statistics gathering

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_MVIEW	Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.
DBMS_NETWORK_ACL_ADMIN	Provides the interface to administer the network Access Control List (ACL)
DBMS_NETWORK_UTL	Provides the interface to administer the network Access Control List (ACL)
DBMS_OBFUSCATION_TOOLKIT	Provides procedures for Data Encryption Standards
DBMS_ODCI	Returns the CPU cost of a user function based on the elapsed time of the function
DBMS_OFFLINE_OG	Provides a public interface for offline instantiation of master groups
DBMS_OLAP	Provides procedures for summaries, dimensions, and query rewrites
DBMS_OUTLN	Provides the interface for procedures and functions associated with management of stored outlines Synonymous with OUTLN_PKG
DBMS_OUTLN_EDIT	Lets you edit an invoker's rights package
DBMS_OUTPUT	Accumulates information in a buffer so that it can be retrieved later
DBMS_PCLXUTIL	Provides intra-partition parallelism for creating partition-wise local indexes
DBMS_PIPE	Provides a DBMS pipe service which enables messages to be sent between sessions
DBMS_PREDICTIVE_ANALYTICS	Provides subroutines that implement automatic data mining operations for predict, explain, and profile
DBMS_PREPROCESSOR	Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form
DBMS_PROFILER	Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks
DBMS_PROPAGATION_ADM	Provides administrative procedures for configuring propagation from a source queue to a destination queue
DBMS_RANDOM	Provides a built-in random number generator
DBMS_RECTIFIER_DIFF	Provides an interface to detect and resolve data inconsistencies between two replicated sites
DBMS_REDEFINITION	Lets you perform an online reorganization of tables
DBMS_REFRESH	Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time Requires the Distributed Option
DBMS_REPAIR	Provides data corruption repair procedures
DBMS_REPCAT	Provides routines to administer and update the replication catalog and environment. Requires the Replication Option.
DBMS_REPCAT_ADMIN	Lets you create users with the privileges needed by the symmetric replication facility. Requires the Replication Option.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_REPCAT_INSTANTIATE	Instantiates deployment templates. Requires the Replication Option.
DBMS_REPCAT_RGT	Controls the maintenance and definition of refresh group templates. Requires the Replication Option.
DBMS_REPUTIL	Provides routines to generate shadow tables, triggers, and packages for table replication.
DBMS_RESCONFIG	Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource
DBMS_RESOURCE_MANAGER	Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema
DBMS_RESOURCE_MANAGER_PRIVS	Maintains privileges associated with resource consumer groups
DBMS_RESULT_CACHE	Provides an interface to operate on the Result Cache
DBMS_RESUMABLE	Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution
DBMS_RLMGR	Contains various procedures to create and manage rules and rule sessions by the Rules Manager
DBMS_RLS	Provides row level security administrative interface
DBMS_ROWID	Provides procedures to create rowids and to interpret their contents
DBMS_RULE	Describes the EVALUATE procedure used in Streams
DBMS_RULE_ADM	Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams
DBMS_SCHEDULER	Provides a collection of scheduling functions that are callable from any PL/SQL program
DBMS_SERVER_ALERT	Lets you issue alerts when some threshold has been violated
DBMS_SERVICE	Lets you create, delete, activate and deactivate services for a single instance
DBMS_SESSION	Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures
DBMS_SHARED_POOL	Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism
DBMS_SPACE	Provides segment space information not available through standard SQL
DBMS_SPACE_ADMIN	Provides tablespace and segment space administration not available through the standard SQL
DBMS_SPM	Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements
DBMS_SQL	Lets you use dynamic SQL to access the database

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_SQLDIAG	Provides an interface to the SQL Diagnosability functionality
DBMS_SQLTUNE	Provides the interface to tune SQL statements
DBMS_STAT_FUNCS	Provides statistical functions
DBMS_STATS	Provides a mechanism for users to view and modify optimizer statistics gathered for database objects
DBMS_STORAGE_MAP	Communicates with FMON to invoke mapping operations
DBMS_STREAMS	Describes the interface to convert SYS.AnyData objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.
DBMS_STREAMS_ADMIN	Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level
DBMS_STREAMS_AUTH	Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators
DBMS_STREAMS_ADVISOR_ADM	Provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered
DBMS_STREAMS_MESSAGING	Provides interfaces to enqueue messages into and dequeue messages from a SYS.AnyData queue
DBMS_STREAMS_TABLESPACE_ ADM	Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another
DBMS_TDB	Reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.
DBMS_TRACE	Provides routines to start and stop PL/SQL tracing
DBMS_TRANSACTION	Provides access to SQL transaction statements from stored procedures and monitors transaction activities
DBMS_TRANSFORM	Provides an interface to the message format transformation features of Oracle Advanced Queuing
DBMS_TTS	Checks if the transportable set is self-contained
DBMS_TYPES	Consists of constants, which represent the built-in and user-defined types
DBMS_UTILITY	Provides various utility routines
DBMS_WARNING	Provides the interface to query, modify and delete current system or session settings
DBMS_WM	Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions
DBMS_WORKLOAD_CAPTURE	Configures the Workload Capture system and produce the workload capture data.

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
DBMS_WORKLOAD_REPLAY	Provides an interface to replay and report on a record of a workload on a production or test system
DBMS_WORKLOAD_REPOSITORY	Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines
DBMS_XA	Contains the XA/Open interface for applications to call XA interface in PL/SQL
DBMS_XDB	Describes Resource Management and Access Control interface for PL/SQL
DBMS_XDB_ADMIN	Provides an interface to implement XMLIndex administration operation
DBMS_XDBRESOURCE	Provides an interface to operate on the XDB resource's metadata and contents
DBMS_XDB_VERSION	Describes the versioning interface
DBMS_XDBT	Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance
DBMS_XDBZ	Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)
DBMS_XEVENT	Provides event-related types and supporting subprograms
DBMS_XMLDOM	Explains access to XMLType objects
DBMS_XMLGEN	Converts the results of a SQL query to a canonical XML format
DBMS_XMLINDEX	Provides an interface to implement asychronous indexing and apply node referencing
DBMS_XMLPARSER	Explains access to the contents and structure of XML documents
DBMS_XMLQUERY	Provides database-to-XMLType functionality
DBMS_XMLSAVE	Provides XML-to-database-type functionality
DBMS_XMLSCHEMA	Explains procedures to register and delete XML schemas
DBMS_XMLSTORE	Provides the ability to store XML data in relational tables
DBMS_XMLTRANSLATIONS	Provides an interface to perform translations so that strings can be searched or displayed in various languages
DBMS_XPLAN	Describes how to format the output of the EXPLAIN PLAN command
DBMS_XSLPROCESSOR	Explains access to the contents and structure of XML documents
DEBUG_EXTPROC	Lets you debug external procedures on platforms with debuggers that attach to a running process
HTF	Hypertext functions generate HTML tags
HTP	Hypertext procedures generate HTML tags
ORD_DICOM	Supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
ORD_DICOM_ADMIN	Used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository
OWA_CACHE	Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications
OWA_COOKIE	Provides an interface for sending and retrieving HTTP cookies from the client's browser
OWA_CUSTOM	Provides a Global PLSQL Agent Authorization callback function
OWA_IMAGE	Provides an interface to access the coordinates where a user clicked on an image
OWA_OPT_LOCK	Contains subprograms that impose optimistic locking strategies so as to prevent lost updates
OWA_PATTERN	Provides an interface to locate text patterns within strings and replace the matched string with another string
OWA_SEC	Provides an interface for custom authentication
OWA_TEXT	Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.
OWA_UTIL	Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table
SDO_CS	Provides functions for coordinate system transformation
SDO_CSW_PROCESS	Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)
SDO_GCDR	Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses
SDO_GEOM	Provides functions implementing geometric operations on spatial objects
SDO_GEOR	Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata
SDO_GEOR_ADMIN	Contains subprograms for administrative operations related to GeoRaster.
SDO_GEOR_UTL	Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data
SDO_LRS	Provides functions for linear referencing system support
SDO_MIGRATE	Provides functions for migrating spatial data from previous releases
SDO_NET	Provides functions and procedures for working with data modeled as nodes and links in a network

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
SDO_NET_MEM	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_OLS	Contains functions and procedures for performing editing and analysis operations on network data using a network memory object
SDO_PC_PKG	Contains subprograms to support the use of point clouds in Spatial
SDO_SAM	Contains functions and procedures for spatial analysis and data mining
SDO_TIN_PKG	Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial
SDO_TOPO	Provides procedures for creating and managing Spatial topologies
SDO_TOPO_MAP	Contains subprograms for editing Spatial topologies using a cache (TopoMap object)
SDO_TUNE	Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial
SDO_UTIL	Provides utility functions and procedures for Oracle Spatial
SDO_WFS_LOCK	Contains subprograms for WFS support for registering and unregistering feature tables
SDO_WFS_PROC	Provides utility functions and procedures for Oracle Spatial
SEM_APIS	Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.
SEM_PERF	Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database
UTL_COLL	Enables PL/SQL programs to use collection locators to query and update
UTL_COMPRESS	Provides a set of data compression utilities
UTL_DBWS	Provides database Web services
UTL_ENCODE	Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts
UTL_FILE	Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O
UTL_HTTP	Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges
UTL_I18N	Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications
UTL_INADDR	Provides a procedure to support internet addressing

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
UTL_LMS	Retrieves and formats error messages in different languages
UTL_MAIL	A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt
UTL_NLA	Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs
UTL_RAW	Provides SQL functions for manipulating RAW datatypes
UTL_REF	Enables a PL/SQL program to access an object by providing a reference to the object
UTL_SMTP	Provides PL/SQL functionality to send emails
UTL_SPADV	Provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment
UTL_TCP	Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world
UTL_URL	Provides escape and unescape mechanisms for URL characters
WPG_DOCLOAD	Provides an interface to download files, both BLOBs and BFILEs
ANYDATA TYPE	A self-describing data instance type containing an instance of the type plus a description
ANYDATASET TYPE	Contains a description of a given type plus a set of data instances of that type
ANYTYPE TYPE	Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions
Oracle Streams AQ Types	Describes the types used in Advanced Queuing
Database URI Type	Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package
Expression Filter Types	Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.
JMS TYPES	Describes JMS types so that a PL/SQL application can use JMS queues of JMS types
Oracle Multimedia ORDAudio TYPE	Supports the storage and management of audio data
Oracle Multimedia ORDDicom Type	Supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data
Oracle Multimedia ORDDoc TYPE	Supports the storage and management of heterogeneous media data including image, audio, and video
Oracle Multimedia ORDImage TYPE	Supports the storage, management, and manipulation of image data

Table 1–1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

Package Name	Description
`Oracle Multimedia SQL/MM Still Image TYPE`	Supports the SQL/MM Still Image Standard, which lets you store, retrieve, and modify images in the database and locate images using visual predicates
`Oracle Multimedia ORDVideo TYPE`	Supports the storage and management of video data
`LOGICAL CHANGE RECORD TYPES`	Describes LCR types, which are message payloads that contain information about changes to a database, used in Streams
`MG_ID Package Types`	Provides an extensible framework that supports current RFID tags with the standard family of EPC bit encodings for the supported encoding types
`RULES TYPEs`	Describes the types used with rules, rule sets, and evaluation contexts
`RULES Manager Types`	Rules Manager is supplied with one predefined type and a public synonym
`UTL Streams Types`	Describes describes abstract streams types used with Oracle XML functionality
`XMLType`	Describes the types and functions used for native XML support in the server

2

APEX_CUSTOM_AUTH

The APEX_CUSTOM_AUTH package provides an interface for authentication and session management.

- Documentation of APEX_CUSTOM_AUTH

Documentation of APEX_CUSTOM_AUTH

For a complete description of this package within the context of APEX, see `APEX_CUSTOM_AUTH` in the *Oracle Application Express API Reference*.

3

APEX_APPLICATION

The APEX_APPLICATION package enables users to take advantage of global variables.

- Documentation of APEX_APPLICATION

Documentation of APEX_APPLICATION

For a complete description of this package within the context of APEX, see `APEX_APPLICATION` in the *Oracle Application Express API Reference*.

4

APEX_ITEM

The APEX_ITEM package enables users to create form elements dynamically based on a SQL query instead of creating individual items page by page.

- Documentation of APEX_ITEM

Documentation of APEX_ITEM

For a complete description of this package within the context of APEX, see `APEX_ITEM` in the *Oracle Application Express API Reference.*

5

APEX_UTIL

The APEX_UTIL package provides utilities for getting and setting session state, getting files, checking authorizations for users, resetting different states for users, and also getting and setting preferences for users.

- Documentation of APEX_UTIL

Documentation of APEX_UTIL

For a complete description of this package within the context of APEX, see `APEX_UTIL` in the *Oracle Application Express API Reference.*

6

CTX_ADM

This Oracle Text package lets you administer the Oracle Text data dictionary. Note that you must install this package in order to use it.

- Documentation of CTX_ADM

Documentation of CTX_ADM

For a complete description of this package within the context of Oracle Text, see `CTX_ADM` in the *Oracle Text Reference*.

7

CTX_CLS

This Oracle Text package enables generation of CTXRULE rules for a set of documents.

- Documentation of CTX_CLS

Documentation of CTX_CLS

For a complete description of this package within the context of Oracle Text, see `CTX_CLS` in the *Oracle Text Reference*.

8

CTX_DDL

This Oracle Text package lets you create and manage the preferences, section groups, and stoplists required for Text indexes. Note that you must install this package in order to use it.

- Documentation of CTX_DDL

Documentation of CTX_DDL

For complete description of this package within the context of Oracle Text, see `CTX_DDL` in the *Oracle Text Reference.*

9

CTX_DOC

This Oracle Text package lets you request document services. Note that you must install this package in order to use it.

- Documentation of CTX_DOC

Documentation of CTX_DOC

For a complete description of this package within the context of Oracle Text, see `CTX_DOC` in the *Oracle Text Reference*.

10

CTX_OUTPUT

This Oracle Text package lets you manage the index log. Note that you must install this package in order to use it.

- Documentation of CTX_OUTPUT

Documentation of CTX_OUTPUT

For a complete description of this package within the context of Oracle Text, see `CTX_OUTPUT` in the *Oracle Text Reference*.

11

CTX_QUERY

This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions. Note that you must install this package in order to use it.

- Documentation of CTX_QUERY

Documentation of CTX_QUERY

For a complete description of this package within the context of Oracle Text, see `CTX_QUERY` in the *Oracle Text Reference*.

12

CTX_REPORT

This Oracle Text package lets you create various index reports. Note that you must install this package in order to use it.

- Documentation of CTX_REPORT

Documentation of CTX_REPORT

For a complete description of this package within the context of Oracle Text, see `CTX_REPORT` in the *Oracle Text Reference*.

13

CTX_THES

This Oracle Text package lets you to manage and browse thesauri. Note that you must install this package in order to use it.

- Documentation of CTX_THES

Documentation of CTX_THES

For a complete description of this package within the context of Oracle Text, see `CTX_THES` in the *Oracle Text Reference*.

14

CTX_ULEXER

This Oracle Text package is for use with the user-lexer. Note that you must install this package in order to use it.

- Documentation of CTX_ULEXER

Documentation of CTX_ULEXER

For a complete description of this package within the context of Oracle Text, see `CTX_ULEXER` in the *Oracle Text Reference.*

15

DBMS_ADDM

The DBMS_ADDM package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

See Also:

- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about "Automatic Workload Repository in Oracle Real Application Clusters Environments"
- *Oracle Database Performance Tuning Guide* for more information about "Automatic Performance Diagnostics"

This chapter contains the following topics:

- Using DBMS_ADDM
  - Security Model
- Summary of DBMS_ADDM Subprograms

Using DBMS_ADDM

- Security Model

Security Model

The DBMS_ADDM package runs with the caller's permission, not the definer's, and then applies the security constraints required by the DBMS_ADVISOR package.

> **See Also:** The DBMS_ADVISOR package for more information about "Security Model".

Summary of DBMS_ADDM Subprograms

Table 15–1 DBMS_ADDM Package Subprograms

Subprogram	Description
ANALYZE_DB Procedure on page 15-5	Creates an ADDM task for analyzing in database analysis mode and executes it
ANALYZE_INST Procedure on page 15-6	Creates an ADDM task for analyzing in instance analysis mode and executes it.
ANALYZE_PARTIAL Procedure on page 15-7	Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it
DELETE Procedure on page 15-8	Deletes an already created ADDM task (of any kind)
DELETE_FINDING_ DIRECTIVE Procedure on page 15-9	Deletes a finding directive
DELETE_PARAMETER_ DIRECTIVE Procedure on page 15-10	Deletes a parameter directive
DELETE_SEGMENT_ DIRECTIVE Procedure on page 15-11	Deletes a segment directive
DELETE_SQL_DIRECTIVE Procedure on page 15-12	Deletes a SQL directive
GET_ASH_QUERY Function on page 15-13	Returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding
GET_REPORT Function on page 15-14	Retrieves the default text report of an executed ADDM task
INSERT_FINDING_ DIRECTIVE Procedure on page 15-15	Creates a directive to limit reporting of a specific finding type.
INSERT_PARAMETER_ DIRECTIVE Procedure on page 15-16	Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter
INSERT_SEGMENT_ DIRECTIVE Procedure on page 15-17	Creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments
INSERT_SQL_DIRECTIVE Procedure on page 15-19	Creates a directive to limit reporting of actions on specific SQL

ANALYZE_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_DB (
   task_name           IN OUT VARCHAR2,
   begin_snapshot      IN     NUMBER,
   end_snapshot        IN     NUMBER,
   db_id               IN     NUMBER := NULL);
```

Parameters

Table 15–2 ANALYZE_DB Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_database_analysis_mode_task';
  DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

ANALYZE_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_INST (
   task_name           IN OUT VARCHAR2,
   begin_snapshot      IN     NUMBER,
   end_snapshot        IN     NUMBER,
   instance_number     IN     NUMBER := NULL,
   db_id               IN     NUMBER := NULL);
```

Parameters

Table 15–3 ANALYZE_INST Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
instance_number	Number of the instance to analyze. By default it is the instance currently connected
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Usage Notes

On single instance systems (i.e., not using RAC) the resulting task is identical to using the ANALYZE_DB procedure.

Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

ANALYZE_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

Syntax

```
DBMS_ADDM.ANALYZE_PARTIAL (
   task_name           IN OUT VARCHAR2,
   instance_numbers    IN     VARCHAR2,
   begin_snapshot      IN     NUMBER,
   end_snapshot        IN     NUMBER,
   db_id               IN     NUMBER := NULL);
```

Parameters

Table 15–4 ANALYZE_PARTIAL Procedure Parameters

Parameter	Description
task_name	Name of the task to be created
instance_numbers	Comma separated list of instance numbers to analyze
begin_snapshot	Number of the snapshot that starts the analysis period
end_snapshot	Number of the snapshot that ends the analysis period
db_id	Database ID for the database you to analyze. By default, this is the database currently connected

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable tname:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_partial_analysis_modetask';
  DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this deletes the local tasks associated with the main task.

Syntax

```
DBMS_ADDM.DELETE (
   task_name           IN VARCHAR2);
```

Parameters

Table 15–5 DELETE Procedure Parameters

Parameter	Description
task_name	Name of the task to be deleted

Examples

```
BEGIN
  DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');
END
```

DELETE_FINDING_DIRECTIVE Procedure

This procedure deletes a finding directive.

Syntax

```
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15–6 DELETE_FINDING_DIRECTIVE Procedure Parameters

Parameter	Description
`task_name`	Name of the task this directive applies to. If the value is `NULL`, it is a system directive.
`dir_name`	Name of the directive. All directives must be given unique names.

DELETE_PARAMETER_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks are not affected by this directive.

Syntax

```
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15–7 DELETE_PARAMETER_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it is a system directive.
dir_name	Name of the directive. All directives must be given unique names.

Examples

```
BEGIN
   DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL,'my Parameter directive');
END;
```

DELETE_SEGMENT_DIRECTIVE Procedure

This procedure deletes a segment directive.

Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15–8 DELETE_SEGMENT_DIRECTIVE Procedure Parameters

Parameter	Description
`task_name`	Name of the task this directive applies to. If the value is `NULL`, it is a system directive.
`dir_name`	Name of the directive. All directives must be given unique names.

DELETE_SQL_DIRECTIVE Procedure

This procedure deletes a SQL directive.

Syntax

```
DBMS_ADDM.DELETE_SQL_DIRECTIVE (
   task_name           IN VARCHAR2,
   dir_name            IN VARCHAR2);
```

Parameters

Table 15–9 DELETE_SQL_DIRECTIVE Procedure Parameters

Parameter	Description
`task_name`	Name of the task this directive applies to. If the value is `NULL`, it is a system directive.
`dir_name`	Name of the directive. All directives must be given unique names.

GET_ASH_QUERY Function

The function returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding. For most types of findings this identifies the exact rows in ASH corresponding to the finding. For some types of findings the query is an approximation and should not be used for exact identification of the finding's impact or the finding's specific activity.

Syntax

```
DBMS_ADDM.GET_ASH_QUERY (
   task_name           IN   VARCHAR2,
   finding_id          IN   NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 15–10 GET_ASH_QUERY Function Parameters

Parameter	Description
`task_name`	Name of the task
`finding`	ID of the finding within the task

Return Values

A `VARCHAR` containing an ASH query identifying the rows in ASH with impact for the finding

GET_REPORT Function

This function retrieves the default text report of an executed ADDM task.

Syntax

```
DBMS_ADDM.GET_REPORT (
   task_name           IN VARCHAR2)
  RETURN CLOB;
```

Parameters

Table 15–11 GET_REPORT Function Parameters

Parameter	Description
task_name	Name of the task

Examples

```
Set long 1000000
Set pagesize 50000
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```

INSERT_FINDING_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   finding_name          IN VARCHAR2,
   min_active_sessions   IN NUMBER := 0,
   min_perc_impact       IN NUMBER := 0);
```

Parameters

Table 15–12 INSERT_FINDING_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
finding_name	Name of an ADDM finding to which this directive applies. All valid findings names appear in the NAME column of view DBA_ADVISOR_FINDING_NAMES.
min_active_sessions	Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.
min_perc_impact	Minimal number for the "percent impact" of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of GET_REPORT shows only an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_FINDING_DIRECTIVE(
   NULL,
   'Undersized SGA directive',
   'Undersized SGA',
   2,
   10);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_PARAMETER_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   parameter_name        IN VARCHAR2);
```

Parameters

Table 15–13 INSERT_PARAMETER_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
parameter_name	Specifies the parameter to use. Valid parameter names appear in V$PARAMETER.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter 'sga_target'. The result of GET_REPORT does not show these actions.

```
var tname varchar2(60);
BEGIN
  DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
   NULL,
   'my Parameter directive',
   'sga_target');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_SEGMENT_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   owner_name            IN VARCHAR2,
   object_name           IN VARCHAR2 := NULL,
   sub_object_name       IN VARCHAR2 := NULL);

DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   object_number         IN NUMBER);
```

Parameters

Table 15–14 INSERT_SEGMENT_DIRECTIVE Procedure Parameters

Parameter	Description
task_name	Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.
dir_name	Name of the directive. All directives must be given unique names.
owner_name	Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for "like" constraints.
object_name	Name of the main object to be filtered. Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.
sub_object_name	Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a '.'). Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.
object_number	Object number of the SEGMENT that this directive is to filter, found in views DBA_OBJECTS or DBA_SEGMENTS

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user SCOTT. The result of GET_REPORT does not show actions for running Segment advisor for segments that belong to SCOTT.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL,
                                     'my Segment directive',
                                     'SCOTT');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

INSERT_SQL_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in `INITIAL` status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```
DBMS_ADDM.INSERT_SQL_DIRECTIVE (
   task_name             IN VARCHAR2,
   dir_name              IN VARCHAR2,
   sql_id                IN VARCHAR2,
   min_active_sessions   IN NUMBER := 0,
   min_response_time     IN NUMBER := 0);
```

Parameters

Table 15–15 INSERT_SQL_DIRECTIVE Procedure Parameters

Parameter	Description
`task_name`	Name of the task this directive applies to. If the value is `NULL`, it applies to all subsequently created ADDM Tasks.
`dir_name`	Name of the directive. All directives must be given unique names.
`sql_id`	Identifies which SQL statement to filter. A valid value contains exactly 13 characters from '0' to '9' and 'a' to 'z'.
`min_active_sessions`	Minimal number of active sessions for the SQL. If a SQL action has less than this number, it is filtered from the ADDM result.
`min_response_time`	Minimal value for response time of the SQL (in microseconds). If the SQL had lower response time, it is filtered from the ADDM result.

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of `GET_REPORT` shows only actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SQL_DIRECTIVE(
      NULL,
      'my SQL directive',
      'abcd123456789',
      2,
      1000000);
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

16

DBMS_ADVANCED_REWRITE

DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information about query rewrite

This chapter contains the following topics:

- Using DBMS_ADVANCED_REWRITE
  - Security Model
- Summary of DBMS_ADVANCED_REWRITE Subprograms

Using DBMS_ADVANCED_REWRITE

This section contains topics which relate to using the `DBMS_ADVANCED_REWRITE` package.

- Security Model

Security Model

No privileges to access these procedures are granted to anyone by default. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

```
GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;
```

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

```
GRANT CREATE MATERIALIZED VIEW TO er;
```

Summary of DBMS_ADVANCED_REWRITE Subprograms

This table list the all the package subprograms in alphabetical order.

Table 16–1 DBMS_ADVANCED_REWRITE Package Subprograms

Subprogram	Description
ALTER_REWRITE_EQUIVALENCE Procedure on page 16-5	Changes the mode of the rewrite equivalence declaration to the mode you specify
BUILD_SAFE_REWRITE_EQUIVALENCE Procedure on page 16-6	Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure
DECLARE_REWRITE_EQUIVALENCE Procedures on page 16-7	Creates a declaration indicating that `source_stmt` is functionally equivalent to `destination_stmt` for as long as the equivalence declaration remains enabled, and that `destination_stmt` is more favorable in terms of performance
DROP_REWRITE_EQUIVALENCE Procedure on page 16-9	Drops the specified rewrite equivalence declaration
VALIDATE_REWRITE_EQUIVALENCE Procedure on page 16-10	Validates the specified rewrite equivalence declaration using the same validation method as described with the `validate` parameter

ALTER_REWRITE_EQUIVALENCE Procedure

This procedure changes the mode of the rewrite equivalence declaration to the mode you specify.

Syntax

```
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
   name            VARCHAR2,
   rewrite_mode    VARCHAR2);
```

Parameters

Table 16–2 ALTER_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to alter. The name can be of the form `owner.name`, where `owner` complies with the rules for a schema name, and `name` compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.
`rewrite_mode`	The following modes are supported, in increasing order of power: `disabled`: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. `text_match`: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. `general`: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified `destination_query`. `recursive`: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified `destination_query` for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the `DBMS_ADVISOR.TUNE_MVIEW` procedure. It is required to enable query rewrite and fast refresh when `DBMS_ADVISOR.TUNE_MVIEW` decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the `BUILD_SAFE_REWRITE_EQUIVALENCE` procedure. You should use either the `DBMS_ADVISOR.TUNE_MVIEW` or the `DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE` procedure as appropriate.

DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance. The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in QUERY_REWRITE_INTEGRITY = trusted and stale_tolerated modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in trusted and stale_tolerated integrity modes.

Syntax

```
DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          VARCHAR2,
   destination_stmt     VARCHAR2,
   validate             BOOLEAN    := TRUE,
   rewrite_mode         VARCHAR2   := 'TEXT_MATCH');

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (
   name                 VARCHAR2,
   source_stmt          CLOB,
   destination_stmt     CLOB,
   validate             BOOLEAN   := TRUE,
   rewrite_mode         VARCHAR2  := 'TEXT_MATCH');
```

Parameters

Table 16–3 DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
name	A name for the equivalence declaration. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate CREATE MATERIALIZED VIEW privileges to alter an equivalence declaration.
source_stmt	A sub-SELECT expression in either VARCHAR2 or CLOB format. This is the query statement that is the target of optimization.
destination_stmt	A sub-SELECT expression in either VARCHAR2 or CLOB format.
validate	A Boolean indicating whether to validate that the specified source_stmt is functionally equivalent to the specified destination_stmt. If validate is specified as TRUE, DECLARE_REWRITE_EQUIVALENCE evaluates the two sub-SELECTs and compares their results. If the results are not the same, DECLARE_REWRITE_EQUIVALENCE does not create the rewrite equivalence and returns an error condition. If FALSE, DECLARE_REWRITE_EQUIVALENCE does not validate the equivalence.

Table 16–3 (Cont.) DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
rewrite_mode	The following modes are supported, in increasing order of power: ■ disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration. ■ text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations. ■ general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query. ■ recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration. Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.

Exceptions

Table 16–4 DECLARE_REWRITE_EQUIVALENCE Procedure Exceptions

Exception	Description
ORA-30388	Name of the rewrite equivalence is not specified
ORA-30391	The specified rewrite equivalence does not exist
ORA-30392	The checksum analysis for the rewrite equivalence failed
ORA-30393	A query block in the statement did not write
ORA-30396	Rewrite equivalence procedures require the COMPATIBLE parameter to be set to 10.1 or greater

Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration's source_stmt or the materialized view's defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration's destination_stmt or the materialized view's container table, respectively.

DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (
   name        VARCHAR2);
```

Parameters

Table 16–5 DROP_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to drop. The name can be of the form `owner.name`, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.

VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration using the same validation method as described with the `VALIDATE` parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure" on page 16-10.

Syntax

```
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (
   name         VARCHAR2);
```

Parameters

Table 16–6 VALIDATE_REWRITE_EQUIVALENCE Procedure Parameters

Parameter	Description
`name`	A name for the equivalence declaration to validate. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the `source_stmt` and `destination_stmt` of the specified equivalence declaration.

17

DBMS_ADVISOR

DBMS_ADVISOR is part of the Server Manageability suite of Advisors, a set of expert systems that identifies and helps resolve performance problems relating to the various database server components.

See Also:

- *Oracle Database Administrator's Guide* for information regarding the Segment Advisor
- *Oracle Database 2 Day + Performance Tuning Guide* for information regarding how to use various Advisors in Enterprise Manager
- *Oracle Database Performance Tuning Guide* for information regarding the SQL Tuning Advisor and SQL Access Advisor
- *Oracle Database 2 Day DBA* and *Oracle Database Administrator's Guide* for information regarding the Undo Advisor

This chapter contains the following topics:

- Using DBMS_ADVISOR
  - Deprecated Subprograms
  - Security Model
- Summary of DBMS_ADVISOR Subprograms

Using DBMS_ADVISOR

This section contains topics which relate to using the `DBMS_ADVISOR` package.

- Deprecated Subprograms
- Security Model

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11*g*:

- ADD_SQLWKLD_REF Procedure
- CREATE_SQLWKLD Procedure
- DELETE_SQLWKLD Procedure
- DELETE_SQLWKLD_REF Procedure
- DELETE_SQLWKLD_STATEMENT Procedures
- IMPORT_SQLWKLD_SCHEMA Procedure
- IMPORT_SQLWKLD_SQLCACHE Procedure
- IMPORT_SQLWKLD_STS Procedure
- IMPORT_SQLWKLD_SUMADV Procedure
- IMPORT_SQLWKLD_USER Procedure
- RESET_SQLWKLD Procedure
- SET_SQLWKLD_PARAMETER Procedures
- UPDATE_SQLWKLD_ATTRIBUTES Procedure
- UPDATE_SQLWKLD_STATEMENT Procedure

Security Model

The ADVISOR privilege is required to use this package.

Summary of DBMS_ADVISOR Subprograms

Table 17–1 DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
ADD_SQLWKLD_REF Procedure on page 17-8	Adds a workload reference to an Advisor task (Caution: Deprecated Subprogram)	SQL Access Advisor only
ADD_SQLWKLD_ STATEMENT Procedure on page 17-9	Adds a single statement to a workload	SQL Access Advisor only
ADD_STS_REF Procedure on page 17-12	Establishes a link between the current SQL Access Advisor task and a SQL Tuning Set	SQL Access Advisor only
CANCEL_TASK Procedure on page 17-13	Cancels a currently executing task operation	All Advisors
COPY_SQLWKLD_TO_ STS Procedure on page 17-14	Copies the contents of a SQL workload object to a SQL Tuning Set	SQL Access Advisor
CREATE_FILE Procedure on page 17-15	Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports	All Advisors
CREATE_OBJECT Procedure on page 17-16	Creates a new task object	All Advisors
CREATE_SQLWKLD Procedure on page 17-18	Creates a new workload object (Caution: Deprecated Subprogram)	SQL Access Advisor only
CREATE_TASK Procedures on page 17-19	Creates a new Advisor task in the repository	All Advisors
DELETE_SQLWKLD Procedure on page 17-21	Deletes an entire workload object (Caution: Deprecated Subprogram)	SQL Access Advisor only
DELETE_SQLWKLD_ REF Procedure on page 17-22	Deletes an entire workload object (Caution: Deprecated Subprogram)	SQL Access Advisor only
DELETE_SQLWKLD_ STATEMENT Procedures on page 17-23	Deletes one or more statements from a workload (Caution: Deprecated Subprogram)	SQL Access Advisor only
DELETE_STS_REF Procedure on page 17-24	Removes a link between the current SQL Access Advisor task and a SQL Tuning Set object	SQL Access Advisor only
DELETE_TASK Procedure on page 17-25	Deletes the specified task from the repository	All Advisors
EXECUTE_TASK Procedure on page 17-26	Executes the specified task	All Advisors
GET_REC_ATTRIBUTES Procedure on page 17-28	Retrieves specific recommendation attributes from a task	All Advisors
GET_TASK_REPORT Function on page 17-29	Creates and returns a report for the specified task	All Advisors
GET_TASK_SCRIPT Function on page 17-30	Creates and returns an executable SQL script of the Advisor task's recommendations in a buffer	All Advisors
IMPLEMENT_TASK Procedure on page 17-32	Implements the recommendations for a task	All Advisors

Table 17–1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
IMPORT_SQLWKLD_SCHEMA Procedure on page 17-33	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor only
IMPORT_SQLWKLD_SQLCACHE Procedure on page 17-35	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor only
IMPORT_SQLWKLD_STS Procedure on page 17-37	Imports data from a SQL Tuning Set into a SQL workload data object (Caution: Deprecated Subprogram)	SQL Access Advisor only
IMPORT_SQLWKLD_SUMADV Procedure on page 17-39	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor only
IMPORT_SQLWKLD_USER Procedure on page 17-41	Imports data into a workload from the current SQL cache (Caution: Deprecated Subprogram)	SQL Access Advisor only
INTERRUPT_TASK Procedure on page 17-43	Stops a currently executing task, ending its operations as it would at a normal exit, so that the recommendations are visible	All Advisors
MARK_RECOMMENDATION Procedure on page 17-44	Sets the `annotation_status` for a particular recommendation	All Advisors
QUICK_TUNE Procedure on page 17-45	Performs an analysis on a single SQL statement	All Advisors
RESET_SQLWKLD Procedure on page 17-46	Resets a workload to its initial starting point (Caution: Deprecated Subprogram)	SQL Access Advisor only
RESET_TASK Procedure on page 17-47	Resets a task to its initial state	All Advisors
SET_DEFAULT_SQLWKLD_PARAMETER Procedures on page 17-48	Imports data into a workload from schema evidence	SQL Access Advisor only
SET_DEFAULT_TASK_PARAMETER Procedures on page 17-49	Modifies a default task parameter	All Advisors
SET_SQLWKLD_PARAMETER Procedures on page 17-50	Sets the value of a workload parameter	SQL Access Advisor only
SET_TASK_PARAMETER Procedure on page 17-51	Sets the specified task parameter value	All Advisors
TUNE_MVIEW Procedure on page 17-64	Shows how to decompose a materialized view into two or more materialized views or to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite	SQL Access Advisor only
UPDATE_OBJECT Procedure on page 17-66	Updates a task object	All Advisors
UPDATE_REC_ATTRIBUTES Procedure on page 17-68	Updates an existing recommendation for the specified task	All Advisors

Table 17–1 (Cont.) DBMS_ADVISOR Package Subprograms

Subprogram	Description	Used in
UPDATE_SQLWKLD_ATTRIBUTES Procedure on page 17-70	Updates a workload object	SQL Access Advisor only
UPDATE_SQLWKLD_STATEMENT Procedure on page 17-71	Updates one or more SQL statements in a workload	SQL Access Advisor only
UPDATE_TASK_ATTRIBUTES Procedure on page 17-73	Updates a task's attributes	All Advisors

ADD_SQLWKLD_REF Procedure

Note: This procedure is deprecated in Release 11*g*R1.

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object. The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use `ADD_STS_REF` instead of `ADD_SQLWKLD_REF` for all SQL Tuning Set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN VARCHAR2,
   is_sts                 IN NUMBER :=0);
```

Parameters

Table 17–2 ADD_SQLWKLD_REF Procedure Parameters

Parameter	Description
`task_name`	The SQL Access Advisor task name that uniquely identifies an existing task.
`workload_name`	The name of the workload object to be linked. Once a object has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workload objects. To remove the link to the workload object, use the procedure `DELETE_REFERENCE`.
`is_sts`	Indicates the type of workload source. Possible values are: ■ 0 - SQL workload object ■ 1 - SQL Tuning Set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
END;
/
```

ADD_SQLWKLD_STATEMENT Procedure

> **Note:** This procedure is deprecated in Release 11*g*R1.

This procedure adds a single statement to the specified workload.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (
   workload_name          IN VARCHAR2,
   module                 IN VARCHAR2,
   action                 IN VARCHAR2,
   cpu_time               IN NUMBER := 0,
   elapsed_time           IN NUMBER := 0,
   disk_reads             IN NUMBER := 0,
   buffer_gets            IN NUMBER := 0,
   rows_processed         IN NUMBER := 0,
   optimizer_cost         IN NUMBER := 0,
   executions             IN NUMBER := 1,
   priority               IN NUMBER := 2,
   last_execution_date    IN DATE := 'SYSDATE',
   stat_period            IN NUMBER := 0,
   username               IN VARCHAR2,
   sql_text               IN CLOB);
```

Parameters

Table 17–3 ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload name that uniquely identifies an existing workload.
module	An optional business application module that will be associated with the SQL statement.
action	An optional application action that will be associated with the SQL statement.
cpu_time	The total CPU time in seconds that is consumed by the SQL statement.
elapsed_time	The total elapsed time in seconds that is consumed by the SQL statement.
disk_reads	The total disk-read operations that are consumed by the SQL statement.
buffer_gets	The total buffer-get operations that are consumed by the SQL statement.
rows_processed	The average number of rows processed by the SQL statement.
optimizer_cost	The optimizer's calculated cost value.
executions	The total execution count by the SQL statement. This value should be greater than zero.
priority	The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.

Table 17–3 (Cont.) ADD_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
last_execution_date	The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.
stat_period	Time interval in seconds from which statement statistics were calculated.
username	The Oracle user name that executed the SQL statement. Because a username is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.
sql_text	The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-47 for directions on setting a task to its initial state.

The ADD_SQLWKLD_STATEMENT procedure accepts several parameters that may be ignored by the caller. cpu_time, elapsed_time, disk_reads, buffer_gets, and optimizer_cost are only used to sort workload data when actual analysis occurs, so actual values are only necessary when the order_list task parameter references a particular statistic.

To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter order_list. The order_list parameter accepts any combination of the keys: buffer_gets, optimizer_cost, cpu_time, disk_reads, elapsed_time, executions, and priority. A typical setting of priority, optimizer_cost would indicate the SQL Access Advisor will sort the workload data by priority and optimizer_cost and process the highest cost statements first. Any statements added to the workload would need to include appropriate priority and optimizer_cost values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the order_list task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales');
```

```
END;
/
```

ADD_STS_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Tuning Set. The link allows an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Tuning Set is made, the STS is protected from removal or modification.

Users should use ADD_STS_REF for any STS-based advisor runs. The older method using ADD_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the ADD_STS_REF function accepts a SQL Tuning Set owner name, whereas ADD_SQLWKLD_REF does not.

Syntax

```
DBMS_ADVISOR.ADD_SQLWKLD_REF(
  task_name  IN VARCHAR2 NOT NULL,
  sts_owner  IN VARCHAR2,
  sts_name   IN VARCHAR2 NOT NULL);
```

Parameters

Table 17–4 ADD_STS_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL Tuning Set. The value of this parameter may be NULL, in which case the advisor assumes the SQL Tuning Set to be owned by the currently logged-in user.
sts_name	The name of the SQL Tuning Set object to be linked. Once a SQL Tuning Set has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to SQL Tuning Sets. To remove the link to the SQL Tuning Set, use the procedure DBMS_ADVISOR.DELETE_STS_REF.

Examples

```
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My STS');
```

CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate. This call does a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as `Ctrl-C`. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (
   task_name      IN  VARCHAR2);
```

Parameters

Table 17–5 CANCEL_TASK Procedure Parameter

Parameter	Description
`task_name`	A valid Advisor task name that uniquely identifies an existing task.

Usage Notes

A cancel command restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/
```

COPY_SQLWKLD_TO_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL Tuning Set.

Syntax

To use this procedure, the caller must have privileges to create and modify a SQL Tuning Set.

Parameters

Table 17–6 COPY_SQLWKLD_TO_STS Procedure Parameter

Parameter	Description
`workload_name`	The SQL Workload object name to copy.
`sts_name`	The SQL Tuning Set name into which the SQL Workload object will be copied.
`import_mode`	Specifies the handling of the target SQL Tuning Set. Possible values are: ■ `APPEND` Causes SQL Workload data to be appended to the target SQL Tuning Set. ■ `NEW` Indicates the SQL Tuning Set can only contain the copied contents. If the SQL Tuning Set exists and has data, an error will be reported. ■ `REPLACE` Causes any existing data in the target SQL Tuning Set to be purged prior to the workload copy. In all cases, if the specified SQL Tuning Set does not exist, it will be created.

Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL Tuning Set.

Examples

```
BEGIN
   DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/
```

CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports. CREATE_FILE accepts a CLOB input parameter and writes the character string contents to the specified file.

Syntax

```
DBMS_ADVISOR.CREATE_FILE (
   buffer       IN  CLOB,
   location     IN  VARCHAR2,
   filename     IN  VARCHAR2);
```

Parameters

Table 17–7 CREATE_FILE Procedure Parameters

Parameter	Description
buffer	A CLOB buffer containing report or script information.
location	Specifies the directory that will contain the new file. You must use the directory alias as defined by the CREATE DIRECTORY statement. The Advisor will translate the alias into the actual directory location.
filename	Specifies the output file to receive the script commands. The filename can only contain the name and an optional file type of the form filename.filetype.

Usage Notes

All formatting must be embedded within the CLOB.

The Oracle server restricts file access within Oracle Stored Procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

```
CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT(task_name),
    'MY_DIR','script.sql');

END;
/
```

CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```
DBMS_ADVISOR.CREATE_OBJECT (
   task_name         IN VARCHAR2,
   object_type       IN VARCHAR2,
   attr1             IN VARCHAR2 :=  NULL,
   attr2             IN VARCHAR2 :=  NULL,
   attr3             IN VARCHAR2 :=  NULL,
   attr4             IN CLOB     :=  NULL,
   object_id         OUT NUMBER);

DBMS_ADVISOR.CREATE_OBJECT (
   task_name         IN VARCHAR2,
   object_type       IN VARCHAR2,
   attr1             IN VARCHAR2 :=  NULL,
   attr2             IN VARCHAR2 :=  NULL,
   attr3             IN VARCHAR2 :=  NULL,
   attr4             IN CLOB     :=  NULL,
   attr5             IN VARCHAR2 :=  NULL,
   object_id         OUT NUMBER);
```

Parameters

Table 17–8 CREATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid Advisor task name that uniquely identifies an existing task.
object_type	Specifies the external object type.
attr1	Advisor-specific data.
attr2	Advisor-specific data.
attr3	Advisor-specific data.
attr4	Advisor-specific data.
attr5	Advisor-specific data.
object_id	The advisor-assigned object identifier.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Return Values

Returns the new object identifier.

Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or

LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
END;
/
```

CREATE_SQLWKLD Procedure

Note: This procedure is deprecated in Release 11*g*R1.

This procedure creates a new private SQL Workload object for the user. A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

Syntax

```
DBMS_ADVISOR.CREATE_SQLWKLD (
   workload_name            IN OUT VARCHAR2,
   description              IN VARCHAR2 := NULL,
   template                 IN VARCHAR2 := NULL,
   is_template              IN VARCHAR2 := 'FALSE');
```

Parameters

Table 17–9 CREATE_SQLWKLD Procedure Parameters

Parameter	Description
`workload_name`	A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.
`description`	Specifies an optional workload description. Descriptions can be up to 256 characters.
`template`	An optional SQL Workload name of an existing workload data object or data object template.
`is_template`	An optional value that enables you to set the newly created workload as a template. Valid values are `TRUE` and `FALSE`.

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

Once a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the `ADD_SQLWKLD_REF` procedure.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/
```

CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

```
DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_id               OUT NUMBER,
   task_name             IN OUT VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (
   advisor_name          IN VARCHAR2,
   task_name             IN VARCHAR2,
   task_desc             IN VARCHAR2 := NULL,
   template              IN VARCHAR2 := NULL,
   is_template           IN VARCHAR2 := 'FALSE',
   how_created           IN VARCHAR2 := NULL);
```

Parameters

Table 17–10 CREATE_TASK Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
task_id	A number that uniquely identifies the created task. The number is generated by the procedure and returned to the user.
task_name	Specifies a new task name. Names must be unique among all tasks for the user. When using the second form of the CREATE_TASK syntax listed above (with OUT), a unique name can be generated. Names can be up to 30 characters long.
task_desc	Specifies an optional task description. Descriptions can be up to 256 characters in length.
template	An optional task name of an existing task or task template. To specify built-in SQL Access Advisor templates, use the template name as described earlier.
is_template	An optional value that allows the user to set the newly created task as template. Valid values are: TRUE and FALSE.
how_created	An optional value that identifies how the source was created.

Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is permanently associated with the original advisor. By default, tasks are created using built-in default settings. To create a task using the parameter settings of an existing task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier `DBMS_ADVISOR.SQLACCESS_ADVISOR` as the `advisor_name`.

The SQL Access Advisor provides three built-in task templates, using the following constants:

- `DBMS_ADVISOR.SQLACCESS_OLTP`

  Parameters are preset to favor an OLTP application environment.

- `DBMS_ADVISOR.SQLACCESS_WAREHOUSE`

  Parameters are preset to favor a data warehouse application environment.

- `DBMS_ADVISOR.SQLACCESS_GENERAL`

  Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```

DELETE_SQLWKLD Procedure

Note: This procedure is deprecated in Release 11*g*R1.

This procedure deletes an existing SQL Workload object from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD (
   workload_name        IN VARCHAR2);
```

Parameters

Table 17–11 DELETE_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload. The wildcard % is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "RESET_TASK Procedure" on page 17-47 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

DELETE_SQLWKLD_REF Procedure

Note: This procedure is deprecated in Release 11*g*R1.

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

Users should use `DELETE_STS_REF` instead of `DELETE_SQLWKLD_REF` for all SQL Tuning Set-based advisor runs. This function is only provided for backward compatibility.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
   task_name              IN VARCHAR2,
   workload_name          IN VARCHAR2,
   is_sts                 IN NUMBER :=0);
```

Parameters

Table 17–12 DELETE_SQLWKLD_REF Procedure Parameters

Parameter	Description
`task_name`	The SQL Access task name that uniquely identifies an existing task.
`workload_name`	The name of the workload object to be unlinked. The wildcard `%` is supported as a `workload_name`. The rules of use are identical to the `LIKE` operator. For example, to remove all links to workload objects, use the wildcard `%` as the `workload_name`.
`is_sts`	Indicates the type of workload source. Possible values are: ■ 0 - SQL workload object ■ 1 - SQL Tuning Set

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/
```

DELETE_SQLWKLD_STATEMENT Procedures

This procedure has been deprecated.

This procedure deletes one or more statements from a workload.

Syntax

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   sql_id               IN NUMBER);

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (
   workload_name        IN VARCHAR2,
   search               IN VARCHAR2,
   deleted              OUT NUMBER);
```

Parameters

Table 17–13 DELETE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant ADVISOR_ALL.
search	Disabled.
deleted	Returns the number of statements deleted by the searched deleted operation.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the "RESET_TASK Procedure" on page 17-47 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  deleted NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

DELETE_STS_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a SQL Tuning Set object.

Users should use DELETE_STS_REF for any STS-based advisor runs. The older method using DELETE_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward compatibility. Furthermore, the DELETE_STS_REF function accepts an STS owner name, whereas DELETE_SQLWKLD_REF does not.

Syntax

```
DBMS_ADVISOR.DELETE_STS_REF (
  task_name  IN VARCHAR2 NOT NULL,
  sts_owner  IN VARCHAR2,
  sts_name   IN VARCHAR2 NOT NULL);
```

Parameters

Table 17–14 DELETE_STS_REF Procedure Parameters

Parameter	Description
task_name	The SQL Access Advisor task name that uniquely identifies an existing task.
sts_owner	The owner of the SQL Tuning Set. The value of this parameter may be NULL, in which case the advisor assumes the SQL Tuning Set to be owned by the currently logged-in user.
sts_name	The name of the SQL Tuning Set to be unlinked. The wildcard % is supported as a STS_NAME. The rules of use are identical to the SQL LIKE operator. For example, to remove all links to SQL Tuning Set objects, use the wildcard % as the STS_NAME.

Examples

```
DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My STS');
```

DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 17–15 DELETE_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be deleted from the repository. The wildcard % is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard % as the TASK_NAME. If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/
```

EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (
   task_name          IN VARCHAR2);

DBMS_ADVISOR.EXECUTE_TASK (
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2             := NULL,
   execution_name    IN VARCHAR2             := NULL,
   execution_params  IN dbms_advisor.argList := NULL,
   execution_desc    IN VARCHAR2             := NULL,
RETURN VARCHAR2;
```

Parameters

Table 17–16 EXECUTE_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
execution_type	The type of action to be performed by the function. If NULL, it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. As an example, the SQL Performance Analyzer accepts the following possible values: ■ EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task. ■ TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework. ■ ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function.
execution_params	A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for. As an example, consider the following: DBMS_ADVISOR.ARGLIST('time_limit', 12, 'username', 'foo')
execution_desc	A 256-length string describing the execution.

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```
DBMS_ADVISOR.GET_REC_ATTRIBUTES (
   workload_name         IN VARCHAR2,
   rec_id                IN NUMBER,
   action_id             IN NUMBER,
   attribute_name        IN VARCHAR2,
   value                 OUT VARCHAR2,
   owner_name            IN VARCHAR2 := NULL);
```

Parameters

Table 17–17 GET_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
rec_id	The Advisor-generated identifier number that is assigned to the recommendation.
action_id	The Advisor-generated action identifier that is assigned to the particular command.
attribute_name	Specifies the attribute to change.
value	The buffer to receive the requested attribute value.
owner_name	Optional owner name of the target task. This permits access to task data not owned by the current user.

Return Values

The requested attribute value is returned in the VALUE argument.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);
END;
/
```

GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_REPORT (
   task_name      IN VARCHAR2,
   type           IN VARCHAR2 := 'TEXT',
   level          IN VARCHAR2 := 'TYPICAL',
   section        IN VARCHAR2 := 'ALL',
   owner_name     IN VARCHAR2 := NULL,
   execution_name IN VARCHAR2 := NULL,
   object_id      IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 17–18 GET_TASK_REPORT Function Parameters

Parameter	Description
task_name	The name of the task from which the script will be created.
type	The only valid value is TEXT.
level	The possible values are BASIC, TYPICAL, and ALL.
section	Advisor-specific report sections.
owner_name	Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the buffer receiving the script.

GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to file. The script will contain all of the accepted recommendations from the specified task.

Syntax

```
DBMS_ADVISOR.GET_TASK_SCRIPT (
   task_name          IN VARCHAR2
   type               IN VARCHAR2 := 'IMPLEMENTATION',
   rec_id             IN NUMBER   := NULL,
   act_id             IN NUMBER   := NULL,
   owner_name         IN VARCHAR2 := NULL,
   execution_name     IN VARCHAR2 := NULL,
   object_id          IN NUMBER   := NULL)
RETURN CLOB;
```

Parameters

Table 17–19 GET_TASK_SCRIPT Function Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.
type	Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.
rec_id	An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.
act_id	Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.
owner_name	An optional task owner name.
execution_name	An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.
object_id	An identifier of an advisor object that can be targeted by the script.

Return Values

Returns the script as a CLOB buffer.

Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

Examples

```
DECLARE
  task_id NUMBER;
```

```
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  buf CLOB;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
    buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
END;
/
```

IMPLEMENT_TASK Procedure

This procedure implements the recommendations of the specified task.

Syntax

```
DBMS_ADVISOR.IMPLEMENT_TASK (
   task_name          IN VARCHAR2,
   rec_id             IN NUMBER := NULL,
   exit_on_error      IN BOOLEAN := NULL);
```

Parameters

Table 17–20 IMPLEMENT_TASK Procedure Parameters

Parameter	Description
task_name	The name of the task.
rec_id	An optional recommendation ID.
exit_on_error	An optional boolean to exit on the first error.

IMPORT_SQLWKLD_SCHEMA Procedure

> **Note:** This procedure is deprecated in Release 11*g*R1.

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 17–21 IMPORT_SQLWKLD_SCHEMA Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.
failed_rows	Returns the number or rows that were not saved due to syntax or validation errors
saved_rows	Returns the number of rows actually saved in the repository.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the VALID_TABLE_LIST parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

IMPORT_SQLWKLD_SQLCACHE Procedure

> **Note:** This procedure is deprecated in Release 11*g*R1.

This procedure creates a SQL workload from the current contents of the server's SQL cache.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 17–22 IMPORT_SQLWKLD_SQLCACHE Procedure Parameters

Parameter	Description
`workload_name`	The workload object name that uniquely identifies an existing workload.
`import_mode`	Specifies the action to be taken when storing the workload. Possible values are: ■ `APPEND` Indicates that the collected workload will be added to any existing workload in the task. ■ `NEW` Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ `REPLACE` Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is `NEW`.
`priority`	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-`HIGH`, 2-`MEDIUM`, or 3-`LOW`.
`saved_rows`	Returns the number of rows saved as output parameters.
`failed_rows`	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-47 to set a task to its initial state.

Examples

```
DECLARE
```

```
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved,
     failed);
END;
/
```

IMPORT_SQLWKLD_STS Procedure

> **Note:** This procedure is deprecated in Release 11*g*R1.

This procedure loads a SQL workload from an existing SQL Tuning Set. A SQL Tuning Set is typically created from the server workload repository using various time and data filters.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name         IN VARCHAR2,
   sts_name              IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (
   workload_name         IN VARCHAR2,
   sts_owner             IN VARCHAR2,
   sts_name              IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 17–23 IMPORT_SQLWKLD_STS Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
sts_owner	The optional owner of the SQL Tuning Set.
sts_name	The name of an existing SQL Tuning Set workload from which the data will be imported. If the sts_owner value is not provided, the owner will default to the current user.
import_mode	Specifies the action to be taken when storing the workload. Possible values are: ■ APPEND Indicates that the collected workload will be added to any existing workload in the task. ■ NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.
priority	Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.
saved_rows	Returns the number of rows actually saved in the repository.

Table 17–23 (Cont.) IMPORT_SQLWKLD_STS Procedure Parameters

Parameter	Description
failed_rows	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-47 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1,
     saved, failed);
END;
/
```

IMPORT_SQLWKLD_SUMADV Procedure

> **Note:** This procedure is deprecated in Release 11*g*R1.

This procedure collects a SQL workload from a Summary Advisor workload. This procedure is intended to assist Oracle9*i* Database Summary Advisor users in the migration to SQL Access Advisor.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   sumadv_id             IN NUMBER,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 17–24 IMPORT_SQLWKLD_SUMADV Procedure Parameters

Parameter	Description
`workload_name`	The workload object name that uniquely identifies an existing workload.
`import_mode`	Specifies the action to be taken when storing the workload. Possible values are: ■ `APPEND` Indicates that the collected workload will be added to any existing workload in the task. ■ `NEW` Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ `REPLACE` Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is `NEW`.
`priority`	Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-`HIGH`, 2-`MEDIUM`, or 3-`LOW`.
`sumadv_id`	Specifies the Summary Advisor workload identifier number.
`saved_rows`	Returns the number of rows actually saved in the repository.
`failed_rows`	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-47 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
  sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
    saved, failed);
END;
/
```

IMPORT_SQLWKLD_USER Procedure

> **Note:** This procedure is deprecated in Release 11*g*R1.

This procedure collects a SQL workload from a specified user table.

Syntax

```
DBMS_ADVISOR.IMPORT_SQLWKLD_USER (
   workload_name          IN VARCHAR2,
   import_mode            IN VARCHAR2 := 'NEW',
   owner_name             IN VARCHAR2,
   table_name             IN VARCHAR2,
   saved_rows             OUT NUMBER,
   failed_rows            OUT NUMBER);
```

Parameters

Table 17–25 IMPORT_SQLWKLD_USER Procedure Parameters

Parameter	Description
`workload_name`	The workload object name that uniquely identifies an existing workload.
`import_mode`	Specifies the action to be taken when storing the workload. Possible values are: ■ `APPEND` Indicates that the collected workload will be added to any existing workload in the task. ■ `NEW` Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown. ■ `REPLACE` Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is `NEW`.
`owner_name`	Specifies the owner name of the table or view from which workload data will be collected.
`table_name`	Specifies the name of the table or view from which workload data will be collected.
`saved_rows`	Returns the number of rows actually saved in the workload object.
`failed_rows`	Returns the number of rows that were not saved due to syntax or validation errors.

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-47 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH',
    'USER_WORKLOAD', saved, failed);
END;
/
```

INTERRUPT_TASK Procedure

This procedure stops a currently executing task. The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.

Syntax

```
DBMS_ADVISOR.INTERRUPT_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 17–26 INTERRUPT_TASK Procedure Parameters

Parameter	Description
task_name	A single Advisor task name that will be interrupted.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
```

While this session is executing its task, you can interrupt the task from a second session using the following statement:

```
BEGIN
  DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/
```

MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

```
DBMS_ADVISOR.MARK_RECOMMENDATION (
   task_name          IN VARCHAR2
   id                 IN NUMBER,
   action             IN VARCHAR2);
```

Parameters

Table 17–27 MARK_RECOMMENDATION Procedure Parameters

Parameter	Description
task_name	Name of the task.
id	The recommendation identifier number assigned by the Advisor.
action	The recommendation action setting. The possible actions are: ■ ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts. ■ IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script. ■ REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.

Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
  rec_id NUMBER;
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

  rec_id := 1;
  DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/
```

QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.

Syntax

```
DBMS_ADVISOR.QUICK_TUNE (
   advisor_name           IN VARCHAR2,
   task_name              IN VARCHAR2,
   attr1                  IN CLOB,
   attr2                  IN VARCHAR2 := NULL,
   attr3                  IN NUMBER := NULL,
   task_or_template       IN VARCHAR2 := NULL);
```

Parameters

Table 17–28 QUICK_TUNE Procedure Parameters

Parameter	Description
advisor_name	Name of the Advisor that will perform the analysis.
task_name	Name of the task.
attr1	Advisor-specific attribute in the form of a CLOB variable.
attr2	Advisor-specific attribute in the form of a VARCHAR2 variable.
attr3	Advisor-specific attribute in the form of a NUMBER.
task_or_template	An optional task name of an existing task or task template.

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of SQLACCESS_GENERAL. The workload will only contain the specified statement, and all task parameters will be defaulted.

attr1 must be the single SQL statement to tune. For the SQL Access Advisor, attr2 is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```
DECLARE
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
                  'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/
```

RESET_SQLWKLD Procedure

Note: This procedure is deprecated in Release 11*g*R1.

This procedure resets a workload to its initial starting point. This has the effect of removing all journal messages, log messages, and recalculating necessary volatility and usage statistics.

Syntax

```
DBMS_ADVISOR.RESET_SQLWKLD (
   workload_name        IN VARCHAR2);
```

Parameters

Table 17–29 RESET_SQLWKLD Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.

Usage Notes

RESET_SQLWKLD should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

  DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/
```

RESET_TASK Procedure

This procedure resets a task to its initial state. All intermediate and recommendation data will be removed from the task. The task status will be set to INITIAL.

Syntax

```
DBMS_ADVISOR.RESET_TASK (
   task_name          IN VARCHAR2);
```

Parameters

Table 17–30 RESET_TASK Procedure Parameters

Parameter	Description
task_name	The task name that uniquely identifies an existing task.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
  DBMS_ADVISOR.RESET_TASK(task_name);
END;
/
```

SET_DEFAULT_SQLWKLD_PARAMETER Procedures

Note: This procedure is deprecated in Release 11*g*R1.

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 17–31 SET_DEFAULT_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
`parameter`	The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.
`value`	The value of the specified parameter. The value can be specified as a string or a number. If the value is `DBMS_ADVISOR.DEFAULT`, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/
```

SET_DEFAULT_TASK_PARAMETER Procedures

This procedure modifies the default value for a user parameter within a task or a template. A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

```
DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name        IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN VARCHAR2);

DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (
   advisor_name        IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN NUMBER);
```

Parameters

Table 17–32 SET_DEFAULT_TASK_PARAMETER Procedure Parameters

Parameter	Description
advisor_name	Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number.

Examples

```
BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
   'VALID_TABLE_LIST', 'SH.%');
END;
/
```

SET_SQLWKLD_PARAMETER Procedures

Note: This procedure is deprecated in Release 11*g*R1.

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (
   workload_name        IN VARCHAR2,
   parameter            IN VARCHAR2,
   value                IN NUMBER);
```

Parameters

Table 17–33 SET_SQLWKLD_PARAMETER Procedure Parameters

Parameter	Description
`workload_name`	The SQL Workload object name that uniquely identifies an existing workload.
`parameter`	The name of the data parameter to be modified. Parameter names are not case sensitive.
`value`	The value of the specified parameter. The value can be specified as a string or a number. If the value is `DBMS_ADVISOR.DEFAULT`, the value will be reset to the default value.

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST','SH.%');
END;
/
```

SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```
DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name           IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN VARCHAR2);

DBMS_ADVISOR.SET_TASK_PARAMETER (
   task_name           IN VARCHAR2
   parameter           IN VARCHAR2,
   value               IN NUMBER);
```

Parameters

Table 17–34 SET_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
parameter	The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.
value	The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.

Usage Notes

A task cannot be modified unless it is in its initial state. See "RESET_TASK Procedure" on page 17-47 to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

Table 17–35 lists SQL Access Advisor task parameters.

Table 17–35 SQL Access Advisor Task Parameters

Parameter	Description
ANALYSIS_SCOPE	A comma-separated list that specifies the tuning artifacts to consider during analysis. The possible values are: ■ ALL Short name for specifying INDEX, MVIEW, TABLE, and PARTITION. ■ EVALUATION Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone. ■ INDEX Allows the SQL Access Advisor to recommend index structure changes. ■ MVIEW Allows the SQL Access Advisor to recommend materialized view and log changes. ■ PARTITION Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the INDEX, MVIEW, and TABLE options. ■ TABLE Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning. Using the new keywords, the following combinations are valid: ■ INDEX ■ MVIEW ■ INDEX, PARTITION ■ INDEX, MVIEW, PARTITION ■ INDEX, TABLE, PARTITION ■ MVIEW, PARTITION ■ MIVEW, TABLE, PARTITION ■ INDEX, MVIEW, TABLE, PARTITION ■ TABLE, PARTITION ■ EVALUATION The default value is INDEX. The datatype is STRINGLIST.
CREATION_COST	When set to true (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time. When set to false, the cost of creation is ignored. The datatype is STRING.
DAYS_TO_EXPIRE	Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation. Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. The datatype is NUMBER. Once the task expires, it becomes a candidate for removal by an automatic purge operation. The possible values are: ■ an integer in the range of 0 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is 30.
DEF_EM_TEMPLATE	Contains the default task or template name from which the Enterprise Manager SQL Access Advisor Wizard reads its initial values. The default value is SQLACCESS_EMTASK. The datatype is STRING.
DEF_INDEX_OWNER	Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name. Possible values are: ■ Existing schema name. Quoted identifiers are supported. ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRING.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
DEF_INDEX_ TABLESPACE	Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED No tablespace clause will be present in the script for indexes. The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_MVIEW_ OWNER	Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name. Possible values are: ■ Existing schema name. Quoted identifiers are supported. ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_MVIEW_ TABLESPACE	Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_MVLOG_ TABLSPACE	Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized view logs. The default value is ADVISOR_UNUSED. The datatype is STRING.
DEF_ PARTITION_ TABLESPACE	Specifies the default tablespace for new partitioning recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are: ■ Existing tablespace name. Quoted identifiers are supported. ■ ADVISOR_UNUSED. No tablespace clause will be present in the script for materialized views. The default value is ADVISOR_UNUSED. The datatype is STRING.
DML_ VOLATILITY	When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DMLs on a column, it may favor a Btree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The datatype is STRING. See the related parameter refresh_mode.
END_TIME	Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second The datatype is STRING.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
EVALUATION_ ONLY	This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated. Possible values are: ■ FALSE ■ TRUE The default value is FALSE. The datatype is STRING.
EXECUTION_ TYPE	This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. The translated values are: ■ FULL => FULL ■ INDEX_ONLY => INDEX ■ MVIEW_ONLY => MVIEW ■ MVIEW_LOG_ONLY => MVIEW_LOG_ONLY The type of recommendations that is desired. Possible values: ■ FULL All supported recommendation types will be considered. ■ INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations. ■ MVIEW_ONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations. ■ MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations. The default value is FULL. The datatype is STRINGLIST.
IMPLEMENT_ EXIT_ON_ERROR	When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error. The possible values are: ■ TRUE ■ FALSE The default value is TRUE. The datatype is STRING.
INDEX_NAME_ TEMPLATE	Specifies the method by which new index names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ ID* in the template. Once formatted, the maximum size of a name is 30 characters. Valid keywords are: ■ Any literal value up to 22 characters. ■ TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit. ■ TASK_ID Causes the current task identifier number to be inserted in hexadecimal form. ■ SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is <TABLE>_IDX$$_<TASK_ID><SEQ>. The datatype is STRING.
INVALID_ ACTION_LIST	Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
INVALID_ MODULE_LIST	Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
INVALID_ SQLSTRING_ LIST	Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
INVALID_ USERNAME_LIST	Contains a fully qualified list of usernames that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's username matches a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted. The possible values are: ■ single username ■ comma-delimited username list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
JOURNALING	Controls the logging of messages to the journal (DBA_ADVISOR_JOURNAL and USER_ADVISOR_JOURNAL views). The higher the setting, the more information is logged to the journal. Possible values are: ■ UNUSED: no journal messages ■ FATAL: explanation of fatal conditions ■ ERROR: explanation of errors ■ WARNING: explanation of warnings ■ INFORMATION: information message ■ INFORMATION2: common information ■ INFORMATION3: common information ■ INFORMATION4: common information ■ INFORMATION5: common information ■ INFORMATION6: common information Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository. INFORMATION6 represents the most thorough message recording and UNUSED is the least. The default value is INFORMATION. The datatype is NUMBER.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
LIMITED_ PARTITION_ SCHEMES	User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor. Possible values are: ■ An integer in the range of 1 to 10 ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is NUMBER.
MAX_NUMBER_ PARTITIONS	Limits the number of partitions the advisor will recommend for any base table, index, or materialized view. Possible values are: ■ An integer in the range of 1 to 4294967295 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.
MODE	Specifies the mode by which Access Advisor will operate during an analysis. Valid values are: ■ LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality. ■ COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality. The default value is COMPREHENSIVE. The datatype is STRING.
MVIEW_NAME_ TEMPLATE	Specifies the method by which new materialized view names are formed. If the *TASK_ID* is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the *TASK_ ID* in the template. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are: ■ Any literal value up to 22 characters. ■ *TASK_ID* Causes the current task identifier number to be inserted in hexadecimal form. ■ *SEQ* Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is: MV$$_<TASK_ID><SEQ>. The datatype is STRING.
ORDER_LIST	This parameter has been deprecated. Contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_ LIST values. A comma must separate multiple order keys. Possible values are: ■ BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. ■ CPU_TIME Sets the order using the SQL statement's CPU time value. ■ DISK_READS Sets the order using the SQL statement's disk-read count value. ■ ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. ■ EXECUTIONS Sets the order using the SQL statement's execution frequency value. ■ OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. ■ I/O Sets the order using the SQL statement's I/O count value. ■ PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
PARTITION_ NAME_TEMPLATE	Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are: ■ Any literal value up to 22 characters. ■ <TABLE> Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit. ■ <TASK_ID> Causes the current task identifier number to be inserted in hexadecimal form. ■ <SEQ> Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token. The default template is PTN$$_<TABLE>_<TASK_ID><SEQ>. The datatype is STRING.
PARTITIONING_ GOAL	Specifies the approach used to make partitioning recommendations. One possible value is PERFORMANCE, which is the default. The datatype is STRING.
PARTITIONING_ TYPES	Specifies the type of partitioning used. Possible values are RANGE and HASH. The datatype is STRING.
RANKING_ MEASURE	Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using RANKING_MEASURE values. A comma must separate multiple order keys. Possible values are: ■ BUFFER_GETS Sets the order using the SQL statement's buffer-get count value. ■ CPU_TIME Sets the order using the SQL statement's cpu time value. ■ DISK_READS Sets the order using the SQL statement's disk-read count value. ■ ELAPSED_TIME Sets the order using the SQL statement's elapsed time value. ■ EXECUTIONS Sets the order using the SQL statement's elapsed time value. ■ OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value. ■ PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value. The default value is PRIORITY, OPTIMIZER_COST. The datatype is STRINGLIST.
RECOMMEND_MV_ EXACT_TEXT_ MATCH	When considering candidate materialized views, exact text match solutions will only be included if this parameter contains TRUE. The possible values are: ■ TRUE ■ FALSE The default value is TRUE. The datatype is STRING.
RECOMMENDED_ TABLESPACES	Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage. Possible values are: ■ TRUE ■ FALSE (the default) The datatype is STRING.
REFRESH_MODE	Specifies whether materialized views are refreshed ON_DEMAND or ON_COMMIT. This will be used to weigh the impact of materialized view refresh when the parameter dml_volatility is set to TRUE. Possible values are: ■ ON_DEMAND ■ ON_COMMIT The default value is ON_DEMAND. The datatype is STRING.
REPORT_DATE_ FORMAT	This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI. The datatype is STRING.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
SHOW_RETAINS	Controls the display of RETAIN actions within an implementation script and the SQL Access Advisor wizard. The possible values are: ■ TRUE ■ FALSE The default value is TRUE. The datatype is STRING.
SQL_LIMIT	Specifies the number of SQL statements to be analyzed. The SQL_LIMIT filter is applied after all other filters have been applied. For example, if only statements referencing the table foo.bar are to be accepted, the SQL_LIMIT value will be only apply to those statements. When used in conjunction with the parameter ORDER_LIST, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys. The possible values are: ■ an integer in the range of 1 to 2147483647 ■ ADVISOR_UNLIMITED ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is NUMBER.
START_TIME	Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where: ■ DD is the numeric date ■ MM is the numeric month ■ YYYY is the numeric year ■ HH is the hour in 24 hour format ■ MI is the minute ■ SS is the second The datatype is STRING.
STORAGE_CHANGE	Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL. When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand. Possible values: ■ Any valid integer including negative values, zero and positive values. The default value is ADVISOR_UNLIMITED. The datatype is NUMBER.
TIME_LIMIT	Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time. Possible values: ■ An integer in the range of 1 to 10,000 ■ ADVISOR_UNLIMITED The default value is 720 (12 hours). The datatype is NUMBER. Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_ACTION_LIST	Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are: ■ single action ■ comma-delimited action list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
VALID_MODULE_LIST	Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive. The possible values are: ■ single application ■ comma-delimited module list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
VALID_SQLSTRING_LIST	Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task. The possible values are: ■ single string ■ comma-delimited string list ■ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.

Table 17–35 (Cont.) SQL Access Advisor Task Parameters

Parameter	Description
VALID_TABLE_LIST	Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. The valid syntax for a table reference is: ▪ schema.table ▪ schema ▪ schema.% (equivalent to schema) ▪ comma-delimited action list ▪ ADVISOR_UNUSED The possible values are: ▪ single table reference ▪ comma-delimited reference list ▪ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is TABLELIST.
VALID_USERNAME_LIST	Contains a fully qualified list of usernames that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. During a task execution, if a SQL statement's username does not match a name in the username list, it will not be processed by the task. A username is not case sensitive unless it is quoted. The possible values are: ▪ single username ▪ comma-delimited username list ▪ ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The datatype is STRINGLIST.
WORKLOAD_SCOPE	Describes the level of application coverage the workload represents. Possible values are FULL and PARTIAL. FULL Should be used if the workload contains all interesting application SQL statements for the targeted tables. PARTIAL (default) Should be used if the workload contains anything less than a full representation of the interesting application SQL statements for the targeted tables. The datatype is STRING.

Segment Advisor Parameters

Table 17–36 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

Table 17–36 Segment Advisor Task Parameters

Parameter	Description
MODE	The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are: ▪ LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository ▪ COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics
TIME_LIST	The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED.

Table 17–36 (Cont.) Segment Advisor Task Parameters

Parameter	Description
RECOMMEND_ALL	Whether to generate recommendations for all segments. The default value is TRUE. If set to TRUE, it generates recommendations all segments specified by the user. If set to FALSE, it generates recommendations for only those objects that are eligible for shrink.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

   DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
   DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
      'SH.%,SCOTT.EMP');
END;
/
```

Undo Advisor Task Parameters

Table 17–37 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

Table 17–37 Undo Advisor Task Parameters

Parameter	Description
TARGET_OBJECTS	The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.
BEGIN_TIME_SEC	The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.
END_TIME_SEC	The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.

Examples

```
DECLARE
   tname  VARCHAR2(30);
   oid    NUMBER;
   BEGIN
     DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
     DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);
```

```
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
    DBMS_ADVISOR.EXECUTE_TASK(tname);
  END;
/
```

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 17–38 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure. See *Oracle Database Performance Tuning Guide* for more information on using these parameters.

Table 17–38 ADDM Task Parameters

Parameter	Description
START_SNAPSHOT	The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
END_SNAPSHOT	The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.
DB_ID	The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.
INSTANCE	The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.
INSTANCES	If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, "1, 3, 5"). By default, all instances are analyzed.
DBIO_EXPECTED	The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.

Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or a RAC database.

```
DECLARE
   tid     NUMBER;
   tname VARCHAR2(30) := 'ADDM_TEST';
BEGIN
   DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
   DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
   DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
   DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/
```

- DBMS_ADDM for details on how to create and execute ADDM tasks

SQL Tuning Advisor Task Parameters

See the DBMS_SQLTUNE package on page 136-1 and *Oracle Database Performance Tuning Guide* for more information.

TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into two or more materialized views and to restate the materialized view in a way that is more advantageous for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

```
DBMS_ADVISOR.TUNE_MVIEW (
   task_name IN OUT VARCHAR2,
   mv_create_stmt IN [CLOB | VARCHAR2]);
```

Parameters

Table 17–39 TUNE_MVIEW Procedure Parameters

Parameter	Description
task_name	The task name for looking up the results in a catalog view. If not specified, the system will generate a name and return.
mv_create_stmt	The original materialized view creation statement.

See Also: *Oracle Database Performance Tuning Guide* for more information about using the TUNE_MVIEW procedure

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one is for CREATE implementation and the other is for undoing the CREATE MATERIALIZED VIEW implementation. The output results are accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to output the TUNE_MVIEW results into a script file for later execution.

USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

These views are to get the result after executing the TUNE_MVIEW procedure.

Table 17–40 USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

Column Name	Column Description
OWNER	The materialized view owner's name.
TASK_NAME	The task name as a key to access the set of recommendations
SCRIPT_TYPE	Recommendation ID used to indicate the row is for IMPLEMENTATION or UNDO script.
ACTION_ID	Action ID used as the command order number.
STATEMENT	For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options: ■ CREATE MATERIALIZED VIEW LOG ■ ALTER MATERIALIZED VIEW LOG FORCE ■ [CREATE | DROP] MATERIALIZED VIEW

Examples

```
name VARCHAR2(30);
DBMS_ADVISOR.TUNE_MVIEW.(name, 'SELECT AVG(C1) FROM my_fact_table WHERE c10 = 7');
```

The following is an example to show how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```
NAME VARCHAR2(30) := 'my_tune_mview_task';
EXECUTE DBMS_ADVISOR.TUNE_MVIEW (name, 'CREATE MATERIALIZED VIEW MY_MV
REFRESH FAST AS SELECT C2, AVG(C1) FROM MY_FACT_TABLE WHERE C10 = 7
GROUP BY C2');
```

You can view the CREATE output results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example:

```
SELECT * FROM USER_TUNE_MVIEW WHERE TASK_NAME='my_tune_mview_task' AND
SCRIPT_TYPE='CREATE';
```

Alternatively, you can save the output results in an external script file as in the following example:

```
CREATE DIRECTORY TUNE_RESULTS AS  ''/myscript_dir'' ;
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS TO PUBLIC;
EXECUTE DBMS_ADVISOR.CREATE_FILE(DBMS_ADVISOR.GET_TASK_SCRIPT('my_tune_mview_
task'), -
'/homes/tune','my_tune_mview_create.sql');
```

The preceding statement will save the CREATE output results in /myscript_dir/my_tune_mview_create.sql.

UPDATE_OBJECT Procedure

This procedure updates an existing task object. Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```
DBMS_ADVISOR.UPDATE_OBJECT (
   task_name       IN VARCHAR2
   object_id       IN NUMBER,
   attr1           IN VARCHAR2 := NULL,
   attr2           IN VARCHAR2 := NULL,
   attr3           IN VARCHAR2 := NULL,
   attr4           IN CLOB := NULL,
   attr5           IN VARCHAR2 := NULL);
```

Parameters

Table 17–41 UPDATE_OBJECT Procedure Parameters

Parameter	Description
task_name	A valid advisor task name that uniquely identifies an existing task.
object_id	The advisor-assigned object identifier.
attr1	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr2	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr3	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr4	Advisor-specific data. If set to NULL, there will be no effect on the target object.
attr5	Advisor-specific data. If set to null, there will be no effect on the target object.

The attribute parameters have different values depending upon the object type. See *Oracle Database Administrator's Guide* for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See *Oracle Database Administrator's Guide* for further information regarding the Segment Advisor.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  obj_id NUMBER;
```

```
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                              'SELECT * FROM SH.SALES',obj_id);
  DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id,NULL,NULL,NULL,
                              'SELECT count(*) FROM SH.SALES');
END;
/
```

UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (
   task_name            IN VARCHAR2
   rec_id               IN NUMBER,
   action_id            IN NUMBER,
   attribute_name       IN VARCHAR2,
   value                IN VARCHAR2);
```

Parameters

Table 17–42 UPDATE_REC_ATTRIBUTES Procedure Parameters

Parameter	Description
`task_name`	The task name that uniquely identifies an existing task.
`rec_id`	The Advisor-generated identifier number that is assigned to the recommendation.
`action_id`	The Advisor-generated action identifier that is assigned to the particular command.
`attribute_name`	Name of the attribute to be changed. The valid values are: ■ `owner` The new owner of the object. ■ `name` The new name of the object. ■ `tablespace` The new tablespace for the object.
`value`	Specifies the new value for the recommendation attribute.

Usage Notes

Recommendation attributes cannot be modified unless the task has successfully executed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
  attribute VARCHAR2(100);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.EXECUTE_TASK(task_name);

attribute := 'SH';
```

```
  DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/
```

UPDATE_SQLWKLD_ATTRIBUTES Procedure

Note: This procedure is deprecated in Release 11*g*R1.

This procedure changes various attributes of a SQL Workload object or template.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (
   workload_name        IN VARCHAR2,
   new_name             IN VARCHAR2 := NULL,
   description          IN VARCHAR2 := NULL,
   read_only            IN VARCHAR2 := NULL,
   is_template          IN VARCHAR2 := NULL,
   how_created          IN VARCHAR2 := NULL);
```

Parameters

Table 17–43 UPDATE_SQLWKLD_ATTRIBUTES Procedure Parameters

Parameter	Description
workload_name	The workload object name that uniquely identifies an existing workload.
new_name	The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.
description	A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Set to TRUE so it cannot be changed.
is_template	TRUE if workload is to be used as a template.
how_created	Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');
  DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

UPDATE_SQLWKLD_STATEMENT Procedure

> **Note:** This procedure is deprecated in Release 11*g*R1.

This procedure updates an existing SQL statement in a specified SQL workload.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   sql_id            IN NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);

DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
   workload_name     IN VARCHAR2,
   search            IN VARCHAR2,
   updated           OUT NUMBER,
   application       IN VARCHAR2 := NULL,
   action            IN VARCHAR2 := NULL,
   priority          IN NUMBER := NULL,
   username          IN VARCHAR2 := NULL);
```

Parameters

Table 17–44 UPDATE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
workload_name	The SQL Workload object name that uniquely identifies an existing workload.
sql_id	The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR.ADVISOR_ALL.
updated	Returns the number of statements changed by a searched update.
application	Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
action	Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
priority	The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.
username	The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository. Because a username is an Oracle identifier, the username value must be entered exactly like it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.

Table 17–44 (Cont.) UPDATE_SQLWKLD_STATEMENT Procedure Parameters

Parameter	Description
search	Disabled.

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See "RESET_TASK Procedure" on page 17-47 to set a task to its initial state.

Examples

```
DECLARE
  workload_name VARCHAR2(30);
  updated NUMBER;
  id NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                     100,400,5041,103,640445,680000,2,
                                     1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
                                     FROM sh.sales WHERE promo_id = 10');

   SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
   WHERE workload_name = 'My Workload';

  DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/
```

UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

```
DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES (
   task_name          IN VARCHAR2
   new_name           IN VARCHAR2 := NULL,
   description        IN VARCHAR2 := NULL,
   read_only          IN VARCHAR2 := NULL,
   is_template        IN VARCHAR2 := NULL,
   how_created        IN VARCHAR2 := NULL);
```

Parameters

Table 17–45 UPDATE_TASK_ATTRIBUTES Procedure Parameters

Parameter	Description
task_name	The Advisor task name that uniquely identifies an existing task.
new_name	The new Advisor task name. If the value is NULL or contains the value ADVISOR_UNUSED, the task will not be renamed. A task name can be up to 30 characters long.
description	A new task description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.
read_only	Sets the task to read-only. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
is_template	Marks the task as a template. Physically, there is no difference between a task and a template; however, a template cannot be executed. Possible values are: TRUE and FALSE. If the value is NULL or contains the value ADVISOR_UNUSED, the setting will not be changed.
how_created	Indicates a source application name that initiated the task creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.

Examples

```
DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';

  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name,'New Task Name');
  DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name',NULL,'New description');
END;
/
```

18

DBMS_ALERT

DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- Using DBMS_ALERT
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Exceptions
  - Operational Notes
  - Examples
- Summary of DBMS_ALERT Subprograms

Using DBMS_ALERT

- Overview
- Security Model
- Constants
- Restrictions
- Exceptions
- Operational Notes
- Examples

Overview

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (`WAITONE`) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (`SIGNAL`) whenever the trigger is fired.

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. `EXECUTE` privilege on this cover package can then be granted rather than on this package.

Constants

The DBMS_ALERT package uses the constants shown in Table 18–1:

Table 18–1 DBMS_ALERT Constants

Name	Type	Value	Description
MAXWAIT	INTEGER	86400000	The maximum time to wait for an alert (1000 days which is essentially forever).

Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

Exceptions

DBMS_ALERT raises the application error -20000 on error conditions. Table 18–2 shows the messages and the procedures that can raise them.

Operational Notes

The following notes relate to general and specific applications:

- Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.
- A waiting application is blocked in the database and cannot do any other work.
- An application can register for multiple events and can then wait for any of them to occur using the `WAITANY` procedure.
- An application can also supply an optional `timeout` parameter to the `WAITONE` or `WAITANY` procedures. A `timeout` of 0 returns immediately if there is no pending alert.
- The signalling session can optionally pass a message that is received by the waiting session.
- Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).
- If the application does not require transaction-based alerts, the `DBMS_PIPE` package may provide a useful alternative.

  See Also: Chapter 100, "DBMS_PIPE"

- If the transaction is rolled back after the call to `SIGNAL`, no alert occurs.
- It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the *prior* alert, but before the data was read for that *prior* alert.
- Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
  - Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the `SET_DEFAULTS` procedure.
  - `WAITANY` procedure. If you use the `WAITANY` procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

Table 18–2 DBMS_ALERT Error Messages

Error Message	Procedure
`ORU-10001 lock request error, status: N`	`SIGNAL`
`ORU-10015 error: N waiting for pipe status`	`WAITANY`
`ORU-10016 error: N sending on pipe 'X'`	`SIGNAL`
`ORU-10017 error: N receiving on pipe 'X'`	`SIGNAL`
`ORU-10019 error: N on lock request`	`WAIT`
`ORU-10020 error: N on lock request`	`WAITANY`

Table 18–2 (Cont.) DBMS_ALERT Error Messages

Error Message	Procedure
ORU-10021 lock request error; status: N	REGISTER
ORU-10022 lock request error, status: N	SIGNAL
ORU-10023 lock request error; status N	WAITONE
ORU-10024 there are no alerts registered	WAITANY
ORU-10025 lock request error; status N	REGISTER
ORU-10037 attempting to wait on uncommitted signal from same session	WAITONE

Examples

Suppose you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed. Your application would look similar to this code:

```
DBMS_ALERT.REGISTER('emp_table_alert');
    <<readagain>>:
   /* ... read the emp table and graph it */
      DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
      if status = 0 then goto <<readagain>>; else
      /* ... error condition */
```

The EMP table would have a trigger similar to this:

```
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
    BEGIN
      DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
   END;
```

When the application is no longer interested in the alert, it makes this request:

```
DBMS_ALERT.REMOVE('emp_table_alert');
```

This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

Summary of DBMS_ALERT Subprograms

Table 18–3 DBMS_ALERT Package Subprograms

Subprogram	Description
REGISTER Procedure on page 18-12	Receives messages from an alert
REMOVE Procedure on page 18-13	Disables notification from an alert
REMOVEALL Procedure on page 18-14	Removes all alerts for this session from the registration list
SET_DEFAULTS Procedure on page 18-15	Sets the polling interval
SIGNAL Procedure on page 18-16	Signals an alert (send message to registered sessions)
WAITANY Procedure on page 18-17	Waits `timeout` seconds to receive alert message from an alert registered for session
WAITONE Procedure on page 18-18	Waits `timeout` seconds to receive message from named alert

REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER (
   name  IN  VARCHAR2);
```

Parameters

Table 18–4 REGISTER Procedure Parameters

Parameter	Description
name	Name of the alert in which this session is interested.

Caution: Alert names beginning with 'ORA$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes

A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.

REMOVE Procedure

This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax

```
DBMS_ALERT.REMOVE (
   name  IN  VARCHAR2);
```

Parameters

Table 18–5 REMOVE Procedure Parameters

Parameter	Description
name	Name of the alert (case-insensitive) to be removed from registration list.

Usage Notes

Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

REMOVEALL Procedure

This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax

```
DBMS_ALERT.REMOVEALL;
```

SET_DEFAULTS Procedure

In case a polling loop is required, use the SET_DEFAULTS procedure to set the polling interval.

Syntax

```
DBMS_ALERT.SET_DEFAULTS (
   sensitivity  IN  NUMBER);
```

Parameters

Table 18–6 SET_DEFAULTS Procedure Parameters

Parameter	Description
sensitivity	Polling interval, in seconds, to sleep between polls. The default interval is five seconds.

SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

Syntax

```
DBMS_ALERT.SIGNAL (
   name     IN  VARCHAR2,
   message  IN  VARCHAR2);
```

Parameters

Table 18–7 SIGNAL Procedure Parameters

Parameter	Description
`name`	Name of the alert to signal.
`message`	Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.

WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```
DBMS_ALERT.WAITANY (
   name      OUT  VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 18–8 WAITANY Procedure Parameters

Parameter	Description
`name`	Returns the name of the alert that occurred.
`message`	Returns the message associated with the alert. This is the message provided by the `SIGNAL` call. If multiple signals on this alert occurred before `WAITANY`, the message corresponds to the most recent `SIGNAL` call. Messages from prior `SIGNAL` calls are discarded.
`status`	Values returned: 0 - alert occurred 1 - timeout occurred
`timeout`	Maximum time to wait for an alert. If no alert occurs before `timeout` seconds, this returns a status of 1.

Usage Notes

An implicit `COMMIT` is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, `DBMS_LOCK.REQUEST` (which is called by `DBMS_ALERT`) returns status 4.

Exceptions

```
-20000, ORU-10024: there are no alerts registered.
```

WAITONE Procedure

This procedure waits for a specific alert to occur. An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Syntax

```
DBMS_ALERT.WAITONE (
   name      IN   VARCHAR2,
   message   OUT  VARCHAR2,
   status    OUT  INTEGER,
   timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

Table 18–9 WAITONE Procedure Parameters

Parameter	Description
name	Name of the alert to wait for.
message	Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITONE, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.
status	Values returned: 0 - alert occurred 1 - timeout occurred
timeout	Maximum time to wait for an alert. If the named alert does not occurs before timeout seconds, this returns a status of 1.

19

DBMS_APPLICATION_INFO

Application developers can use the `DBMS_APPLICATION_INFO` package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- Using DBMS_APPLICATION_INFO
  - Overview
  - Security Model
  - Operational Notes
- Summary of DBMS_APPLICATION_INFO Subprograms

Using DBMS_APPLICATION_INFO

- Overview
- Security Model
- Operational Notes

Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the `V$SESSION` and `V$SQLAREA` views.

Security Model

Note: The public synonym for DBMS_APPLICATION_INFO is not dropped before creation so that you can redirect the public synonym to point to your own package.

No further privileges are required. The DBMSAPIN.SQL script is already run as a part of standard database creation .

Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the `SYS` version of the package. The public synonym for `DBMS_APPLICATION_INFO` can then be changed to point to the DBA's version of the package.

Summary of DBMS_APPLICATION_INFO Subprograms

Table 19–1 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
READ_CLIENT_INFO Procedure on page 19-7	Reads the value of the `client_info` field of the current session
READ_MODULE Procedure on page 19-8	Reads the values of the module and action fields of the current session
SET_ACTION Procedure on page 19-9	Sets the name of the current action within the current module
SET_CLIENT_INFO Procedure on page 19-10	Sets the `client_info` field of the session
SET_MODULE Procedure on page 19-11	Sets the name of the module that is currently running to a new module
SET_SESSION_LONGOPS Procedure on page 19-12	Sets a row in the `V$SESSION_LONGOPS` table

READ_CLIENT_INFO Procedure

This procedure reads the value of the `client_info` field of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_CLIENT_INFO (
   client_info OUT VARCHAR2);
```

Parameters

Table 19–2 READ_CLIENT_INFO Procedure Parameters

Parameter	Description
`client_info`	Last client information value supplied to the `SET_CLIENT_INFO` procedure.

READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

```
DBMS_APPLICATION_INFO.READ_MODULE (
   module_name OUT VARCHAR2,
   action_name OUT VARCHAR2);
```

Parameters

Table 19–3 READ_MODULE Procedure Parameters

Parameter	Description
module_name	Last value that the module name was set to by calling SET_MODULE.
action_name	Last value that the action name was set to by calling SET_ACTION or SET_MODULE.

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';

SQL_TEXT DISK_READS MODULE ACTION
------------------- ---------- ----------------- ----------------
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```
DBMS_APPLICATION_INFO.SET_ACTION (
   action_name IN VARCHAR2);
```

Parameters

Table 19–4 SET_ACTION Procedure Parameters

Parameter	Description
action_name	The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.

Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN

-- balance transfer transaction

   DBMS_APPLICATION_INFO.SET_ACTION(
      action_name => 'transfer from chk to sav');
   UPDATE chk SET bal = bal + :amt
      WHERE acct# = :acct;
   UPDATE sav SET bal = bal - :amt
      WHERE acct# = :acct;
   COMMIT;
   DBMS_APPLICATION_INFO.SET_ACTION(null);

END;
```

SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (
   client_info IN VARCHAR2);
```

Parameters

Table 19–5 SET_CLIENT_INFO Procedure Parameters

Parameter	Description
`client_info`	Supplies any additional information about the client application. This information is stored in the `V$SESSION` view. Information exceeding 64 bytes is truncated.

Note: `CLIENT_INFO` is readable and writable by any user. For storing secured application attributes, you can use the application context feature.

SET_MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

```
DBMS_APPLICATION_INFO.SET_MODULE (
   module_name IN VARCHAR2,
   action_name IN VARCHAR2);
```

Parameters

Table 19–6 SET_MODULE Procedure Parameters

Parameter	Description
module_name	Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.
action_name	Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.

Usage Notes

Example

```
CREATE or replace PROCEDURE add_employee(
  name VARCHAR2,
  salary NUMBER,
  manager NUMBER,
  title VARCHAR2,
  commission NUMBER,
  department NUMBER) AS
BEGIN
  DBMS_APPLICATION_INFO.SET_MODULE(
    module_name => 'add_employee',
    action_name => 'insert into emp');
  INSERT INTO emp
    (ename, empno, sal, mgr, job, hiredate, comm, deptno)
    VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE,
            commission, department);
  DBMS_APPLICATION_INFO.SET_MODULE(null,null);
END;
```

SET_SESSION_LONGOPS Procedure

This procedure sets a row in the V$SESSION_LONGOPS view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions, such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the SET_SESSION_LONGOPS procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the V$SESSION_LONGOPS view.

Syntax

```
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
   rindex      IN OUT BINARY_INTEGER,
   slno        IN OUT BINARY_INTEGER,
   op_name     IN     VARCHAR2       DEFAULT NULL,
   target      IN     BINARY_INTEGER DEFAULT 0,
   context     IN     BINARY_INTEGER DEFAULT 0,
   sofar       IN     NUMBER         DEFAULT 0,
   totalwork   IN     NUMBER         DEFAULT 0,
   target_desc IN     VARCHAR2       DEFAULT 'unknown target',
   units       IN     VARCHAR2       DEFAULT NULL)

set_session_longops_nohint constant BINARY_INTEGER := -1;
```

Parameters

Table 19–7 SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
rindex	A token which represents the v$session_longops row to update. Set this to set_session_longops_nohint to start a new row. Use the returned value from the prior call to reuse a row.
slno	Saves information across calls to set_session_longops: It is for internal use and should not be modified by the caller.
op_name	Specifies the name of the long running task. It appears as the OPNAME column of v$session_longops. The maximum length is 64 bytes.
target	Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the TARGET column of v$session_longops.
context	Any number the client wants to store. It appears in the CONTEXT column of v$session_longops.
sofar	Any number the client wants to store. It appears in the SOFAR column of v$session_longops. This is typically the amount of work which has been done so far.
totalwork	Any number the client wants to store. It appears in the TOTALWORK column of v$session_longops. This is typically an estimate of the total amount of work needed to be done in this long running operation.

Table 19–7 (Cont.) SET_SESSION_LONGOPS Procedure Parameters

Parameter	Description
target_desc	Specifies the description of the object being manipulated in this long operation. This provides a caption for the target parameter. This value appears in the TARGET_DESC field of v$session_longops. The maximum length is 32 bytes.
units	Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of v$session_longops. The maximum length is 32 bytes.

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure's progress.

```
DECLARE
        rindex    BINARY_INTEGER;
        slno      BINARY_INTEGER;
        totalwork number;
        sofar     number;
        obj       BINARY_INTEGER;

      BEGIN
        rindex := dbms_application_info.set_session_longops_nohint;
        sofar := 0;
        totalwork := 10;

        WHILE sofar < 10 LOOP
          -- update obj based on sofar
          -- perform task on object target

          sofar := sofar + 1;
          dbms_application_info.set_session_longops(rindex, slno,
            "Operation X", obj, 0, sofar, totalwork, "table", "tables");
        END LOOP;
      END;
```

DBMS_APPLY_ADM

The DBMS_APPLY_ADM package, one of a set of Oracle Streams packages, provides subprograms to configure and manage Oracle Streams apply processes.

This chapter contains the following topic:

- Using DBMS_APPLY_ADM
  - Overview
  - Operational Notes
- Summary of DBMS_APPLY_ADM Subprograms

See Also: *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and apply processes

Using DBMS_APPLY_ADM

This section contains topics which relate to using the `DBMS_APPLY_ADM` package.

- Overview
- Operational Notes

Overview

This package provides interfaces to start, stop, and configure an apply process. This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

Operational Notes

The following sections contain operational notes for this package:

- Deprecated Apply Process Parameter Value

Deprecated Apply Process Parameter Value

Note: Oracle recommends that you do not use deprecated apply process parameter values. Support for deprecated features is for backward compatibility only.

The `NONE` value for the `commit_serialization` apply process parameter is deprecated. It is replaced by the `DEPENDENT_TRANSACTIONS` value.

See Also: "SET_PARAMETER Procedure" on page 20-50

Summary of DBMS_APPLY_ADM Subprograms

Table 20–1 DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
ADD_STMT_HANDLER Procedure on page 20-7	Adds a statement DML handler for a specified operation on a specified database object to a single Oracle Streams apply process or to all apply processes in the database
ALTER_APPLY Procedure on page 20-9	Alters an Oracle Streams apply process
COMPARE_OLD_VALUES Procedure on page 20-14	Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply
CREATE_APPLY Procedure on page 20-16	Creates an apply process
CREATE_OBJECT_DEPENDENCY Procedure on page 20-23	Creates an object dependency
DELETE_ALL_ERRORS Procedure on page 20-24	Deletes all the error transactions for the specified apply process
DELETE_ERROR Procedure on page 20-25	Deletes the specified error transaction
DROP_APPLY Procedure on page 20-26	Drops an apply process
DROP_OBJECT_DEPENDENCY Procedure on page 20-27	Drops an object dependency
EXECUTE_ALL_ERRORS Procedure on page 20-28	Reexecutes the error transactions for the specified apply process.
EXECUTE_ERROR Procedure on page 20-29	Reexecutes the specified error transaction
GET_ERROR_MESSAGE Function on page 20-32	Returns the message payload from the error queue for the specified message number and transaction identifier
REMOVE_STMT_HANDLER on page 20-33	Removes a statement DML handler for a specified operation on a specified database object from a single apply process or from all apply processes in the database
SET_CHANGE_HANDLER Procedure on page 20-34	Sets or unsets a statement DML handler that tracks changes for a specified operation on a specified database object for a single apply process
SET_DML_HANDLER Procedure on page 20-37	Sets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply process or for all apply processes in the database
SET_ENQUEUE_DESTINATION Procedure on page 20-42	Sets the queue where the apply process automatically enqueues a message that satisfies the specified rule
SET_EXECUTE Procedure on page 20-44	Specifies whether a message that satisfies the specified rule is executed by an apply process

Table 20–1 (Cont.) DBMS_APPLY_ADM Package Subprograms

Subprogram	Description
SET_GLOBAL_INSTANTIATION_SCN Procedure on page 20-46	Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas
SET_KEY_COLUMNS Procedures on page 20-48	Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist
SET_PARAMETER Procedure on page 20-50	Sets an apply parameter to the specified value
SET_SCHEMA_INSTANTIATION_SCN Procedure on page 20-58	Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database
SET_TABLE_INSTANTIATION_SCN Procedure on page 20-61	Records the specified instantiation SCN for the specified table in the specified source database
SET_UPDATE_CONFLICT_HANDLER Procedure on page 20-63	Adds, updates, or drops an update conflict handler for the specified object
SET_VALUE_DEPENDENCY Procedure on page 20-66	Sets or removes a value dependency
START_APPLY Procedure on page 20-67	Directs the apply process to start applying messages
STOP_APPLY Procedure on page 20-68	Stops the apply process from applying any messages and rolls back any unfinished transactions being applied

Note: All procedures commit unless specified otherwise. However, the `GET_ERROR_MESSAGE` function does not commit.

ADD_STMT_HANDLER Procedure

This procedure adds a statement DML handler for a specified operation on a specified database object to a single Oracle Streams apply process or to all apply processes in the database.

This procedure is overloaded. One version of this procedure contains the `statement` and `comment` parameters, and the other does not. The `statement` parameter enables you to create the statement DML handler and add it to one or more apply processes in one step. Otherwise, create the statement DML handler using the `DBMS_STREAMS_HANDLER_ADM` package before adding it to one or more apply processes.

See Also:

- Chapter 144, "DBMS_STREAMS_HANDLER_ADM"
- *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.ADD_STMT_HANDLER(
   object_name     IN  VARCHAR2,
   operation_name  IN  VARCHAR2,
   handler_name    IN  VARCHAR2,
   statement       IN  CLOB,
   apply_name      IN  VARCHAR2  DEFAULT NULL,
   comment         IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.ADD_STMT_HANDLER(
   object_name     IN  VARCHAR2,
   operation_name  IN  VARCHAR2,
   handler_name    IN  VARCHAR2,
   apply_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–2 ADD_STMT_HANDLER Procedure Parameters

Parameter	Description
`object_name`	The name of the source object specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure. If `NULL`, then the procedure raises an error.
`operation_name`	The name of the operation, which can be specified as: ■ `INSERT` ■ `UPDATE` ■ `DELETE` If `NULL`, then the procedure raises an error. **Note:** Statement DML handlers cannot be specified for LOB operations.

Table 20–2 (Cont.) ADD_STMT_HANDLER Procedure Parameters

Parameter	Description
handler_name	The name of the statement DML handler. If the specified statement DML handler exists, then the statement in the statement parameter is added to the existing handler. Ensure that the existing statement DML handler is for the same operation on the same database object as the settings for the operation_name and object_name parameters, respectively. If the existing handler is for a different operation or database object, then an apply error results when the handler is invoked. If the specified statement DML handler does not exist and a non-NULL statement parameter is specified, then this procedure creates the statement DML handler. If the specified statement DML handler does not exist and the statement parameter is not specified or is NULL, then this procedure raises an error. If NULL, then the procedure raises an error.
statement	The text of the SQL statement to add to the statement DML handler. If NULL, then the procedure raises an error.
apply_name	The name of the apply process that uses the statement DML handler. If NULL, then the procedure adds the statement DML handler as a general handler to all apply processes in the database.
comment	A comment for the statement DML handler. If NULL, then no comment is recorded for the statement DML handler.

ALTER_APPLY Procedure

This procedure alters an Oracle Streams apply process.

Syntax

```
DBMS_APPLY_ADM.ALTER_APPLY(
   apply_name                IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   message_handler           IN  VARCHAR2  DEFAULT NULL
   remove_message_handler    IN  BOOLEAN   DEFAULT FALSE,
   ddl_handler               IN  VARCHAR2  DEFAULT NULL,
   remove_ddl_handler        IN  BOOLEAN   DEFAULT FALSE,
   apply_user                IN  VARCHAR2  DEFAULT NULL,
   apply_tag                 IN  RAW       DEFAULT NULL,
   remove_apply_tag          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler         IN  VARCHAR2  DEFAULT NULL,
   remove_precommit_handler  IN  BOOLEAN   DEFAULT FALSE,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–3 ALTER_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply process being altered. You must specify the name of an existing apply process. Do not specify an owner.
rule_set_name	The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the component to apply messages. If you want to use a positive rule set for the component, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then this procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then this procedure removes any existing positive rule set.

Table 20–3 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified apply process. If you remove the positive rule set for a component, and the component does not have a negative rule set, then the component dequeues all messages in its queue. If you remove the positive rule set for a component, and a negative rule set exists for the component, then the component dequeues all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified component. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply process. See "Usage Notes" on page 20-21 in the CREATE_APPLY Procedure for more information about a message handler procedure.
remove_message_handler	If TRUE, then the procedure removes the message handler for the specified apply process. If FALSE, then the procedure retains any message handler for the specified apply process. If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.
ddl_handler	A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply process. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" on page 20-21 in the CREATE_APPLY Procedure for more information about a DDL handler procedure.
remove_ddl_handler	If TRUE, then the procedure removes the DDL handler for the specified apply process. If FALSE, then the procedure retains any DDL handler for the specified apply process. If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 20–3 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
apply_user	The user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. If NULL, then the apply user is not changed. If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted DBA role. Only the SYS user can set the apply_user to SYS. If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the apply process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures These privileges can be granted directly to the apply user, or they can be granted through roles. In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process. These privileges must be granted directly to the apply user. They cannot be granted through roles. By default, this parameter is set to the user who created the apply process by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the apply_user for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.
apply_tag	A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter. If NULL, the default, then the apply tag for the apply process is not changed. The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 20–3 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
remove_apply_tag	If TRUE, then the procedure sets the apply tag for the specified apply process to NULL, and the apply process generates redo entries with NULL tags. If FALSE, then the procedure retains any apply tag for the specified apply process. If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.
precommit_handler	A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process. An internal commit directive is enqueued in the following ways: ▪ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ▪ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply process. The precommit handler procedure must conform to the following restrictions: ▪ Any work that commits must be an autonomous transaction. ▪ Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" on page 20-21 in the CREATE_APPLY Procedure for more information about a precommit handler procedure.
remove_precommit_handler	If TRUE, then the procedure removes the precommit handler for the specified apply process. If FALSE, then the procedure retains any precommit handler for the specified apply process. If the precommit_handler parameter is non-NULL, then this parameter should be set to FALSE.

Table 20–3 (Cont.) ALTER_APPLY Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages. If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified apply process. If you remove the negative rule set for an apply process, and the apply process does not have a positive rule set, then the apply process dequeues all messages in its queue. If you remove the negative rule set for an apply process, and a positive rule set exists for the apply process, then the apply process dequeues all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified apply process. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

An apply process is stopped and restarted automatically when you change the value of one or more of the following ALTER_APPLY procedure parameters:

- message_handler
- ddl_handler
- apply_user
- apply_tag
- precommit_handler

COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply. This procedure is relevant only for UPDATE and DELETE operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The column_list and column_table parameters are mutually exclusive.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about conflict detection and resolution in an Oracle Streams environment

Syntax

```
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_list         IN VARCHAR2,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);

DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
   object_name         IN VARCHAR2,
   column_table        IN DBMS_UTILITY.LNAME_ARRAY,
   operation           IN VARCHAR2 DEFAULT 'UPDATE',
   compare             IN BOOLEAN  DEFAULT TRUE,
   apply_database_link IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 20–4 COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
object_name	The name of the source table specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_list	A comma-delimited list of column names in the table. There must be no spaces between entries. Specify * to include all nonkey columns.
column_table	A PL/SQL index-by table of type DBMS_UTILITY.LNAME_ARRAY that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.
operation	The name of the operation, which can be specified as: ■ UPDATE for UPDATE operations ■ DELETE for DELETE operations ■ * for both UPDATE and DELETE operations
compare	If compare is TRUE, the old values of the specified columns are compared during apply. If compare is FALSE, the old values of the specified columns are not compared during apply.

Table 20–4 (Cont.) COMPARE_OLD_VALUES Procedure Parameters

Parameter	Description
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

By default, an apply process uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you use a time column for conflict detection, then an apply process does not need to check old values for non-key and nontime columns.

Note: An apply process always compares old values for key columns when they are present in a row LCR. This procedure raises an error if a key column is specified in column_list or column_table and the compare parameter is set to FALSE.

CREATE_APPLY Procedure

This procedure creates an apply process.

Note: The user who invokes this procedure must be granted `DBA` role.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY(
   queue_name              IN  VARCHAR2,
   apply_name              IN  VARCHAR2,
   rule_set_name           IN  VARCHAR2  DEFAULT NULL,
   message_handler         IN  VARCHAR2  DEFAULT NULL,
   ddl_handler             IN  VARCHAR2  DEFAULT NULL,
   apply_user              IN  VARCHAR2  DEFAULT NULL,
   apply_database_link     IN  VARCHAR2  DEFAULT NULL,
   apply_tag               IN  RAW       DEFAULT '00',
   apply_captured          IN  BOOLEAN   DEFAULT FALSE,
   precommit_handler       IN  VARCHAR2  DEFAULT NULL,
   negative_rule_set_name  IN  VARCHAR2  DEFAULT NULL,
   source_database         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–5 CREATE_APPLY Procedure Parameters

Parameter	Description
`queue_name`	The name of the queue from which the apply process dequeues messages. You must specify an existing queue in the form `[`*`schema_name`*`.]`*`queue_name`*. For example, to specify a queue in the `hr` schema named `streams_queue`, enter `hr.streams_queue`. If the schema is not specified, then the current user is the default. **Note:** The `queue_name` setting cannot be altered after the apply process is created.
`apply_name`	The name of the apply process being created. A `NULL` specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply process or messaging client. **Note:** The `apply_name` setting cannot be altered after the apply process is created.

Table 20–5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the apply process. The positive rule set contains the rules that instruct the apply process to apply messages. If you want to use a positive rule set for the apply process, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no negative rule set is specified, then the apply process applies either all captured messages or all messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.
message_handler	A user-defined procedure that processes non-LCR messages in the queue for the apply process. See "Usage Notes" on page 20-21 for more information about a message handler procedure.
ddl_handler	A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply process. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See "Usage Notes" on page 20-21 for more information about a DDL handler procedure.

Table 20–5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_user	The user who applies all DML and DDL changes that satisfy the apply process rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used. Only a user who is granted DBA role can set an apply user. Only the SYS user can set the apply_user to SYS. The apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply process and configures the user as a secure queue user of the queue. In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user: ■ The necessary privileges to perform DML and DDL changes on the apply objects ■ EXECUTE privilege on the rule sets used by the apply process ■ EXECUTE privilege on all rule-based transformation functions used in the rule set ■ EXECUTE privilege on all apply handler procedures These privileges can be granted directly to the apply user, or they can be granted through roles. In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply process. These privileges must be granted directly to the apply user. They cannot be granted through roles. **Note:** If the specified user is dropped using DROP USER . . . CASCADE, then the apply_user setting for the apply process is set to NULL automatically. You must specify an apply user before the apply process can run.
apply_database_link	The database at which the apply process applies messages. This parameter is used by an apply process when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply process applies messages at the local database. **Note:** The apply_database_link setting cannot be altered after the apply process is created.

Table 20–5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
apply_tag	A binary tag that is added to redo entries generated by the specified apply process. The tag is a binary value that can be used to track LCRs. The tag is relevant only if a capture process at the database where the apply process is running will capture changes made by the apply process. If so, then the captured changes will include the tag specified by this parameter. By default, the tag for an apply process is the hexadecimal equivalent of '00' (double zero). The following is an example of a tag with a hexadecimal value of 17: HEXTORAW('17') If NULL, then the apply process generates redo entries with NULL tags. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
apply_captured	Either TRUE or FALSE. If TRUE, then the apply process applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Streams capture process. If FALSE, then the apply process applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Streams capture process, such as persistent LCRs or user messages. To apply both captured LCRs and messages in a persistent queue, you must create at least two apply processes. **Note:** The apply_captured setting cannot be altered after the apply process is created. **See Also:** *Oracle Streams Concepts and Administration* for more information about processing messages with an apply process

Table 20–5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
precommit_handler	A user-defined procedure that can receive internal commit directives in the queue for the apply process before they are processed by the apply process. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply process. An internal commit directive is enqueued in the following ways: ■ When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs. ■ When a synchronous capture captures row LCRs, the the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction. ■ When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically. For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For message enqueued by a user or application, the commit SCN is generated by the apply process. The precommit handler procedure must conform to the following restrictions: ■ Any work that commits must be an autonomous transaction. ■ Any rollback must be to a named savepoint created in the procedure. If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue. See "Usage Notes" on page 20-21 for more information about a precommit handler procedure.
negative_rule_set_name	The name of the negative rule set for the apply process. The negative rule set contains the rules that instruct the apply process to discard messages. If you want to use a negative rule set for the apply process, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the apply process applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for an apply process, then the negative rule set is always evaluated first.

Table 20–5 (Cont.) CREATE_APPLY Procedure Parameters

Parameter	Description
source_database	The global name of the source database for the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. If NULL, then the source database name of the first LCR received by the apply process is used for the source database. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. The rules in the apply process rule sets determine which messages are dequeued by the apply process. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.

Usage Notes

The following sections describe usage notes for this procedure:

Handler Procedure Names

For the message_handler, ddl_handler, and precommit_handler parameters, specify an existing procedure in one of the following forms:

- *[schema_name.]procedure_name*
- *[schema_name.]package_name.procedure_name*

If the procedure is in a package, then the package_name must be specified. For example, to specify a procedure in the apply_pkg package in the hr schema named process_ddls, enter hr.apply_pkg.process_ddls. An error is returned if the specified procedure does not exist.

The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified handler procedure. Also, if the *schema_name* is not specified, then the user who invokes the CREATE_APPLY procedure is the default.

Message Handler and DDL Handler Procedure

The procedure specified in both the message_handler parameter and the ddl_handler parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *handler_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a ANYDATA encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a ANYDATA encapsulation of a DDL LCR.

See Also: Chapter 245, "Logical Change Record TYPEs" for information about DDL LCRs

Precommit Handler Procedure

The procedure specified in the `precommit_handler` parameter must have the following signature:

```
PROCEDURE handler_procedure (
   parameter_name   IN  NUMBER);
```

Here, *`handler_procedure`* stands for the name of the procedure and *`parameter_name`* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply process schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply process uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply process does not use column values in the LCRs to detect dependencies.

Note: An error is raised if `NULL` is specified for either of the procedure parameters.

See Also:

- "DROP_OBJECT_DEPENDENCY Procedure" on page 20-27
- *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 20–6 CREATE_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
`object_name`	The name of the child database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`parent_object_name`	The name of the parent database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.departments`. If the schema is not specified, then the current user is the default.

DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply process.

Syntax

```
DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
   apply_name  IN  VARCHAR2 DEFAULT NULL);
```

Parameter

Table 20–7 DELETE_ALL_ERRORS Procedure Parameter

Parameter	Description
apply_name	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply processes are deleted.

DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR(
   local_transaction_id  IN  VARCHAR2);
```

Parameter

Table 20–8 DELETE_ERROR Procedure Parameter

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.

DROP_APPLY Procedure

This procedure drops an apply process.

Syntax

```
DBMS_APPLY_ADM.DROP_APPLY(
   apply_name             IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20–9 DROP_APPLY Procedure Parameters

Parameter	Description
apply_name	The name of the apply process being dropped. You must specify an existing apply process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified apply process, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop an apply process, information about rules created for the apply process using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply process. The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

> **See Also:** *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

DROP_OBJECT_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

Note:

- An error is raised if an object dependency does not exist for the specified database objects.
- An error is raised if `NULL` is specified for either of the procedure parameters.

See Also:

- "CREATE_OBJECT_DEPENDENCY Procedure" on page 20-23
- *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
   object_name         IN  VARCHAR2,
   parent_object_name  IN  VARCHAR2);
```

Parameters

Table 20–10 DROP_OBJECT_DEPENDENCY Procedure Parameters

Parameter	Description
`object_name`	The name of the child database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`parent_object_name`	The name of the parent database object, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.departments`. If the schema is not specified, then the current user is the default.

EXECUTE_ALL_ERRORS Procedure

This procedure reexecutes the error transactions in the error queue for the specified apply process.

The transactions are reexecuted in commit SCN order. Error reexecution stops if an error is raised.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
   apply_name       IN  VARCHAR2  DEFAULT NULL,
   execute_as_user  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–11 EXECUTE_ALL_ERRORS Procedure Parameters

Parameter	Description
`apply_name`	The name of the apply process that raised the errors while processing the transactions. Do not specify an owner. If `NULL`, then all error transactions for all apply processes are reexecuted.
`execute_as_user`	If `TRUE`, then the procedure reexecutes the transactions in the security context of the current user. If `FALSE`, then the procedure reexecutes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The `DBA_APPLY_ERROR` data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.

EXECUTE_ERROR Procedure

This procedure reexecutes the specified error transaction in the error queue.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
   local_transaction_id  IN  VARCHAR2,
   execute_as_user       IN  BOOLEAN   DEFAULT FALSE,
   user_procedure        IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–12 EXECUTE_ERROR Procedure Parameters

Parameter	Description
`local_transaction_id`	The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.
`execute_as_user`	If `TRUE`, then the procedure reexecutes the transaction in the security context of the current user. If `FALSE`, then the procedure reexecutes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The `DBA_APPLY_ERROR` data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply process.
`user_procedure`	A user-defined procedure that modifies the error transaction so that it can be successfully executed. Specify `NULL` to execute the error transaction without running a user procedure. **See Also:** "Usage Notes" on page 20-29 for more information about the user procedure

Usage Notes

You must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[`*`schema_name`*`.]`*`package_name.procedure_name`*
- `[`*`schema_name`*`.]`*`procedure_name`*

If the procedure is in a package, then the *`package_name`* must be specified. The user who invokes the `EXECUTE_ERROR` procedure must have `EXECUTE` privilege on the specified procedure. Also, if the *`schema_name`* is not specified, then the user who invokes the `EXECUTE_ERROR` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `strmadmin` is the *`schema_name`*.

- fix_errors is the *package_name*.
- fix_hr_errors is the *procedure_name*.

In this case, specify the following:

```
strmadmin.fix_errors.fix_hr_errors
```

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
     in_anydata                    IN      ANYDATA,
     error_record                  IN      DBA_APPLY_ERROR%ROWTYPE,
     error_message_number          IN      NUMBER,
     messaging_default_processing  IN OUT  BOOLEAN,
     out_anydata                   OUT     ANYDATA);
```

The user procedure has the following parameters:

- in_anydata: The ANYDATA encapsulation of a message that the apply process passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.
- error_record: The row in the DBA_APPLY_ERROR data dictionary view that identifies the transaction
- error_message_number: The message number of the ANYDATA object in the in_anydata parameter, starting at 1
- messaging_default_processing: If TRUE, then the apply process continues processing the message in the in_anydata parameter, which can include executing DML or DDL statements and invoking apply handlers.

  If FALSE, then the apply process skips processing the message in the in_anydata parameter and moves on to the next message in the in_anydata parameter.
- out_anydata: The ANYDATA object processed by the user procedure and used by the apply process if messaging_default_processing is TRUE.

If an LCR is executed using the EXECUTE LCR member procedure in the user procedure, then the LCR is executed directly, and the messaging_default_processing parameter should be set to FALSE. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.
- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction.
- Do not modify LONG, LONG RAW or LOB column data in an LCR.
- If the ANYDATA object in the in_anydata parameter is a row LCR, then the out_anydata parameter must be row LCR if the messaging_default_processing parameter is set to TRUE.

- If the ANYDATA object in the in_anydata parameter is a DDL LCR, then the out_anydata parameter must be DDL LCR if the messaging_default_processing parameter is set to TRUE.
- The user who runs the user procedure must have SELECT privilege on the DBA_APPLY_ERROR data dictionary view.

Note: LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two `OUT` parameters. These `OUT` parameters contain the destination queue into which the message should be enqueued, if one exists, and whether or not the message should be executed. The destination queue is specified using the `SET_ENQUEUE_DESTINATION` procedure, and the execution directive is specified using the `SET_EXECUTE` procedure.

See Also:

- "SET_ENQUEUE_DESTINATION Procedure" on page 20-42
- "SET_EXECUTE Procedure" on page 20-44

Syntax

```
DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2,
   destination_queue_name  OUT  VARCHAR2,
   execute                 OUT  BOOLEAN)
RETURN ANYDATA;

DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
   message_number          IN   NUMBER,
   local_transaction_id    IN   VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 20–13 GET_ERROR_MESSAGE Function Parameters

Parameter	Description
`message_number`	The identification number of the message. This number identifies the position of the message in the transaction. Query the `DBA_APPLY_ERROR` data dictionary view to view the message number of each apply error.
`local_transaction_id`	Identifier of the error transaction for which to return a message
`destination_queue_name`	Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains `NULL`.
`execute`	Contains `TRUE` if the message should be executed Contains `FALSE` if the message should not be executed

REMOVE_STMT_HANDLER

This procedure removes a statement DML handler for a specified operation on a specified database object from a single apply process or from all apply processes in the database.

See Also:

- Chapter 144, "DBMS_STREAMS_HANDLER_ADM"
- *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.REMOVE_STMT_HANDLER(
   object_name     IN  VARCHAR2,
   operation_name  IN  VARCHAR2,
   handler_name    IN  VARCHAR2,
   apply_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–14 REMOVE_STMT_HANDLER Procedure Parameters

Parameter	Description
object_name	The name of the source object specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure. If NULL, then the procedure raises an error.
operation_name	The name of the operation, which can be specified as: ■ INSERT ■ UPDATE ■ DELETE If NULL, then the procedure raises an error.
handler_name	The name of the statement DML handler. If NULL, then the procedure raises an error.
apply_name	The name of the apply process that uses the statement DML handler. If NULL, then the procedure removes the statement DML handler from all apply processes in the database.

SET_CHANGE_HANDLER Procedure

This procedure sets or unsets a change handler that tracks changes for a specified operation on a specified database object for a single apply process.

A change handler is a special type of statement DML handler that tracks table changes and was created by either the DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE procedure or this SET_CHANGE_HANDLER procedure. Information about change handlers is stored in the ALL_APPLY_CHANGE_HANDLERS and DBA_APPLY_CHANGE_HANDLERS views.

This procedure automatically generates the statement that is added to the change handler based on values specified in the procedure parameters. You should only run this procedure when an Oracle Streams environment that tracks database changes already exists.

Note: Use the MAINTAIN_CHANGE_TABLE Procedure to create an Oracle Streams environment that tracks table changes

Syntax

```
DBMS_APPLY_ADM.SET_CHANGE_HANDLER(
   change_table_name    IN  VARCHAR2,
   source_table_name    IN  VARCHAR2,
   capture_values       IN  VARCHAR2,
   apply_name           IN  VARCHAR2,
   operation_name       IN  VARCHAR2,
   change_handler_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–15 SET_CHANGE_HANDLER Procedure Parameters

Parameter	Description
change_table_name	The table that records changes to the source table. Specify the table as [*schema_name*.]*table_name*. For example, hr.jobs_change_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error.
source_table_name	The table at the source database for which changes are recorded. Specify the table as [*schema_name*.]*table_name*. For example, hr.jobs. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error.

Table 20–15 (Cont.) SET_CHANGE_HANDLER Procedure Parameters

Parameter	Description
capture_values	Specify which values to record in the change table when update operations are performed on the source table: ■ old - To record the original values for an updated column in the source table ■ new - To record the new values for an updated column in the source table ■ * - To record both the original and the new values for an updated column in the source table If NULL, then the procedure raises an error. **Note:** For insert operations, only new column values are captured. For delete operations, only old column values are captured.
apply_name	The name of the apply process that applies changes to the change table. Do not specify an owner. If NULL, then the procedure raises an error.
operation_name	The name of the operation, which can be specified as: ■ INSERT ■ UPDATE ■ DELETE If NULL, then the procedure raises an error. **Note:** Change handlers cannot be specified for LOB operations.
change_handler_name	The name of the change handler. If the specified change handler exists, then a statement is added to the existing handler. Ensure that the existing change handler is for the same operation on the same table as the settings for the operation_name and source_table_name parameters, respectively. If the existing handler is for a different operation or table, then an apply error results when the handler is invoked. If non-NULL and the specified change handler does not exist, then this procedure creates the change handler. If NULL and a change handler exists for the same operation on the same table as the settings for the operation_name and source_table_name parameters, respectively, then the existing change handler is removed. If NULL and the specified change handler does not exist, then the procedure raises an error. **See Also:** "Usage Notes" on page 20-35 for more information about this parameter.

Usage Notes

To check for an existing change handler for a specific operation on a specific source table, run the following query:

```
SELECT HANDLER_NAME, APPLY_NAME FROM DBA_APPLY_CHANGE_HANDLERS
 WHERE  operation_name     = 'operation'
   AND  source_table_owner = 'source_table_owner'
   AND  source_table_name  = 'source_table_name'
   AND  change_table_owner = 'change_table_owner'
   AND  change_table_name  = 'change_table_name';
```

where:

- *operation* is operation specified for the new handler, either `INSERT`, `UPDATE`, or `DELETE`
- *source_table_owner* is the owner of the source table
- *source_table_name* is the name of the source table
- *change_table_owner* is the owner of the change table
- *change_table_owner* is the owner of the change table

SET_DML_HANDLER Procedure

This procedure sets or unsets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply process or for all apply processes in the database. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_DML_HANDLER(
   object_name          IN  VARCHAR2,
   object_type          IN  VARCHAR2,
   operation_name       IN  VARCHAR2,
   error_handler        IN  BOOLEAN   DEFAULT FALSE,
   user_procedure       IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL,
   apply_name           IN  VARCHAR2  DEFAULT NULL,
   assemble_lobs        IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 20–16 SET_DML_HANDLER Procedure Parameters

Parameter	Description
object_name	The name of the source object specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.
object_type	The type of the source object. Currently, TABLE is the only possible source object type.
operation_name	The name of the operation, which can be specified as: ■ INSERT ■ UPDATE ■ DELETE ■ LOB_UPDATE ■ DEFAULT For example, suppose you run this procedure twice for the hr.employees table. In one call, you set operation_name to UPDATE and user_procedure to employees_update. In another call, you set operation_name to INSERT and user_procedure to employees_insert. Both times, you set error_handler to FALSE. In this case, the employees_update procedure is run for UPDATE operations on the hr.employees table, and the employees_insert procedure is run for INSERT operations on the hr.employees table. Specify DEFAULT to set the procedure as the default procedure DML handler for the database object. In this case, the procedure DML handler is used for any INSERT, UPDATE, DELETE, and LOB_WRITE on the database object, if another procedure DML handler is not specifically set for the operation on the database object.

Table 20–16 (Cont.) SET_DML_HANDLER Procedure Parameters

Parameter	Description
error_handler	If TRUE, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply process error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions. If FALSE, then the handler being set is run for all row LCRs involving the specified operation on the specified object.
user_procedure	A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a procedure DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when the apply process encounters an error. Specify NULL to unset a procedure DML handler that is set for the specified operation on the specified object.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.
apply_name	The name of the apply process that uses the procedure DML handler or error handler. If NULL, then the procedure sets the procedure DML handler or error handler as a general handler for all apply processes in the database. If the user_procedure parameter is set to NULL to unset a handler, and the handler being unset is set for a specific apply process, then use the apply_name parameter to specify the apply process to unset the handler.
assemble_lobs	If TRUE, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly. If FALSE, then LOB assembly is not used for LOB columns in LCRs processed by the handler.

Usage Notes

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

If the error_handler parameter is set to TRUE, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply process error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to FALSE, then the user procedure is a procedure DML handler, not an error handler, and a procedure DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a procedure DML handler or an error handler for a particular operation on an object. It cannot set both a procedure DML handler and an error handler for the same object and operation.

If the apply_name parameter is non-NULL, then the procedure DML handler or error handler is set for the specified apply process. In this case, this handler is not invoked for other apply processes at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply processes at the destination database. When a handler is set for a specific apply process, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A procedure DML handler named handler_hr is specified for an apply process named apply_hr for UPDATE operations on the hr.employees table.
- A general procedure DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.

In this case, the apply_hr apply process uses the handler_hr procedure DML handler for UPDATE operations on the hr.employees table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

Attention: Do not modify LONG, LONG RAW, or nonassembled LOB column data in an LCR with procedure DML handlers, error handlers, or custom rule-based transformation functions. Procedure DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

Note: Currently, setting an error handler for an apply process that is applying changes to a non-Oracle database is not supported.

The SET_DML_HANDLER procedure can be used to set either a procedure DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the user_procedure parameter in one of the following forms:

- [*schema_name*.]*package_name.procedure_name*
- [*schema_name*.]*procedure_name*

If the procedure is in a package, then the *package_name* must be specified. The user who invokes the SET_DML_HANDLER procedure must have EXECUTE privilege on the specified procedure. Also, if the *schema_name* is not specified, then the user who invokes the SET_DML_HANDLER procedure is the default.

For example, suppose the procedure_name has the following properties:

- hr is the *schema_name*.
- apply_pkg is the *package_name*.
- employees_default is the *procedure_name*.

In this case, specify the following:

```
hr.apply_pkg.employees_default
```

The following restrictions apply to the user procedure:

- Do not execute COMMIT or ROLLBACK statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the EXECUTE member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.
- If the command type is UPDATE or DELETE, then row operations resubmitted using the EXECUTE member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all non LOB, non LONG, and non LONG RAW columns.
- If the command type is INSERT, then row operations resubmitted using the EXECUTE member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one NOT NULL column, unless a substitute key has been specified by the SET_KEY_COLUMNS procedure. If there is no specified key, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFs, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about and restrictions regarding procedure DML handlers and LOB, LONG, and LONG RAW data types

Signature of a DML Handler Procedure

The procedure specified in the user_procedure parameter must have the following signature:

```
PROCEDURE user_procedure (
   parameter_name  IN  ANYDATA);
```

Here, *user_procedure* stands for the name of the procedure and *parameter_name* stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a ANYDATA encapsulation of a row LCR.

> **See Also:** Chapter 245, "Logical Change Record TYPEs" for more information about LCRs

Signature of an Error Handler Procedure

The procedure you create for error handling must have the following signature:

```
PROCEDURE user_procedure (
     message            IN  ANYDATA,
     error_stack_depth  IN  NUMBER,
     error_numbers      IN  DBMS_UTILITY.NUMBER_ARRAY,
     error_messages     IN  emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the EXECUTE member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use error_numbers(1) and error_messages(1).

Note:

- Each parameter is required and must have the specified data type. However, you can change the names of the parameters.
- The `emsg_array` value must be a user-defined array that is a table of type `VARCHAR2` with at least 76 characters.

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply process.
- The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply process automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an Oracle Streams apply process. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_ENQUEUE.
- The value is a ANYDATA instance containing the queue name specified as a VARCHAR2.

Syntax

```
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
  rule_name               IN  VARCHAR2,
  destination_queue_name  IN  VARCHAR2);
```

Parameters

Table 20–17 SET_ENQUEUE_DESTINATION Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the queue into which the apply process should enqueue the message. Specify the queue in the form [*schema_name.*]*queue_name*. Only local queues can be specified. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. If NULL, then an existing name-value pair with the name APPLY$_ENQUEUE is removed. If no name-value pair exists with the name APPLY$_ENQUEUE for the rule, then no action is taken. If non-NULL and a name-value pair already exists for the rule with the name APPLY$_ENQUEUE, then it is removed, and a new name-value pair with the value specified by this parameter is added.

Usage Notes

If an apply handler, such as a procedure DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

The following are considerations for using this procedure:

- This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply process tries to enqueue a message into it.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The apply user of the apply processes using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
- The specified rule must be in the positive rule set for an apply process. If the rule is in the negative rule set for an apply process, then the apply process does not enqueue the message into the destination queue.
- If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply process rule sets.

SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply process.

This procedure modifies the specified rule's action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an Oracle Streams apply process. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

- The name is APPLY$_EXECUTE.
- The value is a ANYDATA instance that contains NO as a VARCHAR2. When the value is NO, then an apply process does not execute the message and does not send the message to any apply handler.

Syntax

```
DBMS_APPLY_ADM.SET_EXECUTE(
  rule_name  IN  VARCHAR2,
  execute    IN  BOOLEAN);
```

Parameters

Table 20–18 SET_EXECUTE Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.
execute	If TRUE, then the procedure removes the name-value pair with the name APPLY$_EXECUTE for the specified rule. Removing the name-value pair means that the apply process executes messages that satisfy the rule. If no name-value pair with name APPLY$_EXECUTE exists for the rule, then no action is taken. If FALSE, then the procedure adds a name-value pair to the rule's action context. The name is APPLY$_EXECUTE and the value is NO. An apply process does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair already exists for the rule with the name APPLY$_EXECUTE, then it is removed, and a new one with the value NO is added. If NULL, then the procedure raises an error.

Usage Notes

If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.

Note:

- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply process for the apply process to follow the execution directive. If the rule is in the negative rule set for an apply process, then the apply process ignores the execution directive for the rule.

SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–19 SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.
recursive	If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables **Note:** If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, and `base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `CREATE USER`.

If the `recursive` parameter is set to `TRUE`, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any schemas or tables.

Note:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

- *Oracle Streams Replication Administrator's Guide*

SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

Syntax

```
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_list          IN  VARCHAR2,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS(
   object_name          IN  VARCHAR2,
   column_table         IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–20 SET_KEY_COLUMNS Procedure Parameters

Parameter	Description
`object_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If the apply process is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.
`column_list`	A comma-delimited list of the columns in the table that you want to use as the substitute primary key, with no spaces between the column names. If the `column_list` parameter is empty or `NULL`, then the current set of key columns is removed.
`column_table`	A PL/SQL index-by table of type `DBMS_UTILITY.NAME_ARRAY` of the columns in the table that you want to use as the substitute primary key. The index for `column_table` must be 1-based, increasing, dense, and terminated by a `NULL`. If the `column_table` parameter is empty or `NULL`, then the current set of key columns is removed.
`apply_database_link`	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.

Usage Notes

When not empty, this set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object already has primary key columns and you want to use those primary key columns as the key.

Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.

Note:

- Unlike true primary keys, columns specified as substitute key column columns can contain NULLs. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- You should not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-defined types (including object types, REFs, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

Syntax

```
DBMS_APPLY_ADM.SET_PARAMETER (
   apply_name  IN  VARCHAR2,
   parameter   IN  VARCHAR2,
   value       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–21 SET_PARAMETER Procedure Parameters

Parameter	Description
apply_name	The apply process name. Do not specify an owner.
parameter	The name of the parameter you are setting. See "Apply Process Parameters" on page 20-50 for a list of these parameters.
value	The value to which the parameter is set. If NULL, then the parameter is set to its default value.

Apply Process Parameters

The following table lists the parameters for the apply process.

Table 20–22 Apply Process Parameters

Parameter Name	Possible Values	Default	Description
allow_duplicate_rows	Y or N	N	If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply process only updates or deletes one of the rows. If N, then the apply process raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table. **Note:** Regardless of the setting for this parameter, apply processes do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns. **See Also:** "Duplicate Rows and Substitute Primary Key Columns" on page 20-56

Table 20–22 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
commit_serialization	DEPENDENT_TRANSACTIONS or FULL	DEPENDENT_TRANSACTIONS	The order in which applied transactions are committed. Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database. You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the commit_serialization apply parameter. This parameter has the following settings: ■ DEPENDENT_TRANSACTIONS - The apply process can commit nondependent transactions in any order. Performance is best if you specify DEPENDENT_TRANSACTIONS. ■ FULL - The apply process commits applied transactions in the order in which they were committed at the source database. Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies. If you specify DEPENDENT_TRANSACTIONS, then it is possible that a destination database commits changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order: 1. Transaction A 2. Transaction B At the destination database, these transactions might be committed in the opposite order: 1. Transaction B 2. Transaction A If you specify DEPENDENT_TRANSACTIONS and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add RELY constraints to account for the application constraints. See *Oracle Streams Concepts and Administration* for information about virtual dependency definitions and *Oracle Database Data Warehousing Guide* for information about RELY constraints. **Note:** The NONE value is deprecated for this parameter. It is replaced by the DEPENDENT_TRANSACTIONS value.
disable_on_error	Y or N	Y	If Y, then the apply process is disabled on the first unresolved error, even if the error is not fatal. If N, then the apply process continues regardless of unresolved errors.

Table 20–22 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
disable_on_limit	Y or N	N	If Y, then the apply process is disabled if the apply process terminates because it reached a value specified by the time_limit parameter or transaction_limit parameter. If N, then the apply process is restarted immediately after stopping because it reached a limit. When an apply process is restarted, it gets a new session identifier, and the processes associated with the apply process also get new session identifiers. However, the coordinator process number (AP*nn*) remains the same.
maximum_scn	A valid SCN or INFINITE	INFINITE	The apply process is disabled before applying a transaction with a commit SCN greater than or equal to the value specified. If INFINITE, then the apply process runs regardless of the SCN value.
parallelism	A positive integer	4	The number of apply servers that can concurrently apply transactions. The reader server and the apply server process names are AS*nn*, where *nn* can include letters and numbers. The total number of AS*nn* processes is the value of the parallelism parameter plus one. For example, if parallelism is set to 4, then an apply process uses a total of five AS*nn* processes. In this case, there is one reader server and four apply servers. Setting the parallelism parameter to a number higher than the number of available operating system user processes can disable the apply process. Make sure the PROCESSES initialization parameter is set appropriately when you set the parallelism apply process parameter. **Note:** When the value of this parameter is changed from 1 to a higher value for a running apply process, the apply process is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. When the value of this parameter is greater than 1, and the parameter value is decreased or increased, the apply process does not restart.

Table 20–22 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
preserve_encryption	Y or N	Y	Whether to preserve encryption for columns encrypted using transparent data encryption. If Y, then columns in tables at the destination database must be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then an error is raised when the apply process tries to apply the row LCRs. If N, then columns in tables at the destination database do not need to be encrypted when corresponding columns in row LCRs are encrypted. If columns are encrypted in row LCRs but the corresponding columns are not encrypted in the tables at the destination database, then the apply process applies the changes in the row LCRs. **Note:** When the value of this parameter is changed for a running apply process, the apply process is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied.
rtrim_on_implicit_conversion	Y or N	Y	Whether to remove blank padding from the right end of a column when automatic data type conversion is performed during apply. If Y, then blank padding is removed when a CHAR or NCHAR source column in a row LCR is converted to a VARCHAR2, NVARCHAR2, or CLOB column in a table. If N, then blank padding is preserved in the column. **See Also:** *Oracle Streams Concepts and Administration* for information about automatic data type conversion during apply
startup_seconds	0, a positive integer, or INFINITE	0	The maximum number of seconds to wait for another instantiation of the same apply process to finish. If the other instantiation of the same apply process does not finish within this time, then the apply process does not start. If INFINITE, then an apply process does not start until another instantiation of the same apply process finishes.
time_limit	A positive integer or INFINITE	INFINITE	The apply process stops as soon as possible after the specified number of seconds since it started. If INFINITE, then the apply process continues to run until it is stopped explicitly.
trace_level	0 or a positive integer	0	Set this parameter only under the guidance of Oracle Support Services.
transaction_limit	A positive integer or INFINITE	INFINITE	The apply process stops after applying the specified number of transactions. If INFINITE, then the apply process continues to run regardless of the number of transactions applied.

Table 20–22 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
txn_age_spill_threshold	A positive integer or INFINITE	900	The apply process begins to spill messages from memory to hard disk for a particular transaction when the amount of time that any message in the transaction has been in memory exceeds the specified number. The parameter specifies the age in seconds. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 900, and the reader server of an apply process detects that one message in a transaction has been in memory longer than 900 seconds, then all of the messages in the transaction spill from memory to hard disk. If INFINITE, then the apply process does not spill messages to the hard disk based on the age of the messages. Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply process.

Table 20–22 (Cont.) Apply Process Parameters

Parameter Name	Possible Values	Default	Description
txn_lcr_spill_threshold	A positive integer or INFINITE	10000	The apply process begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less. If the reader server of an apply process has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way: 1. Reads the first 10,000 messages in the transaction into memory 2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000 3. Reads the next 100 messages in the transaction into memory 4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100 5. Reads the next 100 messages in the transaction into memory The apply process applies the first 10,100 messages from the hard disk and the last 100 messages from memory. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply process is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages. If INFINITE, then the apply process does not spill messages to the hard disk based on the number of messages in a transaction. Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply process.
write_alert_log	Y or N	Y	If Y, then the apply process writes a message to the alert log on exit. If N, then the apply process does not write a message to the alert log on exit. The message specifies the reason why the apply process stopped.

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is `4,294,967,295`. Where applicable, specify `INFINITE` for larger values.
- For parameters that require an SCN setting, any valid SCN value can be specified.

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when the all of the column values are identical for two or more rows in the table, excluding LOB, `LONG`, and `LONG RAW` columns. You can specify substitute primary key columns for a table at a destination database using by the `SET_KEY_COLUMNS` procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that updates at the source database always update at least one of the columns specified as a substitute key column at the destination database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

If a table does not have a primary key, a unique index that has at least one `NOT NULL` column, or a substitute key, then the key consists of all non LOB, non `LONG`, and non `LONG RAW` columns. When there is no key for a table and the `allow_duplicate_rows` apply process parameter is set to `Y`, a single row LCR with an `UPDATE` or `DELETE` command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the source change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the `allow_duplicate_rows` apply process parameter is set to `Y`, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can

update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply process ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply process determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, `LONG`, and `LONG RAW` columns). Therefore, an apply process always raises an error if a single update or delete changes two or more nonduplicate rows in a table.

For example, consider a table with columns `c1`, `c2`, and `c3` on which the `SET_KEY_COLUMNS` procedure is used to designate column `c1` as the substitute primary key. If two rows have the same key value for the `c1` column, but different value for the `c2` or `c3` columns, then an apply process does not treat the rows as duplicates. If an update or delete modifies more than one row because the `c1` values in the rows are the same, then the apply process raises an error regardless of the setting for the `allow_duplicate_rows` apply process parameter.

See Also: "SET_KEY_COLUMNS Procedures" on page 20-48

SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
  source_schema_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL,
  recursive             IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–23 SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_schema_name	The name of the source schema. For example, hr. When setting an instantiation SCN for schema, always specify the name of the schema at the source database, even if a rule-based transformation or apply handler is configured to change the schema name.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.

Table 20–23 (Cont.) SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
recursive	If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user. If FALSE, then the procedure sets the instantiation SCN for specified schema, but does not set the instantiation SCN for any tables **Note:** If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.

Usage Notes

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply process at the destination database disregards the DDL LCR. Otherwise, the apply process applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a command_type of CREATE TABLE
- DDL LCRs with a non-NULL object_owner specified and neither base_table_owner nor base_table_name specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a command_type of CREATE TABLE and ALTER USER.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a command_type of CREATE USER. A global instantiation SCN is needed for such DDL LCRs.

If the recursive parameter is set to TRUE, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure uses the SET_TABLE_INSTANTIATION_SCN procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the recursive parameter is set to FALSE, then this procedure does not set the instantiation SCN for any tables.

Note: Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

- *Oracle Streams Replication Administrator's Guide*

SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply process.

Syntax

```
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
  source_object_name    IN  VARCHAR2,
  source_database_name  IN  VARCHAR2,
  instantiation_scn     IN  NUMBER,
  apply_database_link   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–24 SET_TABLE_INSTANTIATION_SCN Procedure Parameters

Parameter	Description
source_object_name	The name of the source object specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. When setting an instantiation SCN for a database object, always specify the name of the schema and database object at the source database, even if a rule-based transformation or apply handler is configured to change the schema name or database object name.
source_database_name	The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
instantiation_scn	The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply process is a non-Oracle database.

Usage Notes

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply process at the destination database disregards the LCR. Otherwise, the apply process applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
- DDL LCRs that have a non-NULL base_table_owner and base_table_name specified, except for DDL LCRs with a command_type of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `ALTER TABLE` or `CREATE TRIGGER`.

Note: The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
   object_name          IN  VARCHAR2,
   method_name          IN  VARCHAR2,
   resolution_column    IN  VARCHAR2,
   column_list          IN  DBMS_UTILITY.NAME_ARRAY,
   apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20–25 SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
object_name	The schema and name of the table, specified as [*schema_name*.]*object_name*, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.
method_name	Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained: ■ MAXIMUM: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database. ■ MINIMUM: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database. ■ OVERWRITE: Applies the column list from the source database, overwriting the column values at the destination database. ■ DISCARD: Retains the column list from the destination database, discarding the column list from the source database. If NULL, then the procedure removes any existing update conflict handler with the same object_name, resolution_column, and column_list. If non-NULL, then the procedure replaces any existing update conflict handler with the same object_name and resolution_column.

Table 20–25 (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure Parameters

Parameter	Description
resolution_column	Name of the column used to uniquely identify an update conflict handler. For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the column_list parameter. NULL is not allowed for this parameter. For the OVERWRITE and DISCARD prebuilt methods, you can specify any column in the column list.
column_list	List of columns for which the conflict handler is called. The same column cannot be in more than one column list. If a conflict occurs for one or more of the columns in the list when an apply process tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. **Note:** Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, user-defined type, and Oracle-suppled type columns. Therefore, you should not include these types of columns in the column_list parameter.
apply_database_link	The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. **Note:** Currently, conflict handlers are not supported when applying changes to a non-Oracle database.

Usage Notes

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

If you want to remove an existing update conflict handler, then specify NULL for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply process, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the SET_DML_HANDLER procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

Also, when a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

```
ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED
```

Note: Setting an update conflict handler for an apply process that is applying to a non-Oracle database is not supported.

See Also:

- "Signature of an Error Handler Procedure" on page 20-40 for information about setting an error handler
- "SET_DML_HANDLER Procedure" on page 20-37
- *Oracle Streams Replication Administrator's Guide* for more information about prebuilt and custom update conflict handlers

Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```
DECLARE
  cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
  cols(1) := 'salary';
  cols(2) := 'commission_pct';
  DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name           =>  'hr.employees',
    method_name           =>  'MAXIMUM',
    resolution_column     =>  'salary',
    column_list           =>  cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply process uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.

See Also: *Oracle Streams Concepts and Administration*

Syntax

```
DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_list  IN VARCHAR2);

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
   dependency_name IN VARCHAR2,
   object_name     IN VARCHAR2,
   attribute_table IN DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 20–26 SET_VALUE_DEPENDENCY Procedure Parameters

Parameter	Description
`dependency_name`	The name of the value dependency. If a dependency with the specified name does not exist, then it is created. If a dependency with the specified name exists, then the specified object and attributes are added to the dependency. If `NULL`, an error is raised.
`object_name`	The name of the table, specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. If `NULL` and the specified dependency exists, then the dependency is removed. If `NULL` and the specified dependency does not exist, then an error is raised. If `NULL`, then `attribute_list` and `attribute_table` also must be `NULL`.
`attribute_list`	A comma-delimited list of column names in the table. There must be no spaces between entries.
`attribute_table`	A PL/SQL index-by table of type `DBMS_UTILITY.NAME_ARRAY` that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated.

START_APPLY Procedure

This procedure directs the apply process to start applying messages.

Syntax

```
DBMS_APPLY_ADM.START_APPLY(
   apply_name  IN  VARCHAR2);
```

Parameter

Table 20–27 START_APPLY Procedure Parameter

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is ENABLED, then the apply process is started upon database instance startup. An apply process (a*nnn*) is an Oracle background process. The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of an apply process.

STOP_APPLY Procedure

This procedure stops the apply process from applying messages and rolls back any unfinished transactions being applied.

Syntax

```
DBMS_APPLY_ADM.STOP_APPLY(
   apply_name  IN  VARCHAR2,
   force       IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20–28 STOP_APPLY Procedure Parameters

Parameter	Description
apply_name	The apply process name. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the apply process as soon as possible. If FALSE, then the procedure stops the apply process after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply process depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply process parameter. See "Usage Notes" for more information.

Usage Notes

The apply process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply process is not started upon database instance startup.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply process.

The following table describes apply process behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply process parameter. In all cases, the apply process rolls back any unfinished transactions when it stops.

force	commit_serialization	Apply Process Behavior
TRUE	FULL	The apply process stops immediately and does not apply any unfinished transactions.
TRUE	DEPENDENT_TRANSACTIONS	When the apply process stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.
FALSE	FULL	The apply process stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.
FALSE	DEPENDENT_TRANSACTIONS	Before stopping, the apply process applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.

For example, assume that the commit_serialization apply process parameter is set to DEPENDENT_TRANSACTIONS and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply process has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transaction 2 is not applied, and the apply process stops (transaction 2 is rolled back). If, however, the force parameter is set to FALSE, then transaction 2 is applied before the apply process stops.

A different scenario would result if the commit_serialization apply process parameter is set to FULL. For example, assume that the commit_serialization apply process parameter is set to FULL and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply process has applied transaction A and is in the process of applying transactions B and C when the STOP_APPLY procedure is run. Given this scenario, if the force parameter is set to TRUE, then transactions B and C are not applied, and the apply process stops (transactions B and C are rolled back). If, however, the force parameter is set to FALSE, then transaction B is applied before the apply process stops, and transaction C is rolled back.

> **See Also:** "SET_PARAMETER Procedure" on page 20-50 for more information about the commit_serialization apply process parameter

DBMS_AQ

The DBMS_AQ package provides an interface to Oracle Streams Advanced Queuing (AQ).

See Also:

- *Oracle Streams Advanced Queuing User's Guide*
- Oracle Streams AQ TYPEs for information about TYPEs to use with DBMS_AQ.

This chapter contains the following topics:

- Using DBMS_AQ
  - Constants
  - Data Structures
  - Operational Notes
- Summary of DBMS_AQ Subprograms

Using DBMS_AQ

- Constants
- Data Structures
- Operational Notes

Constants

The DBMS_AQ package uses the constants shown in Table 21–1.

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE.

> **Note:** The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

Table 21–1 Enumerated Constants

Parameter	Options	Type	Description
VISIBILITY	IMMEDIATE		
.	ON_COMMIT		
DEQUEUE_MODE	BROWSE		
.	LOCKED		
.	REMOVE		
.	REMOVE_NODATA		
NAVIGATION	FIRST_MESSAGE		
.	NEXT_MESSAGE		
STATE	WAITING		
.	READY		
.	PROCESSED		
.	EXPIRED		
SEQUENCE_ DEVIATION	BEFORE		
.	TOP		
WAIT	FOREVER	BINARY_ INTEGER	
.	NO_WAIT	BINARY_ INTEGER	
DELAY	NO_DELAY		
EXPIRATION	NEVER		
NAMESPACE	NAMESPACE_AQ		
.	NAMESPACE_ANONYMOUS		
NTFN_GROUPING_ CLASS	NFTN_GROUPING_CLASS_ TIME	NUMBER	
NTFN_GROUPING_ TYPE	NTFN_GROUPING_TYPE_ SUMMARY	NUMBER	

Table 21–1 (Cont.) Enumerated Constants

Parameter	Options	Type	Description
.	NTFN_GROUPING_TYPE_LAST	NUMBER	
NTFN_GROUPING_REPEAT_COUNT	NTFN_GROUPING_FOREVER	NUMBER	

Data Structures

Table 21–2 DBMS_AQ Data Structures

Data Structures	Description
Object Name on page 21-5	Names database objects
Type Name on page 21-5	Defines queue types
Oracle Streams AQ PL/SQL Callback on page 21-6	Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification

Object Name

The `object_name` data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

```
object_name := VARCHAR2;
object_name := [schema_name.]name;
```

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters. Schema names, agent names, and object type names can be up to 30 bytes long. Queue names and queue table names can be up to 24 bytes long.

Type Name

The `type_name` data structure defines queue types.

Syntax

```
type_name := VARCHAR2;
type_name := object_type | "RAW";
```

Attributes

Table 21–3 Type Name Attributes

Attribute	Description
object_type	Maximum number of attributes in the object type is limited to 900.

Table 21–3 (Cont.) Type Name Attributes

Attribute	Description
"RAW"	To store payload of type RAW, Oracle Streams AQ creates a queue table with a LOB column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a LOB column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Streams AQ. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept RAW buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your RAW data will be limited to the maximum amount of contiguous memory (as an OCIRaw is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases. Because LOB columns are used for storing RAW payload, the Oracle Streams AQ administrator can choose the LOB tablespace and configure the LOB storage by constructing a LOB storage string in the storage_clause parameter during queue table creation time.

Oracle Streams AQ PL/SQL Callback

The plsqlcallback data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN  RAW,
  reginfo  IN  SYS.AQ$_REG_INFO,
  descr    IN  SYS.AQ$_DESCRIPTOR,
  payload  IN  RAW,
  payloadl IN  NUMBER);
```

Attributes

Table 21–4 Oracle Streams AQ PL/SQL Callback Attributes

Attribute	Description
context	Specifies the context for the callback function that was passed by dbms_aq.register. See AQ$_REG_INFO Type on page 240-12.
reginfo	See AQ$_REG_INFO Type on page 240-12.
descr	See AQ$_DESCRIPTOR Type on page 240-5
payload	If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.
payloadl	Specifies the length of payload. If payload is null, payload1 = 0.

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```
procedure plsqlcallback(
  context  IN RAW,
  reginfo  IN SYS.AQ$_REG_INFO,
  descr    IN SYS.AQ$_DESCRIPTOR,
```

```
payload  IN VARCHAR2,
payloadl IN NUMBER);
```

Operational Notes

- DBMS_AQ and DBMS_AQADM Java Classes

DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for `DBMS_AQ` and `DBMS_AQADM`. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have `EXECUTE` privileges on the `DBMS_AQIN` package to use these interfaces.

Summary of DBMS_AQ Subprograms

Table 21–5 DBMS_AQ Package Subprograms

Subprograms	Description
BIND_AGENT Procedure on page 21-10	Creates an entry for an Oracle Streams AQ agent in the LDAP directory
DEQUEUE Procedure on page 21-11	Dequeues a message from the specified queue
DEQUEUE_ARRAY Function on page 21-14	Dequeues an array of messages from the specified queue
ENQUEUE Procedure on page 21-16	Adds a message to the specified queue
ENQUEUE_ARRAY Function on page 21-18	Adds an array of messages to the specified queue
LISTEN Procedures on page 21-19	Listen to one or more queues on behalf of a list of agents
POST Procedure on page 21-21	Posts to a anonymous subscription which allows all clients who are registered for the subscription to get notifications
REGISTER Procedure on page 21-22	Registers for message notifications
UNBIND_AGENT Procedure on page 21-23	Removes an entry for an Oracle Streams AQ agent from the LDAP directory
UNREGISTER Procedure on page 21-24	Unregisters a subscription which turns off notification

Note: `DBMS_AQ` does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have `RNDS`, `WNDS`, `RNPS` or `WNPS` constraints defined.

BIND_AGENT Procedure

This procedure creates an entry for an Oracle Streams AQ agent in the LDAP server.

Syntax

```
DBMS_AQ.BIND_AGENT(
   agent        IN SYS.AQ$_AGENT,
   certificate  IN VARCHAR2 default NULL);
```

Parameters

Table 21–6 BIND_AGENT Procedure Parameters

Parameter	Description
`agent`	Agent that is to be registered in LDAP server.
`certificate`	Location (LDAP distinguished name) of the "organizationalperson" entry in LDAP whose digital certificate (attribute `usercertificate`) is to be used for this agent. Example: "cn=OE, cn=ACME, cn=com" is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent.

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (`usercertificate`) of the `OrganizationalPerson` entity. The distinguished name for this `OrganizationalPerson` must be specified when binding the agent.

DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```
DBMS_AQ.DEQUEUE (
   queue_name           IN      VARCHAR2,
   dequeue_options      IN      dequeue_options_t,
   message_properties   OUT     message_properties_t,
   payload              OUT     "<ADT_1>"
   msgid                OUT     RAW);
```

Parameters

Table 21–7 DEQUEUE Procedure Parameters

Parameter	Description
`queue_name`	Specifies the name of the queue.
`dequeue_options`	See DEQUEUE_OPTIONS_T Type on page 240-17.
`message_properties`	See MESSAGE_PROPERTIES_T Type on page 240-24.
`payload`	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. For the definition of *`type_name`* refer to Type Name on page 21-5.
`msgid`	System generated identification of the message.

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in `dequeue_options`:

- `consumer_name`
- `msgid`

  `Msgid` uniquely identifies the message to be dequeued. Only messages in the `READY` state are dequeued unless `msgid` is specified.

- `correlation`

  Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Streams AQ.

- `deq_condition`

  Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A `deq_condition` is specified as a Boolean expression using syntax similar to the `WHERE` clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include `priority`, `corrid` and other columns in the queue table.

  To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with `tab.user_data` as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: `tab.user_data.orderstatus='EXPRESS'`

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the `msgid` and correlation ID in `dequeue_options`.

The database-consistent read mechanism is applicable for queue operations. For example, a `BROWSE` call may not see a message that is enqueued after the beginning of the browsing transaction.

The default `NAVIGATION` parameter during dequeue is `NEXT_MESSAGE`. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the `FIRST_MESSAGE` navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

Note: It may be more efficient to use the `FIRST_MESSAGE` navigation option when messages are concurrently enqueued. If the `FIRST_MESSAGE` option is not specified, Oracle Streams AQ continually generates the snapshot as of the first dequeue command, leading to poor performance. If the `FIRST_MESSAGE` option is specified, then Oracle Streams AQ uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in `LOCKED` or `REMOVE` mode locks only a single message. By contrast, a dequeue operation that seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the `NEXT_TRANSACTION` to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified `WAIT` period.

Using Secure Queues

For secure queues, you must specify `consumer_name` in the `dequeue_options` parameter. See DEQUEUE_OPTIONS_T Type on page 240-17 for more information about `consumer_name`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure on page 22-22.
- You must map the Oracle Streams AQ agent to a database user with dequeue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure on page 22-35.

See Also: *Oracle Streams Concepts and Administration* for information about secure queues

DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   dequeue_options           IN   dequeue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  OUT  message_properties_array_t,
   payload_array             OUT  "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 21–8 DEQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name from which messages are dequeued (same as single-row dequeue).
dequeue_options	The set of options which will be applied to all messages in the array (same as single-row dequeue).
array_size	The number of elements to dequeue.
message_properties_array	A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type on page 240-28.
payload_array	An array of dequeued payload data. "<COLLECTION_1>" can be an associative array, varray or nested table in its PL/SQL representation.
msgid_array	An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type on page 240-29.
error_array	Currently not implemented

Usage Notes

A nonzero wait time, as specified in dequeue_options, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the DEQUEUE_ARRAY function will dequeue up to array_size messages and return immediately.

Dequeue by message_id is not supported. See DEQUEUE Procedure on page 21-11 for more information on the navigation parameter. Existing NAVIGATION modes are supported. In addition, two new NAVIGATION modes are supported for queues enabled for message grouping:

- FIRST_MESSAGE_MULTI_GROUP
- NEXT_MESSAGE_MULTI_GROUP

See Also: ENQUEUE_OPTIONS_T Type on page 240-20

For transaction grouped queues and ONE_GROUP navigation, messages are dequeued from a single transaction group only, subject to the array_size limit. In MULTI_GROUP navigation, messages are dequeued across multiple transaction groups, still subject to the array_size limit. ORA-25235 is returned to indicate the end of a transaction group.

DEQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```
DBMS_AQ.ENQUEUE (
   queue_name           IN      VARCHAR2,
   enqueue_options      IN      enqueue_options_t,
   message_properties   IN      message_properties_t,
   payload              IN       "<ADT_1>",
   msgid                OUT     RAW);
```

Parameters

Table 21–9 ENQUEUE Procedure Parameters

Parameter	Description
queue_name	Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 240-20.
message_properties	See MESSAGE_PROPERTIES_T Type on page 240-24.
payload	Not interpreted by Oracle Streams AQ. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of *type_name* refer to Type Name on page 21-5.
msgid	System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.

Usage Notes

The sequence_deviation parameter in enqueue_options can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the enqueue_options parameter relative_msgid. The relationship is identified by the sequence_deviation parameter.

Specifying sequence_deviation for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

> **Note:** The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error ORA_24033 is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See MESSAGE_PROPERTIES_T Type on page 240-24 for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Streams AQ agent using `DBMS_AQADM.CREATE_AQ_AGENT`. See CREATE_AQ_AGENT Procedure on page 22-22.
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use `DBMS_AQADM.ENABLE_DB_ACCESS` to do this. See ENABLE_DB_ACCESS Procedure on page 22-35.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```
DBMS_AQ.ENQUEUE_ARRAY (
   queue_name                IN   VARCHAR2,
   enqueue_options           IN   enqueue_options_t,
   array_size                IN   pls_integer,
   message_properties_array  IN   message_properties_array_t,
   payload_array             IN   "<COLLECTION_1>",
   msgid_array               OUT  msgid_array_t,
   error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

Table 21–10 ENQUEUE_ARRAY Function Parameters

Parameter	Description
queue_name	The queue name in which messages are enqueued (same as single-row enqueue).
enqueue_options	See ENQUEUE_OPTIONS_T Type on page 240-20.
array_size	The number of elements to enqueue.
message_properties_array	A record containing an array corresponding to each message property. For each property, the user must allocate array_size elements. See MESSAGE_PROPERTIES_ARRAY_T Type on page 240-28.
payload_array	An array of payload data. "<COLLECTION_1>" can be an associative array, VARRAY, or nested table in its PL/SQL representation.
msgid_array	An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type on page 240-29.
error_array	Currently not implemented

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```
DBMS_AQ.LISTEN (
   agent_list            IN    AQ$_AGENT_LIST_T,
   wait                  IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,
   agent                 OUT   SYS.AQ$_AGENT);

DBMS_AQ.LISTEN (
   agent_list             IN   AQ$_AGENT_LIST_T,
   wait                   IN   BINARY_INTEGER DEFAULT FOREVER,
   listen_delivery_mode   IN   PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,
   agent                  OUT  SYS.AQ$_AGENT,
   message_delivery_mode  OUT  PLS_INTEGER);

TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
```

Parameters

Table 21–11 LISTEN Procedure Parameters

Parameter	Description
agent_list	List of agents to listen for
wait	Time out for the listen call in seconds. By default, the call will block forever.
listen_delivery_mode	The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED
agent	Agent with a message available for consumption
message_delivery_mode	Returns the message type along with the queue and consumer for which there is a message

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the `LISTEN` call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

Note: You cannot call `LISTEN` on nonpersistent queues.

POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```
DBMS_AQ.POST (
  post_list       IN  SYS.AQ$_POST_INFO_LIST,
  post_count      IN  NUMBER);
```

Parameters

Table 21–12 POST Procedure Parameters

Parameter	Description
`post_list`	Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$_POST_INFO_LIST Type.
`post_count`	Specifies the number of entries in the `post_list`.

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```
DBMS_AQ.REGISTER (
   reg_list     IN  SYS.AQ$_REG_INFO_LIST,
   count        IN  NUMBER);
```

Parameters

Table 21–13 REGISTER Procedure Parameters

Parameter	Description
`reg_list`	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
`count`	Specifies the number of entries in the `reg_list`.

Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only `TIME` criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion `TIME`)
  - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for `DBCHANGE` namespace)
  - Repeat count – how many times to perform grouping (Default is `FOREVER`)
  - Start time – when to start grouping (Default is current time)
- If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the `sent from` field. You need a Java-enabled database to use this feature.
- If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

> **See Also:** Chapter 23, "DBMS_AQELM" for more information on e-mail and HTTP notifications

UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Streams AQ agent from the LDAP server.

Syntax

```
DBMS_AQ.UNBIND_AGENT(
   agent     IN SYS.AQ$_AGENT);
```

Parameters

Table 21–14 BIND_AGENT Procedure Parameters

Parameter	Description
agent	Agent that is to be removed from the LDAP server

UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

```
DBMS_AQ.UNREGISTER (
   reg_list     IN  SYS.AQ$_REG_INFO_LIST,
   reg_count    IN  NUMBER);
```

Parameters

Table 21–15 UNREGISTER Procedure Parameters

Parameter	Description
`reg_list`	Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.
`reg_count`	Specifies the number of entries in the `reg_list`.

Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.

22

DBMS_AQADM

The DBMS_AQADM package provides procedures to manage Oracle Streams Advanced Queuing (AQ) configuration and administration information.

See Also:

- *Oracle Streams Advanced Queuing User's Guide*
- Chapter 240, "Oracle Streams AQ TYPEs" for information about the TYPEs to use with DBMS_AQADM

This chapter contains the following topics:

- Using DBMS_AQADM
  - Constants
- Subprogram Groups
  - Queue Table Subprograms
  - Privilege Subprograms
  - Queue Subprograms
  - Subscriber Subprograms
  - Notification Subprograms
  - Propagation Subprograms
  - Oracle Streams AQ Agent Subprograms
  - Alias Subprograms
- Summary of DBMS_AQADM Subprograms

Using DBMS_AQADM

This section contains the following topics.

- Constants

Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.

Table 22–1 Enumerated Types in the Administrative Interface

Parameter	Options
retention	0, 1, 2...INFINITE
message_grouping	TRANSACTIONAL, NONE
queue_type	NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE

See Also: For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.

Subprogram Groups

This DBMS_AQADM package is made up of the following subprogram groups:

- Queue Table Subprograms on page 22-5
- Privilege Subprograms on page 22-6
- Queue Subprograms on page 22-7
- Subscriber Subprograms on page 22-8
- Notification Subprograms on page 22-9
- Propagation Subprograms on page 22-10
- Oracle Streams AQ Agent Subprograms on page 22-11
- Alias Subprograms on page 22-12

Queue Table Subprograms

Table 22–2 Queue Table Subprograms

Subprograms	Description
ALTER_QUEUE_TABLE Procedure on page 22-20	Alters the existing properties of a queue table
CREATE_QUEUE_TABLE Procedure on page 22-26	Creates a queue table for messages of a predefined type
DROP_QUEUE_TABLE Procedure on page 22-34	Drops an existing queue table
ENABLE_JMS_TYPES Procedure on page 22-36	A precondition for the enqueue of JMS types and XML types
MIGRATE_QUEUE_TABLE Procedure on page 22-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 22-42	Purges messages from queue tables

Privilege Subprograms

Table 22–3 Privilege Subprograms

Subprograms	Description
GRANT_QUEUE_PRIVILEGE Procedure on page 22-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_ PRIVILEGE Procedure on page 22-40	Grants Oracle Streams AQ system privileges to users and roles
REVOKE_QUEUE_ PRIVILEGE Procedure on page 22-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_ PRIVILEGE Procedure on page 22-47	Revokes Oracle Streams AQ system privileges from users and roles

Queue Subprograms

Table 22–4 Queue Subprograms

Subprograms	Description
ALTER_QUEUE Procedure on page 22-19	Alters existing properties of a queue
CREATE_NP_QUEUE Procedure on page 22-23	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure on page 22-24	Creates a queue in the specified queue table
DROP_QUEUE Procedure on page 22-33	Drops an existing queue
QUEUE_SUBSCRIBERS Function on page 22-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
START_QUEUE Procedure on page 22-51	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure on page 22-52	Disables enqueuing or dequeuing on the specified queue

Subscriber Subprograms

Table 22–5 Subscriber Subprograms

Subprograms	Description
ADD_SUBSCRIBER Procedure on page 22-16	Adds a default subscriber to a queue
ALTER_SUBSCRIBER Procedure on page 22-21	Alters existing properties of a subscriber to a specified queue
REMOVE_SUBSCRIBER Procedure on page 22-45	Removes a default subscriber from a queue

Notification Subprograms

Table 22–6 Notification Subprograms

Subprograms	Description
GET_WATERMARK Procedure on page 22-38	Retrieves the value of watermark set by the `SET_WATERMARK Procedure`
SET_WATERMARK Procedure on page 22-50	Used for Oracle Streams AQ notification to specify and limit memory use

Propagation Subprograms

Table 22–7 Propagation Subprograms

Subprograms	Description
ALTER_PROPAGATION_SCHEDULE Procedure on page 22-18	Alters parameters for a propagation schedule
DISABLE_PROPAGATION_SCHEDULE Procedure on page 22-31	Disables a propagation schedule
ENABLE_PROPAGATION_SCHEDULE Procedure on page 22-37	Enables a previously disabled propagation schedule
SCHEDULE_PROPAGATION Procedure on page 22-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
UNSCHEDULE_PROPAGATION Procedure on page 22-53	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 22-54	Verifies that the source and destination queues have identical types

Oracle Streams AQ Agent Subprograms

Table 22–8 Oracle Streams AQ Agent Subprograms

Subprograms	Description
ALTER_AQ_AGENT Procedure on page 22-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
CREATE_AQ_AGENT Procedure on page 22-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
DISABLE_DB_ACCESS Procedure on page 22-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DROP_AQ_AGENT Procedure on page 22-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
ENABLE_DB_ACCESS Procedure on page 22-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user

Alias Subprograms

Table 22–9 Alias Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 22-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
DEL_ALIAS_FROM_LDAP Procedure on page 22-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP

Summary of DBMS_AQADM Subprograms

Table 22–10 DBMS_AQADM Package Subprograms

Subprograms	Description
ADD_ALIAS_TO_LDAP Procedure on page 22-15	Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP
ADD_SUBSCRIBER Procedure on page 22-16	Adds a default subscriber to a queue
ALTER_AQ_AGENT Procedure on page 22-17	Alters an agent registered for Oracle Streams AQ Internet access, and an Oracle Streams AQ agent that accesses secure queues
ALTER_PROPAGATION_SCHEDULE Procedure on page 22-18	Alters parameters for a propagation schedule
ALTER_QUEUE Procedure on page 22-19	Alters existing properties of a queue
ALTER_QUEUE_TABLE Procedure on page 22-20	Alters the existing properties of a queue table
ALTER_SUBSCRIBER Procedure on page 22-21	Alters existing properties of a subscriber to a specified queue
CREATE_AQ_AGENT Procedure on page 22-22	Registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols, and creates an Oracle Streams AQ agent to access secure queues
CREATE_NP_QUEUE Procedure on page 22-23	Creates a nonpersistent `RAW` queue
CREATE_QUEUE Procedure on page 22-24	Creates a queue in the specified queue table
CREATE_QUEUE_TABLE Procedure on page 22-26	Creates a queue table for messages of a predefined type
DEL_ALIAS_FROM_LDAP Procedure on page 22-29	Drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP
DISABLE_DB_ACCESS Procedure on page 22-30	Revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent
DISABLE_PROPAGATION_SCHEDULE Procedure on page 22-31	Disables a propagation schedule
DROP_AQ_AGENT Procedure on page 22-32	Drops an agent that was previously registered for Oracle Streams AQ Internet access
DROP_QUEUE Procedure on page 22-33	Drops an existing queue
DROP_QUEUE_TABLE Procedure on page 22-34	Drops an existing queue table
ENABLE_DB_ACCESS Procedure on page 22-35	Grants an Oracle Streams AQ Internet agent the privileges of a specific database user
ENABLE_JMS_TYPES Procedure on page 22-36	A precondition for the enqueue of JMS types and XML types

Table 22–10 (Cont.) DBMS_AQADM Package Subprograms

Subprograms	Description
ENABLE_PROPAGATION_SCHEDULE Procedure on page 22-37	Enables a previously disabled propagation schedule
GET_WATERMARK Procedure on page 22-38	Retrieves the value of watermark set by the `SET_WATERMARK Procedure`
GRANT_QUEUE_PRIVILEGE Procedure on page 22-39	Grants privileges on a queue to users and roles
GRANT_SYSTEM_PRIVILEGE Procedure on page 22-40	Grants Oracle Streams AQ system privileges to users and roles
MIGRATE_QUEUE_TABLE Procedure on page 22-41	Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table
PURGE_QUEUE_TABLE Procedure on page 22-42	Purges messages from queue tables
QUEUE_SUBSCRIBERS Function on page 22-44	Returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`
REMOVE_SUBSCRIBER Procedure on page 22-45	Removes a default subscriber from a queue
REVOKE_QUEUE_PRIVILEGE Procedure on page 22-46	Revokes privileges on a queue from users and roles
REVOKE_SYSTEM_PRIVILEGE Procedure on page 22-47	Revokes Oracle Streams AQ system privileges from users and roles
SCHEDULE_PROPAGATION Procedure on page 22-48	Schedules propagation of messages from a queue to a destination identified by a specific database link
SET_WATERMARK Procedure on page 22-50	Used for Oracle Streams AQ notification to specify and limit memory use
START_QUEUE Procedure on page 22-51	Enables the specified queue for enqueuing or dequeuing
STOP_QUEUE Procedure on page 22-52	Disables enqueuing or dequeuing on the specified queue
UNSCHEDULE_PROPAGATION Procedure on page 22-53	Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link
VERIFY_QUEUE_TYPES Procedure on page 22-54	Verifies that the source and destination queues have identical types

ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

Syntax

```
DBMS_AQADM.ADD_ALIAS_TO_LDAP(
   alias          IN VARCHAR2,
   obj_location   IN VARCHAR2);
```

Parameters

Table 22–11 ADD_ALIAS_TO_LDAP Procedure Parameters

Parameter	Description
`alias`	Name of the alias. Example: `west_shipping`.
`obj_location`	The distinguished name of the object (queue, agent or connection factory) to which `alias` refers.

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Streams AQ Internet access.

ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (
   queue_name      IN    VARCHAR2,
   subscriber      IN    sys.aq$_agent,
   rule            IN    VARCHAR2 DEFAULT NULL,
   transformation  IN    VARCHAR2 DEFAULT NULL
   queue_to_queue  IN    BOOLEAN DEFAULT FALSE,
   delivery_mode   IN    PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

Table 22–12 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being defined.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are priority and corrid. To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.
queue_to_queue	If TRUE, propagation is from queue-to-queue.
delivery_mode	The administrator may specify one of DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED, or DBMS_AQADM.PERSISTENT_OR_BUFFERED for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by ALTER_SUBSCRIBER.

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```
rule   => 'PRIORITY <= 3 AND CORRID =  ''FROM JAPAN'''
```

Note that these are all single quotation marks.

ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Streams AQ Internet access. It is also used to alter an Oracle Streams AQ agent that accesses secure queues.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.ALTER_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 22–13 ALTER_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (
   queue_name           IN    VARCHAR2,
   destination          IN    VARCHAR2 DEFAULT NULL,
   duration             IN    NUMBER   DEFAULT NULL,
   next_time            IN    VARCHAR2 DEFAULT NULL,
   latency              IN    NUMBER   DEFAULT 60,
   destination_queue    IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–14 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. The default value is 60. Caution: if latency is not specified for this call, then latency will over-write any existing value with the default value. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It will be at least 60 seconds before the queue will be checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue will not be checked for 10 minutes and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination and as soon as a message is enqueued it will be propagated.
destination_ queue	Name of the target queue to which messages are to be propagated in the form of a dblink

ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters `max_retries`, `retention_time`, and `retry_delay` are not supported for nonpersistent queues.

Syntax

```
DBMS_AQADM.ALTER_QUEUE (
   queue_name        IN    VARCHAR2,
   max_retries       IN    NUMBER   DEFAULT NULL,
   retry_delay       IN    NUMBER   DEFAULT NULL,
   retention_time    IN    NUMBER   DEFAULT NULL,
   auto_commit       IN    BOOLEAN  DEFAULT TRUE,
   comment           IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–15 ALTER_QUEUE Procedure Parameters

Parameter	Description
`queue_name`	Name of the queue that is to be altered
`max_retries`	Limits the number of times a dequeue with `REMOVE` mode can be attempted on a message. The maximum value of `max_retries` is 2**31 -1. A message is moved to an exception queue if `RETRY_COUNT` is greater than `MAX_RETRIES`. `RETRY_COUNT` is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including `ALTER SYSTEM KILL SESSION`) or `SHUTDOWN ABORT` on the instance, then `RETRY_COUNT` is not incremented. Note that `max_retries` is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
`retry_delay`	Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is `NULL`, which means that the value will not be altered. Note that `retry_delay` is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
`retention_time`	Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is `NULL`, which means that the value will not be altered.
`auto_commit`	`TRUE` causes the current transaction, if any, to commit before the `ALTER_QUEUE` operation is carried out. The `ALTER_QUEUE` operation become persistent when the call returns. This is the default. `FALSE` means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.
`comment`	User-specified description of the queue. This user comment is added to the queue catalog. The default value is `NULL`, which means that the value will not be changed.

ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```
DBMS_AQADM.ALTER_QUEUE_TABLE (
   queue_table          IN   VARCHAR2,
   comment              IN   VARCHAR2       DEFAULT NULL,
   primary_instance     IN   BINARY_INTEGER DEFAULT NULL,
   secondary_instance   IN   BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 22–16 ALTER_QUEUE_TABLE Procedure Parameters

Parameter	Description
`queue_table`	Name of a queue table to be created.
`comment`	Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is `NULL` which means that the value will not be changed.
`primary_instance`	This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is `NULL`, which means that the current value will not be changed.
`secondary_instance`	The queue table fails over to the secondary instance if the primary instance is not available. The default value is `NULL`, which means that the current value will not be changed.

ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

```
DBMS_AQADM.ALTER_SUBSCRIBER (
   queue_name     IN    VARCHAR2,
   subscriber     IN    sys.aq$_agent,
   rule           IN    VARCHAR2
   transformation IN    VARCHAR2);
```

Parameters

Table 22–17 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent on whose behalf the subscription is being altered. See "AQ$_ AGENT Type" on page 240-3.
rule	A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.
transformation	Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the *schema*.AQ$*queue_table*_R and *schema*.AQ$*queue_table*_S views.

CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Streams AQ Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Streams AQ agent to access secure queues.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```
DBMS_AQADM.CREATE_AQ_AGENT (
  agent_name                IN VARCHAR2,
  certificate_location      IN VARCHAR2 DEFAULT NULL,
  enable_http               IN BOOLEAN DEFAULT FALSE,
  enable_smtp               IN BOOLEAN DEFAULT FALSE,
  enable_anyp               IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 22–18 CREATE_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
certification_location	Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Streams AQ through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.
enable_http	TRUE means the agent can access Oracle Streams AQ through HTTP. FALSE means the agent cannot access Oracle Streams AQ through HTTP.
enable_smtp	TRUE means the agent can access Oracle Streams AQ through SMTP (e-mail). FALSE means the agent cannot access Oracle Streams AQ through SMTP.
enable_anyp	TRUE means the agent can access Oracle Streams AQ through any protocol (HTTP or SMTP).

Usage Notes

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Streams AQ Internet agents.

CREATE_NP_QUEUE Procedure

> **Note:** nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

This procedure creates a nonpersistent RAW queue.

Syntax

```
DBMS_AQADM.CREATE_NP_QUEUE (
   queue_name              IN        VARCHAR2,
   multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,
   comment                 IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–19 CREATE_NP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Language Reference.*
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.
comment	User-specified description of the queue. This user comment is added to the queue catalog.

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ$_MEM_SC or AQ$_MEM_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with CREATE_NP_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the LISTEN call on a nonpersistent queue.

CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```
DBMS_AQADM.CREATE_QUEUE (
   queue_name          IN       VARCHAR2,
   queue_table         IN       VARCHAR2,
   queue_type          IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE,
   max_retries         IN       NUMBER         DEFAULT NULL,
   retry_delay         IN       NUMBER         DEFAULT 0,
   retention_time      IN       NUMBER         DEFAULT 0,
   dependency_tracking IN       BOOLEAN        DEFAULT FALSE,
   comment             IN       VARCHAR2       DEFAULT NULL,
   auto_commit         IN       BOOLEAN        DEFAULT TRUE);
```

Parameters

Table 22–20 CREATE_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in *Oracle Database SQL Language Reference* with regard to reserved characters.
queue_table	Name of the queue table that will contain the queue.
queue_type	Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.
max_retries	Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of max_retries is 2**31 -1. A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retry_delay	Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if max_retries is set to 0. Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.
retention_time	Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.

Table 22–20 (Cont.) CREATE_QUEUE Procedure Parameters

Parameter	Description
dependency_tracking	Reserved for future use. FALSE is the default. TRUE is not permitted in this release.
comment	User-specified description of the queue. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All queue names must be unique within a schema. After a queue is created with CREATE_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```
DBMS_AQADM.CREATE_QUEUE_TABLE (
   queue_table          IN      VARCHAR2,
   queue_payload_type   IN      VARCHAR2,
   storage_clause       IN      VARCHAR2        DEFAULT NULL,
   sort_list            IN      VARCHAR2        DEFAULT NULL,
   multiple_consumers   IN      BOOLEAN         DEFAULT FALSE,
   message_grouping     IN      BINARY_INTEGER  DEFAULT NONE,
   comment              IN      VARCHAR2        DEFAULT NULL,
   auto_commit          IN      BOOLEAN         DEFAULT TRUE,
   primary_instance     IN      BINARY_INTEGER  DEFAULT 0,
   secondary_instance   IN      BINARY_INTEGER  DEFAULT 0,
   compatible           IN      VARCHAR2        DEFAULT NULL,
   secure               IN      BOOLEAN         DEFAULT FALSE);
```

Parameters

Table 22–21 CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be created
queue_payload_type	Type of the user data stored. See Type Name on page 21-5 for valid values for this parameter.
storage_clause	Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage_clause argument.The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLEPSACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See *Oracle Database SQL Language Reference* for the usage of these parameters.

Table 22–21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
sort_list	The columns to be used as the sort key in ascending order. This parameter has the following format: '*sort_column_1*,*sort_column_2*' The allowed column names are priority and enq_time. If both columns are specified, then *sort_column_1* defines the most significant order. After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created. If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order. Even with the default ordering defined, a dequeuer is allowed to choose a message to dequeue by specifying its msgid or correlation. msgid, correlation, and sequence_deviation take precedence over the default dequeueing order, if they are specified.
multiple_consumers	FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.
message_grouping	Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.
comment	User-specified description of the queue table. This user comment is added to the queue catalog.
auto_commit	TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Note: This parameter has been deprecated.
primary_instance	The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance. The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.
secondary_instance	The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.
compatible	The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.

Table 22–21 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
secure	This parameter must be set to TRUE if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.

Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- aq$_*queue_table_name*_e, a default exception queue associated with the queue table
- aq$*queue_table_name*, a read-only view, which is used by Oracle Streams AQ applications for querying queue data
- aq$_*queue_table_name*_t, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- aq$_*queue_table_name*_i, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations

For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- aq$_*queue_table_name*_s, a table for storing information about the subscribers
- aq$_*queue_table_name*_r, a table for storing information about rules on subscriptions

aq$_*queue_table_name*_h, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Streams AQ object type payloads. However, only CLOB and BLOB can be propagated using Oracle Streams AQ propagation in Oracle8*i* release 8.1.5 or later. See the *Oracle Streams Advanced Queuing User's Guide* for more information.

The default value of the compatible parameter depends on the database compatibility mode in the init.ora. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0

You can specify and modify the primary_instance and secondary_instance only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

Syntax

```
DBMS_AQ.DEL_ALIAS_FROM_LDAP(
   alias IN VARCHAR2);
```

Parameters

Table 22–22 DEL_ALIAS_FROM_LDAP Procedure Parameters

Parameter	Description
alias	The alias to be removed.

DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Streams AQ Internet agent.

Syntax

```
DBMS_AQADM.DISABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 22–23 DISABLE_DB_ACCESS Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent.
db_username	Specifies the database user whose privileges are to be revoked from the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously granted those privileges using the ENABLE_DB_ACCESS Procedure.

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

```
DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
   queue_name            IN   VARCHAR2,
   destination           IN   VARCHAR2 DEFAULT NULL,
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–24 DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Streams AQ Internet access.

Syntax

```
DBMS_AQADM.DROP_AQ_AGENT (
  agent_name                IN VARCHAR2)
```

Parameters

Table 22–25 DROP_AQ_AGENT Procedure Parameters

Parameter	Description
agent_name	Specifies the username of the Oracle Streams AQ Internet agent

DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```
DBMS_AQADM.DROP_QUEUE (
   queue_name        IN    VARCHAR2,
   auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–26 DROP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue that is to be dropped.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.

DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (
   queue_table       IN    VARCHAR2,
   force             IN    BOOLEAN DEFAULT FALSE,
   auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–27 DROP_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Name of a queue table to be dropped.
force	FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.
auto_commit	TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the `force` option is used, in which case this is done automatically.

ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Streams AQ Internet agent the privileges of a specific database user.

Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS (
  agent_name                IN VARCHAR2,
  db_username               IN VARCHAR2)
```

Parameters

Table 22–28 ENABLE_DB_ACCESS Procedure Parameters

Parameter	Description
`agent_name`	Specifies the username of the Oracle Streams AQ Internet agent.
`db_username`	Specified the database user whose privileges are to be granted to the Oracle Streams AQ Internet agent.

Usage Notes

The Oracle Streams AQ Internet agent should have been previously created using the CREATE_AQ_AGENT Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

> **See Also:** *Oracle Streams Concepts and Administration* for information about secure queues

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Streams AQ Internet agents and the names of the database users whose privileges are granted to them.

ENABLE_JMS_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams `Sys.Anydata` queues unless you call this procedure after `DBMS_STREAMS_ADM.SET_UP_QUEUE`. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

Syntax

```
DBMS_AQADM.ENABLE_JMS_TYPES (
   queue_table   IN   VARCHAR2);
```

Parameters

Table 22–29 ENABLE_JMS_TYPES Procedure Parameters

Parameter	Description
`queue_table`	Specifies name of the queue table to be enabled for JMS and XML types.

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (
   queue_name          IN   VARCHAR2,
   destination         IN   VARCHAR2 DEFAULT NULL,
   destination_queue   IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 22–30 ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
`queue_name`	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`destination`	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is `NULL`, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
`destination_queue`	Name of the target queue to which messages are to be propagated in the form of a `dblink`

GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by `SET_WATERMARK`.

Syntax

```
DBMS_AQADM.GET_WATERMARK (
   wmvalue     OUT      NUMBER);
```

Parameters

Table 22–31 GET_WATERMARK Procedure Parameter

Parameter	Description
`wmvalue`	Watermark value in megabytes.

GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (
   privilege        IN    VARCHAR2,
   queue_name       IN    VARCHAR2,
   grantee          IN    VARCHAR2,
   grant_option     IN    BOOLEAN := FALSE);
```

Parameters

Table 22–32 GRANT_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
grant_option	Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Streams AQ system privileges to users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. Initially, only SYS and SYSTEM can use this procedure successfully.

Syntax

```
DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (
   privilege         IN    VARCHAR2,
   grantee           IN    VARCHAR2,
   admin_option      IN    BOOLEAN := FALSE);
```

Parameters

Table 22–33 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ system privilege to grant. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. ENQUEUE_ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE_ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE_ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.
admin_option	Specifies if the system privilege is granted with the ADMIN option or not. If the privilege is granted with the ADMIN option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.

MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

```
DBMS_AQADM.MIGRATE_QUEUE_TABLE (
   queue_table   IN   VARCHAR2,
   compatible    IN   VARCHAR2);
```

Parameters

Table 22–34 MIGRATE_QUEUE_TABLE Procedure Parameters

Parameter	Description
`queue_table`	Specifies name of the queue table to be migrated.
`compatible`	Set this to `8.1` to upgrade an 8.0-compatible queue table, or set this to `8.0` to downgrade an 8.1-compatible queue table.

PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

Syntax

```
DBMS_AQADM.PURGE_QUEUE_TABLE(
   queue_table        IN   VARCHAR2,
   purge_condition    IN   VARCHAR2,
   purge_options      IN   aq$_purge_options_t);
```

where type aq$_purge_options_t is described in Chapter 240, "Oracle Streams AQ TYPEs".

Parameters

Table 22–35 PURGE_QUEUE_TABLE Procedure Parameters

Parameter	Description
queue_table	Specifies the name of the queue table to be purged.
purge_condition	Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL WHERE clause, and it is case-sensitive. The condition is based on the columns of aq$queue_table_name view. When specifying the purge_condition, qualify the column names in aq$queue_table_name view with qtview. To purge all queues in a queue table, set purge_condition to either NULL (a bare null word, no quotes) or '' (two single quotes).
purge_options	Type aq$_purge_options_t contains a block parameter and a delivery_mode parameter. ■ If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times. ■ delivery_mode is used to specify whether DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED or DBMS_AQADM.PERSISTENT_OR_BUFFERED types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged.

Usage Notes

- You an purge selected messages from the queue table by specifying a purge_condition. Table 22–35 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.

- A trace file is generated in the `udump` destination when you run this procedure. It details what the procedure is doing.
- This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one `purge_queue_table` call depending on the number of messages in the queue table.

QUEUE_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type `DBMS_AQADM.AQ$_subscriber_list_t`. Each element of the collection is of type `sys.aq$_agent`. This functionality is provided for 8.1-compatible queues by the `AQ$`*`queue_table_name`*`_S` view.

Syntax

```
DBMS_AQADM.QUEUE_SUBSCRIBERS (
   queue_name         IN         VARCHAR2);
RETURN aq$_subscriber_list_t IS
```

Parameters

Table 22–36 QUEUE_SUBSCRIBERS Function Parameters

Parameter	Description
`queue_name`	Specifies the queue whose subscribers are to be printed.

REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```
DBMS_AQADM.REMOVE_SUBSCRIBER (
   queue_name          IN          VARCHAR2,
   subscriber          IN          sys.aq$_agent);
```

Parameters

Table 22–37 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
queue_name	Name of the queue.
subscriber	Agent who is being removed. See AQ$_AGENT Type on page 240-3.

REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (
   privilege         IN      VARCHAR2,
   queue_name        IN      VARCHAR2,
   grantee           IN      VARCHAR2);
```

Parameters

Table 22–38 REVOKE_QUEUE_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.
queue_name	Name of the queue.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.

Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor's privileges are revoked.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Streams AQ system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

```
DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (
   privilege         IN   VARCHAR2,
   grantee           IN   VARCHAR2);
```

Parameters

Table 22–39 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The Oracle Streams AQ system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.
grantee	Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.

SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.SCHEDULE_PROPAGATION (
   queue_name          IN    VARCHAR2,
   destination         IN    VARCHAR2 DEFAULT NULL,
   start_time          IN    DATE     DEFAULT SYSDATE,
   duration            IN    NUMBER   DEFAULT NULL,
   next_time           IN    VARCHAR2 DEFAULT NULL,
   latency             IN    NUMBER   DEFAULT 60,
   destination_queue   IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–40 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
start_time	Initial start time for the propagation window for messages from the source queue to the destination.
duration	Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.
next_time	Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, next_time should be specified as SYSDATE + 1 - duration/86400.
latency	Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in

either the same or different queues, the message is propagated to all of them at the same time.

SET_WATERMARK Procedure

This procedure is used for Oracle Streams AQ notification to specify and limit memory use.

Syntax

```
DBMS_AQADM.SET_WATERMARK (
   wmvalue     IN      NUMBER);
```

Parameters

Table 22–41 SET_WATERMARK Procedure Parameter

Parameter	Description
wmvalue	Watermark value in megabytes.

START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (
   queue_name       IN     VARCHAR2,
   enqueue          IN     BOOLEAN DEFAULT TRUE,
   dequeue          IN     BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–42 START_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be enabled
enqueue	Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```
DBMS_AQADM.STOP_QUEUE (
   queue_name      IN   VARCHAR2,
   enqueue         IN   BOOLEAN DEFAULT TRUE,
   dequeue         IN   BOOLEAN DEFAULT TRUE,
   wait            IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 22–43 STOP_QUEUE Procedure Parameters

Parameter	Description
queue_name	Name of the queue to be disabled
enqueue	Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.
dequeue	Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.
wait	Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```
DBMS_AQADM.UNSCHEDULE_PROPAGATION (
   queue_name         IN  VARCHAR2,
   destination        IN  VARCHAR2 DEFAULT NULL
   destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22–44 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
queue_name	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.
destination	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
destination_queue	Name of the target queue to which messages are to be propagated in the form of a dblink

VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types. The result of the verification is stored in the table `sys.aq$_message_types`, overwriting all previous output of this command.

Syntax

```
DBMS_AQADM.VERIFY_QUEUE_TYPES (
   src_queue_name    IN    VARCHAR2,
   dest_queue_name   IN    VARCHAR2,
   destination       IN    VARCHAR2 DEFAULT NULL,
   rc                OUT   BINARY_INTEGER);
```

Parameters

Table 22–45 VERIFY_QUEUE_TYPES Procedure Parameters

Parameter	Description
`src_queue_name`	Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`dest_queue_name`	Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.
`destination`	Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is `NULL`, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.
`rc`	Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in `rc`.

23

DBMS_AQELM

The DBMS_AQELM package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide* for detailed information about DBMS_AQELM

This chapter contains the following topic:

- Summary of DBMS_AQELM Subprograms

Summary of DBMS_AQELM Subprograms

Table 23–1 DBMS_ALERT Package Subprograms

Subprogram	Description
SET_MAILHOST Procedure on page 23-3	Sets the host name for the SMTP server that the database will uses send out e-mail notifications
SET_MAILPORT Procedure on page 23-4	Sets the port number for the SMTP server
SET_SENDFROM Procedure on page 23-5	Sets the sent-from e-mail address

SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```
DBMS_AQELM.SET_MAILHOST (
   mailhost  IN  VARCHAR2);
```

Parameters

Table 23–2 SET_MAILHOST Procedure Parameters

Parameter	Description
mailhost	SMTP server host name.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.

SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

```
DBMS_AQELM.SET_MAILPORT (
   mailport  IN NUMBER);
```

Parameters

Table 23–3 SET_MAILPORT Procedure Parameters

Parameter	Description
mailport	SMTP server port number.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25

SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

```
DBMS_AQELM.SET_SENDFROM (
   sendfrom  IN  VARCHAR2);
```

Parameters

Table 23–4 SET_SENDFROM Procedure Parameters

Parameter	Description
sendfrom	The sent-from e-mail address.

Usage Notes

As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package should set the sent-from address before registering for e-mail notifications

24

DBMS_AQIN

The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide* for detailed information about DBMS_AQIN

This chapter contains the following topic:

- Using DBMS_AQIN
  - Over view

Using DBMS_AQIN

This section contains topics which relate to using the `DBMS_AQIN` package.

- Overview

Overview

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

```
GRANT EXECUTE ON DBMS_AQIN to user;
```

Note that you can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINSTRATOR_ROLE.

25

DBMS_ASSERT

The DBMS_ASSERT package provides an interface to validate properties of the input value.

> **See Also:** *Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- Using DBMS_ASSERT
  - Operational Notes
- Summary of DBMS_ASSERT Subprograms

Using DBMS_ASSERT

- Operational Notes

Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned through the return value. Most functions return the value unchanged, however, several functions modify the value.

Summary of DBMS_ASSERT Subprograms

Table 25–1 DBMS_APPLICATION_INFO Package Subprograms

Subprogram	Description
ENQUOTE_LITERAL Function on page 25-5	Enquotes a string literal
ENQUOTE_NAME Function on page 25-6	Encloses a name in double quotes
NOOP Functions on page 25-7	Returns the value without any checking
QUALIFIED_SQL_NAME Function on page 25-8	Verifies that the input string is a qualified SQL name
SCHEMA_NAME Function on page 25-9	Verifies that the input string is an existing schema name
SIMPLE_SQL_NAME Function on page 25-10	Verifies that the input string is a simple SQL name
SQL_OBJECT_NAME Function on page 25-11	Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object

ENQUOTE_LITERAL Function

This function enquotes a string literal.

Syntax

```
DBMS_ASSERT.ENQUOTE_LITERAL (
   str            VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 25–2 ENQUOTE_LITERAL Function Parameters

Parameter	Description
str	String to enquote

Usage Notes

- Add leading and trailing single quotes to a string literal.
- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.

ENQUOTE_NAME Function

This function encloses a name in double quotes.

Syntax

```
DBMS_ASSERT.ENQUOTE_NAME (
   str            VARCHAR2,
   capitalize     BOOLEAN DEFAULT TRUE)
RETURN VARCHAR2;
```

Parameters

Table 25–3 ENQUOTE_NAME Function Parameters

Parameter	Description
`str`	String to enquote
`capitalize`	If `TRUE` or defaulted, alphabetic characters of `str` which was not in quotes are translated to upper case

NOOP Functions

This function returns the value without any checking.

Syntax

```
DBMS_ASSERT.NOOP (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;

DBMS_ASSERT.NOOP (
   str      CLOB CHARACTER SET ANY_CS)
 RETURN     CLOB CHARACTER SET str%CHARSET;
```

Parameters

Table 25–4 NOOP Function Parameters

Parameter	Description
`str`	Input value

QUALIFIED_SQL_NAME Function

This function verifies that the input string is a qualified SQL name.

Syntax

```
DBMS_ASSERT.QUALIFIED_SQL_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–5 QUALIFIED_SQL_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44004: string is not a qualified SQL name

Usage Notes

A qualified SQL name <qualified name> can be expressed by the following grammar:

```
<local qualified name> ::= <simple name> {'.' <simple name>}
<database link name> ::= <local qualified name> ['@' <connection string>]
<connection string> ::= <simple name>
<qualified name> ::= <local qualified name> ['@' <database link name>]
```

SCHEMA_NAME Function

This function verifies that the input string is an existing schema name.

Syntax

```
DBMS_ASSERT.SCHEMA_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–6 SCHEMA_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44001: Invalid schema name

Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.

SIMPLE_SQL_NAME Function

This function verifies that the input string is a simple SQL name.

Syntax

```
DBMS_ASSERT.SIMPLE_SQL_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–7 SIMPLE_SQL_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44003: string is not a simple SQL name

Usage Notes

- The input value must be meet the following conditions:
  - The name must begin with an alphabetic character. It may contain alphanumeric characters as well as the characters _, $, and # in the second and subsequent character positions.
  - Quoted SQL names are also allowed.
  - Quoted names must be enclosed in double quotes.
  - Quoted names allow any characters between the quotes.
  - Quotes inside the name are represented by two quote characters in a row, for example, "a name with "" inside" is a valid quoted name.
  - The input parameter may have any number of leading and/or trailing white space characters.
- The length of the name is not checked.

SQL_OBJECT_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an existing SQL object.

Syntax

```
DBMS_ASSERT.SQL_OBJECT_NAME (
   str      VARCHAR2 CHARACTER SET ANY_CS)
 RETURN     VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 25–8 SQL_OBJECT_NAME Function Parameters

Parameter	Description
str	Input value

Exceptions

ORA44002: Invalid object name

26

DBMS_AUDIT_MGMT

DBMS_AUDIT_MGMT provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the various audit trail types like database audit trails, operating system (OS) audit trails, and XML audit trails.

> **See Also:** "Verifying Security Access with Auditing" in the *Oracle Database Security Guide* for more information on using the DBMS_AUDIT_MGMT package to manage audit trails

This chapter contains the following topics:

- Using DBMS_AUDIT_MGMT
  - Overview
  - Security Model
  - Constants

Using DBMS_AUDIT_MGMT

This section contains topics which relate to using the `DBMS_AUDIT_MGMT` package. The following topics are included:

- Overview
- Security Model
- Constants
- Views

Overview

Database auditing helps meet your database security and compliance requirements. Audit records are written to database tables, operating system (OS) files, or XML files depending on the AUDIT_TRAIL initialization parameter setting.

When AUDIT_TRAIL is set to DB, database records are written to the AUD$ table. When AUDIT_TRAIL is set to OS, audit records are written to operating system files. When AUDIT_TRAIL is set to XML, audit records are written to operating system files in XML format.

> **See Also:** "Verifying Security Access with Auditing" in the *Oracle Database Security Guide* for more background information on database auditing

It is important to manage your audit records properly in order to ensure efficient performance and disk space managment. The DBMS_AUDIT_MGMT subprograms enable you to efficiently manage your audit trail records.

The DBMS_AUDIT_MGMT package provides a subprogram that allows you to move the database audit trail tables out of the SYSTEM tablespace. This improves overall database performance by reducing the load on the SYSTEM tablespace. It also enables you to dedicate an optimized tablespace for audit records.

The DBMS_AUDIT_MGMT subprograms also enable you to manage your operating system and XML audit files. You can define properties like the maximum size and age of an audit file. This enables you to keep the file sizes of OS and XML audit files in check.

The DBMS_AUDIT_MGMT subprograms enable you to perform cleanup operations on all audit trail types. Audit trails can be cleaned based on the Last Archive Timestamp value. The Last Archive Timestamp represents the timestamp of the most recent audit record that was securely archived.

The DBMS_AUDIT_MGMT package provides a subprogram that enables audit administrators to set the last archive timestamp for archived audit records. This subprogram can also be used by external archival systems to set the last archive timestamp.

The DBMS_AUDIT_MGMT subprograms also enable you to configure jobs that periodically delete audit trail records. The frequency with which these jobs should run can be controlled by the audit administrator.

Security Model

All DBMS_AUDIT_MGMT subprograms require the user to have EXECUTE privilege over the DBMS_AUDIT_MGMT package. The SYSDBA role has EXECUTE privileges on the package by default.

Oracle strongly recommends that only audit administrators should have EXECUTE privileges over the DBMS_AUDIT_MGMT package.

Constants

The DBMS_AUDIT_MGMT package defines several enumerated constants that can be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD.

The DBMS_AUDIT_MGMT package includes the constants shown in the following tables:

- DBMS_AUDIT_MGMT Constants - Audit Trail Types
- DBMS_AUDIT_MGMT Constants - Audit Trail Properties
- DBMS_AUDIT_MGMT Constants - Purge Job Status

Audit trails can be classified based on whether audit records are written to database tables, operating system files, or XML files. Table 26–1 lists the audit trail type constants.

Table 26–1 DBMS_AUDIT_MGMT Constants - Audit Trail Types

Constant	Type	Description
AUDIT_TRAIL_ALL	PLS_INTEGER	All audit trail types. This includes the standard database audit trail (SYS.AUD$ and SYS.FGA_LOG$ tables), operating system (OS) audit trail, and XML audit trail.
AUDIT_TRAIL_AUD_STD	PLS_INTEGER	Standard database audit records in the SYS.AUD$ table
AUDIT_TRAIL_DB_STD	PLS_INTEGER	Both standard audit (SYS.AUD$) and FGA audit(SYS.FGA_LOG$) records
AUDIT_TRAIL_FGA_STD	PLS_INTEGER	Standard database fine-grained auditing (FGA) records in the SYS.FGA_LOG$ table
AUDIT_TRAIL_FILES	PLS_INTEGER	Both operating system (OS) and XML audit trails
AUDIT_TRAIL_OS	PLS_INTEGER	Operating system audit trail. This refers to the audit records stored in operating system files.
AUDIT_TRAIL_XML	PLS_INTEGER	XML audit trail. This refers to the audit records stored in XML files.

Audit trail properties determine the audit configuration settings. Table 26–2 lists the constants related to audit trail properties.

Table 26–2 DBMS_AUDIT_MGMT Constants - Audit Trail Properties

Constant	Type	Description
CLEAN_UP_INTERVAL	PLS_INTEGER	Interval, in hours, after which the cleanup procedure is called to clear audit records in the specified audit trail
DB_DELETE_BATCH_SIZE	PLS_INTEGER	Specifies the batch size to be used for deleting audit records in database audit tables. The audit records are deleted in batches of size equal to DB_DELETE_BATCH_SIZE.
FILE_DELETE_BATCH_SIZE	PLS_INTEGER	Specifies the batch size to be used for deleting audit files in the audit directory. The audit files are deleted in batches of size equal to FILE_DELETE_BATCH_SIZE.

Table 26–2 (Cont.) DBMS_AUDIT_MGMT Constants - Audit Trail Properties

Constant	Type	Description
OS_FILE_MAX_AGE	PLS_INTEGER	Specifies the maximum number of days for which an operating system (OS) or XML audit file can be kept open before a new audit file gets created
OS_FILE_MAX_SIZE	PLS_INTEGER	Specifies the maximum size, in kilobytes (KB), to which an operating system (OS) or XML audit file can grow before a new file is opened

The audit trail purge job cleans the audit trail. Table 26–3 lists the constants related to purge job status values.

Table 26–3 DBMS_AUDIT_MGMT Constants - Purge Job Status

Constant	Type	Description
PURGE_JOB_DISABLE	PLS_INTEGER	Disables a purge job
PURGE_JOB_ENABLE	PLS_INTEGER	Enables a purge job

Views

The views listed in Table 26–4 are used to display DBMS_AUDIT_MGMT configuration and cleanup events.

Table 26–4 Views used by DBMS_AUDIT_MGMT

View	Description
DBA_AUDIT_MGMT_CLEAN_EVENTS	Displays the cleanup event history
DBA_AUDIT_MGMT_CLEANUP_JOBS	Displays the currently configured audit trail purge jobs
DBA_AUDIT_MGMT_CONFIG_PARAMS	Displays the currently configured audit trail properties
DBA_AUDIT_MGMT_LAST_ARCH_TS	Displays the last archive timestamps set for the audit trails

See Also: *Oracle Database Reference* for more information on these views

Subprogram Groups

The `DBMS_AUDIT_MGMT` package subprograms can be grouped into the following categories:

- Audit Trail Management Subprograms
- Audit Trail Cleanup Subprograms

Audit Trail Management Subprograms

Audit trail management subprograms enable you to manage audit trail properties.

Table 26–5 Audit Trail Management Subprograms

Subprogram	Description
CLEAR_AUDIT_TRAIL_PROPERTY Procedure on page 26-14	Clears the value for the audit trail property that you specify
SET_AUDIT_TRAIL_LOCATION Procedure on page 26-25	Moves the audit trail tables from their current tablespace to a user-specified tablespace
SET_AUDIT_TRAIL_PROPERTY Procedure on page 26-27	Sets an audit trail property for the audit trail type that you specify

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.

Audit Trail Cleanup Subprograms

Audit trail cleanup subprograms help you perform cleanup related operations on the audit trail records.

Table 26–6 Audit Trail Cleanup Subprograms

Subprogram	Description
CLEAN_AUDIT_TRAIL Procedure on page 26-12	Deletes audit trail records/files that have been archived
CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure on page 26-16	Clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure
CREATE_PURGE_JOB Procedure on page 26-17	Creates a purge job for periodically deleting the audit trail records/files
DEINIT_CLEANUP Procedure on page 26-19	Undoes the setup and initialization performed by the INIT_CLEANUP Procedure
DROP_PURGE_JOB Procedure on page 26-20	Drops the purge job created using the CREATE_PURGE_JOB Procedure
INIT_CLEANUP Procedure on page 26-22	Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records/files
IS_CLEANUP_INITIALIZED Function on page 26-24	Checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type
SET_LAST_ARCHIVE_TIMESTAMP Procedure on page 26-30	Sets a timestamp indicating when the audit records/files were last archived
SET_PURGE_JOB_INTERVAL Procedure on page 26-32	Sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job that you specify
SET_PURGE_JOB_STATUS Procedure on page 26-33	Enables or disables the purge job that you specify

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.

Summary of DBMS_AUDIT_MGMT Subprograms

Table 26–7 DBMS_AUDIT_MGMT Package Subprograms

Subprogram	Description
CLEAN_AUDIT_TRAIL Procedure on page 26-12	Deletes audit trail records that have been archived
CLEAR_AUDIT_TRAIL_PROPERTY Procedure on page 26-14	Clears the value for the audit trail property that you specify
CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure on page 26-16	Clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure
CREATE_PURGE_JOB Procedure on page 26-17	Creates a purge job for periodically deleting the audit trail records
DEINIT_CLEANUP Procedure on page 26-19	Undoes the setup and initialization performed by the INIT_CLEANUP Procedure
DROP_PURGE_JOB Procedure on page 26-20	Drops the purge job created using the CREATE_PURGE_JOB Procedure
GET_AUDIT_COMMIT_DELAY Function on page 26-21	Returns the Audit Commit Delay as the number of seconds. This is the maximum time that it takes to `COMMIT` an audit record to the database audit trail.
INIT_CLEANUP Procedure on page 26-22	Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records
IS_CLEANUP_INITIALIZED Function on page 26-24	Checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type
SET_AUDIT_TRAIL_LOCATION Procedure on page 26-25	Moves the audit trail tables from their current tablespace to a user-specified tablespace
SET_AUDIT_TRAIL_PROPERTY Procedure on page 26-27	Sets the audit trail properties for the audit trail type that you specify
SET_LAST_ARCHIVE_TIMESTAMP Procedure on page 26-30	Sets a timestamp indicating when the audit records were last archived
SET_PURGE_JOB_INTERVAL Procedure on page 26-32	Sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job that you specify
SET_PURGE_JOB_STATUS Procedure on page 26-33	Enables or disables the purge job that you specify

CLEAN_AUDIT_TRAIL Procedure

This procedure deletes audit trail records. The `CLEAN_AUDIT_TRAIL` procedure is usually called after the SET_LAST_ARCHIVE_TIMESTAMP Procedure has been used to set the last archived timestamp for the audit records.

Syntax

```
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
   audit_trail_type         IN PLS_INTEGER,
   use_last_arch_timestamp  IN BOOLEAN DEFAULT TRUE) ;
```

Parameters

Table 26–8 CLEAN_AUDIT_TRAIL Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the cleanup operation needs to be performed. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5.
`use_last_arch_timestamp`	Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of `TRUE` indicates that only audit records created before the last archive timestamp should be deleted. A value of `FALSE` indicates that all audit records should be deleted. The default value is `TRUE`. Oracle recommends using this value, as this helps guard against inadvertent deletion of records.

Usage Notes

The following usage notes apply:

- When cleaning up operating system (OS) or XML audit files, only files in the current audit directory, specified by the `AUDIT_FILE_DEST` parameter, are cleaned up.
- For Windows platforms, no cleanup is performed when the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`. This is because operating system (OS) audit records on Windows are written to the Windows Event Viewer.
- For Unix platforms, no cleanup is performed for cases where the operating system (OS) audit records are written to the syslog. When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`, it removes only the `*.aud` files under the directory specified by the `AUDIT_FILE_DEST` initialization parameter.

  See Also: "AUDIT_SYSLOG_LEVEL" in the *Oracle Database Reference*

- When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_XML`, this procedure only removes XML audit files (`*.xml`) from the current audit directory.

Oracle database maintains a book-keeping file (`adx_$ORACLE_SID.txt`) for the XML audit files. This file is not removed by the cleanup procedure.

Examples

The following example calls the `CLEAN_AUDIT_TRAIL` procedure to clean up the operating system (OS) audit trail records that were updated before the last archive timestamp.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
   audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   use_last_arch_timestamp => TRUE);
END;
/
```

CLEAR_AUDIT_TRAIL_PROPERTY Procedure

This procedure clears the value for the audit trail property that is specified. Audit trail properties are set using the SET_AUDIT_TRAIL_PROPERTY Procedure.

The CLEAR_AUDIT_TRAIL_PROPERTY procedure can optionally reset the property value to it's default value through the use_default_values parameter.

Syntax

```
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
   audit_trail_type        IN PLS_INTEGER,
   audit_trail_property    IN PLS_INTEGER,
   use_default_values      IN BOOLEAN DEFAULT FALSE) ;
```

Parameters

Table 26–9 CLEAR_AUDIT_TRAIL_PROPERTY Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the property needs to be cleared. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5
audit_trail_property	The audit trail property whose value needs to be cleared. You cannot clear the value for the CLEANUP_INTERVAL property. Audit trail properties are listed in Table 26–2, " DBMS_AUDIT_MGMT Constants - Audit Trail Properties"
use_default_values	Specifies whether the default value of the audit_trail_property should be used in place of the cleared value. A value of TRUE causes the default value of the parameter to be used. A value of FALSE causes the audit_trail_property to have no value. The default value for this parameter is FALSE.

Usage Notes

The following usage notes apply:

- You can use this procedure to clear the value for an audit trail property that you do not wish to use. For example, if you do not want a restriction on the operating system audit file size, then you can use this procedure to reset the OS_FILE_MAX_SIZE property.

  You can also use this procedure to reset an audit trail property to it's default value. You need to set use_default_values to TRUE when invoking the procedure.

- The DB_DELETE_BATCH_SIZE property needs to be individually cleared for the AUDIT_TRAIL_AUD_STD and AUDIT_TRAIL_FGA_STD audit trail types. You cannot clear this property collectively using the AUDIT_TRAIL_DB_STD and AUDIT_TRAIL_ALL audit trail types.

- If you clear the value of the DB_DELETE_BATCH_SIZE property with use_default_value set to FALSE, the default value of DB_DELETE_BATCH_SIZE is still assumed. This is because audit records are always deleted in batches.

- The FILE_DELETE_BATCH_SIZE property needs to be individually cleared for the AUDIT_TRAIL_OS and AUDIT_TRAIL_XML audit trail types. You cannot clear this property collectively using the AUDIT_TRAIL_FILES and AUDIT_TRAIL_ALL audit trail types.
- If you clear the value of the FILE_DELETE_BATCH_SIZE property with use_default_value set to FALSE, the default value of FILE_DELETE_BATCH_SIZE is still assumed. This is because audit files are always deleted in batches.
- You cannot clear the value for the CLEANUP_INTERVAL property.

Examples

The following example calls the CLEAR_AUDIT_TRAIL_PROPERTY procedure to clear the value for the audit trail property, OS_FILE_MAX_SIZE. The procedure uses a value of FALSE for the USE_DEFAULT_VALUES parameter. This means that there will be no maximum size threshhold for operating system (OS) audit files.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
   AUDIT_TRAIL_TYPE        =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   AUDIT_TRAIL_PROPERTY    =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
   USE_DEFAULT_VALUES      =>  FALSE );
END;
/
```

CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure.

Syntax

```
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type     IN PLS_INTEGER,
   rac_instance_number  IN PLS_INTEGER DEFAULT NULL) ;
```

Parameters

Table 26–10 CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the timestamp needs to be cleared. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5.
`rac_instance_number`	The instance number for the Oracle Real Application Clusters (RAC) instance. The default value is `NULL`. The `rac_instance_number` is not relevant for single instance databases.

Usage Notes

The following usage notes apply:

- The timestamp for only one `audit_trail_type` can be cleared at a time.
- The following are invalid `audit_trail_type` values for this procedure and cannot be used:
  - AUDIT_TRAIL_ALL
  - AUDIT_TRAIL_DB_STD
  - AUDIT_TRAIL_FILES

Examples

The following example calls the `CLEAR_LAST_ARCHIVE_TIMESTAMP` procedure to clear the timestamp value for the operating system (OS) audit trail type.

```
BEGIN
DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type     =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   rac_instance_number  =>  1);
END;
/
```

CREATE_PURGE_JOB Procedure

This procedure creates a purge job for periodically deleting the audit trail records.

This procedure carries out the cleanup operation at intervals specified by the user. It calls the CLEAN_AUDIT_TRAIL Procedure to perform the cleanup operation.

The SET_PURGE_JOB_INTERVAL Procedure is used to modify the frequency of the purge job.

The SET_PURGE_JOB_STATUS Procedure is used to enable or disable the purge job.

The DROP_PURGE_JOB Procedure is used to drop a purge job created with the `CREATE_PURGE_JOB` procedure.

Syntax

```
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_purge_interval  IN PLS_INTEGER,
   audit_trail_purge_name      IN VARCHAR2,
   use_last_arch_timestamp     IN BOOLEAN DEFAULT TRUE) ;
```

Parameters

Table 26–11 CREATE_PURGE_JOB Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the purge job needs to be created. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5.
`audit_trail_purge_interval`	The interval, in hours, at which the clean up procedure is called. A lower value means that the cleanup is performed more often.
`audit_trail_purge_name`	A name to identify the purge job.
`use_last_arch_timestamp`	Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of `TRUE` indicates that only audit records created before the last archive timestamp should be deleted. A value of `FALSE` indicates that all audit records should be deleted. The default value is `TRUE`.

Usage Notes

Use this procedure to schedule the CLEAN_AUDIT_TRAIL Procedure for your audit trail records.

Examples

The following example calls the `CREATE_PURGE_JOB` procedure to create a cleanup job called `CLEANUP`, for all audit trail types. It sets the `audit_trail_purge_interval` parameter to 100. This means that the cleanup job is invoked every 100 hours. It also sets the `use_last_arch_timestamp` parameter

value to TRUE. This means that all audit records older than the last archive timestamp are deleted.

```
BEGIN
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
  audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
  audit_trail_purge_interval => 100 /* hours */,
  audit_trail_purge_name => 'CLEANUP',
  use_last_arch_timestamp => TRUE);
END;
/
```

DEINIT_CLEANUP Procedure

This procedure undoes the setup and initialization performed by the INIT_CLEANUP Procedure. The `DEINIT_CLEANUP` procedure clears the value of the `default_cleanup_interval` parameter. However, when used for audit tables, it does not move the audit trail tables back to their original tablespace.

Syntax

```
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
   audit_trail_type  IN PLS_INTEGER) ;
```

Parameters

Table 26–12 DEINIT_CLEANUP Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the procedure needs to be called. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5

Examples

The following example clears the `default_cleanup_interval` parameter setting for the standard database audit trail:

```
BEGIN
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
  AUDIT_TRAIL_TYPE  => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD);
END;
/
```

DROP_PURGE_JOB Procedure

This procedure drops the purge job created using the CREATE_PURGE_JOB Procedure. The name of the purge job is passed as an argument.

Syntax

```
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
   audit_trail_purge_name    IN VARCHAR2) ;
```

Parameters

Table 26–13 DROP_PURGE_JOB Procedure Parameters

Parameter	Description
audit_trail_purge_name	The name of the purge job which is being deleted. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.

Examples

The following example calls the DROP_PURGE_JOB procedure to drop the purge job called CLEANUP.

```
BEGIN
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
  AUDIT_TRAIL_PURGE_NAME  => 'CLEANUP');
END;
/
```

GET_AUDIT_COMMIT_DELAY Function

This function returns the Audit Commit Delay as the number of seconds. Audit Commit Delay is the maximum time that it takes to `COMMIT` an audit record to the database audit trail. If it takes more time to COMMIT an audit record than defined by the Audit Commit Delay, then a copy of the audit record is written to the operating system (OS) audit trail.

The Audit Commit Delay value is useful when determining the last archive timestamp for database audit records.

Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_COMMIT_DELAY
  RETURN NUMBER;
```

INIT_CLEANUP Procedure

This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records. If the audit trail tables are in the SYSTEM tablespace, then the procedure moves them to the SYSAUX tablespace.

Moving the audit trail tables out of the SYSTEM tablespace enhances overall database performance. The INIT_CLEANUP procedure moves the audit trail tables to the SYSAUX tablespace. If the SET_AUDIT_TRAIL_LOCATION Procedure has already moved the audit tables elsewhere, then no tables are moved.

The SET_AUDIT_TRAIL_LOCATION Procedure enables you to specify an alternate target tablespace for the database audit tables.

The INIT_CLEANUP procedure is currently not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. No preliminary set up is required for these audit trail types.

> **See Also:** Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5 for a list of all audit trail types

This procedure also sets a default cleanup interval for the audit trail records.

Syntax

```
DBMS_AUDIT_MGMT.INIT_CLEANUP(
   audit_trail_type          IN PLS_INTEGER,
   default_cleanup_interval  IN PLS_INTEGER);
```

Parameters

Table 26–14 INIT_CLEANUP Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the clean up operation needs to be initialized. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5
default_cleanup_interval	The default time interval, in hours, after which the cleanup procedure should be called. The minimum value is 1 and the maximum is 999.

Usage Notes

The following usage notes apply:

- This procedure may involve data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the SYSAUX tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the SYSAUX tablespace for frequent write operations.
- You can change the default_cleanup_interval later using the SET_AUDIT_TRAIL_PROPERTY Procedure.

- If you do not wish to move the audit trail tables to the SYSAUX tablespace, then you should use the DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION procedure to move the audit trail tables to another tablespace before calling the INIT_CLEANUP procedure.

  See Also: "SET_AUDIT_TRAIL_LOCATION Procedure" on page 26-25

Examples

The following example calls the INIT_CLEANUP procedure to set a default_cleanup_interval of 12 hours for all audit trail types:

```
BEGIN
DBMS_AUDIT_MGMT.INIT_CLEANUP(
             audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
      default_cleanup_interval => 12 /* hours */);
END;
/
```

See Also: Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5 for a list of all audit trail types

IS_CLEANUP_INITIALIZED Function

This function checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type. The `IS_CLEANUP_INITIALIZED` function returns `TRUE` if the procedure has already been run for the audit trail type. It returns `FALSE` if the procedure has not been run for the audit trail type.

This function is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. The function always returns TRUE for these audit trail types. No preliminary set up is required for these audit trail types.

> **See Also:** Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5 for a list of all audit trail types

Syntax

```
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
   audit_trail_type  IN PLS_INTEGER)
 RETURN BOOLEAN;
```

Parameters

Table 26–15 IS_CLEANUP_INITIALIZED Function Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the function needs to be called. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5

Examples

The following example checks to see if the standard database audit trail type has been initialized for cleanup operation. If the audit trail type has not been initialized, then it calls the INIT_CLEANUP Procedure to initialize the audit trail type.

```
BEGIN
 IF
   NOT DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD)
 THEN
   DBMS_AUDIT_MGMT.INIT_CLEANUP(
      audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
      default_cleanup_interval => 12 /* hours */);
 END IF;
END;
/
```

SET_AUDIT_TRAIL_LOCATION Procedure

This procedure moves the audit trail tables from their current tablespace to a user-specified tablespace.

The `SET_AUDIT_TRAIL_LOCATION` procedure is currently not relevant for the `AUDIT_TRAIL_OS`, `AUDIT_TRAIL_XML`, and `AUDIT_TRAIL_FILES` audit trail types. The `AUDIT_FILE_DEST` initialization parameter is the only way you can specify the destination directory for these audit trail types.

See Also:

- Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5 for a list of all audit trail types
- "AUDIT_FILE_DEST" in the *Oracle Database Reference*

Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_location_value  IN VARCHAR2) ;
```

Parameters

Table 26–16 SET_AUDIT_TRAIL_LOCATION Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the audit trail location needs to be set. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5
`audit_trail_location_value`	The target location/tablespace for the audit trail records

Usage Notes

The following usage notes apply:

- This procedure involves data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the target tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the target tablespace for frequent write operations.
- This procedure is valid for the following `audit_trail_type` values only:
  - AUDIT_TRAIL_AUD_STD
  - AUDIT_TRAIL_FGA_STD
  - AUDIT_TRAIL_DB_STD

Examples

The following example moves the database audit trail tables, `AUD$` and `FGA_LOG$`, from the current tablespace to a user-created tablespace called `RECORDS`:

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
       audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_DB_STD,
       audit_trail_location_value =>  'RECORDS');
END;
/
```

SET_AUDIT_TRAIL_PROPERTY Procedure

This procedure sets an audit trail property for the audit trail type that is specified.

The procedure sets properties like OS_FILE_MAX_SIZE, OS_FILE_MAX_AGE, and FILE_DELETE_BATCH_SIZE for operating system (OS) and XML audit trail types. The OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties determine the maximum size and age of an audit trail file before a new audit trail file gets created. The FILE_DELETE_BATCH_SIZE property specifes the number of audit trail files that are deleted in one batch.

The procedure sets properties like DB_DELETE_BATCH_SIZE and CLEANUP_INTERVAL for the database audit trail type. DB_DELETE_BATCH_SIZE specifies the batch size in which records get deleted from audit trail tables. This ensures that if a cleanup operation gets interrupted midway, the process does not need to start afresh the next time it is invoked. This is because all batches before the last processed batch are already committed.

The CLEANUP_INTERVAL specifies the frequency, in hours, with which the cleanup procedure is called.

Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
   audit_trail_type            IN PLS_INTEGER,
   audit_trail_property        IN PLS_INTEGER,
   audit_trail_property_value  IN PLS_INTEGER) ;
```

Parameters

Table 26–17 SET_AUDIT_TRAIL_PROPERTY Procedure Parameters

Parameter	Description
audit_trail_type	The audit trail type for which the property needs to be set. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5
audit_trail_property	The audit trail property that is being set. Audit trail properties are listed in Table 26–2, " DBMS_AUDIT_MGMT Constants - Audit Trail Properties"

Table 26–17 (Cont.) SET_AUDIT_TRAIL_PROPERTY Procedure Parameters

Parameter	Description
audit_trail_property_value	The value of the property specified using audit_trail_property. The following are valid values for audit trail properties: ■ OS_FILE_MAX_SIZE can have a minimum value of 1 and maximum value of 2000000. The default value is 10000. OS_FILE_MAX_SIZE is measured in kilobytes (KB). ■ OS_FILE_MAX_AGE can have a minimum value of 1 and a maximum value of 497. The default value is 5. OS_FILE_MAX_AGE is measured in days. ■ DB_DELETE_BATCH_SIZE can have a minimum value of 100 and a maximum value of 1000000. The default value is 10000. DB_DELETE_BATCH_SIZE is measured as the number of audit records that are deleted in one batch. ■ FILE_DELETE_BATCH_SIZE can have a minimum value of 100 and a maximum value of 1000000. The default value is 1000. FILE_DELETE_BATCH_SIZE is measured as the number of audit files that are deleted in one batch. ■ CLEANUP_INTERVAL can have a minimum value of 1 and a maximum value of 999. The default value is set using the INIT_CLEANUP Procedure. CLEANUP_INTERVAL is measured in hours.

Usage Notes

The following usage notes apply:

- The audit trail properties for which you do not explicitly set values use their default values.
- If you have set both the OS_FILE_MAX_SIZE and OS_FILE_MAX_AGE properties for an operating system (OS) or XML audit trail type, then a new audit trail file gets created depending on which of these two limits is reached first.

  For example, let us take a scenario where OS_FILE_MAX_SIZE is 10000 and OS_FILE_MAX_AGE is 5. If the operating system audit file is already more than 5 days old and has a size of 9000 KB, then a new audit file is opened. This is because one of the limits has been reached.
- The DB_DELETE_BATCH_SIZE property needs to be individually set for the AUDIT_TRAIL_AUD_STD and AUDIT_TRAIL_FGA_STD audit trail types. You cannot set this property collectively using the AUDIT_TRAIL_DB_STD and AUDIT_TRAIL_ALL audit trail types.
- The DB_DELETE_BATCH_SIZE property enables you to control the number of audit records that are deleted in one batch. Setting a large value for this parameter requires increased allocation for the undo log space.
- The FILE_DELETE_BATCH_SIZE property needs to be individually set for the AUDIT_TRAIL_OS and AUDIT_TRAIL_XML audit trail types. You cannot set this property collectively using the AUDIT_TRAIL_FILES and AUDIT_TRAIL_ALL audit trail types.

- The FILE_DELETE_BATCH_SIZE property enables you to control the number of audit files that are deleted in one batch. Setting a very large value may engage the GEN0 background process for a long time.

Examples

The following example calls the SET_AUDIT_TRAIL_PROPERTY procedure to set the OS_FILE_MAX_SIZE property for the operating system (OS) audit trail. It sets this property value to 102400. This means that a new audit file gets created every time the current audit file size reaches 100 MB.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
       audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
       audit_trail_property  =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
       audit_trail_property_value =>  102400 /* 100MB*/ );
END;
/
```

The following example calls the SET_AUDIT_TRAIL_PROPERTY procedure to set the OS_FILE_MAX_AGE property for the operating system (OS) audit trail. It sets this property value to 5. This means that a new audit file gets created every sixth day.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
       audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
       audit_trail_property  =>  DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE,
       audit_trail_property_value  =>  5 /* days */);
END;
/
```

The following example calls the SET_AUDIT_TRAIL_PROPERTY procedure to set the DB_DELETE_BATCH_SIZE property for the AUDIT_TRAIL_AUD_STD audit trail. It sets this property value to 100000. This means that during a cleanup operation, audit records are deleted from the SYS.AUD$ table in batches of size 100000.

```
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
       audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
       audit_trail_property => DBMS_AUDIT_MGMT.DB_DELETE_BATCH_SIZE,
       audit_trail_property_value => 100000 /* delete batch size */);
END;
/
```

SET_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records. The CLEAN_AUDIT_TRAIL Procedure uses this timestamp to decide on the audit records to be deleted.

Syntax

```
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type     IN PLS_INTEGER,
   last_archive_time    IN TIMESTAMP,
   rac_instance_number  IN PLS_INTEGER DEFAULT NULL) ;
```

Parameters

Table 26–18 SET_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

Parameter	Description
`audit_trail_type`	The audit trail type for which the timestamp needs to be set. Audit trail types are listed in Table 26–1, " DBMS_AUDIT_MGMT Constants - Audit Trail Types" on page 26-5.
`last_archive_time`	The `TIMESTAMP` value based on which the audit records or files should be deleted. This indicates the last time when the audit records/files were archived.
`rac_instance_number`	The instance number for the Oracle Real Application Clusters (RAC) instance.The default value is `NULL`. The `rac_instance_number` is not relevant for the database audit trail type, as the database audit trail tables are shared by all RAC instances. The `rac_instance_number` is also not relevant for a single-instance database.

Usage Notes

The following usage notes apply:

- The `last_archive_time` must be specified in Coordinated Universal Time (UTC) when the audit trail types are `AUDIT_TRAIL_AUD_STD` or `AUDIT_TRAIL_FGA_STD`. This is because the database audit trails store the timestamps in UTC. UTC is also known as Greenwich Mean Time (GMT).
- The `last_archive_time` must be specified as the local time zone time when the audit trail types are `AUDIT_TRAIL_OS` or `AUDIT_TRAIL_XML`. The time zone must be the time zone of the machine where the OS or XML audit files were created. This is because the operating system audit files are cleaned based on the audit file's Last Modification Timestamp property. The Last Modification Timestamp property value is stored in the local time zone of the machine.
- The following `audit_trail_type` values for valid for this procedure:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_OS`
  - `AUDIT_TRAIL_XML`

- When using an Oracle Real Application Clusters (RAC) database, Oracle recommends that you use the Network Time Protocol (NTP) to synchronize individual RAC nodes.

Examples

The following example calls the `SET_LAST_ARCHIVE_TIMESTAMP` procedure to set the last archive timestamp for the operating system (OS) audit trail type on Oracle RAC instance 1. It uses the `TO_TIMESTAMP` function to convert a character string into a timestamp value.

A subsequent call to the CLEAN_AUDIT_TRAIL Procedure, with `use_last_arch_timestamp` set to `TRUE`, will delete all those OS audit files from the current `AUDIT_FILE_DEST` directory that were modified before 10-Sep-2007 14:10:10.0.

```
BEGIN
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
   audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
   last_archive_time =>
TO_TIMESTAMP('10-SEP-0714:10:10.0','DD-MON-RRHH24:MI:SS.FF'),
   rac_instance_number => 1);
END;
/
```

SET_PURGE_JOB_INTERVAL Procedure

This procedure sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job specified. The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
   audit_trail_purge_name      IN VARCHAR2,
   audit_trail_interval_value  IN PLS_INTEGER) ;
```

Parameters

Table 26–19 SET_PURGE_JOB_INTERVAL Procedure Parameters

Parameter	Description
audit_trail_purge_name	The name of the purge job for which the interval is being set. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.
audit_trail_interval_value	The interval, in hours, at which the clean up procedure should be called. This value modifies the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure

Usage Notes

Use this procedure to modify the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure.

Examples

The following example calls the SET_PURGE_JOB_INTERVAL procedure to change the frequency at which the purge job called CLEANUP is invoked. The new interval is set to 24 hours.

```
BEGIN
DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
  AUDIT_TRAIL_PURGE_NAME       => 'CLEANUP',
  AUDIT_TRAIL_INTERVAL_VALUE   => 24 );
END;
/
```

SET_PURGE_JOB_STATUS Procedure

This procedure enables or disables the specified purge job. The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

```
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
   audit_trail_purge_name    IN VARCHAR2,
   audit_trail_status_value  IN PLS_INTEGER) ;
```

Parameters

Table 26–20 SET_PURGE_JOB_STATUS Procedure Parameters

Parameter	Description
audit_trail_purge_name	The name of the purge job for which the status is being set. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.
audit_trail_status_value	One of the values specified in DBMS_AUDIT_MGMT Constants - Purge Job Status. The value PURGE_JOB_ENABLE enables the specified purge job. The value PURGE_JOB_DISABLE disables the specified purge job.

Examples

The following example calls the SET_PURGE_JOB_STATUS procedure to enable the CLEANUP purge job.

```
BEGIN
DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
  audit_trail_purge_name      => 'CLEANUP',
  audit_trail_status_value    => DBMS_AUDIT_MGMT.PURGE_JOB_ENABLE);
END;
/
```

27

DBMS_AUTO_TASK_ADMIN

The DBMS_AUTO_TASK_ADMIN package provides an interface to AUTOTASK functionality. It is used by the DBA as well as Enterprise Manager to access the AUTOTASK controls. Enterprise Manager also uses the AUTOTASK Advisor.

> **See Also:** *Oracle Database Administrator's Guide* for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

- Using DBMS_AUTO_TASK_ADMIN
  - Constants
- Summary of DBMS_AUTO_TASK_ADMIN Subprograms

Using DBMS_AUTO_TASK_ADMIN

- Constants

Constants

The DBMS_AUTO_TASK_ADMIN package uses the constants shown in Table 27–1:

Table 27–1 DBMS_AUTO_TASK_ADMIN Constants

Name	Type	Value	Description
PRIORITY_MEDIUM	VARCHAR2	'MEDIUM'	Task with this priority should be executed as time permits
PRIORITY_HIGH	VARCHAR2	'HIGH'	Task with this priority should be executed within the current Maintenance Window
PRIORITY_URGENT	VARCHAR2	'URGENT'	Task with this priority is to be executed at the earliest opportunity

Summary of DBMS_AUTO_TASK_ADMIN Subprograms

Table 27–2 DBMS_XMLSTORE Package Subprograms

Method	Description
DISABLE Procedures on page 27-5	Prevents AUTOTASK from executing any requests from a specified client or operation.
ENABLE Procedures on page 27-6	Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control
GET_CLIENT_ ATTRIBUTES Procedure on page 27-7	Returns values of select client attributes
GET_P1_RESOURCES Procedure on page 27-8	Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups
OVERRIDE_PRIORITY Procedures on page 27-9	Manually overrides task priority.
SET_CLIENT_SERVICE Procedure on page 27-10	Associates an AUTOTASK Client with a specified Service
SET_P1_RESOURCES Procedure on page 27-11	Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients

DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

Syntax

Disables all AUTOTASK functionality.

```
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```
DBMS_AUTO_TASK_ADMIN.DISABLE (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   window_name       IN    VARCHAR2);
```

Parameters

Table 27–3 DISABLE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be disabled

Usage Notes

- If operation and window_name are both NULL, the client is disabled.
- If operation is not NULL, window_name is ignored and the operation is disabled
- If operation is NULL and window_name is not NULL, the client is disabled in the specified window.

ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control. Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation.Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   window_name       IN    VARCHAR2);
```

Parameters

Table 27–4 ENABLE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
window_name	Optional name of the window in which client is to be enabled

Usage Notes

- If operation and window_name are both NULL, the client is enabled.
- If operation is not NULL, window_name is ignored and the specified operation is enabled
- If operation is NULL and window_name is not NULL, the client is enabled in the specified window.

GET_CLIENT_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES(
   client_name         IN    VARCHAR2,
   service_name        OUT   VARCHAR2,
   window_group        OUT   VARCHAR2);
```

Parameters

Table 27–5 GET_CLIENT_ATTRIBUTES Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL
window_group	Name of the window group in which the client is active

GET_P1_RESOURCES Procedure

This procedure returns percent of resources allocated to each AUTOTASK High Priority Consumer Group.

Syntax

```
DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES(
   stats_group_pct     OUT   NUMBER,
   seg_group_pct       OUT   NUMBER,
   tune_group_pct      OUT   NUMBER,
   health_group_pct    OUT   NUMBER);
```

Parameters

Table 27–6 GET_P1_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seq_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

Usage Notes

Values will add up to 100%.

OVERRIDE_PRIORITY Procedures

This procedure is used to manually override task priority. This can be done at the client, operation or individual task level. This priority assignment is honored during the next maintenance window in which the named client is active. Specifically, setting the priority to URGENT causes a high priority job to be generated at the start of the maintenance window. Setting priority to CLEAR removes the override.

Syntax

Override Priority for a Client.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Override Priority for an Operation.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Override Priority for a Task.

```
DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (
   client_name       IN    VARCHAR2,
   operation         IN    VARCHAR2,
   task_target_type  IN    VARCHAR2,
   task_target_name  IN    VARCHAR2,
   priority          IN    VARCHAR2);
```

Parameters

Table 27–7 OVERRIDE_PRIORITY Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
priority	URGENT, HIGH, MEDIUM or LOW
operation	Name of the operation as specified in DBA_AUTOTASK_OPERATION View
task_target_type	Type of target to be affected, as found in V$AUTOTASK_TARGET_TYPE View
task_target_name	Name of the specific target to be affected

SET_CLIENT_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(
   client_name        IN    VARCHAR2,
   service_name       IN   VARCHAR2);
```

Parameters

Table 27–8 SET_CLIENT_SERVICE Procedure Parameters

Parameter	Description
client_name	Name of the client, as found in DBA_AUTOTASK_CLIENT View
service_name	Service name for client, may be NULL

Usage Notes

All work performed on behalf of the Client takes place only on instances where the service is enabled.

SET_P1_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES(
   stats_group_pct     OUT   NUMBER,
   seg_group_pct       OUT   NUMBER,
   tune_group_pct      OUT   NUMBER,
   health_group_pct    OUT   NUMBER);
```

Parameters

Table 27–9 SET_P1_RESOURCES Procedure Parameters

Parameter	Description
stats_group_pct	%resources for Statistics Gathering
seq_group_pct	%resources for Space Management
tune_group_pct	%resources for SQL Tuning
health_group_pct	%resources for Health Checks

Usage Notes

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.

28

DBMS_AUTO_TASK_IMMEDIATE

The `DBMS_AUTO_TASK_IMMEDIATE` package consists of one subprogram whose function is to initiate gathering of optimizer statistics without delay.

This chapter contains the following topics:

- Summary of DBMS_AUTO_TASK_IMMEDIATE Subprograms

Summary of DBMS_AUTO_TASK_IMMEDIATE Subprograms

Table 28–1 DBMS_AUTO_TASK_IMMEDIATE Subprograms

Subprogram	Description
GATHER_OPTIMIZER_STATS Procedure on page 28-3	Initiates gathering of optimizer statistics without waiting for the start of a maintenance window

GATHER_OPTIMIZER_STATS Procedure

This procedure initiates gathering of optimizer statistics without waiting for the start of a maintenance window.

Syntax

```
DBMS_AUTO_TASK_IMMEDIATE.GATHER_OPTIMIZER_STATS;
```

29

DBMS_AW_STATS

DBMS_AW_STATS contains subprograms for managing optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

> **See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topic:

- Using DBMS_AW_STATS
- Summary of DBMS_AW_STATS Subprograms

Using DBMS_AW_STATS

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.

Summary of DBMS_AW_STATS Subprograms

Table 29–1 DBMS_AW_STATS Package Subprograms

Subprogram	Description
ANALYZE Procedure on page 29-4	Generates optimizer statistics on cubes and cube dimensions.
CLEAR Procedure on page 29-7	Clears optimizer statistics from cubes and cube dimensions.

ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a cube dimension. These statistics are used to generate some execution plans, as described in "Using DBMS_AW_STATS" on page 29-2.

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

Syntax

```
DBMS_AW_STATS.ANALYZE
     (inname       IN VARCHAR2);
```

Parameters

Table 29–2 ANALYZE Procedure Parameters

Parameter	Description
`inname`	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is *`owner.cube_name`*. For a dimension, the format is *`owner.dimension_name`*.

Usage Notes

Always analyze the dimensions first, then the cube.

After analyzing a dimension, analyze all cubes that use that dimension.

Example

This sample script generates optimizer statistics on `UNITS_CUBE` and its dimensions.

```
BEGIN
     DBMS_AW_STATS.ANALYZE('time');
     DBMS_AW_STATS.ANALYZE('customer');
     DBMS_AW_STATS.ANALYZE('product');
     DBMS_AW_STATS.ANALYZE('channel');
     DBMS_AW_STATS.ANALYZE('units_cube');
END;
/
```

The following statements create and display an execution plan for a`SELECT` statement that joins columns from `UNITS_CUBE_VIEW`, `CUSTOMER_PRIMARY_VIEW`, and the `ACCOUNTS` table:

```
EXPLAIN PLAN FOR SELECT
     cu.long_description customer,
     a.city city,
     a.zip_pc zip,
     cu.level_name "LEVEL",
     round(f.sales) sales
/* From dimension views and cube view */
FROM time_calendar_view t,
     product_primary_view p,
     customer_view cu,
     channel_view ch,
     units_cube_view f,
     account a
/* Create level filters instead of GROUP BY */
WHERE t.long_description = '2004'
    AND p.level_name ='TOTAL'
    AND cu.customer_account_id like 'COMP%'
    AND ch.level_name = 'TOTAL'
/* Join dimension views to cube view */
    AND t.dim_key = f.TIME
    AND p.dim_key = f.product
    AND cu.dim_key = f.customer
    AND ch.dim_key = f.channel
    AND a.account_id = cu.customer_account_id
ORDER BY zip;
```

```
SQL>  SELECT plan_table_output FROM TABLE(dbms_xplan.display());

---------------------------------------------------

   2 - access("A"."ACCOUNT_ID"=SYS_OP_ATG(VALUE(KOKBF$),39,40,2))
   8 - filter(SYS_OP_ATG(VALUE(KOKBF$),16,17,2)='2004' AND
              SYS_OP_ATG(VALUE(KOKBF$),39,40,2) LIKE 'COMP%' AND
              SYS_OP_ATG(VALUE(KOKBF$),47,48,2)='TOTAL' AND
              SYS_OP_ATG(VALUE(KOKBF$),25,26,2)='TOTAL')
```

```
   9 - filter("A"."ACCOUNT_ID" LIKE 'COMP%')

Note
-----
   - dynamic sampling used for this statement

30 rows selected.
```

CLEAR Procedure

Clears the statistics generated by the ANALYZE Procedure.

Syntax

```
DBMS_AW_STATS.CLEAR (
          inname        IN  VARCHAR2;
```

Parameters

Table 29–3 CLEAR Procedure Parameters

Parameter	Description
inname	The qualified name of a cube or a dimension. For a cube, the format of a qualified name is *owner.cube_name*. For a dimension, the format is *owner.dimension_name*.

Examples

The following scripts clears the statistics from UNITS_CUBE and its dimensions.

```
BEGIN
     DBMS_AW_STATS.clear('units_cube');
     DBMS_AW_STATS.clear('time');
     DBMS_AW_STATS.clear('customer');
     DBMS_AW_STATS.clear('product');
     DBMS_AW_STATS.clear('channel');
END;
/
```

30

DBMS_CAPTURE_ADM

The DBMS_CAPTURE_ADM package, one of a set of Oracle Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and capture processes

This chapter contains the following topic:

- Summary of DBMS_CAPTURE_ADM Subprograms

Summary of DBMS_CAPTURE_ADM Subprograms

Table 30–1 DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
ABORT_GLOBAL_INSTANTIATION Procedure on page 30-4	Reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SCHEMA_INSTANTIATION Procedure on page 30-5	Reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION and PREPARE_TABLE_INSTANTIATION procedures
ABORT_SYNC_INSTANTIATION Procedure on page 30-6	Reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure
ABORT_TABLE_INSTANTIATION Procedure on page 30-7	Reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure
ALTER_CAPTURE Procedure on page 30-8	Alters a capture process
ALTER_SYNC_CAPTURE Procedure on page 30-13	Alters a synchronous capture
BUILD Procedure on page 30-15	Extracts the data dictionary of the current database to the redo logs and automatically specifies database supplemental logging for all primary key and unique key columns
CREATE_CAPTURE Procedure on page 30-16	Creates a capture process
CREATE_SYNC_CAPTURE Procedure on page 30-26	Creates a synchronous capture
DROP_CAPTURE Procedure on page 30-28	Drops a capture process
INCLUDE_EXTRA_ATTRIBUTE Procedure on page 30-30	Includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture
PREPARE_GLOBAL_INSTANTIATION Procedure on page 30-32	Performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SCHEMA_INSTANTIATION Procedure on page 30-33	Performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables
PREPARE_SYNC_INSTANTIATION Function on page 30-34	Performs the synchronization necessary for instantiating one or more tables at another database and returns the prepare SCN
PREPARE_TABLE_INSTANTIATION Procedure on page 30-35	Performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table
SET_PARAMETER Procedure on page 30-36	Sets a capture process parameter to the specified value

Table 30–1 (Cont.) DBMS_CAPTURE_ADM Package Subprograms

Subprogram	Description
START_CAPTURE Procedure on page 30-41	Starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue
STOP_CAPTURE Procedure on page 30-42	Stops the capture process from mining redo logs

Note: All subprograms commit unless specified otherwise.

ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures

Syntax

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION();
```

ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SCHEMA_INSTANTIATION procedure. It also reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure on tables in the specified schema.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the PREPARE_SCHEMA_INSTANTIATION procedure
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure for tables in the specified schema

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
   schema_name  IN  VARCHAR2);
```

Parameter

Table 30–2 ABORT_SCHEMA_INSTANTIATION Procedure Parameter

Parameter	Description
schema_name	The name of the schema for which to abort the effects of preparing instantiation

ABORT_SYNC_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The table_names parameter is VARCHAR2 data type in one version and DBMS_UTILITY.UNCL_ARRAY data type in the other version.

Syntax

```
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
   table_names IN VARCHAR2);

DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
   table_names IN DBMS_UTILITY.UNCL_ARRAY);
```

Parameters

Table 30–3 ABORT_SYNC_INSTANTIATION Procedure Parameter

Parameter	Description
table_names	When the table_names parameter is VARCHAR2 data type, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries. When the table_names parameter is DBMS_UTILITY.UNCL_ARRAY data type, specify a PL/SQL index-by table of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated. In either version of the procedure, specify the name of each table in the form [*schema_name*.]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.

ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_TABLE_INSTANTIATION procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the PREPARE_TABLE_INSTANTIATION procedure

Syntax

```
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
   table_name  IN  VARCHAR2);
```

Parameter

Table 30–4 ABORT_TABLE_INSTANTIATION Procedure Parameter

Parameter	Description
table_name	The name of the table for which to abort the effects of preparing instantiation, specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.

ALTER_CAPTURE Procedure

This procedure alters a capture process.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
   capture_name              IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   start_scn                 IN  NUMBER    DEFAULT NULL,
   use_database_link         IN  BOOLEAN   DEFAULT NULL,
   first_scn                 IN  NUMBER    DEFAULT NULL,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE,
   capture_user              IN  VARCHAR2  DEFAULT NULL,
   checkpoint_retention_time IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 30–5 ALTER_CAPTURE Procedure Parameters

Parameter	Description
`capture_name`	The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.
`rule_set_name`	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. To change the positive rule set for the capture process, specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a positive rule set in the `hr` schema named `job_capture_rules`, enter `hr.job_capture_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If you specify `NULL` and the `remove_rule_set` parameter is set to `FALSE`, then the procedure retains any existing positive rule set. If you specify `NULL` and the `remove_rule_set` parameter is set to `TRUE`, then the procedure removes any existing positive rule set. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process

Table 30–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified capture process. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
start_scn	A valid SCN for the database from which the capture process should start capturing changes. The SCN value be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN. An error is returned if an invalid SCN is specified or if the capture process is enabled.
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects. If NULL, then the current value of this parameter for the capture process is not changed.

Table 30–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
`first_scn`	Specifies the lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements: ▪ It must be greater than the current first SCN for the capture process. ▪ It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero. ▪ It must be less than or equal to the required checkpoint SCN for the capture process. An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" on page 30-12 for information about determining an SCN value that meets all of these conditions. When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See BUILD Procedure on page 30-15 for more information about a LogMiner data dictionary. If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN.
`negative_rule_set_name`	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. To change the negative rule set for the capture process, specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a negative rule set in the `hr` schema named `neg_capture_rules`, enter `hr.neg_capture_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If you specify `NULL` and the `remove_negative_rule_set` parameter is set to `FALSE`, then the procedure retains any existing negative rule set. If you specify `NULL` and the `remove_negative_rule_set` parameter is set to `TRUE`, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.

Table 30–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified capture process. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges: ▪ EXECUTE privilege on the rule sets used by the capture process ▪ EXECUTE privilege on all rule-based transformation functions used in the rule set These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles. The capture process is stopped and restarted automatically when you change the value of this parameter. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run.

Table 30–5 (Cont.) ALTER_CAPTURE Procedure Parameters

Parameter	Description
checkpoint_retention_time	Either the number of days that a capture process should retain checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If NULL, then the checkpoint retention time is not changed. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. **See Also:** *Oracle Streams Concepts and Administration* for more information about checkpoint retention time

Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the first_scn parameter. The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
   FROM DBA_CAPTURE;
```

ALTER_SYNC_CAPTURE Procedure

This procedure alters a synchronous capture.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE(
   capture_name   IN  VARCHAR2,
   rule_set_name  IN  VARCHAR2  DEFAULT NULL,
   capture_user   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 30–6 ALTER_SYNC_CAPTURE Procedure Parameters

Parameter	Description
`capture_name`	The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.
`rule_set_name`	The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. To change the rule set for the synchronous capture, specify an existing rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to specify a positive rule set in the `strmadmin` schema named `sync_cap_rules`, enter `strmadmin.sync_cap_rules`. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You should only specify a rule set that was created using the `DBMS_STREAMS_ADM` package. If `NULL`, then the rule set is not changed. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a synchronous capture

Table 30–6 (Cont.) ALTER_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_SYNC_CAPTURE procedure must be granted DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges: ■ EXECUTE privilege on the rule sets used by the synchronous capture ■ EXECUTE privilege on all rule-based transformation functions used in the rule set These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles. **Note:** If the specified user is dropped using DROP USER . . . CASCADE, then the capture_user setting for the synchronous capture is set to NULL automatically. You must specify a capture user before the synchronous capture can capture changes.

BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the following SQL statement:

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `first_scn`, and the other does not.

Syntax

```
DBMS_CAPTURE_ADM.BUILD(
   first_scn  OUT  NUMBER);

DBMS_CAPTURE_ADM.BUILD();
```

Parameters

Table 30–7 BUILD Procedure Parameter

Parameter	Description
`first_scn`	Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process

Usage Notes

If there are any in-flight transactions, then this procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during the data dictionary build.

You can run this procedure multiple times at a source database.

If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.

A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.

After executing this procedure, you can query the `FIRST_CHANGE#` column of the `V$ARCHIVED_LOG` dynamic performance view where the `DICTIONARY_BEGIN` column is `YES` to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes.You can specify the first SCN for a capture process when you run the `CREATE_CAPTURE` or `ALTER_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:

- *Oracle Streams Replication Administrator's Guide* for more information about creating a capture process
- Chapter 124, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
   queue_name                 IN  VARCHAR2,
   capture_name               IN  VARCHAR2,
   rule_set_name              IN  VARCHAR2  DEFAULT NULL,
   start_scn                  IN  NUMBER    DEFAULT NULL,
   source_database            IN  VARCHAR2  DEFAULT NULL,
   use_database_link          IN  BOOLEAN   DEFAULT FALSE,
   first_scn                  IN  NUMBER    DEFAULT NULL,
   logfile_assignment         IN  VARCHAR2  DEFAULT 'implicit',
   negative_rule_set_name     IN  VARCHAR2  DEFAULT NULL,
   capture_user               IN  VARCHAR2  DEFAULT NULL,
   checkpoint_retention_time  IN  NUMBER    DEFAULT 60);
```

Parameters

Table 30–8 CREATE_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [*schema_name*.]*queue_name*. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the capture process is created.
capture_name	The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner. **Note:** The capture_name setting cannot be altered after the capture process is created.

Table 30–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a capture process
start_scn	A valid SCN for the database from which the capture process should start capturing changes. An error is returned if an invalid SCN is specified. **See Also:** "Usage Notes" on page 30-20 for more information setting the start_scn parameter
source_database	The global name of the source database. The source database is where the changes to be captured originated. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for use_database_link and first_scn can be specified.

Table 30–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
use_database_link	If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. A database link with the same name as the global name of the source database must exist at the downstream database. The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary. During the creation of a downstream capture process, if the first_scn parameter is set to NULL, then the use_database_link parameter must be set to TRUE. Otherwise, an error is returned. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually: ■ Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created. ■ Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process. ■ Prepare source database objects for instantiation.
first_scn	Specifies the lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database. You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available. **See Also:** "Usage Notes" on page 30-20 for more information setting the first_scn parameter

Table 30–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
logfile_assignment	If implicit, the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database. If explicit, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the FOR *logminer_session_name* clause when the redo log file is added manually to the downstream database. If explicit, then redo transport services cannot be used to add redo log files to the capture process being created. If you specify explicit for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log. **See Also:** "Usage Notes" on page 30-20 for information about adding redo log files manually
negative_rule_set_name	The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.

Table 30–8 (Cont.) CREATE_CAPTURE Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the user who runs the CREATE_CAPTURE procedure is used. Only a user who is granted DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. **Note:** If the specified user is dropped using DROP USER... CASCADE, then the capture_user setting for the capture process is set to NULL automatically. You must specify a capture user before the capture process can run. **See Also:** "Usage Notes" on page 30-20 for more information about this parameter.
checkpoint_retention_time	Either the number of days that a capture process should retain checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. **See Also:** *Oracle Streams Concepts and Administration* for more information about checkpoint retention time

Usage Notes

Consider the following usage notes when you run this procedure:

- DBA Role Required for User Who Invokes the CREATE_CAPTURE Procedure
- Capture User Requirements
- First SCN and Start SCN Settings
- Explicit Log File Assignment

DBA Role Required for User Who Invokes the CREATE_CAPTURE Procedure

The user who invokes this procedure must be granted DBA role.

Capture User Requirements

The capture_user parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- EXECUTE privilege on the rule sets used by the capture process

- EXECUTE privilege on all rule-based transformation functions used in the positive rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.

Note:

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
- Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

First SCN and Start SCN Settings

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:

first_scn Setting	start_scn Setting	Capture Process Type	Description
Non-NULL	NULL	Local or Downstream	The new capture process is created at the local database with a new LogMiner session starting from the value specified for the first_scn parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised when the capture process is started. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.
Non-NULL	Non-NULL	Local or Downstream	If the specified value for the start_scn parameter is greater than or equal to the specified value for the first_scn parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the start_scn parameter is less than the specified value for the first_scn parameter, then an error is raised. The BUILD procedure in the DBMS_CAPTURE_ADM package is not run automatically. This procedure must have been called at least once before on the source database, and the specified first_scn must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the BUILD procedure has not been run at least once on the source database, then an error is raised. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.

first_scn Setting	start_scn Setting	Capture Process Type	Description
NULL	Non-NULL	Local	The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true: ▪ There is no existing capture process for the local source database, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the database. ▪ There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the database. In either of these cases, the BUILD procedure in the DBMS_CAPTURE_ADM package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the BUILD procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build. However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit. If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.

first_scn Setting	start_scn Setting	Capture Process Type	Description
NULL	Non-NULL	Downstream	When the CREATE_CAPTURE procedure creates a downstream capture process, the use_database_link parameter must be set to TRUE when the first_scn parameter is set to NULL. Otherwise, an error is raised. The database link is used to obtain the current SCN of the source database. The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true: ■ There is no existing capture process that captures changes to the source database at the downstream database, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database. ■ There are existing capture processes that capture changes to the source database at the downstream database, but none of the capture processes have taken a checkpoint yet, and the specified value for the start_scn parameter is greater than or equal to the current SCN for the source database. In either of these cases, the BUILD procedure in the DBMS_CAPTURE_ADM package is run during capture process creation. The first time you start the new capture process, it uses the resulting build of the source data dictionary in the redo log files copied to the downstream database to create a LogMiner data dictionary. Here, the first SCN for the new capture process corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the BUILD procedure waits until these transactions commit before completing. However, if at least one existing capture process has taken a checkpoint and captures changes to the source database at the downstream database, then the new capture process shares an existing LogMiner data dictionary with one or more of these existing capture processes. In this case, one of these existing capture processes with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit. If there is no existing capture process that captures changes to the source database at the downstream database (or no existing capture process has taken a checkpoint), and the specified start_scn parameter value is less than the current SCN for the source database, then an error is raised.
NULL	NULL	Local or Downstream	The behavior is the same as setting the first_scn parameter to NULL and setting the start_scn parameter to the current SCN of the source database.

Note: When you create a capture process using the DBMS_STREAMS_ADM package, both the first SCN and the start SCN are set to NULL during capture process creation.

See Also: BUILD Procedure on page 30-15 for more information about the BUILD procedure and the LogMiner data dictionary

Explicit Log File Assignment

If you specify explicit for the logfile_assignment parameter, then you add a redo log file manually to a downstream database using the following statement:

```
ALTER DATABASE REGISTER LOGICAL LOGFILE
   file_name FOR capture_process;
```

Here, *file_name* is the name of the redo log file being added and *capture_process* is the name of the capture process that will use the redo log file at the downstream database. The *capture_process* is equivalent to the *logminer_session_name* and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the DBMS_FILE_TRANSFER package, FTP, or some other transfer method.

> **See Also:** *Oracle Database SQL Language Reference* for more information about the ALTER DATABASE statement and *Oracle Data Guard Concepts and Administration* for more information registering redo log files

CREATE_SYNC_CAPTURE Procedure

This procedure creates a synchronous capture.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about creating a synchronous capture

Syntax

```
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE(
   queue_name     IN  VARCHAR2,
   capture_name   IN  VARCHAR2,
   rule_set_name  IN  VARCHAR2,
   capture_user   IN  VARCHAR2  DEFAULT NUL);
```

Parameters

Table 30–9 CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
queue_name	The name of the queue into which the synchronous capture enqueues changes. You must specify an existing queue in the form [*schema_name.*]*queue_name*. For example, to specify a queue in the strmadmin schema named streams_queue, enter strmadmin.streams_queue. If the schema is not specified, then the current user is the default. **Note:** The queue_name setting cannot be altered after the synchronous capture is created.
capture_name	The name of the synchronous capture being created. A NULL specification is not allowed. Do not specify an owner. **Note:** The capture_name setting cannot be altered after the synchronous capture is created.
rule_set_name	The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes. Specify an existing rule set in the form [*schema_name.*]*rule_set_name*. For example, to specify a positive rule set in the strmadmin schema named sync_cap_rules, enter strmadmin.sync_cap_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You should only specify a rule set that was created using the DBMS_STREAMS_ADM package. If NULL, then an error is returned. **Note:** Synchronous capture rules must be added to the synchronous capture rule set using the ADD_TABLE_RULES or ADD_SUBSET_RULES procedure in the DBMS_STREAMS_ADM package. A synchronous capture ignores rules added to the rule set with other procedures. **See Also:** *Oracle Streams Concepts and Administration* for more information about the changes that can be captured by a synchronous capture

Table 30–9 (Cont.) CREATE_SYNC_CAPTURE Procedure Parameters

Parameter	Description
capture_user	The user in whose security domain the synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the user who runs the CREATE_SYNC_CAPTURE procedure is used. Only a user who is granted DBA role can set a capture user. Only the SYS user can set the capture_user to SYS. **Note:** If the specified user is dropped using DROP USER . . . CASCADE, then the capture_user setting for the synchronous capture is set to NULL automatically. You must specify a capture user before the synchronous capture can capture changes. **See Also:** "Usage Notes" on page 30-27 for more information about this parameter.

Usage Notes

When the CREATE_SYNC_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.

The capture_user parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- ENQUEUE privilege on the queue specified in the queue_name parameter
- EXECUTE privilege on the rule set used by the synchronous capture
- EXECUTE privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles.

> **Note:** A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

DROP_CAPTURE Procedure

This procedure drops a capture process.

Note: A capture process must be stopped before it can be dropped.

See Also: "STOP_CAPTURE Procedure" on page 30-42

Syntax

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
   capture_name           IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 30–10 DROP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- ALL_STREAMS_RULES
- DBA_STREAMS_RULES

See Also: *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
   capture_name    IN  VARCHAR2,
   attribute_name  IN  VARCHAR2,
   include         IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 30–11 INCLUDE_EXTRA_ATTRIBUTE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.
attribute_name	The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the user who performed the change captured in the LCR. The type is VARCHAR2.
include	If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture. If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.

Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want

to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify `FALSE` for the `include` parameter.

PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure should be used to prepare the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
   supplemental_logging  IN  VARCHAR2  DEFAULT 'keys');
```

Parameter

Table 30–12 PREPARE_GLOBAL_INSTANTIATION Procedure Parameter

Parameter	Description
`supplemental_logging`	Either `none`, `keys`, or `all`. If `none` is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables. If `keys` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying `keys` does not enable supplemental logging of bitmap join index columns. If `all` is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, user-defined types, and Oracle-supplied types.

Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables. This procedure should be used to prepare the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
   schema_name           IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'keys');
```

Parameters

Table 30–13 PREPARE_SCHEMA_INSTANTIATION Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema. For example, `hr`.
`supplemental_logging`	Either `none`, `keys`, or `all`.
	If `none` is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.
	If `keys` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying `keys` does not enable supplemental logging of bitmap join index columns.
	If `all` is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, user-defined types, and Oracle-supplied types.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

PREPARE_SYNC_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function should be used to prepare one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs subsequent to the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The `table_names` parameter is `VARCHAR2` data type in one version and `DBMS_UTILITY.UNCL_ARRAY` data type in the other version.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names IN VARCHAR2)
RETURN NUMBER;

DBMS_CAPTURE_ADM.PREPARE_SYNC_INSTANTIATION(
   table_names IN DBMS_UTILITY.UNCL_ARRAY)
RETURN NUMBER;
```

Parameters

Table 30–14 PREPARE_SYNC_INSTANTIATION Function Parameter

Parameter	Description
`table_names`	When the `table_names` parameter is `VARCHAR2` data type, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries. When the `table_names` parameter is `DBMS_UTILITY.UNCL_ARRAY` data type, specify a PL/SQL index-by table of this type that contains the names of the tables to prepare for instantiation. The first table name should be at position 1, the second at position 2, and so on. The table does not need to be `NULL` terminated. In either version of the function, specify the name of each table in the form `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.

PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table. This procedure should be used to prepare the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs subsequent to the lowest SCN for an object can be used for instantiating the object.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about instantiation and supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
   table_name            IN  VARCHAR2,
   supplemental_logging  IN  VARCHAR2  DEFAULT 'keys');
```

Parameters

Table 30–15 PREPARE_TABLE_INSTANTIATION Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`supplemental_logging`	Either `none`, `keys`, or `all`.
	If `none` is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.
	If `keys` is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying `keys` does not enable supplemental logging of bitmap join index columns.
	If `all` is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, `LONG`, `LONG RAW`, user-defined types, and Oracle-supplied types.

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```
DBMS_CAPTURE_ADM.SET_PARAMETER(
   capture_name  IN  VARCHAR2,
   parameter     IN  VARCHAR2,
   value         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 30–16 SET_PARAMETER Procedure Parameters

Parameter	Description
`capture_name`	The name of the capture process. Do not specify an owner.
`parameter`	The name of the parameter you are setting. See "Capture Process Parameters" on page 30-36 for a list of these parameters.
`value`	The value to which the parameter is set. If `NULL`, then the parameter is set to its default value.

Usage Notes

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Capture Process Parameters

The following table lists the parameters for the capture process.

Table 30–17 Capture Process Parameters

Parameter Name	Possible Values	Default	Description
disable_on_limit	Y or N	N	If Y, then the capture process is disabled because it reached a value specified by the time_limit parameter or message_limit parameter. If N, then the capture process is restarted immediately after stopping because it reached a limit. When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (CP*nn*) remains the same.
downstream_real_time_mine	Y or N	Y for local capture processes N for downstream capture processes	If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement ALTER SYSTEM ARCHIVE LOG CURRENT to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. See *Oracle Streams Replication Administrator's Guide* for information about creating a real-time downstream capture process. If N, then the capture process is an archived-log downstream capture process. This parameter is ignored for local capture processes.
maximum_scn	A valid SCN or INFINITE	INFINITE	The capture process is disabled before capturing a change record with an SCN greater than or equal to the value specified. If INFINITE, then the capture process runs regardless of the SCN value.

Table 30–17 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
merge_threshold	A negative integer, 0, a positive integer, or INFINITE	60	The amount of time, in seconds, between the message creation time of the original capture process and the message creation time of the cloned capture process. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then automatic merge begins by running the MERGE_STREAMS procedure. If the difference is greater than the value specified by this parameter, then automatic merge does not begin, and the value is recorded in the LAG column of the DBA_STREAMS_SPLIT_MERGE view. The CAPTURE_MESSAGE_CREATE_TIME is recorded in the V$STREAMS_CAPTURE view. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes and the split_threshold parameter is set to a value other than INFINITE. If a negative value is specified, then automatic merge is disabled. If 0 (zero) is specified, then there must be no lag between the original capture process and the cloned capture process to begin the merge. If INFINITE is specified, then automatic merging starts immediately. **See Also:** *Oracle Streams Replication Administrator's Guide*
message_limit	A positive integer or INFINITE	INFINITE	The capture process stops after capturing the specified number of messages. If INFINITE, then the capture process continues to run regardless of the number of messages captured.
message_tracking_frequency	0 or a positive integer	2000000	The frequency at which messages captured by the capture process are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is *capture_process_name*:AUTOTRACK, where *capture_process_name* is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically. See *Oracle Streams Replication Administrator's Guide* for more information about message tracking.

Table 30–17 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
parallelism	A positive integer	1	The number of preparer servers that can concurrently mine the redo log for the capture process. A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the parallelism capture process parameter. So, if parallelism is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server. Setting the parallelism parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the PROCESSES initialization parameter is set appropriately when you set the parallelism capture process parameter. **Note:** When you change the value of this parameter, the capture process is stopped and restarted automatically. **See Also:** *Oracle Streams Concepts and Administration* for more information about capture process components
skip_autofiltered_table_ddl	Y or N	Y	If Y, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process. If N, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets. The AUTO_FILTERED column in the DBA_STREAMS_UNSUPPORTED data dictionary view shows which tables are automatically filtered by capture processes.
split_threshold	0, a positive integer, or INFINITE	1800	The amount of time, in seconds, that a stream is broken before the stream is automatically split from other streams that flow from the capture process. When a stream is split, the capture process, queue, and propagation are cloned. In this case, a stream is a flow of logical change records (LCRs) that flows from a capture process to an apply. A stream is broken when LCRs captured by the capture process cannot reach the apply process. For example, a stream is broken when the relevant propagation or apply process is disabled. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes. If 0 (zero), then automatic splitting starts immediately. If INFINITE, then automatic splitting is disabled. The stream is not split regardless of the amount of time that it is broken. This parameters is designed to be used with the merge_threshold parameter. You can monitor an automatic split and merge operation by querying the DBA_STREAMS_SPLIT_MERGE view. **See Also:** *Oracle Streams Replication Administrator's Guide*

Table 30–17 (Cont.) Capture Process Parameters

Parameter Name	Possible Values	Default	Description
`startup_seconds`	`0`, a positive integer, or `INFINITE`	`0`	The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually. If `INFINITE`, then the capture process does not start until another instantiation of the same capture process finishes.
`time_limit`	A positive integer or `INFINITE`	`INFINITE`	The capture process stops as soon as possible after the specified number of seconds since it started. If `INFINITE`, then the capture process continues to run until it is stopped explicitly.
`trace_level`	`0` or a positive integer	`0`	Set this parameter only under the guidance of Oracle Support Services.
`write_alert_log`	`Y` or `N`	`Y`	If `Y`, then the capture process writes a message to the alert log on exit. If `N`, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.

Note:

- For all parameters that are interpreted as positive integers, the maximum possible value is `4,294,967,295`. Where applicable, specify `INFINITE` for larger values.
- For parameters that require an SCN setting, any valid SCN value can be specified.

START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by c.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of a capture process.

See Also: Chapter 141, "DBMS_STREAMS_ADM"

Syntax

```
DBMS_CAPTURE_ADM.START_CAPTURE(
   capture_name  IN  VARCHAR2);
```

Parameters

Table 30–18 START_CAPTURE Procedure Parameter

Parameter	Description
capture_name	The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A NULL setting is not allowed.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup. A capture process (c*nnn*) is an Oracle background process.

STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

The stop status is persistently recorded. Hence, if the status is DISABLED, then the capture process is not started upon database instance startup.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.

Syntax

```
DBMS_CAPTURE_ADM.STOP_CAPTURE(
   capture_name  IN  VARCHAR2,
   force         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 30–19 STOP_CAPTURE Procedure Parameters

Parameter	Description
capture_name	The name of the capture process. A NULL setting is not allowed. Do not specify an owner.
force	If TRUE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then it aborts. If FALSE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then an ORA-26672 error is returned, and the capture process might continue to run.

Usage Notes

The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup. A capture process (*cnnn*) is an Oracle background process.

31

DBMS_CDC_PUBLISH

The DBMS_CDC_PUBLISH package, one of a set of Change Data Capture packages, is used by a publisher to set up an Oracle Change Data Capture system to capture and publish change data from one or more Oracle relational source tables.

Change Data Capture captures and publishes only committed data. Oracle Change Data Capture identifies new data that has been added to, updated in, or removed from relational tables, and publishes the change data in a form that is usable by subscribers.

Typically, a Change Data Capture system has one **publisher** who captures and publishes changes for any number of Oracle relational source tables. The publisher then provides subscribers (applications or individuals) with access to the published data. Subscribers access the published data using the DBMS_CDC_SUBSCRIBE package.

> **See Also:** *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture

This chapter contains the following topics:

- Using DBMS_CDC_PUBLISH
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Views
- Summary of DBMS_CDC_PUBLISH Subprograms

Using DBMS_CDC_PUBLISH

This section contains the following topics, which relate to using the `DBMS_CDC_PUBLISH` package:

- Overview
- Deprecated Subprograms
- Security Model
- Views

Overview

Through the DBMS_CDC_PUBLISH package, the publisher creates and maintains change sources, change sets, and change tables, and eventually drops them when they are no longer useful.

The publisher, typically a database administrator, is concerned primarily with the source of the data and with creating the schema objects that describe the structure of the capture system: change sources, change sets, and change tables.

Most Change Data Capture systems have one publisher and many subscribers. The publisher accomplishes the following main objectives:

1. Determines which source table changes need to be published.
2. Decides whether to capture changes asynchronously or synchronously.
3. Uses the subprograms in the DBMS_CDC_PUBLISH package to capture change data from the source tables and make it available by creating and administering the change source, change set, and change table objects.
4. Allows controlled access to subscribers by using the SQL GRANT and REVOKE statements to grant and revoke the SELECT privilege on change tables for users and roles. (This is necessary to allow the subscribers to subscribe to the change data using the DBMS_CDC_SUBSCRIBE package.)

See Also: Chapter 32, "DBMS_CDC_SUBSCRIBE" for information on the package used to subscribe to published change data

Deprecated Subprograms

> **Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11*g*:

- `DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION` with a subscription handle

  When dropping a subscription, the publisher should now specify the name of the subscription to be dropped, not the subscription handle.

- `DBMS_CDC_PUBLISH.DROP_SUBSCRIBER_VIEW`

  Dropping a subscriber view is now performed automatically by Change Data Capture.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_CDC_PUBLISH package. Additional privileges and roles are required depending on the publishing mode and whether the publisher is on the source or staging database. See the section on Granting Privileges and Roles to the Publisher in *Oracle Database Data Warehousing Guide* for details.

Views

The DBMS_CDC_PUBLISH package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_PUBLISH Subprograms

Table 31–1 describes the subprograms in the DBMS_CDC_PUBLISH supplied package and the mode or modes with which each can be used. A value of All in the Mode column indicates that the subprogram can be used with synchronous and all modes of asynchronous Change Data Capture, a value of Asynchronous in the Mode column indicates that the subprogram can be used with all modes of asynchronous Change Data Capture (HotLog, Distributed HotLog, and AutoLog).

Table 31–1 DBMS_CDC_PUBLISH Package Subprograms

Subprogram	Mode	Description
ALTER_AUTOLOG_CHANGE_SOURCE Procedure on page 31-8	Asynchronous AutoLog	Changes one or more properties of an existing AutoLog change source
ALTER_CHANGE_SET Procedure on page 31-10	All	Changes one or more of the properties of an existing change set
ALTER_CHANGE_TABLE Procedure on page 31-13	All	Adds or drops columns for an existing change table, or changes the properties of an existing change table
ALTER_HOTLOG_CHANGE_SOURCE Procedure on page 31-16	Asynchronous Distributed HotLog	Changes one or more properties of an existing Distributed HotLog change source
CREATE_AUTOLOG_CHANGE_SOURCE Procedure on page 31-18	Asynchronous AutoLog	Creates an AutoLog change source
CREATE_CHANGE_SET Procedure on page 31-20	All	Creates a change set
CREATE_CHANGE_TABLE Procedure on page 31-23	All	Creates a change table in a specified schema
CREATE_HOTLOG_CHANGE_SOURCE Procedure on page 31-27	Asynchronous Distributed HotLog	Creates a Distributed HotLog change source
DROP_CHANGE_SET Procedure on page 31-29	All	Drops an existing change set
DROP_CHANGE_SOURCE Procedure on page 31-30	Asynchronous Autolog and Asynchronous Distributed Hotlog	Drops an existing AutoLog or Distributed HotLog change source
DROP_CHANGE_TABLE Procedure on page 31-31	All	Drops an existing change table
DROP_SUBSCRIPTION Procedure on page 31-32	All	Allows a publisher to drop a subscription that was created by a subscriber
GET_DDLOPER Function on page 31-33	All	Converts a binary integer into a user friendly string that describes the DDL operation that actually took place
PURGE Procedure on page 31-34	All	Removes unneeded rows from all change tables in the staging database
PURGE_CHANGE_SET Procedure on page 31-35	All	Removes unneeded rows from all change tables in a specified change set
PURGE_CHANGE_TABLE Procedure on page 31-36	All	Removes unneeded rows from a specified change table

ALTER_AUTOLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing AutoLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_AUTOLOG_CHANGE_SOURCE(
     change_source_name  IN VARCHAR2,
     description         IN VARCHAR2 DEFAULT NULL,
     remove_description  IN CHAR DEFAULT 'N',
     first_scn           IN NUMBER DEFAULT NULL);
```

Parameters

Table 31–2 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
`change_source_name`	Name of an existing AutoLog change source. Change source names follow Oracle schema object naming rules.
`description`	New description of the change source. The description must be specified using 255 or fewer characters.
`remove_description`	A value of `'Y'` or `'N'`. If the value is `'Y'`, then the current description is changed to `NULL`. If the value is `'N'`, then the current description is unchanged. Do not specify the description parameter with this parameter.
`first_scn`	New first SCN.

Exceptions

Table 31–3 ALTER_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
`ORA-31401`	Specified change source is not an existing change source
`ORA-31445`	Invalid lock handle while acquiring lock on string
`ORA-31452`	Invalid value for parameter, expecting: `Y` or `N`
`ORA-31497`	Invalid value specified for `first_scn`
`ORA-31498`	The `description` and `remove_description` parameters cannot both be specified
`ORA-31499`	Null value specified for required parameter
`ORA-31501`	Specified change source is not an AutoLog change source
`ORA-31504`	Cannot alter or drop predefined change source
`ORA-31507`	Specified parameter value longer than maximum length

Usage Notes

- Properties supplied to this procedure with a `NULL` value are unchanged.
- This procedure can be used to change more than one property at a time.
- This procedure can be used in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

See Also: The section on asynchronous Change Data Capture and redo log files in *Oracle Database Data Warehousing Guide* for information on how the publisher can use the `ALTER_AUTOLOG_CHANGE_SOURCE` procedure in making SCN adjustments after determining which redo logs are no longer needed for an asynchronous AutoLog change set.

ALTER_CHANGE_SET Procedure

This procedure changes the properties of an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_SET(
     change_set_name         IN VARCHAR2,
     description             IN VARCHAR2 DEFAULT NULL,
     remove_description      IN CHAR DEFAULT 'N',
     enable_capture          IN CHAR DEFAULT NULL,
     recover_after_error     IN CHAR DEFAULT NULL,
     remove_ddl              IN CHAR DEFAULT NULL,
     stop_on_ddl             IN CHAR DEFAULT NULL);
```

Parameters

Table 31–4 ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
description	New description of the change set. Specify using 255 or fewer characters.
remove_ description	A value of 'Y' or 'N'. If the value is 'Y', then the current description is changed to NULL. If the value is 'N', then the current description is unchanged. Do not specify the description parameter with this parameter.
enable_capture	A value of 'Y' or 'N'. If the value is 'Y', then change data capture is enabled for this change set. If the value is 'N', then change data capture is disabled for this change set. Synchronous change sets are created with change data capture enabled. Asynchronous change sets are created with change data capture disabled.
recover_after_ error	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture will attempt to recover from earlier capture errors. If the value is 'N', then Change Data Capture will not attempt to recover from earlier capture errors.
remove_ddl	A value of 'Y' or 'N'. If the value is 'Y' and the value of the recover_after_error parameter is 'Y', then any DDL records that may have caused capture errors will be filtered out during recovery. If the value is 'N', then DDL records that may have caused capture errors will not be filtered out during recovery. This parameter has meaning only when the recover_after_error parameter is specified with a value of 'Y'.

Table 31–4 (Cont.) ALTER_CHANGE_SET Procedure Parameters

Parameter	Description
stop_on_ddl	A value of 'Y' or 'N'.
	If the value is 'Y', then Change Data Capture stops when a DDL event is detected.
	If the value is 'N', then Change Data Capture continues when a DDL event is detected.
	See the Usage Notes for additional information about this parameter.

Exceptions

Table 31–5 ALTER_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31445	Invalid lock handle while acquiring lock on string
ORA-31468	Cannot process DDL change record
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31485	Invalid database link
ORA-31498	The description and remove_description parameters cannot both be specified
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the predefined synchronous change set, SYNC_SET, cannot be altered, and the following parameters cannot be altered for publisher-defined synchronous change sets: enable_capture, recover_after_error, remove_ddl, and stop_on_ddl.
- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can alter more than one parameter at a time.
- Enabling or disabling an asynchronous HotLog or AutoLog change set starts or stops the Oracle Streams capture process and apply process underlying the change set. Enabling or disabling an asynchronous Distributed HotLog change set starts or stops the Oracle Streams apply process underlying the change set.
- The effect of the stop_on_ddl parameter is as follows:
  - When the stop_on_ddl parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity

to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the `stop_on_ddl` parameter is set to `'Y'` and any of the following statements is encountered:

* `ANALYZE TABLE`
* `LOCK TABLE`
* `GRANT` privileges to access a table
* `REVOKE` privileges to access a table
* `COMMENT` on a table
* `COMMENT` on a column

These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

– When the `stop_on_ddl` parameter is set to `'N'`, Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects change tables, that change can result in a capture error. There are also system conditions that can cause capture errors, such as being out of disk space.

See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been stopped and the DDL statement that caused it to be stopped. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

- The publisher can attempt to recover an asynchronous change set after a capture error by specifying `'Y'` for the `recover_after_error` parameter. Capture errors can occur when any of the following is true:
  – The `stop_on_ddl` parameter is set to `'Y'` and there is a DDL record in the change data. In this case, to recover from the error, the publisher must also specify `'Y'` for the `remove_ddl` parameter.
  – The `stop_on_ddl` parameter is set to `'N'` and there is a DDL record that affects capture. For example, if the publisher drops and re-creates a change table, it causes an error the next time that Change Data Capture attempts to add change data to the named change table.
  – A miscellaneous error occurs, such as running out of disk space, or a redo log file error (such as ORA-01688: unable to extend table *string.string* partition *string* by *string* in tablespace *string*).

  See Also: *Oracle Database Data Warehousing Guide* for more information on how to recover from a capture error.

ALTER_CHANGE_TABLE Procedure

This procedure adds columns to, or drops columns from, or changes the properties of, a change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_CHANGE_TABLE(
     owner                  IN VARCHAR2,
     change_table_name      IN VARCHAR2,
     operation              IN VARCHAR2,
     column_list            IN VARCHAR2,
     rs_id                  IN CHAR,
     row_id                 IN CHAR,
     user_id                IN CHAR,
     timestamp              IN CHAR,
     object_id              IN CHAR,
     source_colmap          IN CHAR,
     target_colmap          IN CHAR,
     ddl_markers            IN CHAR  DEFAULT NULL);
```

Parameters

Table 31–6 ALTER_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	The schema that owns the change table.
change_table_name	The change table that is being altered. Change table names follow the Oracle schema object naming rules.
operation	Either the value ADD or DROP to indicate whether to add or drop the user columns specified with the column_list parameter and any control columns specified by other parameters.
column_list	User column names and datatypes for each column of the source table that should be added to, or dropped from, the change table. The list is comma-delimited.

Table 31–6 (Cont.) ALTER_CHANGE_TABLE Procedure Parameters

Parameter	Description
rs_id row_id user_id timestamp object_id source_colmap target_colmap ddl_markers	Each listed parameter specifies a particular control column, as follows: ■ The rs_id parameter specifies the RSID$ control column. ■ The row_id parameter specifies the ROW_ID$ control column. ■ The user_id parameter specifies the USERNAME$ control column. ■ The timestamp parameter specifies the TIMESTAMP$ control column. ■ The object_id parameter specifies the SYS_NC_OID$ control column. ■ The source_colmap parameter specifies the SOURCE_COLMAP$ control column. ■ The target_colmap parameter specifies the TARGET_COLMAP$ control column. ■ The ddl_markers parameter tracks all DDL operations on the source table and stores information about those operations in the change table. These are the three additional control columns you get when ddl_markers is enabled. There are three values: DDLOPER$ is a bit vector that indicates what kind of DDL operation happened. (Use the procedure DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$) to get the name of the DDL operation.) DDLDESC$ is a CLOB containing the actual DDL statement executed. DDLPDOBJN$ is not used in this release. Each parameter must have a value of either 'Y' or 'N', where: ■ 'Y': Adds the specified control column to, or drops it from the change table, as indicated by the operation parameter. ■ 'N': Neither adds the specified control column, nor drops it from the change table.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns.

Exceptions

Table 31–7 ALTER_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31403	Specified change table already contains the specified column
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column *control-column-name*
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31423	Specified change table does not contain the specified column
ORA-31454	Invalid value specified for operation parameter, expecting ADD or DROP

Table 31–7 (Cont.) ALTER_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31455	Nothing to alter
ORA-31456	Error executing a procedure in the DBMS_CDC_UTILITY package
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher cannot add and drop user columns in the same call to the ALTER_CHANGE_TABLE procedure; these schema changes require separate calls.
- The publisher must not specify the name of the control columns in the column_list parameter.
- When altering an asynchronous change table, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode, the publisher also must accept the default value or specify 'N' for the row_id and username parameters when the change source is 9.2 or 10.1.

  See Also: *Oracle Database Data Warehousing Guide* for information about the impact on subscriptions when a publisher adds a column to a change table.

ALTER_HOTLOG_CHANGE_SOURCE Procedure

This procedure changes the properties of an existing Distributed HotLog change source.

Syntax

```
DBMS_CDC_PUBLISH.ALTER_HOTLOG_CHANGE_SOURCE(
     change_source_name  IN VARCHAR2,
     description         IN VARCHAR2 DEFAULT NULL,
     remove_description  IN CHAR DEFAULT 'N',
     enable_source       IN CHAR DEFAULT NULL);
```

Parameters

Table 31–8 ALTER_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
`change_source_name`	Name of an existing Distributed HotLog change source. Change source names follow Oracle schema object naming rules.
`description`	New description of the change source. The description must be specified using 255 or fewer characters.
`remove_description`	A value of `'Y'` or `'N'`. If the value is `'Y'`, then the current description is changed to `NULL`. If the value is `'N'`, then the current description is unchanged. Do not specify the description parameter with this parameter.
`enable_source`	A value of `'Y'` or `'N'`. If the value is `'Y'`, then the change source is enabled. If the value is `'N'`, then the change source is disabled.

Exceptions

Table 31–9 ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
`ORA-31401`	Change source is not an existing change source
`ORA-31455`	Nothing to `ALTER`
`ORA-31480`	Staging database and source database cannot be the same
`ORA-31481`	Change source is not a HotLog change source
`ORA-31482`	Invalid option for non-distributed HotLog change source
`ORA-31484`	Source database must be at least 9.2.0.6 or greater
`ORA-31485`	Invalid database link
`ORA-31498`	The `description` and `remove_description` parameters cannot both be specified
`ORA-31499`	Null value specified for required parameter
`ORA-31504`	Cannot alter or drop predefined change source
`ORA-31507`	Parameter value longer than maximum length
`ORA-31532`	Cannot enable change source

Table 31–9 (Cont.) ALTER_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- Properties supplied to this procedure with a NULL value are unchanged.
- This procedure can be used to change more than one property at a time.
- Enabling or disabling a Distributed HotLog change source starts or stops the Oracle Streams capture process that underlies the change source.
- This procedure cannot be used to alter the change source for the asynchronous HotLog mode of Change Database Capture. The change source for the asynchronous HotLog mode is the predefined change source, HOTLOG_SOURCE, which cannot be altered.

CREATE_AUTOLOG_CHANGE_SOURCE Procedure

This procedure creates an AutoLog change source. An AutoLog change source is based on of a set of redo log files automatically copied by redo transport services to the system on which the staging database resides.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_AUTOLOG_CHANGE_SOURCE(
     change_source_name  IN VARCHAR2,
     description         IN VARCHAR2 DEFAULT NULL,
     source_database     IN VARCHAR2,
     first_scn           IN NUMBER,
     online_log          IN CHAR DEFAULT 'N');
```

Parameters

Table 31–10 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source. Change source names follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	Global name of the change source's source database instance.
first_scn	The SCN of the start of a LogMiner dictionary that is in the change source's archived redo log files.
online_log	A value of 'Y' or 'N' If the value is 'Y', then the change source uses the AutoLog online option to hot-mine the source database online redo log to gather change data. There can only be one change source with online_log='Y' on a given staging database. If the value is 'N', then the change source uses the AutoLog archive option to get change data from archived redo log files. There can be one or more change sources with online_log='N' on a given staging database.

Exceptions

Table 31–11 CREATE_AUTOLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source specified
ORA-31497	Invalid value specified for first_scn
ORA-31499	Null value specified for required parameter
ORA-31507	Specified parameter value is longer than the maximum length
ORA-31508	Invalid parameter value for synchronous change set
ORA-31535	Cannot support change source in this configuration

Usage Notes

- The publisher can use this procedure for asynchronous Change Data Capture only.

- The publisher must take care when specifying a value for the source_database parameter. Change Data Capture does not validate this value when creating the change source. The publisher can query the GLOBAL_NAME column in the GLOBAL_NAME view at the source database for the source_database parameter value.
- The publisher must configure redo transport services to automatically copy the log files to the system on which the staging database resides.

  See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on configuring redo transport services to automatically copy the log files to the system on which the staging database resides.

- An AutoLog change source must begin with an archived redo log file that contains a LogMiner dictionary. The CREATE_AUTOLOG_CHANGE_SOURCE first_scn parameter indicates the SCN for this dictionary extraction and is the point at which the change source can begin capturing changes. The publisher can determine the value for the first_scn parameter using either of the following methods:
  - Direct DBMS_CAPTURE_ADM.BUILD to return the value when the dictionary is built:

```
SET SERVEROUTPUT ON
VARIABLE FSCN NUMBER;
BEGIN
 :FSCN := 0;
 DBMS_CAPTURE_ADM.BUILD(:FSCN);
 DBMS_OUTPUT.PUT_LINE('The first_scn value is ' || :FSCN);
END;
/
The first_scn value is 207722
```

  - Make the following query on the source database. If this query returns multiple distinct values for first_change#, then the data dictionary has been extracted more than once and the publisher should choose the first_change# value that is the most appropriate to the change source.

```
SELECT DISTINCT FIRST_CHANGE#, NAME
   FROM V$ARCHIVED_LOG
   WHERE DICTIONARY_BEGIN = 'YES';
```

  See Also: The section on performing asynchronous AutoLog publishing in *Oracle Database Data Warehousing Guide* for information on archived redo log files and the LogMiner dictionary.

- For the asynchronous mode of Change Data Capture, the amount of change data captured is dependent on the level of supplemental logging enabled at the source database.

  See Also: *Oracle Database Data Warehousing Guide* for information about supplemental logging.

CREATE_CHANGE_SET Procedure

This procedure allows the publisher to create a change set. For asynchronous HotLog and AutoLog Change Data Capture, the publisher can optionally provide beginning and ending date values at which to begin and end change data capture.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_SET(
     change_set_name        IN VARCHAR2,
     description            IN VARCHAR2 DEFAULT NULL,
     change_source_name     IN VARCHAR2,
     stop_on_ddl            IN CHAR DEFAULT 'N',
     begin_date             IN DATE DEFAULT NULL,
     end_date               IN DATE DEFAULT NULL);
```

Parameters

Table 31–12 CREATE_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set. Change set names follow the Oracle schema object naming rules.
description	Description of the change set. Specify using 255 or fewer characters.
change_source_name	Name of the existing change source to contain this change set.
stop_on_ddl	A value of 'Y' or 'N'. If the value is 'Y', then Change Data Capture stops when a DDL event is detected. If the value is 'N', then Change Data Capture continues when a DDL event is detected. See the Usage Notes for additional information about this parameter.
begin_date	Date on which the publisher wants the change set to begin capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.
end_date	Date on which the publisher wants the change set to stop capturing changes. A value for this parameter is valid for the asynchronous HotLog and AutoLog modes of Change Data Capture only.

Exceptions

Table 31–13 CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31407	The end_date must be greater than the begin_date
ORA-31408	Invalid value specified for begin_scn or end_scn
ORA-31437	Duplicate change set specified
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31483	Cannot have spaces in the parameter
ORA-31485	Invalid database link

Table 31–13 (Cont.) CREATE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31487	Cannot support begin dates or end dates in this configuration
ORA-31488	Cannot support change set in this configuration
ORA-31499	Null value specified for required parameter
ORA-31503	Invalid date supplied for begin_date or end_date
ORA-31507	Specified parameter value longer than maximum length
ORA-31508	Invalid parameter value for synchronous change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture. However, the default values for the following parameters are the only supported values for synchronous change sets: begin_date, end_date, and stop_on_ddl. The default values for the following parameters are the only supported values for asynchronous Distributed HotLog change sets: begin_date and end_date.
- When the change source is Distributed HotLog on a release of Oracle Database earlier than 10.2, Change Data Capture inserts rows into the CHANGE_PROPAGATION and CHANGE_PROPAGATION_SETS views on the staging database.
- An AutoLog online change source (created with online_log='Y') can only contain one change set.
- The begin_date and end_date parameters are optional. The publisher can specify neither of them, one of them, or both. The effect of these parameters is as follows:
  - When a begin_date is specified, changes from transactions that begin on or after that date are captured.
  - When a begin_date is not specified, capture starts with the earliest available change data.
  - When an end_date is specified, changes from transactions that are committed on or before that date are captured.
  - When an end_date is not specified, Change Data Capture continues indefinitely.
- The effect of the stop_on_ddl parameter is as follows:
  - When the stop_on_ddl parameter is set to 'Y', asynchronous Change Data Capture stops if DDL is encountered during change data capture. Some DDL statements can adversely affect capture, such as a statement that drops a source table column that is being captured. The publisher has an opportunity to analyze and adjust to DDL changes that may adversely affect change tables while capture is stopped, thereby preventing possible errors during capture.

    Because these statements do not affect the column data itself, Change Data Capture does not stop capturing change data when the stop_on_ddl parameter is set to 'Y' and any of the following statements is encountered:

    * ANALYZE TABLE
    * LOCK TABLE
    * GRANT privileges to access a table

  * `REVOKE` privileges to access a table
  * `COMMENT` on a table
  * `COMMENT` on a column

  These statements can be issued on the source database without concern for their impact on Change Data Capture processing.

– When the `stop_on_ddl` parameter is set to `'N'`, Change Data Capture does not stop if DDL is encountered during change data capture. If a change set does not stop on DDL, but a DDL change occurs that affects capture, that change can result in a capture error.

  See Also: *Oracle Database Data Warehousing Guide* for information on the effects of, and how to recover from, a capture error.

Whenever a DDL statement causes processing to stop, a message is written to the alert log indicating for which change set processing has been terminated and the DDL statement that caused it to be terminated. Similarly, whenever DDL statements are ignored by Change Data Capture and processing continues, a message is written to the alert log indicating which DDL statement was ignored.

CREATE_CHANGE_TABLE Procedure

This procedure creates a change table in a specified schema.

> **Note:** Oracle recommends that the publisher be certain that the source table that will be referenced in a `CREATE_CHANGE_TABLE` procedure has been created prior to calling this procedure, particularly if the change set that will be specified in the procedure has the `stop_on_ddl` parameter set to `'Y'`.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_CHANGE_TABLE(
     owner                  IN VARCHAR2,
     change_table_name      IN VARCHAR2,
     change_set_name        IN VARCHAR2,
     source_schema          IN VARCHAR2,
     source_table           IN VARCHAR2,
     column_type_list       IN VARCHAR2,
     capture_values         IN VARCHAR2,
     rs_id                  IN CHAR,
     row_id                 IN CHAR,
     user_id                IN CHAR,
     timestamp              IN CHAR,
     object_id              IN CHAR,
     source_colmap          IN CHAR,
     target_colmap          IN CHAR,
     options_string         IN VARCHAR2,
     ddl_markers            IN CHAR  DEFAULT 'Y');
```

Parameters

Table 31–14 CREATE_CHANGE_TABLE Procedure Parameters

Parameter	Description
`owner`	Name of the schema that owns the change table.
`change_table_name`	Name of the change table that is being created. Change table names follow the Oracle schema object naming rules.
`change_set_name`	Name of the change set in which this change table resides.
`source_schema`	The schema where the source table is located.
`source_table`	The source table from which the change records are captured.
`column_type_list`	The user columns and datatypes that are being tracked. Specify using a comma-delimited list.
`capture_values`	One of the following capture values for update operations: ■ `OLD`: Captures the original values from the source table. ■ `NEW`: Captures the changed values from the source table. ■ `BOTH`: Captures the original and changed values from the source table.

Table 31–14 (Cont.) CREATE_CHANGE_TABLE Procedure Parameters

Parameter	Description
rs_id row_id user_id timestamp object_id source_colmap target_colmap ddl_markers	Each listed parameter specifies a particular control column as follows: ■ The rs_id parameter specifies the RSID$ control column. ■ The row_id parameter specifies the ROW_ID$ control column. ■ The user_id parameter specifies the USERNAME$ control column. ■ The timestamp parameter specifies the TIMESTAMP$ control column. ■ The object_id parameter specifies the SYS_NC_OID$ control column. ■ The source_colmap parameter specifies the SOURCE_COLMAP$ control column. ■ The target_colmap parameter specifies the TARGET_COLMAP$ control column. ■ The ddl_markers parameter tracks all DDL operations on the source table and stores information about those operations in the change table. There are three values: DDLOPER$ is a bit vector that indicates what kind of DDL operation happened. (Use the procedure DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$) to get the name of the DDL operation.) DDLDESC$ is a CLOB containing the actual DDL statement executed. DDLPDOBJN$ is not used in this release. Each parameter can have a value of 'Y' or 'N', where: ■ 'Y': Adds the specified control column to the change table. ■ 'N': Does not add the specified control column to the change table.
options_string	The syntactically correct options to be passed to a CREATE TABLE DDL statement. The options string is appended to the generated CREATE TABLE DDL statement after the closing parenthesis that defines the columns of the table. See the Usage Notes for more information.

See Also: *Oracle Database Data Warehousing Guide* for a complete description of control columns

Exceptions

Table 31–15 CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31402	Unrecognized parameter specified
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31416	Invalid SOURCE_COLMAP value
ORA-31417	Column list contains control column *control-column-name*
ORA-31418	Specified source schema does not exist
ORA-31419	Specified source table does not exist
ORA-31420	Unable to submit the purge job

Table 31–15 (Cont.) CREATE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Owner schema does not exist
ORA-31438	Duplicate change table
ORA-31447	Cannot create change tables in the SYS schema
ORA-31450	Invalid value for change_table_name
ORA-31451	Invalid value for capture_values, expecting: OLD, NEW, or BOTH
ORA-31452	Invalid value for parameter, expecting: Y or N
ORA-31459	System triggers for DBMS_CDC_PUBLISH package are not installed
ORA-31467	No column found in the source table
ORA-31471	Invalid OBJECT_ID value

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- A change table is a database table that contains the change data resulting from DML statements (INSERT, UPDATE, and DELETE) made to a source table. A given change table can capture changes from only one source table.
- A change table is a database table that contains two types of columns:
  - User columns, which are copies of actual columns of source tables that reside in the change table.
  - Control columns, which maintain special metadata for each change row in the change table. Information such as the DML operation performed, the capture time (time stamp), and changed column vectors are examples of control columns. The publisher must not specify the name of the control columns in the user column list.
- If there are multiple publishers on the staging database for the Distributed HotLog mode of Change Data capture, and one publisher defines a change table in another publisher's Distributed HotLog change set, then Change Data Capture uses the database link established by the publisher who created the change set to access the source database. Therefore, the database link to the source database established by the publisher who created the change set must be intact for the change table to be successfully created. If the change set publisher's database link is not present when creating a change table, an error is returned indicating that the connection description for the remote database was not found.
- The publisher must not attempt to control a change table's partitioning properties. Change Data Capture automatically manages the change table partitioning as part of its change table management.
- When creating a change table for any mode of asynchronous Change Data Capture, the publisher must accept the default value or specify 'N' for the source_colmap and object_id parameters. In addition, for the asynchronous Distributed HotLog mode of Change Data Capture, the publisher also must accept the default value or specify 'N' for the row_id and username parameters when the change source is 9.2 or 10.1.

- When the publisher specifies the `rs_id` parameter, the `RSID$` column is added to the change table. The `RSID$` column value reflects an operation's capture order within a transaction, but not across transactions. The publisher cannot use the `RSID$` column value by itself to order committed operations across transactions; it must be used in conjunction with the `CSCN$` column value.
- The publisher can control a change table's physical properties, tablespace properties, and so on, by specifying the `options_string` parameter. With the `options_string` parameter, the publisher can set any option that is valid for the `CREATE TABLE` DDL statement (except for partitioning properties).

  Note: How the publisher defines the `options_string` parameter can have an effect on the performance and operations in a Change Data Capture system. For example, if the publisher places several constraints in the options column, it can have a noticeable effect on performance. Also, if the publisher uses `NOT NULL` constraints and a particular column is not changed in an incoming change row, then the constraint can cause the `INSERT` operation to fail and the transaction that contains the `INSERT` operation to be rolled back.

- Oracle recommends that change tables not be created in system tablespaces. This can be accomplished if the publisher's default tablespace is not the system tablespace or if the publisher specifies a tablespace in the `options_string` parameter. If a tablespace is not specified by the publisher, and the publisher's default table space is the system tablespace, then Change Data Capture creates change tables in the system tablespace.

  See Also: *Oracle Database Data Warehousing Guide* for more information on, and examples of, creating change tables in tablespaces managed by the publisher.

CREATE_HOTLOG_CHANGE_SOURCE Procedure

This procedure creates a Distributed HotLog change source on the source database when the publisher runs this procedure from the staging database. A Distributed HotLog change source is based on data in the online redo log files that is automatically transferred to the staging database by Oracle Streams propagation.

Syntax

```
DBMS_CDC_PUBLISH.CREATE_HOTLOG_CHANGE_SOURCE(
     change_source_name     IN VARCHAR2,
     description            IN VARCHAR2 DEFAULT NULL,
     source_database        IN VARCHAR2);
```

Parameters

Table 31–16 CREATE_HOTLOG_CHANGE_SOURCE Procedure Parameters

Parameters	Description
change_source_name	Name of the Distributed HotLog change source to be created. Each change source name must be unique and must follow the Oracle schema object naming rules.
description	Description of the change source. Specify using 255 or fewer characters.
source_database	The name of the database link defined from the staging database to the source database, where the source database is Oracle9*i* Database, Database 10*g* Release 1, Oracle Database 10*g* Release 2, or Oracle Database 11g Release 1. See *Oracle Database Data Warehousing Guide* for information on creating database links for the Distributed HotLog mode of Change Data Capture.

Exceptions

Table 31–17 CREATE_HOTLOG_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31436	Duplicate change source
ORA-31480	Staging database and source database cannot be the same
ORA-31483	Cannot have spaces in the parameter
ORA-31484	Source database must be at least 9.2.0.6 or greater
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31507	Parameter value longer than the maximum length
ORA-31534	Change Data Capture publisher is missing DBA role

Usage Notes

- The publisher can use this procedure for the asynchronous Distributed HotLog mode of Change Data Capture only.

  This procedure cannot be used to create a change source for the asynchronous HotLog mode of Change Database Capture. The publisher must use the

predefined change source, HOTLOG_SOURCE, for the asynchronous HotLog mode of Change Data Capture.

- A Distributed HotLog change source can contain one or more change sets, but they must all be on the same staging database.
- A staging database publisher cannot create multiple Distributed HotLog change sources with the same name, even when those change sources are on different source databases.
- When the publisher creates a change source on a release of Oracle Database earlier than 10.2, Change Data Capture:
  - Generates names for the Streams capture process, capture queue, and propagation based on the change source name. If a generated name is already in use, an error indicating that the capture process, queue, or propagation cannot be created is returned.
  - Inserts a row into the `CHANGE_SOURCES` view on the staging database where the `SOURCE_TYPE` column of the inserted row indicates that the source Oracle Database release is earlier than 10.2.
- Note that the database link indicated by the `source_database` parameter must exist when creating, altering, or dropping a Distributed HotLog change source and the change sets and change tables it contains. However, this database link is not required for change capture to occur. Once the required Distributed HotLog change sources, change sets and change tables are in place and enabled, this database link can be dropped without interrupting change capture. This database link would need to be recreated to create, alter, or drop Distributed HotLog change sources, change sets and change tables.

DROP_CHANGE_SET Procedure

This procedure drops an existing change set that was created with the CREATE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SET(
     change_set_name     IN VARCHAR2);
```

Parameters

Table 31–18 DROP_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of the change set to be dropped. Change set names follow the Oracle schema object naming rules.

Exceptions

Table 31–19 DROP_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Specified change set is not an existing change set
ORA-31411	Specified change set is referenced by a change table
ORA-31485	Invalid database link
ORA-31499	Null value specified for required parameter
ORA-31505	Cannot alter or drop predefined change set
ORA-31507	Specified parameter value is longer than maximum length

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The change set to be dropped cannot contain any change tables.
- The predefined synchronous change set, SYNC_SET, cannot be dropped.

DROP_CHANGE_SOURCE Procedure

This procedure drops an existing AutoLog change source that was created with the CREATE_AUTOLOG_CHANGE_SOURCE procedure or an existing Distributed HotLog change source that was created with the CREATE_HOTLOG_CHANGE_SOURCE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_SOURCE(
     change_source_name    IN VARCHAR2);
```

Parameters

Table 31–20 DROP_CHANGE_SOURCE Procedure Parameters

Parameter	Description
change_source_name	Name of the change source to be dropped. Change source names follow the Oracle schema object naming rules.

Exceptions

Table 31–21 DROP_CHANGE_SOURCE Procedure Exceptions

Exception	Description
ORA-31401	Specified change source is not an existing change source
ORA-31406	Specified change source is referenced by a change set
ORA-31499	Null value specified for required parameter
ORA-31504	Cannot alter or drop predefined change source
ORA-31507	Specified parameter value longer than maximum length

Usage Notes

- The change source to be dropped cannot contain any change sets.
- The predefined change sources, HOTLOG_SOURCE and SYNC_SOURCE, cannot be dropped.

DROP_CHANGE_TABLE Procedure

This procedure drops an existing change table that was created with the CREATE_CHANGE_TABLE procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_CHANGE_TABLE(
     owner              IN VARCHAR2,
     change_table_name  IN VARCHAR2,
     force_flag         IN CHAR);
```

Parameters

Table 31–22 DROP_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Name of the schema that owns the change table.
change_table_name	Name of the change table to be dropped. Change table names follow the Oracle schema object naming rules.
force_flag	Drops the change table, depending on whether or not there are subscriptions to it, as follows: ■ 'Y': Drops the change table even if there are subscriptions to it. ■ 'N': Drops the change table only if there are no subscriptions to it.

Exceptions

Table 31–23 DROP_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist
ORA-31422	Specified owner schema does not exist
ORA-31424	Change table has active subscriptions
ORA-31441	Table is not a change table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- If the publisher wants to drop a change table while there are active subscriptions to that table, he or she must call the DROP_CHANGE_TABLE procedure using the force_flag => 'Y' parameter. This tells Change Data Capture to override its normal safeguards and allow the change table to be dropped despite active subscriptions. The subscriptions that include the dropped table will no longer be valid, and subscribers will lose access to the change data.

DROP_SUBSCRIPTION Procedure

This procedure allows a publisher to drop a subscription that was created by a subscriber with a prior call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure.

Syntax

```
DBMS_CDC_PUBLISH.DROP_SUBSCRIPTION(
     subscription_name  IN VARCHAR2);
```

Parameters

Table 31–24 DROP_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	Name of the subscription that was specified by a previous call to the DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 31–25 DROP_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31432	Invalid source table

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- This procedure works the same way as the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.
- This procedure provides the publisher with a way to drop subscriptions that have not been dropped by the subscriber. It is possible that a subscription that is no longer needed still exists and is holding change data in a change table indefinitely. The publisher can use this procedure to remove such a subscription so that a purge operation can clean up its change data. Oracle recommends that the publisher attempt to verify that the subscription is not needed prior to dropping it. If that is not possible, the publisher should inform the subscription owner that the subscription has been dropped. Ideally, subscribers drop subscriptions that are no longer needed using the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure and the publisher need not use the DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION procedure.

GET_DDLOPER Function

This function converts a binary integer into a user friendly string that describes the DDL operation that actually took place.

Syntax

```
DBMS_CDC_PUBLISH.GET_DDLOPER (ddloper IN BINARY_INTEGER)
     RETURN VARCHAR2;
```

Parameters

Table 31–26 Function Parameters

Parameter	Description
ddloper	An integer value representing what DDL operation actually occurred. This value is obtained from the ddloper$ column in the subscriber's view.

Example

The following illustrates how to use change markers. First, you execute a DDL statement and then verify that it has been captured.

```
ALTER TABLE cdc_psales DROP PARTITION Dec_06;

SELECT ddloper$, DECODE(ddloper$, NULL, 'NULL',
       DBMS_CDC_PUBLISH.GET_DDLOPER(ddloper$))
          AS DDL_OPER
FROM cdc_psales_act
WHERE DDLOPER$ IS NOT NULL
ORDER BY cscn$;

ddloper$            DDL_OPER
---------------------------------
512                 Drop Partition
1 row selected.

SELECT ddldesc$
FROM cdc_psales_act
WHERE ddloper$
IS NOT NULL
ORDER BY cscn;

DDLDESC$
------------------------
alter table cdc_psales drop partition Dec_06
1 row selected.
```

Usage Notes

- If an invalid value for ddloper is given, then 'Invalid value for DDLOPR$' will be returned by this function.
- This function only works for asynchronous Change Data Capture.

PURGE Procedure

This procedure monitors change table usage by all subscriptions, determines which rows are no longer needed by any subscriptions, and removes the unneeded rows to prevent change tables from growing indefinitely. When called, this procedure purges all change tables on the staging database.

Syntax

```
DBMS_CDC_PUBLISH.PURGE;
```

Exceptions

Only standard Oracle exceptions (for example, a privilege violation) are returned during a purge operation.

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually or automatically:
  - The publisher can run this procedure manually from the command line to purge data from change tables.
  - The publisher can run this procedure in a script to routinely perform a purge operation and control the growth of change tables.
- Note that the `DBMS_CDC_PUBLISH.PURGE` procedure (used by the publisher and the Change Data Capture default purge job) is distinct from the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure (used by subscribers). A call to the `DBMS_CDC_PUBLISH.PURGE` procedure physically removes unneeded rows from change tables. A call to the `DBMS_CDC_SUBSCRIBE.PURGE_WINDOW` procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_SET Procedure

This procedure removes unneeded rows from all change tables in the named change set. This procedure allows a finer granularity purge operation than the basic PURGE procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_SET(
    change_set_name IN VARCHAR2,
    force           IN CHAR DEFAULT 'Y',
    purge_date      IN DATE DEFAULT NULL);
```

Parameters

Table 31–27 PURGE_CHANGE_SET Procedure Parameters

Parameter	Description
change_set_name	Name of an existing change set. Change set names follow the Oracle schema object naming rules.
force	If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.
purge_date	All records that have a commit_timestamp of less than or equal to this date will be purged.

Exceptions

Table 31–28 PURGE_CHANGE_SET Procedure Exceptions

Exception	Description
ORA-31410	Change set is not an existing change set

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from change tables in a specific change set.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_SET procedure physically removes unneeded rows from change tables in the specified change set. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

PURGE_CHANGE_TABLE Procedure

This procedure removes unneeded rows from the named change table. This procedure allows a finer granularity purge operation than the basic PURGE procedure or the PURGE_CHANGE_SET procedure.

Syntax

```
DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE(
     owner               IN VARCHAR2,
     change_table_name   IN VARCHAR2,
     force               IN CHAR DEFAULT 'Y',
     purge_date          IN DATE DEFAULT NULL);
```

Parameters

Table 31–29 PURGE_CHANGE_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the named change table.
change_table_name	Name of an existing change table. Change table names follow the Oracle schema object naming rules.
force	If 'Y', try to use partition split/drop, but if the required lock cannot be acquired, use a delete statement to purge. If 'N', only use split/drop partition statements to purge. If a lock cannot be acquired, then no data will be purged.
purge_date	All records that have a commit_timestamp of less than or equal to this date will be purged.

Exceptions

Table 31–30 PURGE_CHANGE_TABLE Procedure Exceptions

Exception	Description
ORA-31421	Change table does not exist

Usage Notes

- The publisher can use this procedure for asynchronous and synchronous Change Data Capture.
- The publisher can run this procedure manually from the command line or in a script to purge unneeded rows from a specified change table.
- Note that the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure (used by the publisher) is distinct from the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure (used by subscribers). A call to the DBMS_CDC_PUBLISH.PURGE_CHANGE_TABLE procedure physically removes unneeded rows from the specified change table. A call to the DBMS_CDC_SUBSCRIBE.PURGE_WINDOW procedure, logically removes change rows from a subscription window, but does not physically remove rows from the underlying change tables.

32

DBMS_CDC_SUBSCRIBE

The DBMS_CDC_SUBSCRIBE package, one of a set of Change Data Capture packages, lets subscribers view and query change data that was captured and published with the DBMS_CDC_PUBLISH package.

A Change Data Capture system usually has one publisher and many subscribers. The **subscribers** (applications or individuals), use the Oracle supplied package, DBMS_CDC_SUBSCRIBE, to access published data.

> **See Also:** *Oracle Database Data Warehousing Guide* for information regarding Oracle Change Data Capture.

This chapter contains the following topics:

- Using DBMS_CDC_SUBSCRIBE
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Views
- Summary of DBMS_CDC_SUBSCRIBE Subprograms

Using DBMS_CDC_SUBSCRIBE

This section contains the following topics, which relate to using the `DBMS_CDC_SUBSCRIBE` package:

- Overview
- Deprecated Subprograms
- Security Model
- Views

Overview

The primary role of the subscriber is to use the change data. Through the DBMS_CDC_SUBSCRIBE package, each subscriber registers interest in source tables by subscribing to them.

Once the publisher sets up the system to capture data into change tables (which are viewed as publications by subscribers) and grants subscribers access to the change tables, subscribers can access and query the published change data for any of the source tables of interest. Using the subprograms in the DBMS_CDC_SUBSCRIBE package, the subscriber accomplishes the following main objectives:

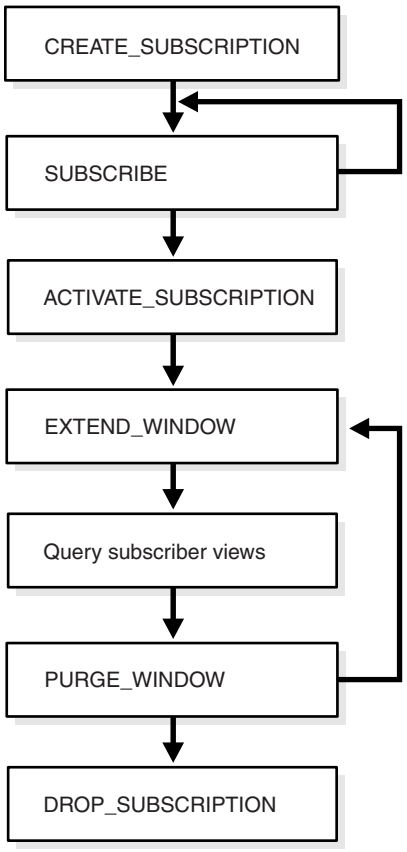
1. Indicates the change data of interest by creating a subscription and associated subscriber views on published source tables and source columns
2. Activates the subscription to indicate that the subscriber is ready to receive change data
3. Extends the subscription window to receive a new set of change data
4. Uses SQL SELECT statements to retrieve change data from the subscriber views
5. Purges the subscription window when finished processing a block of changes
6. Drops the subscription when finished with the subscription

Figure 32–1 provides a graphical flowchart of the order in which subscribers most typically use the subprograms in the DBMS_CDC_SUBSCRIBE package (which are listed in Table 32–1). A subscriber would typically create a subscription, subscribe to one or more source tables and columns, activate the subscription, extend the subscription window, query the subscriber views, purge the subscription window, and then either extend the subscription window again or drop the subscription.

Note: If a subscriber uses the PURGE_WINDOW procedure immediately after using an EXTEND_WINDOW procedure, then change data may be lost without ever being processed.

See Also: Chapter 31, "DBMS_CDC_PUBLISH" for information on the package for publishing change data.

Figure 32–1 Subscription Flow



This is a text description of arpls011.gif. This figure provides a graphical flowchart. The flowchart shows the following sequence:

1. CREATE_SUBSCRIPTION
2. SUBSCRIBE
3. Either repeat step 2 or continue to step 4
4. ACTIVATE_SUBSCRIPTION
5. EXTEND_WINDOW
6. Query subscriber views
7. PURGE_WINDOW
8. Either return to step 5 or continue to step 9
9. DROP_SUBSCRIPTION

****

Deprecated Subprograms

The following subprograms are deprecated with Oracle Database 11*g*:

- `DROP_SUBSCRIBER_VIEW`

  Subscribers no longer need to drop subscriber views. This work is now done automatically by Change Data Capture.

- `GET_SUBSCRIPTION_HANDLE`

  Subscribers no longer explicitly specify subscription handles. Subscribers should use the `CREATE_SUBSCRIPTION` procedure instead to specify a subscription name.

- `PREPARE_SUBSCRIBER_VIEW`

  Subscribers no longer need to prepare subscriber views. This work is now done automatically by Change Data Capture.

Security Model

Change Data Capture grants `EXECUTE` privileges to `PUBLIC` on the `DBMS_CDC_SUBSCRIBE` package.

Views

The DBMS_CDC_SUBSCRIBE package uses the views listed in the section on Getting Information About the Change Data Capture Environment in *Oracle Database Data Warehousing Guide*.

Summary of DBMS_CDC_SUBSCRIBE Subprograms

Table 32–1 DBMS_CDC_SUBSCRIBE Package Subprograms

Subprogram	Description
ACTIVATE_SUBSCRIPTION Procedure on page 32-9	Indicates that a subscription is ready to start accessing change data
CREATE_SUBSCRIPTION Procedure on page 32-10	Creates a subscription and associates it with one change set
DROP_SUBSCRIPTION Procedure on page 32-12	Drops a subscription that was created with a prior call to the `CREATE_SUBSCRIPTION` procedure
EXTEND_WINDOW Procedure on page 32-13	Sets a subscription window high boundary so that new change data can be seen
PURGE_WINDOW Procedure on page 32-15	Sets the low boundary for a subscription window to notify Change Data Capture that the subscriber is finished processing a set of change data
SUBSCRIBE Procedure on page 32-16	Specifies a source table and the source columns for which the subscriber wants to access change data and specifies the subscriber view through which the subscriber sees change data for the source table

ACTIVATE_SUBSCRIPTION Procedure

This procedure indicates that a subscription is ready to start accessing change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.ACTIVATE_SUBSCRIPTION (
     subscription_name  IN VARCHAR2);
```

Parameters

Table 32–2 ACTIVATE_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 32–3 ACTIVATE_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- The ACTIVATE_SUBSCRIPTION procedure indicates that the subscriber is finished subscribing to tables, and the subscription is ready to start accessing change data.
- Once the subscriber activates the subscription:
  - No additional source tables can be added to the subscription.
  - Change Data Capture holds the available data for the source tables and sets the subscription window to empty.
  - The subscriber must use the EXTEND_WINDOW procedure to see the initial set of change data.
  - The subscription cannot be activated again.
- A subscription cannot be activated if the underlying change set has reached its end_date parameter value.

CREATE_SUBSCRIPTION Procedure

This procedure creates a subscription that is associated with one change set. This procedure replaces the deprecated GET_SUBSCRIPTION_HANDLE procedure.

Syntax

```
DBMS_CDC_SUBSCRIBE.CREATE_SUBSCRIPTION (
     change_set_name      IN  VARCHAR2,
     description          IN  VARCHAR2,
     subscription_name    IN  VARCHAR2);
```

Parameters

Table 32–4 CREATE_SUBSCRIPTION Procedure Parameters

Parameter	Description
change_set_name	The name of an existing change set to which the subscriber subscribes
description	A description of the subscription (which might include, for example, the purpose for which it is used). The description must be specified using 255 or fewer characters.
subscription_name	A unique name for a subscription that must consist of 30 characters or fewer and cannot have a prefix of CDC$. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 32–5 CREATE_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31415	Specified change set does not exist
ORA-31449	Invalid value for change_set_name
ORA-31457	Maximum length of description field exceeded
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31506	Duplicate subscription name specified
ORA-31510	Name uses reserved prefix CDC$
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The CREATE_SUBSCRIPTION procedure allows a subscriber to register interest in a change set associated with source tables of interest.
- A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source tables for which the subscriber has privileges and the change sets in which the source table columns are published.
- Subscriptions are not shared among subscribers; rather, each subscription name is validated against a given subscriber's login ID.

- Subscriptions cannot be created if the underlying change set has reached its `end_date` parameter value.

DROP_SUBSCRIPTION Procedure

This procedure drops a subscription.

Syntax

```
DBMS_CDC_SUBSCRIBE.DROP_SUBSCRIPTION (
     subscription_name  IN VARCHAR2);
```

Parameters

Table 32–6 DROP_SUBSCRIPTION Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.

Exceptions

Table 32–7 DROP_SUBSCRIPTION Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist

Usage Notes

Subscribers should be diligent about dropping subscriptions that are no longer needed so that change data will not be held in the change tables unnecessarily.

EXTEND_WINDOW Procedure

This procedure sets the subscription window high boundary so that new change data can be seen.

Syntax

```
DBMS_CDC_SUBSCRIBE.EXTEND_WINDOW (
     subscription_name  IN VARCHAR2,
     upper_bound        IN DATE DEFAULT NULL);
```

Parameters

Table 32–8 EXTEND_WINDOW Procedure Parameters

Parameter	Description
subscription_name	The unique name of the subscription that was specified by a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
upper_bound	A date/timestamp to move the upper bound of the subscription window to.

Exceptions

Table 32–9 EXTEND_WINDOW Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31508	Invalid parameter value for synchronous change set
ORA-31509	Publication does not exist
ORA-31514	Change set disabled due to capture error

Usage Notes

- Until the subscriber calls the EXTEND_WINDOW procedure to begin receiving change data, the subscription window remains empty.
  - The first time that the subscriber calls the EXTEND_WINDOW procedure, it establishes the initial boundaries for the subscription window.
  - Subsequent calls to the EXTEND_WINDOW procedure extend the high boundary of the subscription window so that new change data can be seen.
- Oracle recommends that subscribers not view change tables directly. Instead, subscribers should use the DBMS_CDC_SUBSCRIBE package and access data through subscriber views only. Control column values are guaranteed to be consistent only when viewed through subscriber views that have been updated with a call to the EXTEND_WINDOW procedure.

- When the underlying change set for a subscription has reached its `end_date` parameter value, subsequent calls to the `EXTEND_WINDOW` procedure will not raise the high boundary.
- Subscriptions employing synchronous Change Data Capture are not allowed to extend the window to a specified date. Hence, the `upper_bound` parameter should not be specified.

PURGE_WINDOW Procedure

This procedure sets the low boundary of the subscription window so that the subscription no longer sees any change data, effectively making the subscription window empty. The subscriber calls this procedure to notify Change Data Capture that the subscriber is finished processing a block of change data.

Syntax

```
DBMS_CDC_SUBSCRIBE.PURGE_WINDOW (
     subscription_name   IN VARCHAR2,
     lower_bound         IN DATE DEFAULT NULL);
```

Parameters

Table 32–10 PURGE_WINDOW Procedure Parameters

Parameter	Description
subscription_name	The name of the subscription that was specified for a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
lower_bound	A date/timestamp to move the lower bound of the subscription window to.

Exceptions

Table 32–11 PURGE_WINDOW Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31429	Subscription has not been activated
ORA-31432	Invalid source table
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31514	Change set disabled due to capture error

Usage Notes

- When finished with a set of changes, the subscriber purges the subscription window with the PURGE_WINDOW procedure. By this action, the subscriber performs the following functions:
  - Informs Change Data Capture that the subscriber is finished with the current set of change data.
  - Enables Change Data Capture to remove change data that is no longer needed by any subscribers.

  Change Data Capture manages the change data to ensure that it is available as long as there are subscribers who need it.
- When the underlying change set for a subscription has reached its end_date parameter value, subsequent calls to the PURGE_WINDOW procedure will not move the low boundary.

SUBSCRIBE Procedure

This procedure specifies a source table and the source columns for which the subscriber wants to access change data. In addition, it specifies the subscriber view through which the subscriber sees change data for the source table.

Syntax

There are two versions of syntax for the SUBSCRIBE procedure, as follow:

- Using source schema and source table

  When this syntax is used, Change Data Capture will attempt to find a single publication ID that contains the specified source_table and column_list. If such a publication cannot be found, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
     subscription_name    IN VARCHAR2,
     source_schema        IN VARCHAR2,
     source_table         IN VARCHAR2,
     column_list          IN VARCHAR2,
     subscriber_view      IN VARCHAR2);
```

- Using publication IDs

  When this syntax is used, Change Data Capture will use the publication ID to identify the change table. If the columns specified in the column_list parameter are not in the identified change table, then Change Data Capture returns an error.

```
DBMS_CDC_SUBSCRIBE.SUBSCRIBE (
   subscription_name    IN VARCHAR2,
   publication_id       IN NUMBER,
   column_list          IN VARCHAR2,
   subscriber_view      IN VARCHAR2);
```

Parameters

Table 32–12 SUBSCRIBE Procedure Parameters

Parameter	Description
subscription_name	The name of a subscription that was specified for, or returned by, a previous call to the CREATE_SUBSCRIPTION procedure. Subscription names follow the Oracle schema object naming rules.
source_schema	The name of the schema where the source table resides
source_table	The name of a published source table
column_list	A comma-delimited list of columns from the published source table or publication
subscriber_view	Unique name for the subscriber view for this source table or publication that must consist of 30 or fewer characters and must not have a prefix of CDC$. Subscriber view names follow the Oracle schema object naming rules.
publication_id	A valid publication_id, which the subscriber can obtain from the ALL_PUBLISHED_COLUMNS view.

Exceptions

Table 32–13 SUBSCRIBE Procedure Exceptions

Exception	Description
ORA-31409	One or more values for input parameters are incorrect
ORA-31425	Subscription does not exist
ORA-31426	Cannot modify active subscriptions
ORA-31427	Publication string already subscribed
ORA-31428	No publication contains all the specified columns
ORA-31432	Invalid source table
ORA-31466	No publications found
ORA-31469	Cannot enable Change Data Capture for change set
ORA-31510	Name uses reserved prefix CDC$
ORA-31511	Name exceeds maximum length of 30 characters

Usage Notes

- The SUBSCRIBE procedure allows a subscriber to subscribe to one or more published source tables and to specific columns in each source table. Each call to the SUBSCRIBE procedure can specify only a single source table or publication ID. The subscriber can make multiple calls to the SUBSCRIBE procedure to include multiple source tables or publications IDs in a subscription.
- If the columns of interest are all in a single publication, the subscriber can call the SUBSCRIBE procedure using the source_schema and source_table parameters or using the publication_id parameter. However, if there are multiple publications on a single source table and these publications share some columns, and if any of the shared columns will be used by a single subscription, then the subscriber should call the SUBSCRIBE procedure using the publication_id parameter.
- The subscriber can subscribe to any valid publication ID on which the subscriber has privileges to access. The subscriber can find valid publication IDs on which the subscriber has access by querying the ALL_PUBLISHED_COLUMNS view.
- A subscriber can query the ALL_PUBLISHED_COLUMNS view to see all the published source table columns accessible to the subscriber.
- Subscriptions must be created before a subscriber calls the SUBSCRIBE procedure. Change Data Capture does not guarantee that there will be any change data available at the moment the subscription is created.
- Subscribers can subscribe only to published columns from the source table. All of the columns specified in a single call to the SUBSCRIBE procedure must come from the same publication. Any control columns associated with the underlying change table are added to the subscription automatically.
- All specified source tables or publications must be in the change set that is associated with the named subscription.
- A single source table can have more than one publication defined on it. A subscriber can subscribe to one or more of these publications. However a subscriber can subscribe to a particular publication only once.

- Each publication in a subscription has its own subscriber view. Subscriber views are used to query the change data encompassed by the subscription's current window. Subscriber views are created in the schema of the subscriber.
- A subscriber cannot subscribe to a publication within a change set that has reached its `end_date` parameter value.

DBMS_COMPARISON

The DBMS_COMPARISON package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

- Using DBMS_COMPARISON
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- Data Structures
- Summary of DBMS_COMPARISON Subprograms

See Also:

- *Oracle Database 2 Day + Data Replication and Integration Guide* for information about using the basic features of this package
- *Oracle Streams Replication Administrator's Guide* for information about using the advanced features of this package

Using DBMS_COMPARISON

This section contains topics which relate to using the `DBMS_COMPARISON` package.

- Overview
- Security Model
- Constants
- Views
- Operational Notes

Overview

The DBMS_COMPARISON package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a **shared database object**. Several data dictionary views contain information about comparisons made with the DBMS_COMPARISON package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the CREATE_COMPARE procedure in this package to create a **comparison**. The comparison identifies the database objects to compare and specifies parameters for the comparison.
2. Run the COMPARE function in this package to compare the database object at the two databases and identify differences. This function returns TRUE when no differences are found and FALSE when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the COMPARE function.
3. If you want to examine the comparison results, query the following data dictionary views:
   - DBA_COMPARISON_SCAN
   - USER_COMPARISON_SCAN
   - DBA_COMPARISON_SCAN_VALUES
   - USER_COMPARISON_SCAN_VALUES
   - DBA_COMPARISON_ROW_DIF
   - USER_COMPARISON_ROW_DIF
4. If there are differences, and you want to synchronize the database objects at the two databases, then run the CONVERGE procedure in this package.

After you create a comparison with the CREATE_COMPARISON procedure in the DBMS_COMPARISON package, you can run the comparison at any time using the COMPARE function. Each time you run the COMPARE function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the RECHECK function.

The comparison results for a single execution of the COMPARE function can include one or more **scans**. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.

A **bucket** is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the `COMPARE` function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the **parent scan** of each scan that analyzes the smaller buckets into which the larger bucket was split. The **root scan** in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the `RECHECK` function, and you can converge a scan using the `CONVERGE` procedure. When you want to recheck or converge all of the rows comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about comparisons, including detailed information about scans, buckets, parent scans, and root scans

Security Model

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

Each subprogram in the DBMS_COMPARISON package has a comparison_name parameter. The current user must be the owner of the specified comparison to run a subprogram in the DBMS_COMPARISON package.

To run the COMPARE function, RECHECK function, or CONVERGE procedure, the following users must have SELECT privilege on each copy of the shared database object:

- The comparison owner at the local database
- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The CONVERGE procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have INSERT, UPDATE, and DELETE privileges on the shared database object at this database.

In addition, when the CONVERGE procedure is run with either the local_converge_tag or remote_converge_tag parameter set to a non-NULL value, then the following additional requirements must be met:

- If the local table "wins," then the user at the remote database to which the invoker of the CONVERGE procedure connects through a database link must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- If the remote table "wins," then the invoker of the CONVERGE procedure at the local database must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.

Constants

The DBMS_COMPARISON package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_COMPARISON.CMP_SCAN_MODE_FULL.

Table 33–1 lists the parameters and enumerated constants.

Table 33–1 DBMS_COMPARISON Parameters with Enumerated Constants

Parameter	Option	Type	Description
comparison_mode	■ CMP_COMPARE_MODE_OBJECT	VARCHAR2(30)	CMP_COMPARE_MODE_OBJECT is a database object. This constant can be specified as 'OBJECT'.
scan_mode	■ CMP_SCAN_MODE_FULL ■ CMP_SCAN_MODE_RANDOM ■ CMP_SCAN_MODE_CYCLIC ■ CMP_SCAN_MODE_CUSTOM	VARCHAR2(30)	CMP_SCAN_MODE_FULL indicates that the entire database object is compared. This constant can be specified as 'FULL'. CMP_SCAN_MODE_RANDOM indicates that a random portion of the database object is compared. This constant can be specified as 'RANDOM'. CMP_SCAN_MODE_CYCLIC indicates that a portion of the database object is compared when you perform a single comparison. When you compare the database object again, another portion of the database object is compared, starting where the last comparison ended. This constant can be specified as 'CYCLIC'. CMP_SCAN_MODE_CUSTOM indicates that the user who runs the subprogram specifies the range to compare in the database object. This constant can be specified as 'CUSTOM'.
converge_options	■ CMP_CONVERGE_LOCAL_WINS ■ CMP_CONVERGE_REMOTE_WINS	VARCHAR2(30)	CMP_CONVERGE_LOCAL_WINS indicates that the column values at the local database replace the column values at the remote database when these column values are different. This constant can be specified as 'LOCAL'. CMP_CONVERGE_REMOTE_WINS indicates that the column values at the remote database replace the column values at the local database when these column values are different. This constant can be specified as 'REMOTE'.

Table 33–1 (Cont.) DBMS_COMPARISON Parameters with Enumerated Constants

Parameter	Option	Type	Description
null_value	■ CMP_NULL_VALUE_DEF	VARCHAR2(100)	CMP_NULL_VALUE_DEF indicates that ORA$STREAMS$NV is substituted for NULL values in database objects during comparison. This constant can be specified as 'ORA$STREAMS$NV'.
max_num_buckets	■ CMP_MAX_NUM_BUCKETS	INTEGER	CMP_MAX_NUM_BUCKETS indicates that the maximum number of buckets is 1,000. This constant can be specified as 1000.
min_rows_in_bucket	■ CMP_MIN_ROWS_IN_BUCKET	INTEGER	CMP_MIN_ROWS_IN_BUCKET indicates that the minimum number of rows in a bucket is 10,000. This constant can be specified as 10000.

Views

The DBMS_COMPARISON package uses the following views:

- DBA_COMPARISON
- USER_COMPARISON
- DBA_COMPARISON_COLUMNS
- USER_COMPARISON_COLUMNS
- DBA_COMPARISON_SCAN
- USER_COMPARISON_SCAN
- DBA_COMPARISON_SCAN_VALUES
- USER_COMPARISON_SCAN_VALUES
- DBA_COMPARISON_ROW_DIF
- USER_COMPARISON_ROW_DIF

Operational Notes

This section contains the following operational notes for the DBMS_COMPARISON package:

- Oracle Database Release Requirements for the DBMS_COMPARISON Package
- Database Character Set Requirements for the DBMS_COMPARISON Package
- Database Object Requirements for the DBMS_COMPARISON Package
- Index Column Requirements for the DBMS_COMPARISON Package
- Data Type Requirements for the DBMS_COMPARISON Package
- Only Converge Rows That Are Not Being Updated

Oracle Database Release Requirements for the DBMS_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the DBMS_COMPARISON package:

- The local database that runs the subprograms in the DBMS_COMPARISON package must be an Oracle Database 11*g* Release 1 (11.1) database.
- The remote database must be an Oracle Database 10*g* Release 1 (10.1) or later database. Oracle databases prior to this release and non-Oracle databases are not supported.

Database Character Set Requirements for the DBMS_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

> **See Also:** *Oracle Database Globalization Support Guide* for information about database character sets

Database Object Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare the following types of database objects:

- Tables
- Single-table views
- Materialized views
- Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the DBMS_COMPARISON package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the data types of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the columns that exist in both database objects.

See Also: CREATE_COMPARISON Procedure on page 33-20

Index Column Requirements for the DBMS_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following data types:

- Number columns are of the following data types: `NUMBER`, `FLOAT`, `BINARY_FLOAT`, and `BINARY_DOUBLE`.
- Timestamp columns are of the following data types: `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, and `TIMESTAMP WITH LOCAL TIME ZONE`
- Interval columns are of the following data types: `INTERVAL YEAR TO MONTH` and `INTERVAL DAY TO SECOND`.

For all scan modes to be supported by the `DBMS_COMPARISON` package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or `DATE` data type column
- A composite index that only includes number, timestamp, interval, or `DATE` data type columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

For the scan modes `CMP_SCAN_MODE_FULL` and `CMP_SCAN_MODE_CUSTOM` to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` data type column
- A composite index that only includes number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the `DBMS_COMPARISON` package does not support the database objects. For example, if the database objects only have a single index on an `NVARCHAR2` column, then the `DBMS_COMPARISON` package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a `NUMBER` column and an `NCHAR` column, then the `DBMS_COMPARISON` package does not support them.

You can specify an index when you create a comparison using the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint
- A unique constraint on one or more non-`NULL` columns

If these constraints are not present on a table, then use the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure to specify an index whose columns satisfy this requirement.

When a single index value identifies both a local row and a remote row, the two rows must be copies of the same row in the replicated tables. In addition, each pair of copies of the same row must always have the same index value.

The DBMS_COMPARISON package can use an index only if all of the columns in the index are included in the column_list parameter when the comparison is created with the CREATE_COMPARISON procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
  WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND
        INDEX_COLUMN    = 'Y';
```

If there is more than one index column, then the index column with 1 for the COLUMN_POSITION is the lead index column in the composite index.

See Also:

- "Constants" on page 33-6 for information about scan modes
- CREATE_COMPARISON Procedure on page 33-20 for information about specifying an index for a comparison

Data Type Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare data in columns of the following data types:

- VARCHAR2
- NVARCHAR2
- NUMBER
- FLOAT
- DATE
- BINARY_FLOAT
- BINARY_DOUBLE
- TIMESTAMP
- TIMESTAMP WITH TIME ZONE
- TIMESTAMP WITH LOCAL TIME ZONE
- INTERVAL YEAR TO MONTH
- INTERVAL DAY TO SECOND
- RAW
- CHAR
- NCHAR

If a column with data type TIMESTAMP WITH LOCAL TIME ZONE is compared, then the two databases must use the same time zone. Also, if a column with data type NVARCHAR2 or NCHAR is compared, then the two databases must use the same national character set.

The DBMS_COMPARISON package cannot compare data in columns of the following data types:

- LONG
- LONG RAW

- ROWID
- UROWID
- CLOB
- NCLOB
- BLOB
- BFILE
- User-defined types (including object types, REFs, varrays, and nested tables)
- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the supported columns in a shared database object.

See Also:

- CREATE_COMPARISON Procedure on page 33-20
- *Oracle Database SQL Language Reference* for more information about data types
- *Oracle Database Globalization Support Guide* for information about national character sets

Only Converge Rows That Are Not Being Updated

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have already been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

Attention: If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the CONVERGE procedure is run.

See Also: *Oracle Streams Replication Administrator's Guide* for information about the DBMS_COMPARISON package in an Oracle Streams replication environment

Data Structures

The DBMS_COMPARISON package defines a RECORD type.

RECORD Types

- COMPARISON_TYPE Record Type

COMPARISON_TYPE Record Type

Contains information returned by the COMPARE function or CONVERGE procedure in the DBMS_COMPARISON package.

> **Note:** The COMPARE function only returns a value for the scan_id field.

Syntax

```
TYPE COMPARISON_TYPE IS RECORD(
  scan_id            NUMBER,
  loc_rows_merged    NUMBER,
  rmt_rows_merged    NUMBER,
  loc_rows_deleted   NUMBER,
  rmt_rows_deleted   NUMBER);
```

Fields

Table 33–2 COMPARISON_TYPE Attributes

Field	Description
scan_id	The scan ID of the scan
loc_rows_merged	The number of rows in the local database object updated with information from the database object at the remote site
rmt_rows_merged	The number of rows in the database object updated at the remote site with information from the database object at the local site
loc_rows_deleted	The number of rows deleted from the local database object
rmt_rows_deleted	The number of rows deleted from the remote database object

Summary of DBMS_COMPARISON Subprograms

Table 33–3 DBMS_COMPARISON Package Subprograms

Subprogram	Description
COMPARE Function on page 33-16	Performs the specified comparison
CONVERGE Procedure on page 33-18	Executes data manipulation language (DML) changes to synchronize the portion of the database object that was compared in the specified scan
CREATE_COMPARISON Procedure on page 33-20	Creates a comparison
DROP_COMPARISON Procedure on page 33-24	Drops a comparison
PURGE_COMPARISON Procedure on page 33-25	Purges the comparison results, or a subset of the comparison results, for a comparison
RECHECK Function on page 33-26	Rechecks the differences in a specified scan for a comparison

COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the CREATE_COMPARISON procedure.

See Also:

- "Overview" on page 33-3
- CREATE_COMPARISON Procedure on page 33-20

Syntax

```
DBMS_COMPARISON.COMPARE(
   comparison_name  IN   VARCHAR2,
   scan_info        OUT  COMPARISON_TYPE,
   min_value        IN   VARCHAR2   DEFAULT NULL,
   max_value        IN   VARCHAR2   DEFAULT NULL,
   perform_row_dif  IN   BOOLEAN    DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 33–4 COMPARE Function Parameters

Parameter	Description
comparison_name	The name of the comparison.
scan_info	Information about the compare operation returned in the COMPARISON_TYPE data type. See COMPARISON_TYPE Record Type on page 33-14.
min_value	When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 33-10. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See Constants on page 33-6 for information about scan modes.

Table 33–4 (Cont.) COMPARE Function Parameters

Parameter	Description
max_value	When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the maximum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 33-10. If the scan mode is set to a value other than CMP_SCAN_MODE_CUSTOM, then this parameter must be set to NULL. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then an error is raised. To determine the scan mode for the comparison, query the DBA_COMPARISON data dictionary view. See Constants on page 33-6 for information about scan modes.
perform_row_dif	If TRUE, then compares each row individually in the database object being compared after reaching the smallest possible bucket for the comparison. If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See "Overview" on page 33-3 for information about buckets.

Return Values

This function returns TRUE when no differences are found in the database objects being compared. This function returns FALSE when differences are found in the database objects being compared.

CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

Syntax

```
DBMS_COMPARISON.CONVERGE(
   comparison_name      IN   VARCHAR2,
   scan_id              IN   NUMBER,
   scan_info            OUT  COMPARISON_TYPE,
   converge_options     IN   VARCHAR2  DEFAULT CMP_CONVERGE_LOCAL_WINS,
   perform_commit       IN   BOOLEAN   DEFAULT TRUE,
   local_converge_tag   IN   RAW       DEFAULT NULL,
   remote_converge_tag  IN   RAW       DEFAULT NULL);
```

Parameters

Table 33–5 CONVERGE Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
scan_id	The identifier for the scan that contains the differences between the database objects being converged. See "Overview" on page 33-3 for more information about specifying a scan ID in this parameter.
scan_info	Information about the converge operation returned in the COMPARISON_TYPE data type. See COMPARISON_TYPE Record Type on page 33-14.
converge_options	Either the CMP_CONVERGE_LOCAL_WINS constant or the CMP_CONVERGE_REMOTE_WINS constant. See "Constants" on page 33-6 for information about these constants.
perform_commit	If TRUE, then performs a COMMIT periodically while making the DML changes. The CONVERGE procedure might perform more than one COMMIT when this parameter is set to TRUE. If FALSE, then does not perform a COMMIT after making DML changes.
local_converge_tag	The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used. See "Security Model" on page 33-5 for information about security requirement related to this parameter, and see the *Oracle Streams Replication Administrator's Guide* for more information about tags.

Table 33–5 (Cont.) CONVERGE Procedure Parameters

Parameter	Description
remote_converge_tag	The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used. See "Security Model" on page 33-5 for information about security requirement related to this parameter, and see the *Oracle Streams Replication Administrator's Guide* for more information about tags.

Usage Notes

If one of the database objects being converged is a read-only materialized view, then the converge_options parameter must be set to ensure that the read-only materialized view "wins" in the converge operation. The CONVERGE procedure raises an error if it tries to make changes to a read-only materialized view.

CREATE_COMPARISON Procedure

This procedure creates a comparison.

Syntax

```
DBMS_COMPARISON.CREATE_COMPARISON(
   comparison_name      IN  VARCHAR2,
   schema_name          IN  VARCHAR2,
   object_name          IN  VARCHAR2,
   dblink_name          IN  VARCHAR2,
   index_schema_name    IN  VARCHAR2  DEFAULT NULL,
   index_name           IN  VARCHAR2  DEFAULT NULL,
   remote_schema_name   IN  VARCHAR2  DEFAULT NULL,
   remote_object_name   IN  VARCHAR2  DEFAULT NULL,
   comparison_mode      IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
   column_list          IN  VARCHAR2  DEFAULT '*',
   scan_mode            IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
   scan_percent         IN  NUMBER    DEFAULT NULL,
   null_value           IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
   local_converge_tag   IN  RAW       DEFAULT NULL,
   remote_converge_tag  IN  RAW       DEFAULT NULL,
   max_num_buckets      IN  NUMBER    DEFAULT CMP_MAX_NUM_BUCKETS,
   min_rows_in_bucket   IN  NUMBER    DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

Parameters

Table 33–6 CREATE_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
schema_name	The name of the schema that contains the local database object to compare.
object_name	The name of the local database object to compare.
dblink_name	Database link to the remote database. The specified database object in the remote database is compared with the database object in the local database. If NULL, then the comparison is configured to compare two database objects in the local database. In this case, parameters that specify the remote database object apply to the second database object in the comparison and to operations on the second database object. For example, specify the second database object in this procedure by using the remote_schema_name and remote_object_name parameters.
index_schema_name	The name of the schema that contains the index. If NULL, then the schema specified in the schema_name parameter is used.
index_name	The name of the index. If NULL, then the system determines the index columns for the comparison automatically. If the index_schema_name parameter is non-NULL, then the index_name parameter must also be non-NULL. Otherwise, an error is raised. **See Also:** "Usage Notes" on page 33-22 for more information about specifying an index

Table 33–6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
remote_schema_name	The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases. If NULL, then the schema specified in the schema_name parameter is used.
remote_object_name	The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases. If NULL, then the database object specified in the object_name parameter is used.
comparison_mode	Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.
column_list	Specify '*' to include all of the columns in the database objects being compared. To compare a subset of columns in the database objects, specify a comma-separated list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence. See "Usage Notes" on page 33-22 for information about columns that are required in the column_list parameter.
scan_mode	Either CMP_SCAN_MODE_FULL, CMP_SCAN_MODE_RANDOM, CMP_SCAN_MODE_CYCLIC, or CMP_SCAN_MODE_CUSTOM. If you specify CMP_SCAN_MODE_CUSTOM, then make sure you specify an index using the index_schema_name and index_name parameters. Specifying an index ensures that you can specify the correct min_value and max_value for the lead index column when you run the COMPARE or RECHECK function. See "Constants" on page 33-6 for information about these constants.
scan_percent	The percentage of the database object to scan for comparison when the scan_mode parameter is set to either CMP_SCAN_MODE_RANDOM or CMP_SCAN_MODE_CYCLIC. For these scan_mode settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_FULL, then the entire database object is scanned for comparison. If NULL and the scan_mode parameter is set to CMP_SCAN_MODE_CUSTOM, then the portion of the database object scanned for comparison is specified when the COMPARE function is run. If non-NULL and the scan_mode parameter is set to either CMP_SCAN_MODE_FULL or CMP_SCAN_MODE_CUSTOM, then the scan_percent parameter is ignored. **Note:** When the scan_percent parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified scan_percent value. See "Index Column Requirements for the DBMS_COMPARISON Package" on page 33-10 for more information about the lead index column.

Table 33–6 (Cont.) CREATE_COMPARISON Procedure Parameters

Parameter	Description
null_value	The value to substitute for each NULL in the database objects being compared. Specify a value or use the CMP_NULL_VALUE_DEF constant. If a column being compared can contain NULLs, then the value specified for this parameter must be different than any non-NULL value in the column. Otherwise, if the value specified for this parameter can appear in the column, some row differences might not be found. See "Constants" on page 33-6 for information about this constant.
local_converge_tag	The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being compared. If the local_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 33-18 for more information. See the *Oracle Streams Replication Administrator's Guide* for more information about tags.
remote_converge_tag	The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being compared. If the remote_converge_tag parameter is non-NULL in the CONVERGE procedure when comparison results for this comparison are converged, then the setting in the CONVERGE procedure takes precedence. See CONVERGE Procedure on page 33-18 for more information. See the *Oracle Streams Replication Administrator's Guide* for more information about tags.
max_num_buckets	Specify the maximum number of buckets to use. Specify a value or use the CMP_MAX_NUM_BUCKETS constant. See "Constants" on page 33-6 for information about this constant. See "Overview" on page 33-3 for information about buckets. **Note:** If an index column for a comparison is a VARCHAR2 or CHAR column, then the number of buckets might exceed the value specified for the max_num_buckets parameter.
min_rows_in_bucket	Specify the minimum number of rows in each bucket. Specify a value or use the CMP_MIN_ROWS_IN_BUCKET constant. See "Constants" on page 33-6 for information about this constant. See "Overview" on page 33-3 for information about buckets.

Usage Notes

This section contains usage notes for the CREATE_COMPARISON procedure.

Usage Notes for the index_schema_name and index_name Parameters

When you specify an index for a comparison with the index_schema_name and index_name parameters, the specified index determines the comparison's index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.

The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether or not to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in `column_list` parameter might or might not be used.

The columns in the specified index must meet the requirements described in "Index Column Requirements for the DBMS_COMPARISON Package" on page 33-10. If the index columns do not meet these requirements, then an error is raised.

> **Note:** If you do not specify an index when you create a comparison, then the `CREATE_COMPARISON` procedure selects either the primary key, if it exists, or an existing unique index. The procedure never selects a non-unique index. However, if you specify an index, then the `CREATE_COMPARISON` procedure does not check its uniqueness. Therefore, if you specify a non-unique index, and duplicate index keys exist, then the results might be incorrect when the `CONVERGE` procedure synchronizes data.

Usage Notes for the column_list Parameter

When the `column_list` parameter is set to a value other than `'*'`, the following columns are required in the `column_list` parameter:

- Any columns that are required to meet the index column requirements for the `DBMS_COMPARISON` package. If the `index_name` parameter is non-`NULL`, then the columns in the specified index must be in the column list. If the `index_name` parameter is `NULL`, then see "Index Column Requirements for the DBMS_COMPARISON Package" on page 33-10.
- If you plan to use the `CONVERGE` procedure to make changes to a database object based on the comparison, then any columns in this database object that have a `NOT NULL` constraint but no default value must be included in the column list. If these columns are not included, then the `CONVERGE` procedure returns an error. See CONVERGE Procedure on page 33-18.

DROP_COMPARISON Procedure

This procedure drops a comparison.

Syntax

```
DBMS_COMPARISON.DROP_COMPARISON(
   comparison_name  IN  VARCHAR2);
```

Parameters

Table 33–7 DROP_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.

PURGE_COMPARISON Procedure

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

> **Note:** At least one of the following parameters must be set to NULL: scan_id or purge_time. If both the scan_id and purge_time parameters are NULL, then this procedure purges all comparison results for the comparison.

Syntax

```
DBMS_COMPARISON.PURGE_COMPARISON(
   comparison_name  IN  VARCHAR2,
   scan_id          IN  NUMBER     DEFAULT NULL,
   purge_time       IN  TIMESTAMP  DEFAULT NULL);
```

Parameters

Table 33–8 PURGE_COMPARISON Procedure Parameters

Parameter	Description
comparison_name	The name of the comparison.
scan_id	The scan ID of the scan for which results are purged. The scan ID must identify a root scan. If the scan ID does not identify a root scan, then an error is raised. When a root scan ID is specified, it is purged, and all direct and indirect child scans of the specified root scan are purged. If NULL, then no scan ID is considered when purging comparison results for the comparison. See "Overview" on page 33-3 for information about scans.
purge_time	The date before which results are purged. If NULL, then no date is considered when purging comparison results for the comparison.

RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function will continue to check the database object from the point where the previous scan ended.

Note: This function does not compare the shared database object for differences that were not recorded in the specified comparison scan. To check for those differences, run the `COMPARE` function.

See Also:

- *Oracle Streams Replication Administrator's Guide*
- COMPARE Function on page 33-16

Syntax

```
DBMS_COMPARISON.RECHECK(
   comparison_name  IN  VARCHAR2,
   scan_id          IN  NUMBER,
   perform_row_dif  IN  BOOLEAN  DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 33–9 RECHECK Function Parameters

Parameter	Description
`comparison_name`	The name of the comparison.
`scan_id`	The scan ID of the scan to recheck. See "Overview" on page 33-3 for more information about specifying a scan ID in this parameter.
`perform_row_dif`	If `TRUE`, then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison. If `FALSE`, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See "Overview" on page 33-3 for information about buckets.

Return Values

This function returns `TRUE` when no differences are found in the database objects being compared. This function returns `FALSE` when differences are found in the database objects being compared.

34

DBMS_COMPRESSION

The DBMS_COMPRESSION package provides an interface to facilitate choosing the correct compression level for an application.

- *Oracle Database Concepts*
- *Oracle Database SQL Language Reference*
- *Oracle Database 2 Day + Data Warehousing Guide*
- *Oracle Database Data Warehousing Guide*
- *Oracle Database VLDB and Partitioning Guide*
- *Oracle Database Reference*

This chapter contains the following topics:

- Using DBMS_COMPRESSION
  - Overview
  - Security Model
  - Constants
  - Views
- Summary of DBMS_COMPRESSION Subprograms

Using DBMS_COMPRESSION

- Overview
- Security Model
- Constants
- Views

Overview

The DBMS_COMPRESSION package gathers compression-related information within a database environment. This includes tools for estimating compressibility of a table for both partitioned and non-partitioned tables, and gathering row-level compression information on previously compressed tables. This gives the user with adequate information to make compression-related decision.

Security Model

The DBMS_COMPRESSSION package is owned by user SYS, and must be created by SYS. The execution privilege is granted to PUBLIC. Subprograms in this package are executed using the privileges of the current user.

Constants

The DBMS_COMPRESSION package uses the constants shown in Table 34–1, " DBMS_COMPRESSION Constants - Compression Types"e:

Table 34–1 DBMS_COMPRESSION Constants - Compression Types

Constant	Type	Value	Description
COMP_NOCOMPRESS	NUMBER	1	No compression
COMP_FOR_OLTP	NUMBER	2	OLTP compression
COMP_FOR_QUERY_HIGH	NUMBER	4	High compression level for query operations
COMP_FOR_QUERY_LOW	NUMBER	8	Low compression level for query operations
COMP_FOR_ARCHIVE_HIGH	NUMBER	16	High compression level for archive operations
COMP_FOR_ARCHIVE_LOW	NUMBER	32	Low compression level for archive operations

Views

The DBMS_DST package uses views described in the *Oracle Database Reference*. The twenty catalog views that contain a COMPRESS_FOR or DEF_COMPRESS_FOR will have a list of valid displayed values to be one of the following:

- BASIC
- OLTP
- QUERY LOW
- QUERY HIGH
- ARCHIVE LOW
- ARCHIVE LOW

The affected views are:

- ALL_ALL_TABLES
- ALL_OBJECT_TABLES
- ALL_PART_TABLES
- ALL_TABLES
- ALL_TAB_PARTITIONS
- ALL_TAB_SUBPARTITIONS
- DBA_ALL_TABLES
- DBA_OBJECT_TABLES
- DBA_PART_TABLES
- DBA_TABLES
- DBA_TAB_PARTITIONS
- DBA_TAB_SUBPARTITIONS
- DBA_TABLESPACES
- USER_OBJECT_TABLES
- USER_PART_TABLES
- USER_TABLES
- USER_TAB_PARTITIONS
- USER_TABLESPACES

Summary of DBMS_COMPRESSION Subprograms

Table 34–2 DBMS_COMPRESSION Package Subprograms

Subprogram	Description
GET_COMPRESSION_RATIO Procedure on page 34-8	Analyzes the compression ratio of a table, and gives information about compressibility of a table
GET_COMPRESSION_TYPE Function on page 34-9	Returns the compression type for a specified row

GET_COMPRESSION_RATIO Procedure

This procedure analyzes the compression ratio of a table, and gives information about compressibility of a table. Various parameters can be provided by the user to selectively analyze different compression types.

Syntax

```
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (
   scratchtbsname        IN    VARCHAR2,
   ownname               IN    VARCHAR2,
   tabname               IN    VARCHAR2,
   partname              IN    VARCHAR2,
   comptype              IN    NUMBER,
   blkcnt_cmp            OUT   PLS_INTEGER,
   blkcnt_uncmp          OUT   PLS_INTEGER,
   row_perblk_cmp        OUT   PLS_INTEGER,
   row_perblk_uncmp      OUT   PLS_INTEGER,
   cmp_ratio             OUT   NUMBER,
   comptype_str          OUT   varchar2);
```

Parameters

Table 34–3 GET_COMPRESSION_RATIO Procedure Parameters

Parameter	Description
scratchtbsname	Temporary scratch tablespace that can be used for analysis
ownname	Schema of the table to analyze
tabname	Name of the table to analyze
partname	In case of partitioned tables, the related partition name
comptype	Compression types for which analysis should be performed
blkcnt_cmp	Number of blocks used by compressed sample of the table
blkcnt_uncmp	Number of blocks used by uncompressed sample of the table
row_perblk_cmp	Number of rows in a block in compressed sample of the table
row_perblk_uncmp	Number of rows in a block in uncompressed sample of the table
cmp_ratio	Compression ratio, blkcnt_uncmp divided by blkcnt_cmp
comptype_str	String describing the compression type

Usage Notes

The procedure creates different tables in the scratch tablespace and runs analysis on these objects. It does not modify anything in the user-specified tables.

GET_COMPRESSION_TYPE Function

This function returns the compression type for a specified row. If the row is chained, the function returns the compression type of the head piece only, and does not examine the intermediate or the tail piece since head pieces can be differently compressed.

Syntax

```
DBMS_COMPRESSION.GET_COMPRESSION_TYPE (
   ownname    IN    VARCHAR2,
   tabname    IN    VARCHAR2,
   row_id     IN    ROWID)
  RETURN NUMBER;
```

Parameters

Table 34–4 GET_COMPRESSION_TYPE Function Parameters

Parameter	Description
ownname	Schema name of the table
tabname	Name of table
rowid	Rowid of the row

Return Values

Flag to indicate the compression type (see DBMS_COMPRESSION Constants - Compression Types).

35

DBMS_CONNECTION_POOL

The DBMS_CONNECTION_POOL package provides an interface to manage Database Resident Connection Pool.

> **See Also:** *Oracle Database Concepts* for more information on "Database Resident Connection Pooling"

This chapter contains the following topic:

- Summary of DBMS_CONNECTION_POOL Subprograms

Summary of DBMS_CONNECTION_POOL Subprograms

Table 35–1 DBMS_CONNECTION_POOL Package Subprograms

Subprogram	Description
ALTER_PARAM Procedure on page 35-3	Alters a specific configuration parameter as a standalone unit and does not affect other parameters
CONFIGURE_POOL Procedure on page 35-4	Configures the pool with advanced options
START_POOL Procedure on page 35-6	Starts the pool for operations. It is only after this call that the pool could be used by connection clients for creating sessions
STOP_POOL Procedure on page 35-7	Stops the pool and makes it unavailable for the registered connection clients
RESTORE_DEFAULTS Procedure on page 35-8	Restores the pool to default settings

ALTER_PARAM Procedure

This procedure alters a specific configuration parameter as a standalone unit and does not affect other parameters.

Syntax

```
DBMS_CONNECTION_POOL.ALTER_PARAM (
   pool_name     IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
   param_name    IN  VARCHAR2,
   param_value   IN  VARCHAR2);
```

Parameters

Table 35–2 ALTER_PARAM Procedure Parameters

Parameter	Description
`pool_name`	Pool to be configured. Currently only the default pool name is supported.
`param_name`	Any parameter name from `CONFIGURE_POOL`
`param_value`	Parameter value for `param_name`.

Exceptions

Table 35–3 ALTER_PARAM Procedure Exceptions

Exception	Description
`ORA-56500`	Connection pool not found
`ORA-56504`	Invalid connection pool configuration parameter name
`ORA-56505`	Invalid connection pool configuration parameter value
`ORA-56507`	Connection pool alter configuration failed

Examples

```
DBMS_CONNECTION_POOL.ALTER_PARAM(
   'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');
```

CONFIGURE_POOL Procedure

This procedure configures the pool with advanced options.

Syntax

```
DBMS_CONNECTION_POOL.CONFIGURE_POOL (
   pool_name                IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
   minsize                  IN NUMBER   DEFAULT 4,
   maxsize                  IN NUMBER   DEFAULT 40,
   incrsize                 IN NUMBER   DEFAULT 2,
   session_cached_cursors   IN NUMBER   DEFAULT 20,
   inactivity_timeout       IN NUMBER   DEFAULT 300,
   max_think_time           IN NUMBER   DEFAULT 120,
   max_use_session          IN NUMBER   DEFAULT 500000,
   max_lifetime_session     IN NUMBER   DEFAULT 86400);
```

Parameters

Table 35–4 CONFIGURE_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be configured. Currently only the default pool name is supported.
minsize	Minimum number of pooled servers in the pool
maxsize	Maximum allowed pooled servers in the pool
incrsize	Pool would increment by this number of pooled server when pooled server are unavailable at application request time
session_cached_cursors	Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter
inactivity_timeout	TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.
max_think_time	Maximum time of inactivity by the client after getting a session from the pool. If the client does not issue a database call after grabbing a server from the pool, the client will be forced to relinquish control of the pooled server and will get an ORA-xxxxx error. The freed up server may or may not be returned to the pool.
max_use_session	Maximum number of times a connection can be taken and released to the pool
max_lifetime_session	TTL (Time to live) for a pooled session

Exceptions

Table 35–5 CONFIGURE_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

Usage Notes

- All expressions of time are in seconds
- All of the parameters should be set based on statistical request patterns.
- `minsize` should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.
- `maxsize` should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.
- `session_cached_cursors` is typically set to the number of most frequently used statements. It occupies cursor resource on the server
- In doubt, do not set the `increment` and `inactivity_timeout`. The pool will have reasonable defaults.
- `max_use_session` and `max_lifetime_session` allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.

START_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

Syntax

```
DBMS_CONNECTION_POOL.START_POOL (
   pool_name  IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 35–6 START_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be started. Currently only the default pool name is supported.

Exceptions

Table 35–7 START_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56501	Connection pool startup failed

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

STOP_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

Syntax

```
DBMS_CONNECTION_POOL.STOP_POOL (
   pool_name   IN   VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 35–8 STOP_POOL Procedure Parameters

Parameter	Description
pool_name	Pool to be stopped. Currently only the default pool name is supported.

Exceptions

Table 35–9 STOP_POOL Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56506	Connection pool shutdown failed

Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.

RESTORE_DEFAULTS Procedure

This procedure restores the pool to default settings.

Syntax

```
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (
   pool_name   IN  VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 35–10 RESTORE_DEFAULTS Procedure Parameters

Parameter	Description
pool_name	Pool to be restored. Currently only the default pool name is supported.

Exceptions

Table 35–11 RESTORE_DEFAULTS Procedure Exceptions

Exception	Description
ORA-56500	Connection pool not found
ORA-56507	Connection pool alter configuration failed

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.

36

DBMS_CQ_NOTIFICATION

The DBMS_CQ_NOTIFICATION package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* regarding implementing database change notification.

This chapter contains the following topics:

- Using DBMS_CQ_NOTIFICATION
  - Overview
  - Security Model
  - Constants
  - Operational Notes
  - Examples
- Data Structures
  - OBJECT Types
- Summary of DBMS_CQ_NOTIFICATION Subprograms

Using DBMS_CQ_NOTIFICATION

- Overview
- Security Model
- Constants
- Operational Notes
- Examples

Overview

The DBMS_CQ_NOTIFICATION package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and |COMMIT|s, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a BEGIN-END block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the BEGIN phase. Any queries executed subsequently (inside the registration block) are considered "interesting queries" and objects referenced by those queries during query execution are registered. The registration is completed by ENDing the registration block.

The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

Typical Applications

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

Security Model

The DBMS_CQ_NOTIFICATION package requires that the user have the CHANGE NOTIFICATION system privilege in order to receive notifications, and be granted EXECUTE privilege on the DBMS_CQ_NOTIFICATION package.

In addition the user is required to have SELECT privileges on all objects to be registered. Note that if the SELECT privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

Constants

The DBMS_CQ_NOTIFICATION package uses the constants shown in Table 36–1. The constants are used as flag parameters either during registration or when received during the notification.

The DBMS_CQ_NOTIFICATION package has sets of constants:

- EVENT_STARTUP, EVENT_SHUTDOWN, EVENT_SHUTDOWN_ANY, EVENT_DEREG describe the type of the notification published by the database.
- INSERTOP, DELETEOP, UPDATEOP, ALTEROP, DROPOP and UNKNOWNOP describe the type of operation on a table (during a notification published by the database).
- QOS_RELIABLE, QOS_DEREG_NFY, QOS_ROWIDs describe registration Quality of Service properties that the client requires. These are specified during registration.

Table 36–1 DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
ALL_OPERATIONS	BINARY_INTEGER	0	Interested in being notified on all operations, specified as a parameter during registration
ALL_ROWS BINARY_ INTEGER	BINARY_INTEGER	1	All rows within the table may have been potentially modified
EVENT_STARTUP	BINARY_INTEGER	1	Instance startup notification
EVENT_SHUTDOWN	BINARY_INTEGER	2	Instance shutdown notification
EVENT_SHUTDOWN_ANY	BINARY_INTEGER	3	Any instance shutdown when running RAC
EVENT_DEREG	BINARY_INTEGER	5	Registration has been removed
EVENT_OBJCHANGE	BINARY_INTEGER	6	Notification for object change
EVENT_QUERYCHANGE CONSTANT	BINARY_INTEGER	7	Notification for query result set change
INSERTOP	BINARY_INTEGER	2	Insert operation
UPDATEOP	BINARY_INTEGER	4	Update operation
DELETEOP	BINARY_INTEGER	8	Delete operation
ALTEROP	BINARY_INTEGER	16	Table altered
DROPOP	BINARY_INTEGER	32	Table dropped
UNKNOWNOP	BINARY_INTEGER	64	Unknown operation
QOS_RELIABLE	BINARY_INTEGER	1	Reliable or persistent notification. Also implies that the notifications will be inserted into the persistent storage atomically with the committing transaction that results in an object change.
QOS_DEREG_NFY	BINARY_INTEGER	2	Purge registration on first notification
QOS_ROWIDS	BINARY_INTEGER	4	Require rowids of modified rows
QOS_QUERY	BINARY_INTEGER	8	Register at query granularity
QOS_BEST_EFFORT	BINARY_INTEGER	16	Best effort evaluation

Table 36–1 (Cont.) DBMS_CQ_NOTIFICATION Constants

Name	Type	Value	Description
NTFN_GROUPING_CLASS_TIME	BINARY_INTEGER	1	Group notifications by time
NTFN_GROUPING_TYPE_SUMMARY	BINARY_INTEGER	1	Summary grouping of notifications
NTFN_GROUPING_TYPE_LAST	BINARY_INTEGER	2	Last notification in the group
NTFN_GROUPING_FOREVER	BINARY_INTEGER	-1	Repeat notifications forever

Operational Notes

With regard to object level registration:

- The notifications are published by the database when a transaction changes the registered objects and COMMITs.
- All objects referenced in the queries executed inside the registration block starting from the previous NEW_REG_START or ENABLE_REG to REG_END are considered interesting objects and added to the registration.

With regard to query result change registration:

- The notifications are published by the database when a transaction changes the result set of the registered query and COMMITs.

Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the job_queue_processes parameter set to a nonzero value? This parameter needs to be configured to a nonzero value in order to receive PL/SQL notifications through the handler.
- Are the registrations being created as a non-SYS user?
- If you are attempting DML changes on the registered object, are you COMMITing the transaction? Please note that the notifications are transactional and will be generated when the transaction COMMITs.
- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the JOBQ process that attempts to execute the procedure. The trace file would be usually named <ORACLE_SID>_j*_<PID>.trc.'

  For example, if the ORACLE_SID is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc.

  Suppose a registration is created with 'chnf_callback as the notification handler and with registration_id 100. Let us suppose the user forgets to define the chnf_callback procedure. Then the JOBQ trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
   Error in PLSQL notification of msgid:
   Queue :
   Consumer Name :
   PLSQL function :chnf_callback
   Exception Occured, Error msg:
   ORA-00604: error occurred at recursive SQL level 2
   ORA-06550: line 1, column 7:
   PLS-00201: identifier 'CHNF_CALLBACK' must be declared
   ORA-06550: line 1, column 7:
   PL/SQL: Statement ignored
```

See Also: For more information about troubleshooting Database Change Notification, see *Oracle Database Advanced Application Developer's Guide*.

Examples

Object Change Registration Example

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

The DBMS_CQ_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.
2. Create a server side stored procedure to process notifications

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
                            table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
                          row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
   regid           NUMBER;
   tbname          VARCHAR2(60);
   event_type      NUMBER;
   numtables       NUMBER;
   operation_type  NUMBER;
   numrows         NUMBER;
   row_id          VARCHAR2(20);
 BEGIN
     regid      := ntfnds.registration_id;
     numtables  := ntfnds.numtables;
     event_type := ntfnds.event_type;

  INSERT INTO nfevents VALUES(regid, event_type);
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
    FOR i IN 1..numtables LOOP
      tbname          := ntfnds.table_desc_array(i).table_name;
      operation_type  := ntfnds.table_desc_array(I). Opflags;
      INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
```

```
      /* Send the table name and operation_type to client side listener using UTL_
HTTP */
      /* If interested in the rowids, obtain them as follows */
      IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
        numrows := ntfnds.table_desc_array(i).numrows;
      ELSE
        numrows :=0;   /* ROWID INFO NOT AVAILABLE */
      END IF;

      /* The body of the loop is not executed when numrows is ZERO */
      FOR j IN 1..numrows LOOP
          Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
          INSERT INTO nfrowchanges VALUES(regid, tbname, Row_id);
         /* optionally Send out row_ids to client side listener using UTL_HTTP; */
      END LOOP;

    END LOOP;
  END IF;
  COMMIT;
END;
/
```

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (`chnf_callback`) as the name of the server side PL/SQL procedure to be executed when a notification is generated.

```
Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
  REGDS      SYS.CHNF$_REG_INFO;
  regid      NUMBER;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  qosflags   NUMBER;
BEGIN
 qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE +
         DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
DBMS_CQ_NOTIFICATION.REG_END;
END;
/
```

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any `COMMIT`ted changes to the `HR.EMPLOYEES` table. As an example, let us assume that the following update is performed on the employees table.

```
UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;
COMMIT;
```

Once the notification is processed, you will find rows which might look like the following in the `nfevents`, `nftablechanges` and `nfrowchanges` tables.

```
SQL> SELECT * FROM nfevents;

     REGID     EVENT_TYPE
---------------------------
     20045          6
```

```
SQL> SELECT * FROM nftablechanges;

  REGID      TABLE_NAME         TABLE_OPERATION
----------------------------------------
  20045      HR.EMPLOYEES            4

SQL> select * from nfrowchanges;

    REGID      TABLE_NAME          ROW_ID
-----------------------------------------------------
    20045     HR.EMPLOYEES    AAAKB/AABAAAJ8zAAF
```

Notes

1. In the above example, a registration was created on the EMPLOYEES table with 'chnf_callback' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (QOS_RELIABLE) and rowid notifications (QOS_ROWIDS)
2. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of EVENT_OBJCHANGE. In all other cases (e.g EVENT_DEREG, EVENT_SHUTDOWN), the table descriptor array should not be accessed.
3. The handler accesses the row descriptor array from the table notification descriptor only if the ALL_ROWS bit is not set in the table operation flag. If the ALL_ROWS bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like TRUNCATE that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation.

   This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1% of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

   Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier HTTP listener of its cache management system (as in the example) using UTL_HTTP. The listener could then refresh its cache by querying from the back-end database.

Query Result Change Registration Example

1. Creating a Callback

```
CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid NUMBER, event_type NUMBER);

Rem Create a table to record notification queries
```

```
CREATE TABLE nfqueries (qid NUMBER, qop NUMBER);

Rem Create a table to record changes to registered tables
CREATE TABLE nftablechanges(
       qid               NUMBER,
       table_name        VARCHAR2(100),
       table_operation   NUMBER);

Rem Create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(
       qid               NUMBER,
       table_name        VARCHAR2(100),
       row_id            VARCHAR2(2000));

CREATE OR REPLACE PROCEDURE chnf_callback
  (ntfnds IN CQ_NOTIFICATION$_DESCRIPTOR)
IS
  regid           NUMBER;
  tbname          VARCHAR2(60);
  event_type      NUMBER;
  numtables       NUMBER;
  operation_type  NUMBER;
  numrows         NUMBER;
  row_id          VARCHAR2(2000);
  numqueries      NUMBER;
  qid NUMBER;
  qop NUMBER;

BEGIN
  regid := ntfnds.registration_id;
  event_type := ntfnds.event_type;
  INSERT INTO nfevents VALUES(regid, event_type);
  numqueries :=0;
  IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_QUERYCHANGE) THEN
      numqueries := ntfnds.query_desc_array.count;
      FOR i in 1..numqueries LOOP
         qid := ntfnds.QUERY_DESC_ARRAY(i).queryid;
         qop := ntfnds.QUERY_DESC_ARRAY(i).queryop;
         INSERT INTO nfqueries VALUES(qid, qop);
         numtables := 0;
         numtables := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array.count;
         FOR j IN 1..numtables LOOP
           tbname := ntfnds.QUERY_DESC_ARRAY(i).table_desc_array(j).table_name;
           operation_type := ntfnds.QUERY_DESC_ARRAY(i).table_desc_
array(j).Opflags;
           INSERT INTO nftablechanges VALUES(qid, tbname, operation_type);
           IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0)
           THEN
             numrows := ntfnds.query_desc_array(i).table_desc_array(j).numrows;
           ELSE
             numrows :=0;   /* ROWID INFO NOT AVAILABLE */
           END IF;

            /* The body of the loop is not executed when numrows is ZERO */
            FOR k IN 1..numrows LOOP
               Row_id := ntfnds.query_desc_array(i).table_desc_array(j).row_
desc_array(k).row_id;
               INSERT INTO nfrowchanges VALUES(qid, tbname, Row_id);
```

```
           END LOOP;  /* loop over rows */
         END LOOP;     /* loop over tables */
       END LOOP;        /* loop over queries */
  END IF;
  COMMIT;
END;
/
```

2. Creates a query registration

```
DECLARE
  reginfo    cq_notification$_reg_info;
  mgr_id     NUMBER;
  dept_id    NUMBER;
  v_cursor   SYS_REFCURSOR;
  regid      NUMBER;
BEGIN
  /* Register two queries for result-set-change notifications: */
  /* 1. Construct registration information.
        'chnf_callback' is name of notification handler.
        QOS_QUERY specifies result-set-change notifications. */

        reginfo := cq_notification$_reg_info('chnf_callback',
           DBMS_CQ_NOTIFICATION.QOS_QUERY,0, 0, 0);

  /* 2. Create registration */

        regid := DBMS_CQ_NOTIFICATION.NEW_REG_START(reginfo);

        OPEN v_cursor FOR
           SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, manager_id
           FROM HR.employees
           WHERE employee_id = 7902;
        CLOSE v_cursor;

       OPEN v_cursor for
        SELECT dbms_cq_notification.CQ_NOTIFICATION_QUERYID, department_id
        FROM HR.departments
        WHERE department_name = 'IT';
       CLOSE v_cursor;

  DBMS_CQ_NOTIFICATION.REG_END;
END;
/
```

3. After creating the query registrations, the output from `USER_CQ_NOTIFICATION_QUERIES` would appear as follows.

```
SQL> SELECT queryid, regid, to_char(querytext)
     FROM user_cq_notification_queries;

   QUERYID      REGID
---------- ----------
TO_CHAR(QUERYTEXT)
--------------------------------------------------------------------------------
-
        22         41
 SELECT HR.DEPARTMENTS.DEPARTMENT_ID  FROM HR.DEPARTMENTS  WHERE
HR.DEPARTMENTS.
DEPARTMENT_NAME  = 'IT'
```

```
        21         41
 SELECT HR.EMPLOYEES.MANAGER_ID  FROM HR.EMPLOYEES  WHERE
HR.EMPLOYEES.EMPLOYEE_
ID  = 7902

Now, let us perform an UPDATE that changes the result of the query with queryid
22
by renaming the department with name 'IT' to FINANCE.

SQL>  update departments set department_name = 'FINANCE' where department_name
= 'IT';

1 row updated.

SQL> commit;

Commit complete.

Now we can query the notifications that we recorded in the callback.

SQL> select * from nfevents;

     REGID EVENT_TYPE
---------- ----------
        61          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nfqueries;

       QID        QOP
---------- ----------
        42          7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nftablechanges;
SQL> select * from nftablechanges;

     REGID
----------
TABLE_NAME
--------------------------------------------------------------------------------
-
TABLE_OPERATION
---------------
        42
HR.DEPARTMENTS
              4

TABLE_OPERATION 4 corresponds to UPDATEOP

SQL> select * from nfrowchanges;
     REGID
----------
TABLE_NAME
```

```
--------------------------------------------------------------------------------
-
ROW_ID
--------------------------------------------------------------------------------
-
        61
HR.DEPARTMENTS
AAANkdAABAAALinAAF
```

Data Structures

The DBMS_CQ_NOTIFICATION package defines the following OBJECT types.

OBJECT Types

- CQ_NOTIFICATION$_DESCRIPTOR Object Type
- CQ_NOTIFICATION$_QUERY Object Type
- CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_TABLE Object Type
- CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_ROW Object Type
- CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_REG_INFO Object Type

CQ_NOTIFICATION$_DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the SYS.CHNF$_DESC type.

Syntax

```
TYPE SYS.CHNF$_DESC IS OBJECT(
   registration_id    NUMBER,
   transaction_id     RAW(8),
   dbname             VARCHAR2(30),
   event_type         NUMBER,
   numtables          NUMBER,
   table_desc_array   CQ_NOTIFICATION$_TABLE_ARRAY,
   query_desc_array   CQ_NOTIFICATION$_QUERY_ARRAY);
```

Attributes

Table 36–2 CQ_NOTIFICATION$_DESCRIPTOR Object Type

Attribute	Description
registration_id	Registration ID returned during registration
transaction_id	Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE or EVENT_QUERYCHANGE.
dbname	Name of database
event_type	Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, or EVENT_QUERYCHANGE, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)
numtables	Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.
table_desc_array	Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.
query_desc_array	Array of queries changed. This will be NULL unless event_type is EVENT_QUERYCHANGE

CQ_NOTIFICATION$_QUERY Object Type

The object type describes the changes to a query result caused by an event such as a transaction commit. An array of CQ_NOTIFICATION$_QUERY descriptors is embedded inside the top level notification descriptor (CQ_NOTIFICATION$_DESCRIPTOR) for events of type EVENT_QUERYCHANGE. The array corresponds to the SET of queryids which were invalidated as a result of the event.

This is a synonym for the base type SYS.CHNF$_QDESC.

Syntax

```
TYPE SYS.CHNF$_QDESC IS OBJECT (
  queryid            NUMBER,
  queryop            NUMBER,
  table_desc_array   CQ_NOTIFICATION$_TABLE_ARRAY);
```

Attributes

Table 36–3 TYPE SYS.CQ_NOTIFICATION$_QUERY Object Type

Attribute	Description
queryid	QueryId of the changed query
queryop	Operation describing change to the query
table_desc_array	Array of table changes which contributed to the query Result Set change

CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type

This type corresponds to an array of `CQ_NOTIFICATION$_QUERY` objects. It is a synonym for the `SYS.CHNF$_QUERY_ARRAY` type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_
TABLE;
```

CQ_NOTIFICATION$_TABLE Object Type

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for events of type EVENT_OBJCHANGE For query result set changes (event type will be set to EVENT_QUERYCHANGE), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_TDESC.

Syntax

```
TYPE SYS.CHNF$_TDESC IS OBJECT (
  opflags            NUMBER,
  table_name         VARCHAR2(2*M_IDEN+1),
  numrows            NUMBER,
  row_desc_array     CQ_NOTIFICATION$_ROW_ARRAY)
```

Attributes

Table 36–4 TYPE SYS.CQ_NOTIFICATION$_TABLE Object Type

Attribute	Description
opflags	Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE * FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.
table_name	Name of modified table
numrows	Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.
row_desc_array	Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.

CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type

This type corresponds to an array of `CQ_NOTIFICATION$_TABLE` objects. It is a synonym for the `SYS.CHNF$_TDESC_ARRAY` type.

Syntax

```
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_
TABLE;
```

CQ_NOTIFICATION$_ROW Object Type

An array of CQ_NOTIFICATION$_ROW is embedded inside a CQ_NOTIFICATION$_TABLE (table change descriptor) if the QOS_ROWIDS option was chosen at the time of registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_RDESC.

Syntax

```
TYPE SYS.CHNF$_RDESC IS OBJECT (
  opflags            NUMBER,
  row_id             VARCAHR2 (2000));
```

Attributes

Table 36–5 TYPE SYS.CQ_NOTIFICATION$_ROW Object Type

Attribute	Description
opflags	Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).
row_id	The rowid of the modified row

CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type

This object type corresponds to an array of `CQ_NOTIFICATION$_ROW` objects and is embedded inside the `CQ_NOTIFICATION$_TABLE` if `QOS_ROWIDS` was specified during registration and the `ALL_ROWS` bit is not set in the `opflags` field of the table change descriptor.

This type is a synonym for the `SYS.CHNF$_RDESC_ARRAY` type.

Syntax

```
TYPE CQ_NOTIFICATION$_ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_ROW;
```

CQ_NOTIFICATION$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type `previously named SYS.CHNF$_REG_INFO`.

Syntax

```
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  transaction_lag               NUMBER,
  ntfn_grouping_class           NUMBER,
  ntfn_grouping_value           NUMBER,
  ntfn_grouping_type            NUMBER,
  ntfn_grouping_start_time      TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count    NUMBER);
```

Attributes

Table 36–6 TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
`callback`	Name of the server side PL/SQL procedure to be executed on a notification. Prototype is `<call_backname>(ntfnds IN SYS.chnf$_desc)`
`qosflags`	Quality of service flags. Can be set to an `OR` of the following values: ■ `QOS_RELIABLE` (`0x1`): Notifications are reliable (persistent) and survive instance death. This means that on an instance death in a RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/ latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown. ■ `QOS_DEREG_NFY` (`0x2`): The registration will be expunged on the first notification ■ `QOS_ROWIDS` (`0x4`): The notification needs to include information about the rowids that were modified ■ `QOS_QUERY (0x8)`: specifies query result change notification as opposed to object change notification ■ `QOS_BEST_EFFORt (0x16)`: can register simplified versions of queries and minimizes evaluation with some false positives.

Table 36–6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
timeout	If set to a nonzero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the timeout option can be combined with the purge on notification (QOS_DEREG_NFY) option as well.
operations_filter	if nonzero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types: ■ 0: Notify on all operations (DBMS_CQ_NOTIFICATION.ALL_OPERATIONS) ■ 0x2: Notify on every INSERT (DBMS_CQ_NOTIFICATION.INSERTOP) ■ 0x4: Notify on every UPDATE (DBMS_CQ_NOTIFICATION.UPDATEOP) ■ 0x8: Notify on every DELETE (DBMS_CQ_NOTIFICATION.DELETEOP) A combination of operations can be specified by using a bitwise OR. Caution: This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the "GROUPING notification" option.
transaction_lag	Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated. **Caution**: This parameter will be honored for object level registrations but ignored for query result change notification registrations.
ntfn_grouping_class	When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME by which notifications are grouped by time.
ntfn_grouping_value	The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.
ntfn_grouping_type	The type of grouping desired. It can be one of two allowed values ■ DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY - all notifications in the group are summarized into a single notification ■ DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST - only the last notification in the group is published and the earlier ones discarded
ntfn_grouping_start_time	When to start generating notifications. If specified as NULL, it defaults to the current system generated time.

Table 36–6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

Attribute	Description
ntfn_grouping_repeat_count	How many times the notification should be repeated. Set this to DBMS_CQ_NOTIFICATION.NTFN_GROUPING_FOREVER to receive notifications for the life time of the registration. Set to a nonzero value if only a certain number of notifications are desired for the life time of the registration.

Usage Notes

- The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER);
```

  The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  transaction_lag               NUMBER);
```

  The third definition contains all the members of the type except transaction_lag which is being deprecated:

```
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
  callback                      VARCHAR2(20),
  quosflags                     NUMBER,
  timeout                       NUMBER,
  operations_filter             NUMBER,
  ntfn_grouping_class           NUMBER,
  ntfn_grouping_value           NUMBER,
  ntfn_grouping_type            NUMBER,
  ntfn_grouping_start_time      TIMESTAMP WITH TIME ZONE,
  ntfn_grouping_repeat_count    NUMBER);
```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format schema_name.procedure_name. The procedure must have the following signature:

```
PROCEDURE <procedure_name>(ntfnds IN SYS.chnf$_desc)
```

  CHNF$_DESC describes the change notification descriptor.

- The init.ora parameter job_queue_processes must be set to a nonzero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.

Summary of DBMS_CQ_NOTIFICATION Subprograms

Table 36–7 DBMS_CQ_NOTIFICATION Package Subprograms

Subprogram	Description
CQ_NOTIFICATION_QUERYID Function on page 36-27	Returns the queryid of the most recent query that was attempted to be registered in a registration block
DEREGISTER Procedure on page 36-28	De-subscribes the client with the supplied registration identifier (ID)
ENABLE_REG Procedure on page 36-29	Begins a registration block using an existing registration identifier (ID)
NEW_REG_START Function on page 36-30	Begins a new registration block
REG_END Procedure on page 36-31	Ends the registration boundary

CQ_NOTIFICATION_QUERYID Function

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

Syntax

```
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID
 RETURN NUMBER;
```

Return Values

Returns the queryid of the most recently registered query.

DEREGISTER Procedure

This procedure desubscribes the client with the specified registration identifier (ID).

Syntax

```
DBMS_CQ_NOTIFICATION.DEREGISTER (
  regid IN NUMBER);
```

Parameters

Table 36–8 DEREGISTER Procedure Parameters

Parameter	Description
`regid`	Client registration ID

Usage Notes

Only the user that created the registration (or the `SYS` user) will be able to desubscribe the registration.

ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID). It is similar to the interface for creating a new registration, except that it takes an existing `regid` to which to add objects.

Subsequent execution of queries causes the objects referenced in the queries to be added to the specified `regid`, and the registration is completed on invoking the REG_END Procedure.

Syntax

```
DBMS_CQ_NOTIFICATION.ENABLE_REG (
  regid IN NUMBER);
```

Parameters

Table 36–9 ENABLE_REG Procedure Parameters

Parameter	Description
`regid`	Client registration ID

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

NEW_REG_START Function

This procedure begins a new registration block. Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the REG_END procedure.

Syntax

```
DBMS_CQ_NOTIFICATION.NEW_REG_START (
  regds IN sys.chnf$_reg_info)
 RETURN NUMBER;
```

Parameters

Table 36–10 NEW_REG_START Function Parameters

Parameter	Description
sys.chnf$_reg_info	Registration descriptor describing the notification handler and other properties of the registration

Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the CHANGE NOTIFICATION system privilege and SELECT privileges on any objects to be registered.
- The SYS user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```
DBMS_CQ_NOTIFICATION.REG_END;
```

37

DBMS_CRYPTO

DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

> **See Also:** *Oracle Database Security Guide* for further information about using this package and about encrypting data in general.

This chapter contains the following topics:

- Using the DBMS_CRYPTO Subprograms
  - Overview
  - Security Model
  - Types
  - Algorithms
  - Restrictions

  - Operational Notes
- Summary of DBMS_CRYPTO Subprograms

Using the DBMS_CRYPTO Subprograms

- Overview
- Security Model
- Types
- Algorithms
- Restrictions
- Exceptions
- Operational Notes

Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, and SHA-1 cryptographic hashes
- MD5 and SHA-1 Message Authentication Code (MAC)

Block cipher modifiers are also provided with DBMS_CRYPTO. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

Table 37–1 lists the DBMS_CRYPTO package features in comparison to the other PL/SQL encryption package, the DBMS_OBFUSCATION_TOOLKIT.

Table 37–1 DBMS_CRYPTO and DBMS_OBFUSCATION_TOOLKIT Feature Comparison

Package Feature	DBMS_CRYPTO	DBMS_OBFUSCATION_TOOLKIT
Cryptographic algorithms	DES, 3DES, AES, RC4, 3DES_2KEY	DES, 3DES
Padding forms	PKCS5, zeroes	none supported
Block cipher chaining modes	CBC, CFB, ECB, OFB	CBC
Cryptographic hash algorithms	MD5, SHA-1, MD4	MD5
Keyed hash (MAC) algorithms	HMAC_MD5, HMAC_SH1	none supported
Cryptographic pseudo-random number generator	RAW, NUMBER, BINARY_INTEGER	RAW, VARCHAR2
Database types	RAW, CLOB, BLOB	RAW, VARCHAR2

DBMS_CRYPTO is intended to replace the DBMS_OBFUSCATION_TOOLKIT, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, or SHA-1.

Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

Types

Parameters for the DBMS_CRYPTO subprograms use these datatypes:

Table 37–2 DBMS_CRYPTO Datatypes

Type	Description
BLOB	A source or destination binary LOB
CLOB	A source or destination character LOB (excluding NCLOB)
PLS_INTEGER	Specifies a cryptographic algorithm type (used with BLOB, CLOB, and RAW datatypes)
RAW	A source or destination RAW buffer

Algorithms

The following cryptographic algorithms, modifiers, and cipher suites are predefined in this package.

Table 37–3 DBMS_CRYPTO Cryptographic Hash Functions

Name	Description
HASH_MD4	Produces a 128-bit hash, or message digest of the input message
HASH_MD5	Also produces a 128-bit hash, but is more complex than MD4
HASH_SH1	Secure Hash Algorithm (SHA). Produces a 160-bit hash.

Table 37–4 DBMS_CRYPTO MAC (Message Authentication Code) Functions

Name	Description
HMAC_MD5[1]	Same as MD5 hash function, except it requires a secret key to verify the hash value.
HMAC_SH1[1]	Same as SHA hash function, except it requires a secret key to verify the hash value.

[1] Complies with IETF RFC 2104 standard

Table 37–5 DBMS_CRYPTO Encryption Algorithms

Name	Description
ENCRYPT_DES	Data Encryption Standard. Block cipher. Uses key length of 56 bits.
ENCRYPT_3DES_2KEY	Data Encryption Standard. Block cipher. Operates on a block 3 times with 2 keys. Effective key length of 112 bits.
ENCRYPT_3DES	Data Encryption Standard. Block cipher. Operates on a block 3 times.
ENCRYPT_AES128	Advanced Encryption Standard. Block cipher. Uses 128-bit key size.
ENCRYPT_AES192	Advanced Encryption Standard. Block cipher. Uses 192-bit key size.
ENCRYPT_AES256	Advanced Encryption Standard. Block cipher. Uses 256-bit key size.
ENCRYPT_RC4	Stream cipher. Uses a secret, randomly generated key unique to each session.

Table 37–6 DBMS_CRYPTO Block Cipher Suites

Name	Description
DES_CBC_PKCS5	ENCRYPT_DES[1] + CHAIN_CBC[2]+ PAD_PKCS5[3]
DES3_CBC_PKCS5	ENCRYPT_3DES[1] + CHAIN_CBC[2] + PAD_PKCS5[3]

[1] See Table 37–5, " DBMS_CRYPTO Encryption Algorithms"
[2] See Table 37–7, " DBMS_CRYPTO Block Cipher Chaining Modifiers"
[3] See Table 37–8, " DBMS_CRYPTO Block Cipher Padding Modifiers"

Table 37–7 DBMS_CRYPTO Block Cipher Chaining Modifiers

Name	Description
CHAIN_ECB	Electronic Codebook. Encrypts each plaintext block independently.
CHAIN_CBC	Cipher Block Chaining. Plaintext is XORed with the previous ciphertext block before it is encrypted.
CHAIN_CFB	Cipher-Feedback. Enables encrypting units of data smaller than the block size.
CHAIN_OFB	Output-Feedback. Enables running a block cipher as a synchronous stream cipher. Similar to CFB, except that *n* bits of the previous output block are moved into the right-most positions of the data queue waiting to be encrypted.

Table 37–8 DBMS_CRYPTO Block Cipher Padding Modifiers

Name	Description
PAD_PKCS5	Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard
PAD_NONE	Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.
PAD_ZERO	Provides padding consisting of zeroes.

Restrictions

The VARCHAR2 datatype is not directly supported by DBMS_CRYPTO. Before you can perform cryptographic operations on data of the type VARCHAR2, you must convert it to the uniform database character set AL32UTF8, and then convert it to the RAW datatype. After performing these conversions, you can then encrypt it with the DBMS_CRYPTO package.

> **See Also:** "Conversion Rules" on page 37-11 for information about converting datatypes.

Exceptions

Table 37–9 lists exceptions that have been defined for DBMS_CRYPTO.

Table 37–9 DBMS_CRYPTO Exceptions

Exception	Code	Description
CipherSuiteInvalid	28827	The specified cipher suite is not defined.
CipherSuiteNull	28829	No value has been specified for the cipher suite to be used.
KeyNull	28239	The encryption key has not been specified or contains a NULL value.
KeyBadSize	28234	DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.
DoubleEncryption	28233	Source data was previously encrypted.

Operational Notes

- When to Use Encrypt and Decrypt Procedures or Functions
- When to Use Hash or Message Authentication Code (MAC) Functions
- About Generating and Storing Encryption Keys
- Conversion Rules

When to Use Encrypt and Decrypt Procedures or Functions

This package includes both `ENCRYPT` and `DECRYPT` procedures and functions. The procedures are used to encrypt or decrypt `LOB` datatypes (overloaded for `CLOB` and `BLOB` datatypes). In contrast, the `ENCRYPT` and `DECRYPT` functions are used to encrypt and decrypt `RAW` datatypes. Data of type `VARCHAR2` must be converted to `RAW` before you can use `DBMS_CRYPTO` functions to encrypt it.

When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the `HASH` function and the `MAC` function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction only. It is easy to compute a hash value from an input message, but it is extremely difficult to generate an input message that hashes to a particular value. Note that hash values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before storing data, Laurel runs `DBMS_CRYPTO.HASH` against the stored data to create a hash value. When she returns the stored data at a later date, she can again run the hash function against it, using the same algorithm. If the second hash value is identical to the first one, then the data has not been altered. Hash values are similar to "file fingerprints" and are used to ensure data integrity.

The `HASH` function included with `DBMS_CRYPTO`, is a one-way hash function that you can use to generate a hash value from either `RAW` or `LOB` data. The `MAC` function is also a one-way hash function, but with the addition of a secret key. It works the same way as the `DBMS_CRYPTO.HASH` function, except only someone with the key can verify the hash value.

MACs can be used to authenticate files between users. They can also be used by a single user to determine if her files have been altered, perhaps by a virus. A user could compute the MAC of his files and store that value in a table. If the user did not use a MAC function, then the virus could compute the new hash value after infection and replace the table entry. A virus cannot do that with a MAC because the virus does not know the key.

About Generating and Storing Encryption Keys

The `DBMS_CRYPTO` package can generate random material for encryption keys, but it does not provide a mechanism for maintaining them. Application developers must take care to ensure that the encryption keys used with this package are securely generated and stored. Also note that the encryption and decryption operations performed by `DBMS_CRYPTO` occur on the server, not on the client. Consequently, if the key is sent over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although DBMS_CRYPTO cannot generate keys on its own, it does provide tools you can use to aid in key generation. For example, you can use the RANDOMBYTES function to generate random material for keys. (Calls to the RANDOMBYTES function behave like calls to the DESGETKEY and DES3GETKEY functions of the DBMS_OBFUSCATION_TOOLKIT package.)

When generating encryption keys for DES, it is important to remember that some numbers are considered weak and semiweak keys. Keys are considered weak or semiweak when the pattern of the algorithm combines with the pattern of the initial key value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this, filter out the known weak DES keys. Lists of the known weak and semiweak DES keys are available on several public Internet sites.

See Also:

- *Oracle Database Advanced Security Administrator's Guide* for information about configuring network encryption and SSL.
- "Key Management" on page 93-5 for a full discussion about securely storing encryption keys
- "RANDOMBYTES Function" on page 37-20

Conversion Rules

- To convert VARCHAR2 to RAW, use the UTL_I18N.STRING_TO_RAW function to perform the following steps:

  1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

  Syntax example:

  ```
  UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
  ```

- To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:

  1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

  Syntax example:

  ```
  UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
  ```

  See Also: Chapter 222, "UTL_I18N" for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

Examples

The following listing shows PL/SQL block encrypting and decrypting pre-defined '`input_string`' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
   input_string       VARCHAR2 (200) :=  'Secret Message';
   output_string      VARCHAR2 (200);
   encrypted_raw      RAW (2000);             -- stores encrypted binary text
   decrypted_raw      RAW (2000);             -- stores decrypted binary text
   num_key_bytes      NUMBER := 256/8;        -- key length 256 bits (32 bytes)
   key_bytes_raw      RAW (32);               -- stores 256-bit encryption key
   encryption_type    PLS_INTEGER :=          -- total encryption type
                         DBMS_CRYPTO.ENCRYPT_AES256
                       + DBMS_CRYPTO.CHAIN_CBC
                       + DBMS_CRYPTO.PAD_PKCS5;
BEGIN
   DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
   key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
   encrypted_raw := DBMS_CRYPTO.ENCRYPT
      (
         src => UTL_I18N.STRING_TO_RAW (input_string,  'AL32UTF8'),
         typ => encryption_type,
         key => key_bytes_raw
      );
    -- The encrypted value "encrypted_raw" can be used here

   decrypted_raw := DBMS_CRYPTO.DECRYPT
      (
         src => encrypted_raw,
         typ => encryption_type,
         key => key_bytes_raw
      );
   output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

   DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;
```

Summary of DBMS_CRYPTO Subprograms

Table 37–10 DBMS_CRYPTO Package Subprograms

Subprogram	Description
DECRYPT Function on page 37-14	Decrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV (initialization vector)
DECRYPT Procedures on page 37-15	Decrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Function on page 37-16	Encrypts `RAW` data using a stream or block cipher with a user supplied key and optional IV
ENCRYPT Procedures on page 37-17	Encrypts `LOB` data using a stream or block cipher with a user supplied key and optional IV
HASH Function on page 37-18	Applies one of the supported cryptographic hash algorithms (MD4, MD5, or SHA-1) to data
MAC Function on page 37-19	Applies Message Authentication Code algorithms (MD5 or SHA-1) to data to provide keyed message protection
RANDOMBYTES Function on page 37-20	Returns a `RAW` value containing a cryptographically secure pseudo-random sequence of bytes, and can be used to generate random material for encryption keys
RANDOMINTEGER Function on page 37-21	Returns a random `BINARY_INTEGER`
RANDOMNUMBER Function on page 37-22	Returns a random 128-bit integer of the `NUMBER` datatype

DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW DEFAULT NULL)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 37–11 DECRYPT Function Parameters

Parameter Name	Description
src	RAW data to be decrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

  See Also: "Usage Notes" for the ENCRYPT function on page 37-16 for additional information about the ciphers and modifiers available with this package.

- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.

  See Also: "Conversion Rules" on page 37-11 for a discussion of the VARCHAR2 to RAW conversion process.

DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPT.DECRYPT(
   dst IN OUT NOCOPY CLOB         CHARACTER SET ANY_CS,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 37–12 DECRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Key to be used for decryption.
iv	Optional initialization vector for block ciphers. Default is all zeroes.

ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW,
   iv  IN RAW          DEFAULT NULL)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 37–13 ENCRYPT Function Parameters

Parameter Name	Description
src	RAW data to be encrypted.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 37–7 and Table 37–8 on page 37-7 for block cipher chaining and padding modifier constants that have been defined for this package.
- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

  ```
  DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES
                                     + DBMS_CRYPTO.CHAIN_CBC
                                     + DBMS_CRYPTO.PAD_NONE;
  ```

  See Table 37–6 on page 37-6 for the block cipher suites already defined as constants for this package.
- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

  See Also: "Conversion Rules" on page 37-11 for a discussion of the conversion process.

- Stream ciphers, such as RC4, are not recommended for stored data encryption.

ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            BLOB,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);

DBMS_CRYPTO.ENCRYPT(
   dst IN OUT NOCOPY BLOB,
   src IN            CLOB         CHARACTER SET ANY_CS,
   typ IN            PLS_INTEGER,
   key IN            RAW,
   iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(encrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 37–14 ENCRYPT Procedure Parameters

Parameter Name	Description
dst	LOB locator of output data. The value in the output LOB <dst> will be overwritten.
src	LOB locator of input data.
typ	Stream or block cipher type and modifiers to be used.
key	Encryption key to be used for encrypting data.
iv	Optional initialization vector for block ciphers. Default is NULL.

Usage Notes

See "Conversion Rules" on page 37-11 for usage notes about using the ENCRYPT procedure.

HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a *hash value*. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 37-10 for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 37–3 on page 37-6.

Syntax

```
DBMS_CRYPTO.Hash (
   src IN RAW,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.Hash (
   src IN BLOB,
   typ IN PLS_INTEGER)
 RETURN RAW;

DBMS_CRYPTO.Hash (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(hash,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 37–15 HASH Function Parameters

Parameter Name	Description
`src`	The source data to be hashed.
`typ`	The hash algorithm to be used.

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm), specified with the constant, `HASH_SH1`, because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.

MAC Function

A Message Authentication Code, or MAC, is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in "HASH Function" on page 37-18, but they also include a key. Only someone with the identical key can verify the hash. Also refer to "When to Use Hash or Message Authentication Code (MAC) Functions" on page 37-10 for more information about using MACs.

This function applies MAC algorithms to data to provide keyed message protection. See Table 37–4 on page 37-6 for a list of MAC algorithms that have been defined for this package.

Syntax

```
DBMS_CRYPTO.MAC (
   src IN RAW,
   typ IN PLS_INTEGER,
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN BLOB,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;

DBMS_CRYPTO.MAC (
   src IN CLOB CHARACTER SET ANY_CS,
   typ IN PLS_INTEGER
   key IN RAW)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(mac,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 37–16 MAC Function Parameters

Parameter Name	Description
src	Source data to which MAC algorithms are to be applied.
typ	MAC algorithm to be used.
key	Key to be used for MAC algorithm.

RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys. The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator).

Syntax

```
DBMS_CRYPTO.RANDOMBYTES (
   number_bytes IN POSITIVE)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 37–17 RANDOMBYTES Function Parameter

Parameter Name	Description
number_bytes	The number of pseudo-random bytes to be generated.

Usage Note

The number_bytes value should not exceed the maximum length of a RAW variable.

RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle `BINARY_INTEGER` datatype.

Syntax

```
DBMS_CRYPTO.RANDOMINTEGER
 RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(randominteger,WNDS,RNDS,WNPS,RNPS);
```

RANDOMNUMBER Function

This function returns an integer in the Oracle `NUMBER` datatype in the range of [0..2**128-1].

Syntax

```
DBMS_CRYPTO.RANDOMNUMBER
 RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(randomnumber,WNDS,RNDS,WNPS,RNPS);
```

38

DBMS_CSX_ADMIN

The DBMS_CSX_ADMIN package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

The chapter contains the following topics:

- Using DBMS_CSX_ADMIN
  - Overview
  - Constants
- Summary of DBMS_CSX_ADMIN

Using DBMS_CSX_ADMIN

- Overview
- Constants

Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.

Constants

The DBMS_CSX_ADMIN package uses the constants shown in Table 38–1:

Table 38–1 DBMS_CSX_ADMIN Constants

Name	Type	Value	Description
DEFAULT_LEVEL	BINARY_INTEGER	0	Default token table
TAB_LEVEL	BINARY_INTEGER	1	Token table set associated with tables, not tablespaces
TBS_LEVEL	BINARY_INTEGER	2	Token table set associated with a tablespace
NO_CREATE	BINARY_INTEGER	0	Token tables already exist, associate them with the given table/tablespace
NO_INDEXES	BINARY_INTEGER	1	Do not create indexes on the new set of token tables
WITH_INDEXES	BINARY_INTEGER	2	Create indexes on the token tables
DEFAULT_TOKS	BINARY_INTEGER	0	Prepopulate the token tables with default token mappings
NO_DEFAULT_TOKS	BINARY_INTEGER	1	Do not prepopulate the token tables with default token mappings

Examples

Example 1: Register a New Set of Token Tables for the Tablespace

To prepare a tablespace CSXTS for export, the DBA can register a new set of token tables for the tablespace with the following PL/SQL:

```
DECLARE
  tsno   number;
  stmt   varchar2(2000);
BEGIN
  stmt := 'SELECT ts# FROM ts$ WHERE (name = ''' || 'CSXTS' || ''')';
  EXECUTE IMMEDIATE stmt into tsno;
  DBMS_CSX_ADMIN.REGISTERTOKENTABLESET(
    tstabno     =>  tsno,
    guid        =>  NULL,
    flags       =>  DBMS_CSX_ADMIN.TBS_LEVEL,
    tocreate    =>  DBMS_CSX_ADMIN.WITH_INDEXES,
    defaulttoks =>  DBMS_CSX_ADMIN.DEFAULT_TOKS);
  COMMIT;
END;
/
```

In this example, the new token tables are indexed, populated with default token mappings, and associated with all tables in the `CSXTS` tablespace. All subsequent loads of binary XML data in `CSXTS` will make use of the new set of token tables. The advantage is that no loading of binary XML data in other tablespaces will affect the size of the token tables used by `CSXTS` and exported during a tablespace export of `CSXTS`. This setup is suited to the case in which the tablespace does not yet contain binary XML data.

Example 2: Copying the Default Token Tables in a New Set

If binary XML data already exists in the tablespace to be exported, the DBA has the option of copying the default token tables in a new set.

```
DECLARE
  tsno   number;
  stmt   varchar2(2000);
  qntab  varchar2(34);
  nmtab  varchar2(34);
  pttab  varchar2(34);
BEGIN
  stmt := 'select ts# from ts$ where (name = ''' || 'CSXTS' || ''')';
  EXECUTE IMMEDIATE stmt INTO tsno;
  DBMS_CSX_ADMIN.COPYDEFAULTTOKENTABLESET(
    tstabno => tsno, qntab, nmtab, pttatb);
  COMMIT;
END;
/
```

This setup is suited to the case in which the DBA wishes to optimize the export of a tablespace that already contains binary XML data, and does not have associated a token table set. After cloning the default token table set, all subsequent loads of binary XML data in `CSXTS` will make use of the new set of token tables.

Summary of DBMS_CSX_ADMIN

Table 38–2 DBMS_CSX_ADMIN Package Subprograms

Subprogram	Description
COPYDEFAULTTOKENTABLESET Procedure on page 38-7	Creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables
GETTOKENTABLEINFO Procedure & Function on page 38-8	Returns the GUID of the token table set where token mappings for this table
GETTOKENTABLEINFOBYTABLESPACE Procedure on page 38-9	Returns the GUID and the token table names for this tablespace
NAMESPACEIDTABLE Function on page 38-10	Returns default namespace-ID token table
PATHIDTABLE Function on page 38-11	Returns the default path-ID token table
QNAMEIDTABLE Function on page 38-12	Returns the default qname-ID token table.
REGISTERTOKENTABLESET Procedure on page 38-13	Registers a new token table set, creates (if required) the token tables (with the corresponding indexes)

COPYDEFAULTTOKENTABLESET Procedure

This procedure creates a new token table set associated with a given tablespace, and populates the token tables with the token mappings from the default token tables.

Syntax

```
DBMS_CSX_ADMIN.COPYDEFAULTTOKENTABLESET  (
   tsno         IN    NUMBER,
   qnametable   OUT   VARCHAR2,
   nmspctable   OUT   VARCHAR2,
   pttable      OUT   VARCHAR2);
```

Parameters

Table 38–3 COPYDEFAULTTOKENTABLESET Procedure Parameters

Parameter	Description
tsno	Tablespace number the new set of token tables will be associated with
qnametable	Name of the qname-ID table in the new set
nmspctable	Name of the namespace-ID table in the new set
pttable	Name of the path-id table in the new set

GETTOKENTABLEINFO Procedure & Function

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
   ownername      IN   VARCHAR2,
   tablename      IN   VARCHAR2,
   guid           OUT  RAW,
   qnametable     OUT  VARCHAR2,
   nmspctable     OUT  VARCHAR2,
   level          OUT  NUMBER,
   tabno          OUT  NUMBER);

DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
   tabno          IN   NUMBER,
   guid           OUT  RAW);
 RETURN BOOLEAN;
```

Parameters

Table 38–4 GETTOKENTABLEINFO Procedure & Function Parameters

Parameter	Description
ownername	Owner of the table
tablename	Name of the table
guid	GUID of the token table set used by the given table
qnametable	Name of the qname-ID table in the new set
nmspctable	Name of the namespace-ID table in the new set
level	DEFAULT_LEVEL if default token table set, TBS_LEVEL if same token table set is used by all tables in the same tablespace as the given table, TAB_LEVEL otherwise
tabno	Table object number

GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

Syntax

```
DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE  (
   tsname          IN   VARCHAR2,
   tablespaceno    IN   NUMBER,
   guid            OUT  RAW,
   qnametable      OUT  VARCHAR2,
   nmspctable      OUT  VARCHAR2,
   isdefault       OUT  BOOLEAN,
   containTokTab   OUT  BOOLEAN);
```

Parameters

Table 38–5 GETTOKENTABLEINFOBYTABLESPACE Procedure Parameters

Parameter	Description
tsname	Tablespace name
tablespaceno	Tablespace number
guid	GUID of the token table set associated with this tablespace (if any)
qnametable	Name of the qname-ID table
nmspctable	Name of the namespace-ID table
isdefault	TRUE if the token table is the default one
containTokTab	TRUE if the tablespace contains its own token table set

NAMESPACEIDTABLE Function

This procedure returns default namespace-ID token table.

Syntax

```
DBMS_CSX_ADMIN.NAMESPACEIDTABLE
  RETURN VARCHAR2;
```

PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing `EXPLAIN PLAN` for a query on an XML table with an XML index.

Syntax

```
DBMS_CSX_ADMIN.PATHIDTABLE
  RETURN VARCHAR2;
```

QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

Syntax

```
DBMS_CSX_ADMIN.QNAMEIDTABLE
  RETURN VARCHAR2;
```

REGISTERTOKENTABLESET Procedure

This procedure registers a new token table set, creates (if required) the token tables (with the corresponding indexes).

Syntax

```
DBMS_CSX_ADMIN.REGISTERTOKENTABLESET  (
   tstabno      IN  NUMBER  DEFAULT NULL,
   guid         IN  RAW     DEFAULT NULL,
   flags        IN  NUMBER  DEFAULT TBS_LEVEL,
   tocreate     IN  NUMBER  DEFAULT WITH_INDEXES,
   defaulttoks  IN  NUMBER  DEFAULT DEFAULT_TOKS);
```

Parameters

Table 38–6 REGISTERTOKENTABLESET Procedure Parameters

Parameter	Description
tstabno	Tablespace/table number of the tablespace/table using the set of token table we register
guid	GUID of the token table set. If NULL, a new identifier is created, provided the user is SYS.
flags	TAB_LEVEL for table level, TBS_LEVEL for tablespace level
tocreate	Possible values: ■ NO_CREATE if no token tables are created ■ NO_INDEXES if token tables are created, but no indexes ■ WITH_INDEXES if token tables and corresponding indexes are created
defaulttoks	If DEFAULT_TOKS, insert default token mappings

39

DBMS_CUBE

DBMS_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

> **See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- Using DBMS_CUBE
- Using SQL Aggregation Management
- Upgrading Metadata From OLAP 10g to OLAP 11g
- Summary of DBMS_CUBE Subprograms

Using DBMS_CUBE

Cubes and cube dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Cubes can be enabled as cube materialized views for automatic refresh of the cubes and dimensions, and for query rewrite. Several `DBMS_CUBE` subprograms support the creation and maintenance of cube materialized views as a replacement for relational materialized views. These subprograms are discussed in "Using SQL Aggregation Management" on page 39-3.

The metadata for cubes and dimensions is defined in XML documents, called *templates*, which you can derive from relational materialized views using the `CREATE_CUBE` or `DERIVE_FROM_MVIEW` functions. Using a graphical tool named Analytic Workspace Manager, you can enhance the cube with analytic content or create the metadata for new cubes and cube dimensions from scratch.

Several other `DBMS_CUBE` subprograms provide a SQL alternative to Analytic Workspace Manager for creating an analytic workspace from an XML template and for refreshing the data stored in cubes and dimensions. The `IMPORT_XML` procedure creates an analytic workspace with its cubes and cube dimensions from an XML template. The `BUILD` procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying.

Using SQL Aggregation Management

SQL Aggregation Management is a group of PL/SQL subprograms in DBMS_CUBE that supports the rapid deployment of cube materialized views from existing relational materialized views. Cube materialized views are cubes that have been enhanced to use the automatic refresh and query rewrite features of Oracle Database. A single cube materialized view can replace many of the relational materialized views of summaries on a fact table, providing uniform response time to all summary data.

Cube materialized views bring the fast update and fast query capabilities of the OLAP option to applications that query summaries of detail relational tables. The summary data is generated and stored in a cube, and query rewrite automatically redirects queries to the cube materialized views. Applications experience excellent querying performance.

In the process of creating the cube materialized views, DBMS_CUBE also creates a fully functional analytic workspace including a cube and the cube dimensions. The cube stores the data for a cube materialized view instead of the table that stores the data for a relational materialized view. A cube can also support a wide range of analytic functions that enhance the database with information-rich content.

Cube materialized views are registered in the data dictionary along with all other materialized views. A CB$ prefix identifies a cube materialized view.

The DBMS_CUBE subprograms also support life-cycle management of cube materialized views.

> **See Also:** *Oracle OLAP User's Guide* for more information about cube materialized views and enhanced OLAP analytics.

Subprograms in SQL Aggregation Management

These subprograms are included in SQL Aggregation Management:

- CREATE_MVIEW Function
- DERIVE_FROM_MVIEW Function
- DROP_MVIEW Procedure
- REFRESH_MVIEW Procedure

Requirements for the Relational Materialized View

SQL Aggregation Management uses an existing relational materialized view to derive all the information needed to generate a cube materialized view. The relational materialized view determines the detail level of data that is stored in the cube materialized view. The related relational dimension objects determine the scope of the aggregates, from the lowest level specified in the GROUP BY clause of the materialized view subquery, to the highest level of the dimension hierarchy.

The relational materialized view must conform to these requirements:

- Explicit `GROUP BY` clause for one or more columns.
- No expressions in the select list or `GROUP BY` clause.
- At least one of these numeric aggregation methods: `SUM`, `MIN`, `MAX`, or `AVG`.
- No outer joins.
- Summary keys with at least one simple column associated with a relational dimension.

  or

  Summary keys with at least one simple column and no hierarchies or levels.
- Numeric data type of any type for the fact columns. All facts are converted to `NUMBER`.
- Eligible for rewrite. `REWRITE_CAPABILITY` should be `GENERAL`; it cannot be `NONE`. Refer to the `ALL_MVIEWS` entry in the *Oracle Database Reference*.
- Cannot use the `DISTINCT` or `UNIQUE` keywords with an aggregate function in the defining query. For example, `AVG(DISTINCT units)` causes an error in `STRICT` mode and is ignored in `LOOSE` mode.

You can choose between two modes when rendering the cube materialized view, `LOOSE` and `STRICT`. In `STRICT` mode, any deviation from the requirements raises an exception and prevents the materialized view from being created. In `LOOSE` mode (the default), some deviations are allowed, but they affect the content of the materialized view. These elements in the relational materialized view generate warning messages:

- Complex expressions in the defining query are ignored and do not appear in the cube materialized view.
- The `AVG` function is changed to `SUM` and `COUNT`.
- The `COUNT` function without a `SUM`, `MIN`, `MAX`, or `AVG` function is ignored.
- The `STDDEV` and `VARIANCE` functions are ignored.

You can also choose how conditions in the `WHERE` clause are filtered. When filtering is turned off, the conditions are ignored. When turned on, valid conditions are rendered in the cube materialized view, but asymmetric conditions among dimension levels raise an exception.

Permissions for Managing and Querying Cube Materialized Views

To create cube materialized views, you must have these privileges:

- `CREATE [ANY] MATERIALIZED VIEW` privilege
- `CREATE [ANY] DIMENSION` privilege
- `ADVISOR` privilege

To access cube materialized views from another schema using query rewrite, you must have these privileges:

- `GLOBAL QUERY REWRITE` privilege
- `SELECT` privilege on the relational source tables
- `SELECT` privilege on the analytic workspace (`AW$`*`name`*) that supports the cube materialized view
- `SELECT` privilege on the cube
- `SELECT` privilege on the dimensions of the cube

Note that you need `SELECT` privileges on the database objects that *support* the cube materialized views, but not on the cube materialized views.

Example of SQL Aggregation Management

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEEK_PSCAT_SALES_MV.

About Relational Materialized View CAL_MONTH_SALES_MV

This example uses CAL_MONTH_SALES_MV as the basis for creating a cube materialized view. The following query was used to create CAL_MONTH_SALES_MV. CAL_MONTH_SALES_MV summarizes the daily sales data stored in the SALES table by month.

```
SELECT query FROM user_mviews
     WHERE mview_name='CAL_MONTH_SALES_MV';

QUERY
-------------------------------------------
SELECT   t.calendar_month_desc
  ,        sum(s.amount_sold) AS dollars
  FROM     sales s
  ,        times t
  WHERE    s.time_id = t.time_id
  GROUP BY t.calendar_month_desc
```

DBMS_CUBE uses relational dimensions to derive levels and hierarchies for the cube materialized view. The SH schema has relational dimensions for most dimension tables in the schema, as shown by the following query.

```
SELECT dimension_name FROM user_dimensions;

DIMENSION_NAME
-----------------------------------
CUSTOMERS_DIM
PRODUCTS_DIM
TIMES_DIM
CHANNELS_DIM
PROMOTIONS_DIM
```

Creating the Cube Materialized View

This PL/SQL script uses the CREATE_MVIEW function to create a cube materialized view from CAL_MONTH_SALES_MV. CREATE_MVIEW sets the optional BUILD parameter to refresh the cube materialized view immediately.

```
SET serverout ON format wrapped

DECLARE
     salesaw  varchar2(30);

BEGIN
     salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV',
                'build=immediate');
END;
/
```

These messages confirm that the script created and refreshed CB$CAL_MONTH_SALES successfully:

```
Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20081112 08:42:58.0
```

```
03.
Created cube organized materialized view "CB$CAL_MONTH_SALES" for rewrite at 200
81112 08:42:58.004.
```

The following query lists the materialized views in the SH schema:

```
SELECT mview_name FROM user_mviews;

MVIEW_NAME
------------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
```

Two new materialized views are registered in the data dictionary:

- CB$CAL_MONTH_SALES: Cube materialized view
- CB$TIMES_DIM_D1_CAL_ROLLUP: Cube dimension materialized view for the TIME_DIM Calendar Rollup hierarchy

Cube dimension materialized views support refresh of the cube materialized view. You do not directly administer dimension materialized views.

Disabling the Relational Materialized Views

After creating a cube materialized view, disable query rewrite on all relational materialized views for the facts now supported by the cube materialized view. You can drop them when you are sure that you created the cube materialized view with the optimal parameters.

```
ALTER MATERIALIZED VIEW cal_month_sales_mv DISABLE QUERY REWRITE;

Materialized view altered.
```

You can also use the DISABLEQRW parameter in the CREATE_MVIEW function, which disables query rewrite on the source materialized view as described in Table 39–5.

Creating Execution Plans for Cube Materialized Views

You can create execution plans for cube materialized views the same as for relational materialized views. The following command generates an execution plan for a query against the SALES table, which contains data at the day level. The answer set requires data summarized by quarter. Query rewrite would not use the original relational materialized view for this query, because its data is summarized by month. However, query rewrite can use the new cube materialized view for summary data for months, quarters, years, and all years.

```
EXPLAIN PLAN FOR SELECT
           t.calendar_quarter_desc,
           sum(s.amount_sold) AS dollars
  FROM     sales s,
           times t
  WHERE    s.time_id = t.time_id
  AND      t.calendar_quarter_desc LIKE '2001%'
  GROUP BY t.calendar_quarter_desc
  ORDER BY t.calendar_quarter_desc;
```

The query returns these results:

```
CALENDAR_QUARTER_DESC    DOLLARS
```

```
-------------------- ----------
2001-01              6547097.44
2001-02              6922468.39
2001-03              7195998.63
2001-04              7470897.52
```

The execution plan shows that query rewrite returned the summary data from the cube materialized view, CB$CAL_MONTH_SALES, instead of recalculating it from the SALES table.

```
SELECT plan_table_output FROM TABLE(dbms_xplan.display());

PLAN_TABLE_OUTPUT
-------------------------------------------------------------------------------------------------------------------
Plan hash value: 2999729407

-------------------------------------------------------------------------------------------------------
| Id  | Operation                     | Name               | Rows  | Bytes | Cost (%CPU)| Time     |
-------------------------------------------------------------------------------------------------------
|   0 | SELECT STATEMENT              |                    |     1 |    30 |     3  (34)| 00:00:01 |
|   1 |  SORT GROUP BY                |                    |     1 |    30 |     3  (34)| 00:00:01 |
|*  2 |   MAT_VIEW REWRITE CUBE ACCESS | CB$CAL_MONTH_SALES |     1 |    30 |     2   (0)| 00:00:01 |
-------------------------------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------

   2 - filter("CB$CAL_MONTH_SALES"."D1_CALENDAR_QUARTER_DESC" LIKE '2001%' AND
              "CB$CAL_MONTH_SALES"."SYS_GID"=63)

15 rows selected.
```

Maintaining Cube Materialized Views

You can create a cube materialized view that refreshes automatically. However, you can force a refresh at any time using the REFRESH_MVIEW Procedure:

```
BEGIN
     dbms_cube.refresh_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/

Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20081112
14:30:59.534.
```

If you want to drop a cube materialized view, use the DROP_MVIEW Procedure so that all supporting database objects (analytic workspace, cube, cube dimensions, and so forth) are also dropped:

```
BEGIN
     dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES" including
container analytic workspace "SH"."CAL_MONTH_SALES_AW" at 20081112 13:38:47.878.
```

New Database Objects

The CREATE_MVIEW function creates several first class database objects in addition to the cube materialized views. You can explore these objects through the data dictionary by querying views such as ALL_CUBES and ALL_CUBE_DIMENSIONS.

This example created the following supporting objects:

- Analytic workspace CAL_MONTH_SALES_AW (AW$CAL_MONTH_SALES_AW table)
- Cube CAL_MONTH_SALES
- Cube dimension TIMES_DIM_D1
- Dimension hierarchy CAL_ROLLUP
- Dimension levels ALL_TIMES_DIM, YEAR, QUARTER, and MONTH
- Numerous attributes for levels in the CAL_ROLLUP hierarchy

Upgrading Metadata From OLAP 10*g* to OLAP 11*g*

You can upgrade an Oracle OLAP 10*g* analytic workspace to OLAP 11*g* by saving the metadata in an XML template and importing the XML into a new schema. The original analytic workspace remains accessible and unchanged by the upgrade process.

> **Tip:** Oracle recommends using Analytic Workspace Manager for performing upgrades. Using that method, you can upgrade in the same schema, whereas the following procedure requires you to upgrade in a different schema. See the *Oracle OLAP User's Guide*.

These subprograms in `DBMS_CUBE` support the upgrade process:

- EXPORT_XML Procedure
- EXPORT_XML_TO_FILE Procedure
- IMPORT_XML Procedure
- INITIALIZE_CUBE_UPGRADE Procedure

Prerequisites:

- The OLAP 10*g* analytic workspace can use CWM metadata or OLAP standard form (AWXML) metadata.
- Customizations to the OLAP 10*g* analytic workspace may not be exported to the XML template. You must re-create them in OLAP 11*g*.
- The original relational source data must be available to load into the new analytic workspace. If the data is in a different schema or the table names are different, then you must remap the dimensional objects to the new relational sources after the upgrade.
- You must create the OLAP 11*g* analytic workspace in a different schema than the OLAP 10*g* analytic workspace. Create a new user with the following privileges:
  - SELECT privileges on the OLAP 10*g* analytic workspace (`GRANT SELECT ON` *`schema`*`.AW$`*`analytic_workspace`*).
  - SELECT privileges on all database tables and views that contain the source data for the OLAP 10*g* analytic workspace.
  - Appropriate privileges for an OLAP administrator.
  - Same default tablespace as the Oracle 10*g* user.

  See the *Oracle OLAP User's Guide*.

The examples in the following procedure upgrade the example GLOBAL analytic workspace. The Oracle 10*g* schema is named GLOBAL_AW, and the Oracle 11*g* schema is named GLOBAL.

To upgrade an Oracle OLAP 10*g* analytic workspace:

1. Create an XML file describing the export options, as described in "EXPORT_XML_TO_FILE Procedure" on page 39-32.

```
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
```

```
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

2. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 11*g* as the new schema owner for the OLAP 11*g* analytic workspace.
3. Identify objects that require renaming in OLAP 11*g*, as described in "INITIALIZE_CUBE_UPGRADE Procedure" on page 39-37.

   ```
   execute dbms_cube.initialize_cube_upgrade;
   ```

4. Create an XML template in OLAP 11*g* format, as described in "EXPORT_XML_TO_FILE Procedure" on page 39-32.

   ```
   execute dbms_cube.export_xml_to_file('10g_schema', 'options_dir', 'options_
   file', 'output_dir', 'output_file');
   ```

   This example exports the metadata from all OLAP 10*g* analytic workspaces in the GLOBAL_AW schema to a file named global.xml in the UPGRADE_DIR directory. The options.xml file was created in step1.

   ```
   execute dbms_cube.export_xml_to_file('GLOBAL_AW', 'UPGRADE_DIR', 'options.xml',
   'UPGRADE_DIR', 'global.xml');
   ```

5. Create an OLAP 11*g* analytic workspace from the XML template, as described in "IMPORT_XML Procedure" on page 39-35.

   ```
   execute dbms_cube.import_xml('dir_name', 'file_name');
   ```

   This example creates an OLAP 11*g* analytic workspace named GLOBAL from the metadata in global.xml:

   ```
   execute dbms_cube.import_xml('UPGRADE_DIR', 'global.xml');
   ```

6. Load and aggregate the data in the new analytic workspace, as described in "BUILD Procedure" on page 39-14.

   ```
   execute dbms_cube.build('cube1' [',cube2,...']);
   ```

   The following example builds two cubes in the GLOBAL analytic workspace:

   ```
   execute dbms_cube.build('units_cube', 'price_and_cost_cube');
   ```

Summary of DBMS_CUBE Subprograms

Table 39–1 DBMS_CUBE Subprograms

Subprogram	Description
BUILD Procedure on page 39-14	Loads data into one or more cubes and dimensions, and prepares the data for querying.
CREATE_MVIEW Function on page 39-21	Creates a cube materialized view from the definition of a relational materialized view.
DERIVE_FROM_MVIEW Function on page 39-26	Creates an XML template for a cube materialized view from the definition of a relational materialized view.
DROP_MVIEW Procedure on page 39-28	Drops a cube materialized view.
EXPORT_XML Procedure on page 39-30	Exports the XML of an analytic workspace to a CLOB.
EXPORT_XML_TO_FILE Procedure on page 39-32	Exports the XML of an analytic workspace to a file.
IMPORT_XML Procedure on page 39-35	Creates, modifies, or drops an analytic workspace by using an XML template
"INITIALIZE_CUBE_ UPGRADE Procedure" on page 39-37	Identifies Oracle OLAP 10*g* objects that must be renamed in Oracle 11*g* because of namespace conflicts.
REFRESH_MVIEW Procedure on page 39-39	Refreshes a cube materialized view.
VALIDATE_XML Procedure on page 39-41	Checks the XML to assure that it is valid, without committing the results to the database.

BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

Syntax

```
DBMS_CUBE.BUILD (
       script                IN  VARCHAR2,
       method                IN  VARCHAR2        DEFAULT NULL,
       refresh_after_errors  IN  BOOLEAN         DEFAULT FALSE,
       parallelism           IN  BINARY_INTEGER  DEFAULT 0,
       atomic_refresh        IN  BOOLEAN         DEFAULT FALSE,
       automatic_order       IN  BOOLEAN         DEFAULT TRUE,
       add_dimensions        IN  BOOLEAN         DEFAULT TRUE,
       scheduler_job         IN  VARCHAR2        DEFAULT NULL,
       master_build_id       IN  BINARY_INTEGER  DEFAULT 0);
```

Parameters

Table 39–2 BUILD Procedure Parameters

Parameter	Description
`script`	A list of cubes and dimensions and their build options (see "SCRIPT Parameter" on page 39-15).
`method`	A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes. ▪ `C`: Complete refresh clears all dimension values before loading. (Default) ▪ `F`: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table. ▪ `?`: Fast refresh if possible, and otherwise a complete refresh. ▪ `P`: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables. ▪ `S`: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values. See the "Usage Notes" on page 39-18 for additional details. Methods do not apply to dimensions.
`refresh_after_errors`	`TRUE` to roll back just the cube or dimension with errors, and then continue building the other objects. `FALSE` to roll back all objects in the build.
`parallelism`	Number of parallel processes to allocate to this job (see Usage Notes).

Table 39–2 (Cont.) BUILD Procedure Parameters

Parameter	Description
atomic_refresh	TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.
automatic_order	TRUE enables optimization of the build order. Dimensions are loaded before cubes. FALSE builds objects in the order you list them in the script.
add_dimensions	TRUE automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script. FALSE includes only dimensions specifically listed in the script.
scheduler_job	Any text identifier for the job, which will appear in the log table. The string does not need to be unique.
master_build_id	A unique name for the build.

SCRIPT Parameter

The SCRIPT parameter identifies the objects that will be included in the build, and specifies the type of processing that will be performed on each one. The parameter has this syntax:

```
object [ USING ( commands ) ][,...]
```

Where:

object is the qualified name of a cube or a dimension in the form *aw_name.object*, such as GLOBAL.TIME.

SCRIPT Parameter: USING Clause

The USING clause specifies the processing options. It consists of one or more commands separated by commas.

> **Note:** A cube with a rewrite materialized view cannot have a USING clause, except for the ANALYZE command. It uses the default build options.

The commands can be any of the following.

- CLEAR [VALUES | LEAVES | AGGREGATES]

  Prepares the cube for a data refresh. It can also be used on dimensions, but CLEAR removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

  The optional arguments control the refresh method:

  - VALUES: Clears all data in the cube. All facts must be reloaded and all aggregates must be recomputed. This option supports the COMPLETE refresh method. (Default for the C and F methods)
  - LEAVES: Clears the detail data and retains the aggregates. All facts must be reloaded, and the aggregates for any new or changed facts must be computed. This option supports the FAST refresh method. (Default for the ? method)
  - AGGREGATES: Retains the detail data and clears the aggregates. All aggregates must be recomputed.

  If you omit the CLEAR command, DBMS_CUBE loads new and updated facts, but does not delete any old detail data. This is equivalent to a LOAD NO SYNC for dimensions.

- LOAD [SYNCH | NO SYNCH]

  Loads data into the dimension or cube. The optional arguments apply only to dimensions:

  - SYNCH matches the dimension keys to the relational data source. (Default)
  - NO SYNCH loads new dimension keys but does not delete old keys.

- SOLVE

  Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)

- COMPILE

  Creates the supporting structures for the dimension. (Dimensions only)

- ANALYZE

  Runs DBMS_AW_STATS.ANALYZE, which generates and stores optimizer statistics for cubes and dimensions.

- EXECUTE OLAP DML string

  Executes an OLAP DML command or program in the analytic workspace.

- EXECUTE PLSQL string

  Executes a PL/SQL command or script in the database.

- MODEL model_name

  Executes a model previously created for the cube.

- AGGREGATE USING [MEASURE]

  Generates aggregate values using the syntax described in "SCRIPT Parameter: USING Clause: AGGREGATE command".

SCRIPT Parameter: USING Clause: AGGREGATE command

The AGGREGATE command in a script specifies the aggregation rules for one or more measures.

> **Note:** The AGGREGATE command is available only for uncompressed cubes.

AGGREGATE has the following syntax:

```
{ AGGREGATE USING MEASURE
     WHEN measure1 THEN operator1
     WHEN measure2 THEN operator2...
          ELSE default_operator
|
 [AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES (hierarchy)}
```

USING MEASURE Clause

This clause enables you to specify different aggregation operators for different measures in the cube.

Operator Clause

The `operator_clause` has this syntax:

```
operator(WEIGHTBY expression | SCALEBY expression)
```

`WEIGHTBY` multiplies each data value by an expression before aggregation.

`SCALEBY` adds the value of an expression to each data value before aggregation.

Table 39–3 Aggregation Operators

Operator	Option	Description
AVG	WEIGHTBY	Adds data values, then divides the sum by the number of data values that were added together.
FIRST	WEIGHTBY	The first real data value.
HIER_AVG	WEIGHTBY	Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike AVERAGE, which counts only non-NA children, HAVERAGE counts all of the logical children of a parent, regardless of whether each child does or does not have a value.
HIER_FIRST	WEIGHTBY	The first data value in the hierarchy, even when that value is NA.
HIER_LAST	WEIGHTBY	The last data value in the hierarchy, even when that value is NA.
LAST	WEIGHTBY	The last real data value.
MAX	WEIGHTBY	The largest data value among the children of each parent.
MIN	WEIGHTBY	The smallest data value among the children of each parent.
SUM	SCALEBY | WEIGHTBY	Adds data values. (Default)

Processing Options

You can specify these processing options for aggregation:

- `(ALLOW | DISALLOW) OVERFLOW`

  Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.

  – `ALLOW`: A calculation that generates overflow executes without error and produces null results. (Default)

  - DISALLOW: A calculation involving overflow stops executing and generates an error message.

- (ALLOW | DISALLOW) DIVISION BY ZERO

  Specifies whether to allow division by zero.

  - ALLOW: A calculation involving division by zero executes without error but returns a null value. (Default)
  - DISALLOW: A calculation involving division by zero stops executing and generates an error message.

- (CONSIDER | IGNORE) NULLS

  Specifies whether nulls are included in the calculations.

  - CONSIDER: Nulls are included in the calculations. A calculation that includes a null value returns a null value.
  - IGNORE: Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)

- MAINTAIN COUNT

  Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

Usage Notes

Build Methods

The C, S, and ? methods always succeed and can be used on any cube.

The F and P methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

Parallelism

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually allocated by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the PARALLELISM argument of the BUILD procedure.
- Setting of the JOB_QUEUE_PROCESSES database initialization parameter.

Suppose UNITS_CUBE has 12 partitions, PARALLELISM is set to 10, and JOB_QUEUE_PROCESSES is set to 4. OLAP uses four processes, which appear as slave processes in the build log.

The SQL engine may allocate additional processes when the PARALLEL_DEGREE_POLICY database initialization parameter is set to AUTO or LIMITED. For example, if OLAP allocates four processes, the SQL engine might determine that two of those processes should be done by four processes instead, for a total of six processes.

Build Logs

OLAP generates three logs that provide diagnostic information about builds:

- Cube build log

- Rejected values log
- Cube dimension compile log

Analytic Workspace Manager creates these logs automatically as tables in the same schema as the analytic workspace. If you do not use Analytic Workspace Manager, you can create and manage the logs in PL/SQL using the DBMS_CUBE_LOG package.

You can also create the cube log file by running $ORACLE_HOME/olap/admin/utlolaplog.sql. This script creates three additional views:

- CUBE_BUILD_LATEST: Returns rows only from the last build.
- CUBE_BUILD_REPORT: Returns one row for each command with elapsed times.
- CUBE_BUILD_REPORT_LATEST: Returns a report like CUBE_BUILD_REPORT only from the last build.

This report shows a successfully completed build of the objects in the GLOBAL analytic workspace, which has four dimensions and two cubes.

```
SELECT command, status, build_object, build_object_type type
     FROM cube_build_report_latest;

COMMAND                   STATUS     BUILD_OBJECT                   TYPE
------------------------- ---------- ------------------------------ ----------
BUILD                     COMPLETED                                 BUILD
FREEZE                    COMPLETED                                 BUILD
LOAD NO SYNCH             COMPLETED  CHANNEL                        DIMENSION
COMPILE                   COMPLETED  CHANNEL                        DIMENSION

THAW                      COMPLETED                                BUILD

31 rows selected.
```

Examples

This example uses the default parameters to build UNITS_CUBE.

```
EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS_CUBE');
```

The next example builds UNITS_CUBE and explicitly builds two of its dimensions, TIME and CHANNEL.

```
BEGIN
      DBMS_CUBE.BUILD(
          'GLOBAL.TIME USING (LOAD NO SYNCH, COMPILE),
           GLOBAL.CHANNEL,
           GLOBAL.UNITS_CUBE USING (CLEAR LEAVES, LOAD, SOLVE, ANALYZE)
          ',
               '?',           -- solve
               false,         -- refresh after errors
               2,             -- parallelism
               false,         -- atomic refresh
               true,          -- automatic order
               false,         -- add dimensions
               'Units Cube'   -- identify job
      );
END;
/
```

CREATE_MVIEW Function

This function creates a cube materialized view from the definition of a relational materialized view.

Syntax

```
DBMS_CUBE.CREATE_MVIEW (
          mvowner        IN  VARCHAR2,
          mvname         IN  VARCHAR2,
          sam_parameters IN  CLOB  DEFAULT NULL)
    RETURN VARCHAR2;
```

Parameters

Table 39–4 CREATE_MVIEW Function Parameters

Parameter	Description
mvowner	Owner of the relational materialized view.
mvname	Name of the relational materialized view. For restrictions, see "Requirements for the Relational Materialized View" on page 39-5. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.
sam_parameters	Parameters in the form '*parameter1=value1*, *parameter2=value2*,...'. See "SQL Aggregation Management Parameters".

SQL Aggregation Management Parameters

The CREATE_MVIEW and DERIVE_FROM_MVIEW functions use the SQL aggregation management (SAM) parameters described in Table 39–5. Some parameters support the development of cubes with advanced analytics. Other parameters support the development of Java applications. The default settings are appropriate for cube materialized views that are direct replacements for relational materialized views.

Table 39–5 SQL Aggregation Management Parameters

Parameter	Description
ADDTOPS	Adds a top level and a level member to every dimension hierarchy in the cube. If the associated relational dimension has no hierarchy, then a dimension hierarchy is created. TRUE: Creates levels named ALL_*dimension* with level members All_*dimension*. (Default) FALSE: Creates only the hierarchies and levels identified by the relational dimensions.
ADDUNIQUEKEYPREFIX	Controls the creation of dimension keys. TRUE: Creates cube dimension keys by concatenating the level name with the relational dimension key. This practice assures that the dimension keys are unique across all levels, such as CITY_NEW_YORK and STATE_NEW_YORK. (Default) FALSE: Uses the relational dimension keys as cube dimension keys.

Table 39–5 (Cont.) SQL Aggregation Management Parameters

Parameter	Description
ATRMAPTYPE	Specifies whether attributes are mapped by hierarchy levels, dimension levels, or both. HIER_LEVEL: Maps attributes to the levels of a particular dimension hierarchy. (Default) DIM_LEVEL: Maps attributes to the levels of the dimension regardless of hierarchy. BOTH: Maps attributes to both dimension and hierarchy levels. AUTO: Maps attributes to the levels of the dimension for a star schema and to the levels of a particular dimension hierarchy for a snowflake schema.
AWNAME	Provides the name of the analytic workspace that owns the cube. Choose a simple database object name of 1 to 30 bytes. The default name is *fact_tablename*_AW*n*.
BUILD	Specifies whether a data refresh will immediately follow creation of the cube materialized view. IMMEDIATE: Refreshes immediately. DEFERRED: Does not perform a data refresh. (Default) **Note**: Only the CREATE_MVIEW function uses this parameter.
CUBEMVOPTION	Controls validation and creation of a cube materialized view. Regardless of this setting, the function creates an analytic workspace containing a cube and its related cube dimensions. COMPLETE_REFRESH: Creates a complete refresh cube materialized view (full update). FAST_REFRESH: Creates a fast refresh materialized view (incremental update). REWRITE_READY: Runs validation checks for a rewrite cube materialized view, but does not create it. REWRITE: Creates a rewrite cube materialized view. REWRITE_WITH_ATTRIBUTES: Creates a rewrite cube materialized view that includes columns with dimension attributes, resulting in faster query response times. (Default) **Note**: *The following settings do not create a cube materialized view.* Use Analytic Workspace Manager to drop an analytic workspace that does not have a cube materialized view. You can use the DROP_MVIEW procedure to delete an analytic workspace only when it supports a cube materialized view. NONE: Does not create a cube materialized view. COMPLETE_REFRESH_READY: Runs validation checks for a complete refresh cube materialized view, but does not create it. FAST_REFRESH_READY: Runs validation checks for fast refresh, but does not create the cube materialized view.
CUBENAME	Provides the name of the cube derived from the relational materialized view. Choose simple database object name of 1 to 30 bytes. The default name is *fact_tablename*_C*n*.

Table 39–5 (Cont.) SQL Aggregation Management Parameters

Parameter	Description
DIMJAVABINDVARS	Supports access by Java programs to the XML document. TRUE: Generates an XML template that uses Java bind variable notation for the names of dimensions. No XML validation is performed. You cannot use the IMPORT_XML procedure to create a cube using this template. FALSE: Generates an XML template that does not support Java bind variables. (Default)
DISABLEQRW	Controls disabling of query rewrite on the source relational materialized view. TRUE: Issues an ALTER MATERIALIZED VIEW *mview_name* DISABLE QUERY REWRITE command. FALSE: No action. **Note**: Only the CREATE_MVIEW function with BUILD=IMMEDIATE uses this parameter.
EXPORTXML	Exports the XML that defines the dimensional objects to a file, which you specify as *dir/filename*. Both the directory and the file name are case sensitive. *dir*: Name of a database directory. *filename*: The name of the file, typically given an XML filename extension.
FILTERPARTITIONANCESTORLEVELS	Controls the generation of aggregate values above the partitioning level of a partitioned cube. TRUE: Removes levels above the partitioning level from the cube. Requests for summary values above the partitioning level are solved by SQL. FALSE: All levels are retained in the cube. Requests for summary values are solved by OLAP. (Default)
LOGDEST	Directs and stores log messages. By default, the messages are not available. SERVEROUT: Sends messages to server output (typically the screen), which is suitable when working interactively such as in SQL*Plus or SQL Developer. TRACEFILE: Sends messages to the session trace file.
PARTITIONOPTION	Controls partitioning of the cube. NONE: Prevents partitioning. DEFAULT: Allows the Sparsity Advisor to determine whether partitioning is needed and how to partition the cube. (Default) FORCE: Partitions the cube even when the Sparsity Advisor recommends against it. The Sparsity Advisor identifies the best dimension, hierarchy, and level to use for partitioning. *dimension.hierarchy.level*: Partitions the cube using the specified dimension, hierarchy, and level.
POPULATELINEAGE	Controls the appearance of attributes in a cube materialized view. TRUE: Includes all dimension attributes in the cube materialized view. (Default) FALSE: Omits all dimension attributes from the cube materialized view.

Table 39–5 (Cont.) SQL Aggregation Management Parameters

Parameter	Description
PRECOMPUTE	Identifies a percentage of the data that is aggregated and stored. The remaining values are calculated as required by queries during the session. *precompute_percentage*[:*precompute_top_percentage*] Specify the top percentage for partitioned cubes. The default value is 35:0, which specifies precomputing 35% of the bottom partition and 0% of the top partition. If the cube is not partitioned, then the second number is ignored.
REMAPCOMPOSITEKEYS	Controls how multicolumn keys are rendered in the cube. TRUE: Creates a unique key attribute whose values are concatenated string expressions with an underscore between the column values. For example, the value BOSTON_MA_USA might be an expression produced from a multicolumn key composed of CITY, STATE, and COUNTRY columns. In addition, an attribute is created for each individual column to store the relational keys. (Default) FALSE: Creates a unique key attribute for each column.
RENDERINGMODE	Controls whether a loss in fidelity between the relational materialized view and the cube materialized view results in a warning message or an exception. See "Requirements for the Relational Materialized View" on page 39-5. LOOSE: Losses are noted in the optional logs generated by the CREATE_MVIEW Function and the DERIVE_FROM_MVIEW Function. No exceptions are raised. (Default) STRICT: Any loss in fidelity raises an exception so that no XML template is created.
SEEFILTERS	Controls whether conditions in the WHERE clause of the relational materialized view's defining query are retained or ignored. TRUE: Renders valid conditions in the XML template. (Default) FALSE: Ignores all conditions.
UNIQUENAMES	Controls whether top level dimensional objects have unique names. Cross namespace conflicts may occur because dimensional objects have different namespaces than relational objects. TRUE: Modifies all relational names when they are rendered in the cube.(Default) FALSE: Duplicates relational names in the cube unless a naming conflict is detected. In that case, a unique name is created.
UNKNOWNKEYASDIM	Controls handling of simple columns with no levels or hierarchies in the GROUP BY clause of the relational materialized view's defining query. TRUE: Renders a simple column without a relational dimension as a cube dimension with no levels or hierarchies. FALSE: Raises an exception when no relational dimension is found for the column. (Default)
VALIDATEXML	Controls whether the generated XML document is validated. TRUE: Validates the template using the VALIDATE_XML procedure. (Default) FALSE: No validation is done.

Returns

The name of the cube materialized view created by the function.

Usage Notes

See "Using SQL Aggregation Management" on page 39-3

Examples

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEEK_PSCAT_SALES_MV.

The following script creates a cube materialized view using CAL_MONTH_SALES_MV as the relational materialized view. It uses all default options.

```
SET serverout ON format wrapped

DECLARE
     salesaw  varchar2(30);

BEGIN
     salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV');
END;
/
```

The next example sets several parameters for creating a cube materialized view from FWEEK_PSCAT_SALES_MV. These parameters change the cube materialized view in the following ways:

- ADDTOPS: Adds a top level consisting of a single value to the hierarchies. All of the dimensions in Sales History have a top level already.
- PRECOMPUTE: Changes the percentage of materialized aggregates from 35:0 to 40:10.
- EXPORTXML: Creates a text file for the XML document.
- BUILD: Performs a data refresh.

```
DECLARE
     salescubemv   varchar2(30);
     sam_param     clob := 'ADDTOPS=FALSE,
                            PRECOMPUTE=40:10,
                            EXPORTXML=WORK_DIR/sales.xml,
                            BUILD=IMMEDIATE';

BEGIN
     salescubemv := dbms_cube.create_mview('SH', 'FWEEK_PSCAT_SALES_MV',
                    sam_param);
END;
/
```

DERIVE_FROM_MVIEW Function

This function generates an XML template that defines a cube with materialized view capabilities, using the information derived from an existing relational materialized view.

Syntax

```
DBMS_CUBE.DERIVE_FROM_MVIEW (
          mvowner        IN  VARCHAR2,
          mvname         IN  VARCHAR2,
          sam_parameters IN  CLOB  DEFAULT NULL)
     RETURN CLOB;
```

Parameters

Table 39–6 DERIVE_FROM_MVIEW Function Parameters

Parameter	Description
mvowner	Owner of the relational materialized view.
mvname	Name of the relational materialized view. For restrictions, see "Requirements for the Relational Materialized View" on page 39-5. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.
sam_parameters	Optional list of parameters in the form '*parameter1=value1, parameter2=value2,...*'. See "SQL Aggregation Management Parameters" on page 39-21.

Returns

An XML template that defines an analytic workspace containing a cube enabled as a materialized view.

Usage Notes

To create a cube materialized view from an XML template, use the IMPORT_XML procedure. Then use the REFRESH_MVIEW procedure to refresh the cube materialized view with data.

See "Using SQL Aggregation Management" on page 39-3.

Examples

The following example generates an XML template named sales_cube.xml from the CAL_MONTH_SALES_MV relational materialized view in the SH schema.

```
DECLARE
     salescubexml  clob := null;
     sam_param     clob := 'exportXML=WORK_DIR/sales_cube.xml';

BEGIN
     salescubexml := dbms_cube.derive_from_mview('SH', 'CAL_MONTH_SALES_MV',
     sam_param);
END;
```

/

DROP_MVIEW Procedure

This procedure drops a cube materialized view and all associated objects from the database. These objects include the dimension materialized views, cubes, cube dimensions, levels, hierarchies, and the analytic workspace.

Syntax

```
DBMS_CUBE.DROP_MVIEW (
          mvowner        IN  VARCHAR2,
          mvname         IN  VARCHAR2,
          sam_parameters IN  CLOB  DEFAULT NULL);
```

Parameters

Table 39–7 DROP_MVIEW Procedure Parameters

Parameter	Description
mvowner	Owner of the cube materialized view
mvname	Name of the cube materialized view
sam_parameters	EXPORTXML: Exports the XML that drops the dimensional objects to a file, which you specify as *dir/filename*. Both the directory and the file name are case sensitive. *dir*: Name of a database directory. *filename*: The name of the file, typically given an XML filename extension.

Usage Notes

Use this procedure to drop a cube materialized view that you created using the CREATE_MVIEW and DERIVE_FROM_MVIEW functions. If you make modifications to the cubes or dimensions, then DROP_MVIEW may not be able to drop the cube materialized view.

Some of the CUBEMVOPTION parameters used by the CREATE_MVIEW and DERIVE_FROM_MVIEW functions do not create a materialized view. Use Analytic Workspace Manager to drop the analytic workspace, cubes, and cube dimensions.

If you use the EXPORTXML parameter, then you can use the XML document to drop the cube materialized view, after you re-create it. Use the IMPORT_XML procedure.

See "Using SQL Aggregation Management" on page 39-3.

Examples

The current schema has four materialized views. CB$CAL_MONTH_SALES is a cube materialized view for the SALES table. CB$TIMES_DIM_D1_CAL_ROLLUP is a cube dimension materialized view for the TIMES_DIM dimension on the TIMES dimension table. The others are relational materialized views.

```
SELECT mview_name FROM user_mviews;

MVIEW_NAME
------------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
```

```
FWEEK_PSCAT_SALES_MV
```

The following command drops both CB$CAL_MONTH_SALES and CB$TIMES_DIM_D1_CAL_ROLLUP.

```
EXECUTE dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES"
including container analytic workspace "SH"."CAL_MONTH_SALES_AW"
at 20081110 16:31:40.056.
```

This query against the data dictionary confirms that the materialized views have been dropped.

```
SELECT mview_name FROM user_mviews;

MVIEW_NAME
------------------------------
CAL_MONTH_SALES_MV
FWEEK_PSCAT_SALES_MV
```

EXPORT_XML Procedure

This procedure writes OLAP metadata to a CLOB.

Syntax

```
DBMS_CUBE.EXPORT_XML
       (object_ids             IN      VARCHAR2,
        out_xml                IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
       (object_ids             IN      VARCHAR2,
        options_xml            IN      CLOB,
        out_xml                IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
       (object_ids             IN      VARCHAR2,
        options_dirname        IN      VARCHAR2,
        options_filename       IN      VARCHAR2,
        out_xml                IN/OUT  CLOB;
```

Parameters

Table 39–8 EXPORT_XML Procedure Parameters

Parameter	Description
`object_ids`	Either of these identifiers: ▪ The name of a schema, such as `GLOBAL`. ▪ The fully qualified name of an analytic workspace in the form *`owner.aw_name`*`.AW`, such as `GLOBAL.GLOBAL.AW`.
`options_dirname`	The case-sensitive name of a database directory that contains *`options_filename`*.
`options_filename`	A file containing an XML document of export options.
`options_xml`	A CLOB variable that contains an XML document of export options.
`out_xml`	A CLOB variable that will store the XML document of OLAP metadata for the objects listed in *`object_ids`*.

Export Options

See "EXPORT_XML_TO_FILE Procedure" on page 39-32.

Usage Notes

See "Upgrading Metadata From OLAP 10g to OLAP 11g" on page 39-11.

Example

The following PL/SQL script uses CLOBs to upgrade an OLAP 10*g* analytic workspace named GLOBAL in the GLOBAL_AW schema. The result of the upgrade is a copy of the original analytic workspace in OLAP 11*g* format. The new analytic workspace is also named GLOBAL and is created in the GLOBAL schema.

The PL/SQL client must be connected to the database as GLOBAL. The GLOBAL user must have SELECT permissions on GLOBAL_AW.AW$GLOBAL and on all relational data sources. See "Upgrading Metadata From OLAP 10g to OLAP 11g" on page 39-11.

```
DECLARE
  xmlClob clob;
  optionsClob clob;
BEGIN
  -- Create a CLOB for the export options
  dbms_lob.createtemporary(optionsClob, TRUE);
  dbms_lob.open(optionsClob, DBMS_LOB.LOB_READWRITE);
  dbms_lob.writeappend(optionsClob, 8, '<Export>');
  dbms_lob.writeappend(optionsClob,15, '<ExportOptions>');
  dbms_lob.writeappend(optionsClob,47, '<Option Name="SuppressNamespace"
Value="True"/>');
  dbms_lob.writeappend(optionsClob,43, '<Option Name="SuppressOwner"
Value="True"/>');
  dbms_lob.writeappend(optionsClob,49, '<Option Name="PreserveTableOwners"
Value="True"/>');
  dbms_lob.writeappend(optionsClob,16, '</ExportOptions>');
  dbms_lob.writeappend(optionsClob, 9, '</Export>');
  dbms_lob.close(optionsClob);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(xmlClob, TRUE);

  -- Identify duplicate names
  dbms_cube.initialize_cube_upgrade;

  -- Export metadata from an analytic workspace to a CLOB
  dbms_cube.export_xml('GLOBAL_AW.GLOBAL.AW', optionsClob, xmlClob);

  -- Import metadata from the CLOB
  dbms_cube.import_xml(xmlClob);

  -- Load and aggregate the data
  dbms_cube.build('GLOBAL.UNITS_CUBE', 'GLOBAL.PRICE_AND_COST_CUBE');

END;
/
```

EXPORT_XML_TO_FILE Procedure

This procedure exports OLAP metadata to a file. This file can be imported into a new or existing analytic workspace using the IMPORT_XML procedure. In this way, you can create a copy of the analytic workspace in another schema or database.

This procedure can also be used as part of the process for upgrading CWM or OLAP standard form (AWXML) metadata contained in an Oracle OLAP 10*g* analytic workspace to OLAP 11*g* format.

Syntax

```
DBMS_CUBE.EXPORT_XML_TO_FILE
       (object_ids             IN      VARCHAR2,
        output_dirname         IN      VARCHAR2,
        output_filename        IN      VARCHAR2;

DBMS_CUBE.EXPORT_XML_TO_FILE
       (object_ids             IN      VARCHAR2,
        options_dirname        IN      VARCHAR2,
        options_filename       IN      VARCHAR2,
        output_dirname         IN      VARCHAR2,
        output_filename        IN      VARCHAR2;
```

Parameters

Table 39–9 EXPORT_XML_TO_FILE Procedure Parameters

Parameter	Description
`object_ids`	Either of these identifiers: ▪ The name of a schema, such as `GLOBAL_AW`. ▪ The fully qualified name of an analytic workspace in the form *`owner.aw_name`*`.AW`, such as `GLOBAL_AW.GLOBAL.AW`.
`options_dirname`	The case-sensitive name of a database directory that contains `options_filename`. See "Export Options".
`options_filename`	The name of a file containing an XML document of export options. See "Export Options".
`output_dirname`	The case-sensitive name of a database directory where *`output_filename`* is created.
`output_filename`	The name of the template file created by the procedure.

Export Options

The default settings for the export options are appropriate in most cases, and you can omit the *`options_dirname`* and *`options_filename`* parameters. However, when upgrading Oracle OLAP 10*g* metadata to OLAP 11*g*, you must use these parameters to specify an XML document that changes the default settings, like the following:

```
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
```

```
</Export>
```

Table 39–10 Export Options

Option	Description
`SuppressNamespace`	Controls the use of Namespace attributes in XML elements and the namespace qualifier in object names. Enter `True` to drop the namespace from the XML, or enter `False` to retain it (default). Enter `True` when upgrading to Oracle OLAP 11*g* metadata.
`SuppressOwner`	Controls the use of the Owner attribute in XML elements and the owner qualifier in object names. Enter `True` to drop the owner from the XML, or enter `False` to retain it. Enter `True` if you plan to import the exported metadata into a different schema, such as when upgrading to Oracle OLAP 11*g* metadata.
`PreserveTableOwners`	Controls the use of the owner in qualifying table names in the mapping elements, such as GLOBAL.UNITS_HISTORY_FACT instead of UNITS_HISTORY_FACT. Enter `True` to retain the table owner, or enter `False` to default to the current schema for table mappings. If you plan to import the exported metadata to a different schema, you must set this option to `True` to load data from tables and views in the original schema, unless the destination schema has its own copies of the tables and views.

Usage Notes

See "Upgrading Metadata From OLAP 10g to OLAP 11g" on page 39-11.

Examples

The following example generates an XML file named global.xml in OLAP 11*g* format using the default export settings. The metadata is derived from all analytic workspaces and CWM metadata in the GLOBAL_AW schema. The output file is generated in the WORK_DIR database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW', 'WORK_DIR', 'global.xml');
```

The next example also generates an XML file named global.xml in OLAP 11*g* format using the export options set in options.xml. The metadata is derived from the GLOBAL analytic workspace in the GLOBAL_AW schema. Both the options file and the output file are in the WORK_DIR database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW.GLOBAL.AW', 'WORK_DIR',
'options.xml', 'WORK_DIR', 'global.xml');
```

The following PL/SQL script upgrades an Oracle OLAP 10*g* analytic workspace named GLOBAL in the GLOBAL_AW schema to an OLAP 11*g* analytic workspace named GLOBAL in the GLOBAL schema. See "Upgrading Metadata From OLAP 10g to OLAP 11g" on page 39-11 for information about upgrading.

```
BEGIN
-- Identify duplicate names
dbms_cube.initialize_cube_upgrade;

-- Export metadata from the GLOBAL analytic workspace to a file named sales_
upgrade.xml
dbms_cube.export_xml_to_file('GLOBAL_AW', 'UPGRADE_DIR', 'options.xml', 'UPGRADE_
DIR', 'sales_upgrade.xml');

-- Import metadata from sales_upgrade.xml to the current user
dbms_cube.import_xml('UPGRADE_DIR', 'sales_upgrade.xml');
```

```
-- Load and aggregate the data
dbms_cube.build('GLOBAL.UNITS_CUBE', 'GLOBAL.PRICE_AND_COST_CUBE');

END;
/
```

IMPORT_XML Procedure

This procedure creates, modifies, or drops an analytic workspace by using an XML template.

Syntax

```
DBMS_CUBE.IMPORT_XML
       (dirname               IN      VARCHAR2,
        filename              IN      VARCHAR2,
        out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
       (in_xml                IN      CLOB );

DBMS_CUBE.IMPORT_XML
       (in_xml                IN      CLOB,
        out_xml               IN/OUT  CLOB );
```

Parameters

Table 39–11 IMPORT_XML Procedure Parameters

Parameter	Description
dirname	The case-sensitive name of a database directory.
filename	A file containing an XML template.
in_xml	A CLOB containing an XML template.
out_xml	An XML file generated by DBMS_CUBE that shows changes DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.

Usage Notes

The XML can define an entire analytic workspace, a single cube, or a single dimension. When re-creating just a cube or dimension, you must provide the context of an existing analytic workspace.

You can also use IMPORT_XML to drop an analytic workspace by using the XML document generated by the DROP_MVIEW procedure.

See "Upgrading Metadata From OLAP 10g to OLAP 11g" on page 39-11.

Example

This example loads an XML template from a file named GLOBAL.XML and located in a database directory named XML_DIR.

```
EXECUTE dbms_cube.import_xml('XML_DIR', 'GLOBAL.XML');
```

The next example is a SQL script that creates the GLOBAL analytic workspace from an XML template stored in a CLOB. The file is named GLOBAL.XML, and it is located in a database directory named XML_DIR. The previous example shows a more direct method for using an XML file.

```
DEFINE xml_file = 'GLOBAL.XML';
SET ECHO ON;
SET SERVEROUT ON;
```

```
DECLARE
     xml_file     BFILE := bfilename('XML_DIR', '&xml_file');
     in_xml       CLOB;
     out_xml      CLOB := NULL;
     dest_offset  INTEGER := 1;
     src_offset   INTEGER := 1;
     lang_context INTEGER := 0;
     warning      INTEGER;
BEGIN
     -- Setup the clob from a file
     DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
     DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
     DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
     DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
        dest_offset, src_offset, 0, lang_context, warning);

     -- Import the xml
     DBMS_CUBE.IMPORT_XML(in_xml);
END;
/
```

INITIALIZE_CUBE_UPGRADE Procedure

This procedure creates a table that identifies Oracle OLAP 10*g* objects that must be renamed in OLAP 11*g* because of namespace conflicts.

The `export_xml` and `export_xml_to_file` procedures use the names specified in the NEW_NAME column of the table to identify objects in CWM or OLAP standard form (AWXML) analytic workspaces, rather than the original names.

Syntax

```
DBMS_CUBE.INITIALIZE_CUBE_UPGRADE;
```

Usage Notes

This procedure creates a table named CUBE_UPGRADE_INFO.

When INITIALIZE_CUBE_UPGRADE detects a name conflict among subobjects such as levels, hierarchies, and dimension attributes, it creates a row in CUBE_UPGRADE_INFO providing a new, unique name for each one. Rows may also be created for objects that do not require renaming; these rows are distinguished by a value of 0 or null in the CONFLICT column. Top-level objects, such as dimensions and cubes, are not listed.

You can edit the table using SQL `INSERT` and `UPDATE` if you want different names for the OLAP 11*g* objects.

This procedure must be called before EXPORT_XML or EXPORT_XML_TO_FILE is used on any OLAP 10*g* analytic workspace in which two objects or subobjects have the same name.

See "Upgrading Metadata From OLAP 10g to OLAP 11g" on page 39-11.

The following table describes the columns of CUBE_UPGRADE_INFO.

Column	Datatype	NULL	Description
OWNER	VARCHAR2	NOT NULL	Owner of the analytic workspace.
AW	VARCHAR2	NOT NULL	Name of the analytic workspace.
AWXML_ID	VARCHAR2	NOT NULL	Full logical name of the object requiring modification, in the form *simple_name.[subtype_name].object_type*. For example, `TIME.DIMENSION` and `PRODUCT.COLOR.ATTRIBUTE`.
NEW_NAME	VARCHAR2	NOT NULL	The name the object will have in Oracle 11*g* after the upgrade.
OBJECT_CLASS	VARCHAR2	--	`DerivedMeasure` for calculated measures, or empty for all other object types.
CONFLICT	NUMBER	--	Indicates the reason that the row was added to CUBE_UPGRADE_INFO: ■ `0`: The object does not have a naming conflict but appears in the table for other reasons. ■ `1`: Two objects have the same name and would create a conflict in the OLAP 11*g* namespace. The object type (such as level or hierarchy) will be added to the names.

Examples

The following command creates and populates the CUBE_UPGRADE_INFO table:

```
EXECUTE dbms_cube.initialize_cube_upgrade;
```

The table shows that the OLAP 10*g* analytic workspace has a hierarchy and a level named MARKET_SEGMENT, which will be renamed. The table also contains rows for calculated measures, but these objects do not require renaming: The value for CONFLICT is 0.

```
SELECT awxml_id, new_name, conflict FROM cube_upgrade_info;

REFRESH_MVIEW Procedure

This procedure refreshes the data in a cube materialized view.

Syntax

```
DBMS_CUBE.REFRESH_MVIEW (
          mvowner              IN  VARCHAR2,
          mvname               IN  VARCHAR2,
          method               IN  VARCHAR2       DEFAULT NULL,
          refresh_after_errors IN  BOOLEAN        DEFAULT FALSE,
          parallelism          IN  BINARY_INTEGER DEFAULT NULL,
          atomic_refresh       IN  BOOLEAN        DEFAULT FALSE,
          scheduler_job        IN  VARCHAR2       DEFAULT NULL,
          sam_parameters       IN  CLOB           DEFAULT NULL);
```

Parameters

Table 39–12 REFRESH_MVIEW Procedure Parameters

Parameter	Description
mvowner	Owner of the cube materialized view.
mvname	Name of the cube materialized view.
method	A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes. ■ C: Complete refresh clears all dimension values before loading. (Default) ■ F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table. ■ ?: Fast refresh if possible, and otherwise a complete refresh. ■ P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables. ■ S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values. See the "Usage Notes" for the BUILD procedure on page 39-18 for additional details.
refresh_after_errors	TRUE to roll back just the cube or dimension with errors, and then continue building the other objects. FALSE to roll back all objects in the build.
parallelism	Number of parallel processes to allocate to this job. See the "Usage Notes" for the BUILD procedure for additional details.

Table 39–12 (Cont.) REFRESH_MVIEW Procedure Parameters

Parameter	Description
atomic_refresh	TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.
scheduler_job	Any text identifier for the job, which will appear in the log table. The string does not need to be unique.
sam_parameters	None.

Usage Notes

REFRESH_MVIEW changes *mvname* to the name of the cube, then passes the cube name and all parameters to the BUILD procedure. Thus, you can use the BUILD procedure to refresh a cube materialized view. See the "BUILD Procedure" on page 39-14 for additional information about the parameters.

Examples

The following example uses the default settings to refresh a cube materialized view named CB$FWEEK_PSCAT_SALES.

```
SET serverout ON format wrapped

EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES');
```

The next example changes the refresh method to use fast refresh if possible, continue refreshing after an error, and use two parallel processes.

```
EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES', '?', TRUE, 2);
```

After successfully refreshing the cube materialized view, REFRESH_MVIEW returns a message like the following:

```
Completed refresh of cube mview "SH"."CB$FWEEK_PSCAT_SALES" at 20081114
15:04:46.370.
```

VALIDATE_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

Syntax

```
DBMS_CUBE.VALIDATE_XML
       (DIRNAME               IN  VARCHAR2,
        FILENAME              IN  VARCHAR2 );

DBMS_CUBE.VALIDATE_XML
       (IN_XML                IN  CLOB );
```

Parameters

Table 39–13 VALIDATE_XML Procedure Parameters

Parameter	Description
dirname	The case-sensitive name of a database directory.
filename	The name of a file containing an XML template.
IN_XML	The name of a CLOB containing an XML template.

Usage Notes

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

Example

This example reports a problem in the schema:

```
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
BEGIN dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML'); END;

*
ERROR at line 1:
ORA-37162: OLAP error
'GLOBAL.PRICE_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for
cube "GLOBAL.PRICE_CUBE" contains multiple BuildSpecifications with the same
name.
'GLOBAL.UNITS_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for
cube "GLOBAL.UNITS_CUBE" contains multiple BuildSpecifications with the same
name.
XOQ-01400: invalid metadata objects
ORA-06512: at "SYS.DBMS_CUBE", line 411
ORA-06512: at "SYS.DBMS_CUBE", line 441
ORA-06512: at "SYS.DBMS_CUBE", line 501
ORA-06512: at "SYS.DBMS_CUBE", line 520
ORA-06512: at line 1
```

After the problems are corrected, the procedure reports no errors:

```
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');

PL/SQL procedure successfully completed.
```

This example loads an XML template into a temporary CLOB, then validates it. The script is named GLOBAL.XML, and it is located in a database directory named XML_DIR.

```
DEFINE xml_file = 'GLOBAL.XML';

SET ECHO ON;
SET SERVEROUT ON;

DECLARE
     xml_file     BFILE := bfilename('XML_DIR', '&xml_file');
     in_xml       CLOB;
     out_xml      CLOB := NULL;
     dest_offset  INTEGER := 1;
     src_offset   INTEGER := 1;
     lang_context INTEGER := 0;
     warning      INTEGER;
BEGIN
     -- Setup the clob from a file
     DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
     DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
     DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
     DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
        dest_offset, src_offset, 0, lang_context, warning);

     -- Validate the xml
     DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/
```

40

DBMS_CUBE_ADVISE

DBMS_CUBE_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topic:

- Summary of DBMS_CUBE_ADVISE Subprograms

> **See Also:** *Oracle OLAP User's Guide* for information about cube materialized views.

Summary of DBMS_CUBE_ADVISE Subprograms

Table 40–1 Summary of DBMS_CUBE_ADVISE Subprograms

Subprogram	Description
MV_CUBE_ADVICE Function on page 40-3	Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.
SET_CNS_EXCEPTION_LOG Procedure on page 40-6	Identifies the name of an exception log used in validated constraints generated by `MV_CUBE_ADVICE`.
TRACE Procedure on page 40-7	Displays or suppresses diagnostic messages for `MV_CUBE_ADVICE`.

MV_CUBE_ADVICE Function

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and materialized view logs that allow the broadest range of query rewrite transformations and log-based fast refresh of the cube materialized view.

Syntax

```
DBMS_CUBE_ADVISE.MV_CUBE_ADVICE (
          owner        IN  VARCHAR2  DEFAULT USER,
          mvname       IN  VARCHAR2,
          reqtype      IN  VARCHAR2  DEFAULT '0',
          validate     IN  NUMBER    DEFAULT 0)
     RETURN COAD_ADVICE_T  PIPELINED;
```

Parameters

Table 40–2 MV_CUBE_ADVICE Function Parameters

Parameter	Description
owner	Owner of the cube materialized view
mvname	Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB$UNITS_CUBE
reqtype	Type of advice to generate: ■ 0: All applicable advice types ■ 1: Column NOT NULL constraints ■ 2: Primary key constraints ■ 3: Foreign key constraints ■ 4: Relational dimension objects ■ 5: Cube materialized view logs with primary key
validate	Validation option: ■ 0: Validate the constraints ■ 1: Do not validate the constraints

Returns

A table of type COAD_ADVICE_T, consisting of a set of rows of type COAD_ADVICE_REC. Table 40–3 describes the columns.

Table 40–3 MV_CUBE_ADVICE Return Values

Column	Data Type	Description
OWNER	VARCHAR2(30)	Owner of the dimensional object identified in APIOBJECT.
APIOBJECT	VARCHAR2(30)	Name of a cube enhanced with materialized view capabilities, such as UNITS_CUBE.
SQLOBJOWN	VARCHAR2(30)	Owner of the relational object identified in SQLOBJECT.
SQLOBJECT	VARCHAR2(65)	Name of the master table, such as UNITS_FACT, or the cube materialized view, such as CB$UNITS_CUBE.

Table 40–3 (Cont.) MV_CUBE_ADVICE Return Values

Column	Data Type	Description
ADVICETYPE	NUMBER(38,0)	Type of recommendation: ■ 1: Create NOT NULL constraints on the foreign key columns ■ 2: Create primary key constraints on the master table ■ 3: Create primary key constraints on the master view ■ 4: Create foreign key constraints on the master table ■ 5: Create foreign key constraints on the master view ■ 6: Create relational dimensions on the master dimension tables ■ 7: Create a materialized view log ■ 8: Compile the materialized view
DISPOSITION	CLOB	Pre-existing conditions that conflict with the recommendations and should be resolved before SQLTEXT can be executed.
SQLTEXT	CLOB	SQL statement that implements the recommendation.
DROPTEXT	CLOB	SQL statement that reverses SQLTEXT. Pre-existing conditions may prevent these statements from restoring the schema to its previous state.

Usage Notes

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

MV_CUBE_ADVICE generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL DROP MATERIALIZED VIEW LOG statement in the DROPTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

Examples

The following query displays the SQL statements recommended by MV_CUBE_ADVICE. UNITS_FACT is the master table for UNITS_CUBE, and MV_CUBE_ADVICE generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the CB$UNITS_CUBE cube materialized view.

```
SQL> SELECT apiobject, sqlobject, sqltext
      FROM TABLE(dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'));

APIOBJECT    SQLOBJECT       SQLTEXT
------------ --------------- --------------------------------------------
UNITS_CUBE   UNITS_FACT      alter table "GLOBAL"."UNITS_FACT" add constra
                             int "COAD_PK000208" PRIMARY KEY ("CHANNEL_ID"
```

		, "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") rely d isable novalidate
UNITS_CUBE	CB$UNITS_CUBE	alter materialized view "GLOBAL"."CB$UNITS_CU BE" compile

SET_CNS_EXCEPTION_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.

Syntax

```
DBMS_CUBE_ADVISE.SET_CNS_EXCEPTION_LOG (
       exceptlogtab     IN   VARCHAR2  DEFAULT user.EXCEPTIONS);
```

Parameters

Table 40–4 SET_CNS_EXCEPTION_LOG Procedure Parameters

Parameter	Description
exceptlogtab	The name of an existing exception log.

Usage Notes

To create an exception log, use the utlexcpt.sql or the utlexpt1.sql script before executing SET_CNS_EXCEPTION_LOG.

The validate parameter of MV_CUBE_ADVICE must be set to 1.

Examples

The utlexcpt.sql script creates a table named EXCEPTIONS, and the SET_CNS_EXCEPTION_LOG procedure identifies it as the exception log for MV_CUBE_ADVICE. The ALTER TABLE statement now includes the clause VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS".

```
SQL> @utlexcpt
Table created.

SQL> EXECUTE dbms_cube_advise.set_cns_exception_log;
PL/SQL procedure successfully completed.

SQL> SELECT apiobject, sqlobject, advicetype type, sqltext
     FROM TABLE(
     dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));

APIOBJECT    SQLOBJECT       TYPE SQLTEXT
------------ --------------- ---- ------------------------------------------------
UNITS_CUBE   UNITS_FACT         2 alter table "GLOBAL"."UNITS_FACT" add constrai
                                  nt "COAD_PK000219" PRIMARY KEY ("CHANNEL_ID",
                                  "ITEM_ID", "SHIP_TO_ID", "MONTH_ID") norely en
                                  able validate exceptions into "GLOBAL"."EXCEPT
                                  IONS"

UNITS_CUBE   CB$UNITS_CUBE      8 alter materialized view "GLOBAL"."CB$UNITS_CUB
                                  E" compile
```

TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the MV_CUBE_ADVICE function.

Syntax

```
DBMS_CUBE_ADVISE.TRACE (
     diaglevel       IN  BINARY_INTEGER DEFAULT 0);
```

Parameters

Table 40–5 TRACE Procedure Parameters

Parameter	Description
diaglevel	0 to turn tracing off, or 1 to turn tracing on.

Examples

The following example directs the diagnostic messages to server output. The SQL*Plus SERVEROUTPUT setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE dbms_cube_advise.trace(1);
DBMS_COAD_DIAG: Changing diagLevel from [0] to [1]

PL/SQL procedure successfully completed.

SQL> SELECT sqlobject, sqltext, droptext
     FROM TABLE(
     dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'))
     WHERE apiobject='UNITS_CUBE';

SQLOBJECT       SQLTEXT                                  DROPTEXT
--------------- ---------------------------------------- ----------------------------------------
UNITS_FACT      alter table "GLOBAL"."UNITS_FACT" add co alter table "GLOBAL"."UNITS_FACT" drop c
                nstraint "COAD_PK000222" PRIMARY KEY ("C onstraint "COAD_PK000222" cascade
                HANNEL_ID", "ITEM_ID", "SHIP_TO_ID", "MO
                NTH_ID") rely disable novalidate

CB$UNITS_CUBE   alter materialized view "GLOBAL"."CB$UNI alter materialized view "GLOBAL"."CB$UNI

DBMS_CUBE_LOG

DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.

> **See Also:** *Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- Using DBMS_CUBE_LOG
- Summary of DBMS_CUBE_LOG Subprograms

Using DBMS_CUBE_LOG

DBMS_CUBE_LOG manages several logs. These logs enable you to track the progress of long running processes, then use the results to profile performance characteristics. They provide information to help you diagnose and remedy problems that may occur during development and maintenance of a cube: Hierarchies that are improperly structured in the relational source tables, records that fail to load, or data refreshes that take too long to complete. They also help diagnose performance problems in querying cubes.

Analytic Workspace Manager creates the logs automatically using the default names and types. It also disables the logs when Analytic Workspace Manager is closed. To use the same logs outside of Analytic Workspace Manager, you must first enable them. Alternatively, you can create and manage different logs for use outside of Analytic Workspace Manager.

Logging Types

Several logs are available, each one dedicated to storing messages of a particular type. You may use all of them or only those that you find particularly valuable. The logs and their contents are described later in this topic.

- Cube Build Log
- Cube Dimension Compile Log
- Cube Operations Log
- Cube Rejected Records Log

DBMS_CUBE_LOG provides functions that return the binary integer for each log type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- TYPE_BUILD Function
- TYPE_DIMENSION_COMPILE Function
- TYPE_OPERATIONS Function
- TYPE_REJECTED_RECORDS Function

Logging Targets

The TABLE_CREATE procedure creates database tables for storing the logs. Using the ENABLE procedure, you can create additional targets with changes in the destination or logging level. For example, you might target the Cube Operations log to both a table and a disk file. These are the available targets:

- Disk file
- LOB
- Database table
- Trace file

See "ENABLE Procedure" on page 41-14 for more information about creating multiple targets.

DBMS_CUBE_LOG provides functions that return the binary integer for each target type. You can produce more readable code by using these functions instead of integers

for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- TARGET_FILE Function
- TARGET_LOB Function
- TARGET_TABLE Function
- TARGET_TRACE Function

Verbosity Levels

You can decide how much information is recorded in a log. You may want fewer details when leaving a job to run overnight than when you are monitoring the success of a new build. You can choose from these verbosity levels. Each level adds to the preceding level.

- LOWEST: Logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records. This is the basic logging level.
- LOW: Logs messages from the OLAP engine, such as start and finish records for SQL Import, Aggregate, and Update.
- MEDIUM: Logs messages at the level used by Analytic Workspace Manager.
- HIGH: Logs messages that provide tuning information, such as composite lengths, partitioning details, object sizes, and aggregation work lists. This level is intended for use by Oracle Field Services.
- HIGHEST: Logs debugging messages and other information typically sent to a trace file. This level is intended for use by Oracle Support Services.

DBMS_CUBE_LOG provides functions that return the binary integer for each verbosity level. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- LEVEL_LOWEST Function
- LEVEL_LOW Function
- LEVEL_MEDIUM Function
- LEVEL_HIGH Function
- LEVEL_HIGHEST Function

Creating Cube Logs

To store logging information in a database table, you must create that table using the TABLE_CREATE procedure. Cube Build logs are always stored in tables. The ENABLE procedure creates the other target types for the other logs.

To create a Cube Build log:

- Execute the `TABLE_CREATE` procedure.

The following command creates a Cube Build log with the default name of `CUBE_BUILD_LOG`:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_build);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a database table target:

1. Execute the `TABLE_CREATE` procedure to create the table.
2. Execute the `ENABLE` procedure to begin logging.

These commands create and enable a Cube Operations table with the default name of `CUBE_OPERATIONS_LOG` and the default verbosity level:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_operations);
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a trace file, disk file, or LOB target:

- Execute the `ENABLE` procedure.

This command enables the Cube Rejected Records log, sets verbosity to the lowest level, and directs the output to a disk file named `rejects.log` in the `WORK_DIR` database directory:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_rejected_records, -
     dbms_cube_log.target_file, dbms_cube_log.level_lowest, -
     'WORK_DIR/rejects.log');
```

Cube Build Log

The Cube Build log provides information about what happened during a build. Use this log to determine whether the build produced the results you were expecting, and if not, why not.

The contents of the Cube Build log is refreshed continuously during a build. You can query the log at any time to evaluate the progress of the build and to estimate the time to completion.

The default name of the Cube Build log is CUBE_BUILD_LOG. The following table describes its contents.

Note: To manage a Cube Build log, use only the TABLE_CREATE and VERSION procedures.

Column	Datatype	NULL	Description
BUILD_ID	NUMBER	--	A unique sequence number for the build. The same number is used for slave processes in a parallel build.
SLAVE_NUMBER	NUMBER	--	A counter for slave processes in a parallel build: 0 is the master process, 1 is the first slave, 2 is the second slave, and so forth.
STATUS	VARCHAR2(10)	--	The current status of the command: STARTED, COMPLETED, FAILED, or WORKING.
COMMAND	VARCHAR2(25)	--	The name of the command being executed, such as BUILD, LOAD, and SOLVE.
BUILD_OBJECT	VARCHAR2(500)	--	The name of the cube or cube dimension being processed.
BUILD_OBJECT_TYPE	VARCHAR2(10)	--	The type of object: CUBE, DIMENSION, or BUILD.
OUTPUT	CLOB	--	Information structured like an XML document about the command, or NULL when there is no additional information, such as for a STARTED row.
AW	VARCHAR2(30)	--	The name of the analytic workspace that contains the objects of the build.
OWNER	VARCHAR2(30)		The owner of the analytic workspace and all the objects of the build.
PARTITION	VARCHAR2(10)	--	The name of the partition being processed, or NULL when the current operation does not correspond to a partition.
SCHEDULER_JOB	VARCHAR2(100)	--	A user-specified string to identify the build.
TIME	TIMESTAMP(6)	--	The time the row is added to the table.
BUILD_SCRIPT	CLOB	--	The cube build script. Populated only in rows where COMMAND is BUILD.
BUILD_TYPE	VARCHAR2(22)	--	The origin of the build: DBMS_CUBE, DBMS_MVIEW, JAVA, or SLAVE.
COMMAND_DEPTH	NUMBER(2)	--	The nesting depth of the command. For example, COMPILE HIERARCHIES is a component step of COMPILE, so if COMPILE has a depth of 1, then COMPILE HIERARCHIES has a depth of 2.

Column	Datatype	NULL	Description
BUILD_SUB_OBJECT	VARCHAR2(30)	--	The name of a subobject being processed, such as a measure that does not inherit the aggregation rules of the cube.
REFRESH_METHOD	VARCHAR2(1)	--	The refresh method, such as C or F, that is associated with the current command. The refresh method is important only for the CLEAR step.
SEQ_NUMBER	NUMBER	--	Not currently used.
COMMAND_NUMBER	NUMBER	--	The sequence number of the command in the current process, which can be used to distinguish the same command on different objects. For example, a LOAD on PRODUCT and a LOAD on TIME.
IN_BRANCH	NUMBER(1)	--	Not currently used.
COMMAND_STATUS_ NUMBER	NUMBER	--	Identifies the sequence number of all rows for a particular command. For example, a particular command might be represented by four rows: The first row has a status of STARTED and the last row has a status of COMPLETED. This column is used for sorting.

Cube Dimension Compile Log

When solving a cube, OLAP checks the dimension hierarchies to make sure they are valid. Errors that occur during this validation are written to the Cube Dimension Compile log. The checks include:

- Circularity: Hierarchies are defined by parent-child relations among dimension members. Circularity occurs when a dimension member is specified as its own ancestor or descendant.
- Hierarchy type: Hierarchies can be level based or value based. You can define a cube so that only level-based hierarchies are valid, such as a cube materialized view.
- Level options: Level-based hierarchies can be regular, ragged, or skip level. You can define a dimension so that only regular hierarchies are valid, such as a Time dimension.

The default name of the Cube Dimension Compile log is `CUBE_DIMENSION_COMPILE`. The following table describes its contents.

Column	Datatype	NULL	Description
`ID`	`NUMBER`	--	Current operation identifier
`SEQ_NUMBER`	`NUMBER`	--	Sequence number in the Cube Build log
`ERROR#`	`NUMBER(8)`	`NOT NULL`	Number of the error being reported
`ERROR_MESSAGE`	`VARCHAR2(2000)`	--	Error message associated with the error
`DIMENSION`	`VARCHAR2(100)`	--	Name of the dimension being compiled
`DIMENSION_MEMBER`	`VARCHAR2(100)`	--	Faulty dimension member
`MEMBER_ANCESTOR`	`VARCHAR2(100)`	--	Parent of `DIMENSION_MEMBER`
`HIERARCHY1`	`VARCHAR2(100)`	--	First hierarchy involved in the error
`HIERARCHY2`	`VARCHAR2(100)`	--	Second hierarchy involved in the error
`ERROR_CONTEXT`	`CLOB`	--	Additional information about the error

Cube Operations Log

The Cube Operations log contains messages and debugging information for all OLAP engine events. You can track current operations at a very detailed level. Using the SQL_ID column, you can join the Cube Operations log to dynamic performance views such as VSQL, VSESSION, and V$SESSION_LONGOPS to see cube operations in the context of other database operations such as I/O Wait and CPU.

The default name of the Cube Operations log is CUBE_OPERATIONS_LOG. The following table describes its contents.

Column	Datatype	NULL	Description
INST_ID	NUMBER	NOT NULL	Instance identifier
SID	NUMBER	NOT NULL	Session identifier
SERIAL#	NUMBER	NOT NULL	Session serial number
USER#	NUMBER	NOT NULL	User identifier
SQL_ID	VARCHAR2(13)	--	Executing SQL statement identifier
JOB	NUMBER	--	Job identifier
ID	NUMBER	--	Current operation identifier
PARENT_ID	NUMBER	--	Parent operation identifier
SEQ_NUMBER	NUMBER	--	Sequence number in the Cube Build log
TIME	TIMESTAMP(6) WITH TIME ZONE	NOT NULL	Time the record was added to the Cube Operations log
LOG_LEVEL	NUMBER(4)	NOT NULL	Verbosity level of the record, as specified by the DBMS_CUBE_LOG.ENABLE procedure.
DEPTH	NUMBER(4)	--	Nesting depth of the record. For example, a level of 0 indicates that the operation and suboperation are not nested within other operations and suboperations.
OPERATION	VARCHAR2(15)	NOT NULL	Current operation, such as AGGREGATE, ROWSOURCE, or SQLIMPORT.
SUBOPERATION	VARCHAR2(20)	--	Current suboperation, such as Loading or Import
STATUS	VARCHAR2(10)	NOT NULL	Current status of the operation, such as START, TRACE, COMPLETED, or Failed.
NAME	VARCHAR2(20)	NOT NULL	Name of the record, such as ROWS LOADED, AVE_ROW_LEN, and PAGEPOOLSIZE
VALUE	VARCHAR2(4000)	--	Value of NAME
DETAILS	CLOB	--	Additional information about NAME.

Cube Rejected Records Log

The Cube Rejected Records log contains a summary of the loader job and any records that were rejected because they did not meet the expected format.

A single row in the source table may have errors in more than one field. Each field will generates an error in log, resulting in multiple rows with the same rowid in the SOURCE_ROW column.

The default name of the Cube Rejected Records log is CUBE_REJECTED_RECORDS. The following table describes its contents.

Column	Datatype	NULL	Description
ID	NUMBER	--	Current operation identifier
SEQ_NUMBER	NUMBER	--	Sequence number in the Cube Build log
ERROR#	NUMBER(8)	NOT NULL	Number of the error triggered by the record
ERROR_MESSAGE	VARCHAR2	--	Error message associated with the error
RECORD#	NUMBER(38)	--	Input record number
SOURCE_ROW	ROWID	--	Rowid of the row in the source table; null when the source is a view or a query

Summary of DBMS_CUBE_LOG Subprograms

Table 41–1 DBMS_CUBE_LOG Subprograms

Subprogram	Description
DEFAULT_NAME Function on page 41-12	Returns the default table names of the various log types.
DISABLE Procedure on page 41-13	Turns logging off for the duration of a session.
ENABLE Procedure on page 41-14	Turns on logging for the duration of a session, redirects logging to additional output types, and changes the verbosity level in the logs.
FLUSH Procedure on page 41-16	Forces all buffered messages to be written to the logs.
GET_LOG Procedure on page 41-17	Returns the current settings for the level and location of a particular log.
GET_LOG_SPEC Function on page 41-19	Retrieves a description of all active logs.
GET_PARAMETER Function on page 41-20	Returns the current values of the options that control various aspects of logging.
LEVEL_HIGH Function on page 41-21	Returns the integer value of the high verbosity level.
LEVEL_HIGHEST Function on page 41-22	Returns the integer value of the highest verbosity level.
LEVEL_LOW Function on page 41-23	Returns the integer value of the low verbosity level.
LEVEL_LOWEST Function on page 41-24	Returns the integer value of the lowest verbosity level.
LEVEL_MEDIUM Function on page 41-25	Returns the integer value of the medium verbosity level.
SET_LOG_SPEC Procedure on page 41-26	Sets all logging to the values specified in the input string.
SET_PARAMETER Procedure on page 41-27	Sets options that control various aspects of logging.
TABLE_CREATE Procedure on page 41-29	Creates the table targets for the OLAP logs.
TARGET_FILE Function on page 41-30	Returns the integer value of a disk file target.
TARGET_LOB Function on page 41-31	Returns the integer value of a LOB target.
TARGET_TABLE Function on page 41-32	Returns the integer value of a database table target
TARGET_TRACE Function on page 41-33	Returns the integer value of a trace file target.
TYPE_BUILD Function on page 41-34	Returns the integer value of the Cube Build log.
TYPE_DIMENSION_ COMPILE Function on page 41-35	Returns the integer value of the Cube Dimension Compile log.

Table 41–1 (Cont.) DBMS_CUBE_LOG Subprograms

Subprogram	Description
TYPE_OPERATIONS Function on page 41-36	Returns the integer value of the Cube Operations log.
TYPE_REJECTED_ RECORDS Function on page 41-37	Returns the integer value of the Cube Rejected Records log.
VERSION Function on page 41-38	Returns the version number of a specific log table or the current version number of a specific log type.

DEFAULT_NAME Function

This function returns the default table names of the various log types.

Syntax

```
DBMS_CUBE_LOG.DEFAULT_NAME (
           LOG_TYPE       IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS)
     RETURN VARCHAR2;
```

Parameters

Table 41–2 DEFAULT_NAME Function Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE ■ 4: TYPE_BUILD See "Logging Types" on page 41-2.

Returns

The default table name of the specified log type.

Examples

This example returns the default name of the Cube Operations log:

```
SELECT dbms_cube_log.default_name FROM dual;

DEFAULT_NAME
------------------------------
CUBE_OPERATIONS_LOG
```

The next example returns the default name of the Cube Rejected Records log:

```
select dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
     "Default Name" from dual;

Default Name
-------------------------
CUBE_REJECTED_RECORDS
```

DISABLE Procedure

This procedure turns logging off for the duration of a session, unless logging is explicitly turned on again with the ENABLE procedure.

Syntax

```
DBMS_CUBE_LOG.DISABLE (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
          LOG_TARGET     IN   BINARY_INTEGER  DEFAULT);
```

Parameters

Table 41–3 DISABLE Procedure Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE **Note**: You cannot disable the Cube Build log with this procedure. See "Logging Types" on page 41-2.
log_target	One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure. ■ 1: TARGET_TABLE ■ 2: TARGET_TRACE ■ 3: TARGET_FILE ■ 4: TARGET_LOB See "Logging Targets" on page 41-2

Example

This command disables the dimension compilation error log table:

```
EXECUTE dbms_cube_log.disable(dbms_cube_log.type_dimension_compile);
```

ENABLE Procedure

This procedure turns on logging for the duration of a session or until it is turned off using the `DISABLE` procedure.

The `ENABLE` procedure also allows you to direct logging to additional output types and to change the amount of detail in the logs. You can enable a log type to each of the log targets. For example, you can enable the Cube Operations log to the trace file, a table, and a file at different verbosity levels, but you cannot enable the Cube Operations log to two files at the same time.

This procedure also checks the format of the logs and updates them if necessary.

Syntax

```
DBMS_CUBE_LOG.ENABLE (
          LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL);

DBMS_CUBE_LOG.ENABLE (
          LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LOCATION   IN     VARCHAR2        DEFAULT NULL);

DBMS_CUBE_LOG.ENABLE (
          LOG_TYPE       IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_TARGET     IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LEVEL      IN     BINARY_INTEGER  DEFAULT NULL,
          LOG_LOCATION   IN/OUT CLOB );
```

Parameters

Table 41–4 ENABLE Procedure Parameters

Parameter	Description
`log_type`	One of the following log types: ■ 1: `TYPE_OPERATIONS` ■ 2: `TYPE_REJECTED_RECORDS` ■ 3: `TYPE_DIMENSION_COMPILE` **Note**: You cannot disable the Cube Build log with this procedure. See "Logging Types" on page 41-2.
`log_target`	One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the `ENABLE` procedure. ■ 1: `TARGET_TABLE` ■ 2: `TARGET_TRACE` ■ 3: `TARGET_FILE` ■ 4: `TARGET_LOB` See "Logging Targets" on page 41-2

Table 41–4 (Cont.) ENABLE Procedure Parameters

Parameter	Description
`log_level`	One of the following log verbosity levels. Each level adds new types of messages to the previous level. ■ 1: `LEVEL_LOWEST` ■ 2: `LEVEL_LOW` ■ 3: `LEVEL_MEDIUM` ■ 4: `LEVEL_HIGH` ■ 5: `LEVEL_HIGHEST` See "Verbosity Levels" on page 41-3.
`log_location`	The full identity of the log, such as *`owner.table_name`* when `log_target` is a table.

Examples

The following command enables all cube logs:

```
EXECUTE dbms_cube_log.enable;
```

The following PL/SQL procedure sets the log level to `LEVEL_LOWEST`:

```
BEGIN
     dbms_cube_log.disable(dbms_cube_log.type_rejected_records);
     dbms_cube_log.enable(dbms_cube_log.type_rejected_records,
          dbms_cube_log.target_table, dbms_cube_log.level_lowest);
END;
/
```

FLUSH Procedure

This procedure forces all buffered messages to be written to the logs. The buffers are flushed automatically throughout a session, but manually flushing them before viewing the logs assures that you can view all of the messages.

Syntax

```
DBMS_CUBE_LOG.FLUSH ( );
```

Example

The following example flushes the buffers for all of the logs:

```
EXECUTE dbms_cube_log.flush;
```

GET_LOG Procedure

This procedure returns the current settings for the level and location of a particular log.

Syntax

```
DBMS_CUBE_LOG.GET_LOG (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS,
          LOG_TARGET     IN   BINARY_INTEGER  DEFAULT TARGET_TABLE,
          LOG_LEVEL      OUT  BINARY_INTEGER,
          LOG_LOCATION   OUT  VARCHAR2 );
```

Parameters

Table 41–5 GET_LOG Procedure Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE See "Logging Types" on page 41-2.
log_target	One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the ENABLE procedure. ■ 1: TARGET_TABLE ■ 2: TARGET_TRACE ■ 3: TARGET_FILE ■ 4: TARGET_LOB See "Logging Targets" on page 41-2
log_level	One of the following log verbosity levels. Each level adds new types of messages to the previous level. ■ 1: LEVEL_LOWEST ■ 2: LEVEL_LOW ■ 3: LEVEL_MEDIUM ■ 4: LEVEL_HIGH ■ 5: LEVEL_HIGHEST See "Verbosity Levels" on page 41-3.
log_location	The full identity of the log, such as *owner.table_name* when log_target is a table.

Usage Notes

If log_type is not active, then log_level and log_location are null. Use DBMS_CUBE_LOG.ENABLE to activate a log.

Examples

This PL/SQL procedure provides information about the Cube Rejected Records log:

```
SET serverout ON format wrapped
```

```
DECLARE
     myloglevel  binary_integer;
     mylogtarget varchar2(128);

BEGIN
     dbms_cube_log.get_log(dbms_cube_log.type_rejected_records,
     dbms_cube_log.target_table, myloglevel, mylogtarget);

     dbms_output.put_line('Log Level: ' || myloglevel);
     dbms_output.put_line('Log Target: ' || mylogtarget);
END;
/
```

The procedure generates results like the following:

```
Log Level: 5

Log Target: GLOBAL.CUBE_REJECTED_RECORDS
```

GET_LOG_SPEC Function

This function retrieves a description of all active Cube Operations logs, Cube Rejected Records logs, and Cube Dimension Compile logs.

Syntax

```
DBMS_CUBE_LOG.GET_LOG_SPEC ( )
     RETURN VARCHAR2;
```

Returns

The type and target of all active logs.

Usage Notes

You can use the output from this function as the input to `SET_LOG_SPEC`.

Examples

The following example shows that the Cube Operations log, Cube Rejected Records log, and Cube Dimension Compile log are active. The Cube Operations log is stored in the session trace file and the other logs are stored in tables.

```
SELECT dbms_cube_log.get_log_spec FROM dual;

GET_LOG_SPEC
--------------------------------------------------------------------------------
OPERATIONS(TABLE, TRACE) REJECTED_RECORDS(TABLE[DEBUG])
```

GET_PARAMETER Function

This function returns the current values of the options that control various aspects of logging. To set these options, use the SET_PARAMETER function.

Syntax

```
DBMS_CUBE_LOG.GET_PARAMETER (
          LOG_TYPE       IN   BINARY_INTEGER,
          LOG_PARAMETER  IN   BINARY_INTEGER )
     RETURN BINARY_INTEGER;
```

Parameters

Table 41–6 GET_PARAMETER Function Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE See "Logging Types" on page 41-2.
log_parameter	One of the following options: ■ 1: MAX_ERRORS ■ 2: FLUSH_INTERVAL ■ 3: LOG_FULL_RECORD ■ 4: LOG_EVERY_N ■ 5: ALLOW_ERRORS See "SET_PARAMETER Procedure" on page 41-27.

Returns

The value of the specified *log_parameter*.

Examples

This example shows the current maximum number of errors in the Cube Rejected Records log before logging stops. This parameter was previously set with the SET_PARAMETER procedure.

```
SELECT dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1) -
     "Maximum Records" FROM dual;

Maximum Records
---------------
            100
```

LEVEL_HIGH Function

This function returns the integer value of the high verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGH ()
     RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the *LOG_LEVEL* parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 41-3.

Example

This command sets the verbosity level of the cube operations table to high:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_high);
```

LEVEL_HIGHEST Function

This function returns the integer value of the highest verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_HIGHEST ()
     RETURN BINARY_INTEGER;
```

Returns

```
5
```

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 41-3.

Example

This command sets the verbosity level of the cube operations table to highest:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_highest);
```

LEVEL_LOW Function

This function returns the integer value of the low verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_LOW ()
     RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 41-3.

Example

This command sets the verbosity level of the cube operations table to low:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_low);
```

LEVEL_LOWEST Function

This function returns the integer value of the lowest verbosity level. This level logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records.

Syntax

```
DBMS_CUBE_LOG.LEVEL_LOWEST ()
     RETURN BINARY_INTEGER;
```

Returns

```
1
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_LEVEL` parameter in `DBMS_CUBE_LOG` subprograms. See "Verbosity Levels" on page 41-3.

Example

This command sets the verbosity level of the cube operations table to lowest:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_lowest);
```

LEVEL_MEDIUM Function

This function returns the integer value of the medium verbosity level.

Syntax

```
DBMS_CUBE_LOG.LEVEL_MEDIUM ()
     RETURN BINARY_INTEGER;
```

Returns

```
3
```

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels" on page 41-3.

Example

This command sets the verbosity level of the cube operations table to medium:

```
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
     dbms_cube_log.target_table, dbms_cube_log.level_medium);
```

SET_LOG_SPEC Procedure

This procedure sets all logging to the values specified in the input string.

Syntax

```
DBMS_CUBE_LOG.SET_LOG_SPEC (
          LOG_SPEC       IN   VARCHAR2 );
```

Parameters

Table 41–7 SET_LOG_SPEC Procedure Parameters

Parameter	Description
log_spec	A string consisting of *type*(*target*) pairs. *Type* can be: ■ OPERATIONS ■ REJECTED_RECORDS ■ DIMENSION_COMPILE *Target* can be: ■ TABLE ■ TRACE ■ FILE ■ LOB

Usage Notes

The GET_LOG_SPEC function returns a properly formatted string for SET_LOG_SPEC.

Examples

This PL/SQL procedure disables all logs, verifies that they are disabled, then activates the Cube Operations log and the Cube Rejected Records log.

```
BEGIN
     dbms_cube_log.disable;
     dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);

     dbms_cube_log.set_log_spec('OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)');
     dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);
END;
/
```

The output from the procedure verifies that the DISABLE function de-activated all logs, and the SET_LOG_SPEC function activated two logs:

```
Cube Logs:

Cube Logs: OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)
```

SET_PARAMETER Procedure

This procedure sets options that control various aspects of logging. To obtain the current value of these options, use the GET_PARAMETER function.

Syntax

```
DBMS_CUBE_LOG.SET_PARAMETER (
          LOG_TYPE       IN   BINARY_INTEGER,
          LOG_PARAMETER  IN   BINARY_INTEGER,
          VALUE          IN   BINARY_INTEGER );
```

Parameters

Table 41–8 SET_PARAMETER Procedure Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE ■ 4: TYPE_BUILD See "Logging Types" on page 41-2.
log_parameter	One of the following parameters: ■ 1: MAX_ERRORS Maximum number of records before signalling an end to logging, such as the number of rejected records in the Cube Rejected Records log or the number of compilation errors in the dimension compilation error log. ■ 2: FLUSH_INTERVAL The number of seconds to buffer the records before writing them to a log. When this parameter is 0, the records are written directly to the logs without buffering. ■ 3: LOG_FULL_RECORD Controls logging of rejected records. Set this parameter to one of the following constants: 0: FULL_RECORD_AUTO: Log the full record when no row ID is available. 1: FULL_RECORD_ALWAYS: Always log the full record. 2: FULL_RECORD_NEVER: Never log the full record. ■ 4: LOG_EVERY_N Enters a progress message every *n* rows during data maintenance. ■ 5: ALLOW_ERRORS: Displays logging errors, which are initially turned off to allow processing to proceed.
value	The new value of *log_parameter*.

Examples

This PL/SQL procedure sets the two parameters, then uses the GET_PARAMETER function to show the settings:

```
BEGIN
     dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 1, 150);
     dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 2, 5);

     dbms_output.put_line('Max rejected records: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1));

     dbms_output.put_line('Buffer time: ' ||
        dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 2) ||
          ' seconds');
END;
/
```

The procedure displays this information:

```
Max rejected records: 150

Buffer time: 5 seconds
```

TABLE_CREATE Procedure

This procedure creates the table targets for the OLAP logs. You must have the CREATE TABLE privilege to use this procedure.

TABLE_CREATE also upgrades existing log tables to the current version while preserving the data.

Syntax

```
DBMS_CUBE_LOG.TABLE_CREATE (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
          TBLNAME        IN   VARCHAR2        DEFAULT );
```

Parameters

Table 41–9 TABLE_CREATE Procedure Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE ■ 4: TYPE_BUILD See "Logging Types" on page 41-2.
tblname	A table name for the log. These are the default names: ■ CUBE_OPERATIONS_LOG ■ CUBE_REJECTED_RECORDS ■ CUBE_DIMENSION_COMPILE ■ CUBE_BUILD_LOG

Examples

The

This example creates a Cube Operations log table named CUBE_OPERATIONS_LOG:

```
EXECUTE dbms_cube_log.table_create;
```

This example creates a Cube Rejected Records log table named CUBE_REJECTED_RECORDS:

```
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_rejected_records);
```

The next example creates a Cube Build log table named MY_BUILD_LOG:

```
EXECUTE dbms_cube_log.table_create -
     (dbms_cube_log.type_build, 'MY_BUILD_LOG');
```

TARGET_FILE Function

This function returns the integer value of a file target in DBMS_CUBE_LOG subprograms.

Syntax

```
DBMS_CUBE_LOG.TARGET_FILE ()
     RETURN BINARY_INTEGER;
```

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the *LOG_LEVEL* parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 41-2.

Example

This command disables the Cube Operations log file:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_file);
```

TARGET_LOB Function

This function returns the integer value of a LOB target.

Syntax

```
DBMS_CUBE_LOG.TARGET_LOB ()
     RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the *LOG_LEVEL* parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 41-2.

Example

This command disables the Cube Operations log LOB:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_lob);
```

TARGET_TABLE Function

This function returns the integer value of a table target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TABLE ()
     RETURN BINARY_INTEGER;
```

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 41-2.

Example

This command disables the Cube Operations log table:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_table);
```

TARGET_TRACE Function

This function returns the integer value of a trace file target.

Syntax

```
DBMS_CUBE_LOG.TARGET_TRACE ()
     RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets" on page 41-2.

Example

This command disables the Cube Operations log trace file:

```
EXECUTE dbms_cube_log.disable -
     (dbms_cube_log.type_operations, dbms_cube_log.target_trace);
```

TYPE_BUILD Function

This function returns the integer value of the Cube Build log.

Syntax

```
DBMS_CUBE_LOG.TYPE_BUILD ()
     RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types" on page 41-2.

Example

This query returns the default name of a Cube Build log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_build) "Log Name" -
     FROM dual;

Log Name
-------------------------
CUBE_BUILD_LOG
```

TYPE_DIMENSION_COMPILE Function

This function returns the integer value of the Cube Dimension Compile log.

Syntax

```
DBMS_CUBE_LOG.TYPE_DIMENSION_COMPILE ()
     RETURN BINARY_INTEGER;
```

Returns

```
3
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types" on page 41-2.

Example

This query returns the default name of a Cube Dimension Compile log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_dimension_compile) -
     "Log Name" FROM dual;

Log Name
-------------------------
CUBE_DIMENSION_COMPILE
```

TYPE_OPERATIONS Function

This function returns the integer value of the Cube Operations log.

Syntax

```
DBMS_CUBE_LOG.TYPE_OPERATIONS ()
     RETURN BINARY_INTEGER;
```

Returns

```
1
```

Usage Notes

Use this function instead of its binary integer equivalent for the `LOG_TYPE` parameter in `DBMS_CUBE_LOG` subprograms. See "Logging Types" on page 41-2.

Example

This query returns the default name of a Cube Dimension Compile log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_operations) "Log Name" -
     FROM dual;

Log Name
-------------------------
CUBE_OPERATIONS_LOG
```

TYPE_REJECTED_RECORDS Function

This function returns the integer value of the cube Cube Rejected Records log.

Syntax

```
DBMS_CUBE_LOG.TYPE_REJECTED_RECORDS ()
     RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types" on page 41-2.

Example

This query returns the default name of a Cube Rejected Records log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) -
     "Log Name" FROM dual;

Log Name
-------------------------
CUBE_REJECTED_RECORDS
```

VERSION Function

This function returns the version number of a specific log table or the current version number of a specific log type.

Syntax

```
DBMS_CUBE_LOG.VERSION (
          LOG_TYPE       IN   BINARY_INTEGER  DEFAULT 1,
          TBLNAME        IN   VARCHAR2        DEFAULT NULL)
     RETURN BINARY_INTEGER;
```

Parameters

Table 41–10 VERSION Function Parameters

Parameter	Description
log_type	One of the following log types: ■ 1: TYPE_OPERATIONS ■ 2: TYPE_REJECTED_RECORDS ■ 3: TYPE_DIMENSION_COMPILE ■ 4: TYPE_BUILD See "Logging Types" on page 41-2.
tblname	The name of the log table whose version is returned.

Returns

A version number

Examples

This example returns the current version of the Cube Operations log:

```
SELECT dbms_cube_log.version FROM dual;

   VERSION
----------
         2
```

This example returns the version number of an existing Cube Rejected Records log named CUBE_REJECTED_RECORDS.

```
SELECT dbms_cube_log.version(dbms_cube_log.type_rejected_records, -
     'CUBE_REJECTED_RECORDS') version FROM dual;

   VERSION
----------
         2
```

42

DBMS_DATA_MINING

Oracle Data Mining is an analytical technology for deriving actionable information from data. You can use Oracle Data Mining to evaluate the probability of future events and discover unsuspected associations and groupings within your data.

The `DBMS_DATA_MINING` package is the primary interface to Oracle Data Mining. A Java API is layered on the PL/SQL API. Oracle Data Mining also supports a family of SQL functions for deploying data mining models.

Oracle Data Miner, a graphical interface to Oracle Data Mining, is available for download from the Oracle Technology Network. Go to: `http://www.oracle.com/technology/products/bi/odm/index.html`.

See Also:

- Chapter 47, "DBMS_DATA_MINING_TRANSFORM". This package supports data pre-processing for data mining models.
- Chapter 101, "DBMS_PREDICTIVE_ANALYTICS". This package supports several routines that perform automated data mining.
- *Oracle Database SQL Language Reference* for information about the SQL Data Mining functions.
- *Oracle Data Mining Concepts* for an introduction to Oracle Data Mining.
- *Oracle Data Mining Concepts* for new features in 11*g* Release 2 (11.2).

This chapter contains the following topics:

- Using DBMS_DATA_MINING
  - Overview
  - Mining Model Objects
  - Deprecated Subprograms
  - Mining Functions
  - Model Settings
  - Data Types
- Summary of DBMS_DATA_MINING Subprograms

Using DBMS_DATA_MINING

This section contains topics that relate to using the `DBMS_DATA_MINING` package.

- Overview
- Mining Model Objects
- Deprecated Subprograms
- Mining Functions
- Model Settings
- Data Types

Overview

Oracle Data Mining supports both **supervised** and **unsupervised** data mining. Supervised data mining predicts a target value based on historical data. Unsupervised data mining discovers natural groupings and does not use a target.

> **See Also:** *Oracle Data Mining Concepts* for background information on supervised and unsupervised data mining, and for additional information about Data Mining functions and algorithms

A data mining **function** refers to the methods for solving a given class of data mining problems. The mining function must be specified when a model is created. See "Mining Functions" on page 42-8.

> **Note on Terminology:** In data mining terminology, a *function* is a general type of problem to be solved by a given approach to data mining. In SQL language terminology, a *function* is an operator that returns a value.
>
> In Oracle Data Mining documentation, the term *function*, or *mining function* refers to a data mining function; the term *SQL function* or *SQL Data Mining function* refers to a SQL function for scoring (deploying) data mining models. The SQL Data Mining functions are documented in *Oracle Database SQL Language Reference*.

Supervised data mining functions include:

- Classification
- Regression
- Attribute Importance

Unsupervised data mining functions include:

- Clustering
- Association
- Feature Extraction
- Anomaly Detection (one-class classification)

The steps you use to build and apply a mining model depend on the data mining function and the algorithm being used. The algorithms supported by Oracle Data Mining are listed in Table 42–1.

Table 42–1 Oracle Data Mining Algorithms

Algorithm	Abbreviation	Function
Adaptive Bayes Network (deprecated)	ABN	Classification
Apriori	AP	Association
Decision Tree	DT	Classification
Generalized Linear Model	GLM	Classification and Regression
k-Means (default clustering algorithm)	KM	Clustering

Table 42–1 (Cont.) Oracle Data Mining Algorithms

Algorithm	Abbreviation	Function
Minimal Descriptor Length	MDL	Attribute Importance
Naive Bayes (default classification algorithm)	NB	Classification
Non-Negative Matrix Factorization	NMF	Feature Extraction
Orthogonal Partitioning Clustering	O-Cluster	Clustering
Support Vector Machine (default regression algorithm)	SVM	Classification and regression (and anomaly detection through one-class classification)

Mining Model Objects

Mining models are Oracle Database schema objects. They support the standard security features of Oracle Database. Mining models are also supported by SQL `COMMENT` and SQL `AUDIT`.

See Also:

- *Oracle Data Mining Administrator's Guide* for information about mining model objects, SQL `COMMENT`, and SQL `AUDIT`
- *Oracle Data Mining Administrator's Guide* for information about mining model security
- *Oracle Data Mining Administrator's Guide* for information about the sample Data Mining programs

ALL_MINING_MODELS

You can query the data dictionary view `ALL_MINING_MODELS` to obtain a list of accessible mining models.

Example 42–1 ALL_MINING_MODELS

```
SQL> describe all_mining_models
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 OWNER                                     NOT NULL VARCHAR2(30)
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 MINING_FUNCTION                                    VARCHAR2(30)
 ALGORITHM                                          VARCHAR2(30)
 CREATION_DATE                             NOT NULL DATE
 BUILD_DURATION                                     NUMBER
 MODEL_SIZE                                         NUMBER
 COMMENTS                                           VARCHAR2(4000)
```

See Also: *Oracle Data Mining Application Developer's Guide* for more information about `ALL_MINING_MODELS` and related views

Mining Model Naming Restrictions

The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

- It must be 25 or fewer characters long.
- It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

Naming requirements for schema objects are fully documented in *Oracle Database SQL Language Reference*.

ALL_MINING_MODEL_ATTRIBUTES

You can query the data dictionary view `ALL_MINING_MODEL_ATTRIBUTES` to obtain a list of the **data attributes** for each accessible mining model. Data attributes are the

columns of data used by an algorithm to build a model. Some or all of these columns must be present in the data to which the model is applied.

Data attributes are referred to as the **model signature**. The ALL_MINING_MODEL_ATTRIBUTES view lists the data attributes in the model signature, including the target if the model is supervised.

An algorithm builds an internal representation of the data attributes and uses them as either **categoricals** (data that classifies or categorizes) or as **numericals** (continuous data). These internal **model attributes** can be viewed using the GET_MODEL_DETAILS functions.

Example 42–2 ALL_MINING_MODEL_ATTRIBUTES

```
SQL> describe all_mining_model_attributes
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 OWNER                                     NOT NULL VARCHAR2(30)
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 ATTRIBUTE_NAME                            NOT NULL VARCHAR2(30)
 ATTRIBUTE_TYPE                                     VARCHAR2(11)
 DATA_TYPE                                          VARCHAR2(12)
 DATA_LENGTH                                        NUMBER
 DATA_PRECISION                                     NUMBER
 DATA_SCALE                                         NUMBER
 USAGE_TYPE                                         VARCHAR2(8)
 TARGET                                             VARCHAR2(3)
```

See Also: *Oracle Data Mining Application Developer's Guide* for more information about attributes and ALL_MINING_MODEL_ATTRIBUTES

ALL_MINING_MODEL_SETTINGS

The view ALL_MINING_MODEL_SETTINGS returns the **settings** for each accessible mining model. Settings control various characteristics of mining models.

All settings have default values. The values of some settings are generated by the algorithm by default. You can override the default value of a setting by specifying its value in a settings table for the model. All settings, both default and user-specified, are listed in ALL_MINING_MODEL_SETTINGS.

Example 42–3 ALL_MINING_MODEL_SETTINGS

```
SQL> describe all_mining_model_settings
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 OWNER                                     NOT NULL VARCHAR2(30)
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 SETTING_NAME                              NOT NULL VARCHAR2(30)
 SETTING_VALUE                                      VARCHAR2(4000)
 SETTING_TYPE                                       VARCHAR2(7)
```

See Also:

- Model Settings on page 42-9
- *Oracle Data Mining Application Developer's Guide* for more information about ALL_MINING_MODEL_SETTINGS

Deprecated Subprograms

The following subprograms are deprecated in 11*g* Release 2 (11.2).

- `GET_DEFAULT_SETTINGS`

  Replaced with data dictionary views:
  `USER/ALL/DBA_MINING_MODEL_SETTINGS`

- `GET_MODEL_SETTINGS`

  Replaced with data dictionary views:
  `USER/ALL/DBA_MINING_MODEL_SETTINGS`

- `GET_MODEL_SIGNATURE`

  Replaced with data dictionary views:
  `USER/ALL/DBA_MINING_MODEL_ATTRIBUTES`

The following view is deprecated in 11*g* Release 2 (11.2).

- `DM_USER_MODELS`

  Replaced with data dictionary views: `USER/ALL/DBA_MINING_MODELS`

The Adaptive Bayes Network algorithm is deprecated in 11*g* Release 2 (11.2).

> **Note:** Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The `DMSYS` schema no longer exists in 11*g* Release 2 (11.2). Oracle Data Mining metadata is now in `SYS`.

Mining Functions

The constants that specify the mining function of a model are listed in Table 42–2. The concept of a "mining function" is introduced in "Overview" on page 42-3.

All models are created with a mining function. The mining function is a required argument to the **CREATE_MODEL Procedure**.

Table 42–2 Mining Functions

Value	Description
`ASSOCIATION`	Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set. Association models use the Apriori algorithm.
`ATTRIBUTE_IMPORTANCE`	Attribute Importance is a predictive mining function. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome. Attribute Importance models use the Minimal Descriptor Length algorithm.
`CLASSIFICATION`	Classification is a predictive mining function. A classification model uses historical data to predict a categorical target. Classification models can use: Naive Bayes, Adaptive Bayes Network (deprecated), Decision Tree, Logistic Regression, or Support Vector Machine algorithms. The default is Naive Bayes. The classification function can also be used for **anomaly detection**. In this case, the SVM algorithm with a null target is used (One-Class SVM).
`CLUSTERING`	Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set. Clustering models can use: *k*-Means or O-Cluster algorithms. The default is *k*-Means.
`FEATURE_EXTRACTION`	Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model. Feature extraction models use the Non-Negative Matrix Factorization algorithm.
`REGRESSION`	Regression is a predictive mining function. A regression model uses historical data to predict a numerical target. Regression models can use Support Vector Machine or Linear Regression. The default is Support Vector Machine.

Model Settings

Oracle Data Mining uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a mining function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, you must create a settings table. The settings table must have the column names and data types shown in Table 42–3.

Table 42–3 Required Columns in the Model Settings Table

Column Name	Data Type
SETTING_NAME	VARCHAR2(30)
SETTING_VALUE	VARCHAR2(4000)

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the CREATE_MODEL Procedure.

You can find the settings used by a model by querying the data dictionary view ALL_MINING_MODEL_SETTINGS. This view lists the model settings used by the mining models to which you have access. All the setting values are included in the view, whether default or user-specified. See "ALL_MINING_MODEL_SETTINGS" on page 42-6.

Algorithm Names

The **ALGO_NAME** setting specifies the model algorithm. The values for the ALGO_NAME setting are listed in Table 42–4.

Table 42–4 Algorithm Names

ALGO_NAME Value	Description	Mining Function
ALGO_ADAPTIVE_BAYES_NETWORK	Adaptive Bayes Network (deprecated)	Classification
ALGO_DECISION_TREE	Decision Tree	Classification
ALGO_NAIVE_BAYES	Naive Bayes	Classification
ALGO_GENERALIZED_LINEAR_MODEL	Generalized Linear Model	Classification and Regression
ALGO_SUPPORT_VECTOR_MACHINES	Support Vector Machine	Classification and Regression
ALGO_KMEANS	Enhanced *k*_Means	Clustering
ALGO_O_CLUSTER	O-Cluster	Clustering
ALGO_AI_MDL	Minimum Description Length	Attribute Importance
ALGO_APRIORI_ASSOCIATION_RULES	Apriori	Association Rules
ALGO_NONNEGATIVE_MATRIX_FACTOR	Non-Negative Matrix Factorization	Feature Extraction

Oracle Data Mining supports more than one algorithm for the classification, regression, and clustering mining functions. Each of these mining functions has a default algorithm, as shown in Table 42–5.

Table 42–5 Default Algorithms

Mining Function	Default Algorithm
Classification	Naive Bayes
Regression	Support Vector Machine
Clustering	*k*-Means

Automatic Data Preparation

The **PREP_AUTO** setting indicates whether or not the model will use Automatic Data Preparation (ADP). By default ADP is disabled.

When you enable ADP, the model uses heuristics to transform the build data according to the requirements of the algorithm. The transformation instructions are stored with the model and reused whenever the model is applied. You can view the transformation instructions in the model details.

You can choose to supplement automatic data preparations by specifying additional transformations in the `xform_list` parameter when you build the model. (See "CREATE_MODEL Procedure" on page 42-48.)

If you do not use ADP (default) *and* do not specify transformations in the `xform_list` parameter to `CREATE_MODEL` (also the default), you will continue to operate in 10.2 mode. This means that you must implement your own transformations separately in the build, test, and scoring data; you must take special care to implement the exact same transformations in each data set.

If you do not use ADP, but you *do* specify transformations in the `xform_list` parameter to `CREATE_MODEL`, Oracle Data Mining embeds the transformation definitions in the model and prepares the test and scoring data to match the build data. Because of automatic and embedded data preparation, mining models are known as **supermodels**.

The values for the `PREP_AUTO` setting are described in Table 42–6.

Table 42–6 PREP_AUTO Setting

PREP_AUTO Value	Description
`PREP_AUTO_OFF`	Disable Automatic Data Preparation (default).
`PREP_AUTO_ON`	Enable Automatic Data Preparation.

See Also: *Oracle Data Mining Concepts* for information about data preparation

Mining Function Settings

The settings described in Table 42–7 apply to a mining function.

Table 42–7 Mining Function Settings

Mining Function	Setting Name	Setting Value	Description
Association	ASSO_MAX_RULE_LENGTH	TO_CHAR(2<= *numeric_expr* <=20)	Maximum rule length for association rules. Default is 4.
Association	ASSO_MIN_CONFIDENCE	TO_CHAR(0<= *numeric_expr* <=1)	Minimum confidence for association rules. Default is 0.1.
Association	ASSO_MIN_SUPPORT	TO_CHAR(0<= *numeric_expr* <=1)	Minimum support for association rules. Default is 0.1.
Classification	CLAS_COST_TABLE_NAME	*table_name*	(Decision Tree only) Name of a table that stores a cost matrix to be used by the algorithm in building the model. The cost matrix specifies the costs associated with misclassifications. Only Decision Tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time. The cost matrix table is user-created. See "ADD_COST_MATRIX Procedure" on page 42-24 for the column requirements. See *Oracle Data Mining Concepts* for information about costs.
Classification	CLAS_PRIORS_TABLE_NAME	*table_name*	(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data. The priors table is user-created. See *Oracle Data Mining Application Developer's Guide* for the column requirements. See *Oracle Data Mining Concepts* for additional information about priors.
Classification	CLAS_WEIGHTS_TABLE_NAME	*table_name*	(GLM and SVM only) Name of a table that stores weighting information for individual target values in SVM classification and GLM logistic regression models. The weights are used by the algorithm to bias the model in favor of higher weighted classes. The class weights table is user-created. See *Oracle Data Mining Application Developer's Guide* for the column requirements. See *Oracle Data Mining Concepts* for additional information about class weights.
Clustering	CLUS_NUM_CLUSTERS	*TO_CHAR(numeric_expr* >=1)	Number of clusters generated by a clustering algorithm. Default is 10.
Feature Extraction	FEAT_NUM_FEATURES	TO_CHAR(*numeric_expr* >=1)	Number of features to be extracted by a feature extraction model. The default is estimated from the data by the algorithm.

See Also: *Oracle Data Mining Concepts* for information about mining functions

Global Settings

The settings in Table 42–8 are applicable to any type of model, but are currently only implemented for specific algorithms.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_MINING_MODEL_SETTINGS.

Table 42–8 Global Settings

Setting Name	Setting Value	Description
ODMS_ITEM_ID_COLUMN_NAME	*column_name*	(Association Rules only) Name of a column that contains the items in a transaction. When this setting is specified, the algorithm expects the data to be presented in native transactional format, consisting of two columns: ■ Case ID, either categorical or numerical ■ Item ID, either categorical or numerical, specified by ODMS_ITEM_ID_COLUMN_NAME A typical example of transactional data is market basket data, wherein a case represents a basket that may contain many items. Each item is stored in a separate row, and many rows may be needed to represent a case. The case ID values do not uniquely identify each row. Transactional data is also called multi-record case data. Association Rules is normally used with transactional data, but it can also be applied to single-record case data (similar to other algorithms). For more information about single-record and multi-record case data, see *Oracle Data Mining Application Developer's Guide*.
ODMS_ITEM_VALUE_COLUMN_NAME	*column_name*	(Association Rules only) Name of a column that contains a value associated with each item in a transaction. This setting is only used when a value has been specified for ODMS_ITEM_ID_COLUMN_NAME indicating that the data is presented in native transactional format. When ODMS_ITEM_VALUE_COLUMN_NAME is specified, the algorithm expects the build data to consist of three columns: ■ Case ID, either categorical or numerical ■ Item ID, either categorical or numerical, specified by ODMS_ITEM_ID_COLUMN_NAME ■ Item value, either categorical or numerical, specified by ODMS_ITEM_VALUE_COLUMN_NAME The item value column may specify information such as the number of items (for example, three apples) or the type of the item (for example, macintosh apples).
ODMS_MISSING_VALUE_TREATMENT	ODMS_MISSING_VALUE_MEAN_MODE ODMS_MISSING_VALUE_DELETE_ROW	(GLM only) How to treat missing values in the training data. This setting does not affect the scoring data. Oracle Data Mining replaces missing values with the mean (numeric attributes) or the mode (categorical attributes) both at build time and apply time. You can set ODMS_MISSING_VALUE_TREATMENT to ODMS_MISSING_VALUE_DELETE_ROW to override this behavior in the training data. When ODMS_MISSING_VALUE_TREATMENT is set to ODMS_MISSING_VALUE_DELETE_ROW, the rows in the training data that contain missing values are deleted. However, if you want to replicate this missing value treatment in the scoring data, you must perform the transformation explicitly. For instructions, see *Oracle Data Mining Concepts*. The value ODMS_MISSING_VALUE_DELETE_ROW is only valid for tables without nested columns. If this value is used with nested data, an exception is raised.
ODMS_ROW_WEIGHT_COLUMN_NAME	*column_name*	(GLM only) Name of a column in the training data that contains a weighting factor for the rows. Row weights can be used as a compact representation of repeated rows, as in the design of experiments where a specific configuration is repeated several times. Row weights can also be used to emphasize certain rows during model construction. For example, to bias the model towards rows that are more recent and away from potentially obsolete data.

See Also:

Oracle Data Mining Concepts for information about GLM

Oracle Data Mining Concepts for information about Association Rules

Algorithm Settings: Adaptive Bayes Network (deprecated)

These settings affect the behavior of the Adaptive Bayes Network algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 42–9 ABN Settings

Setting	Value	Description
ABNS_MAX_BUILD_MINUTES	TO_CHAR(*numeric_expr* >=0)	Maximum time to complete an ABN model build. Default is 0, which implies no time limit.
ABNS_MAX_NB_PREDICTORS	TO_CHAR(*numeric_expr* >0)	Maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type abns_naive_bayes. Default is 10.
ABNS_MAX_PREDICTORS	TO_CHAR(*numeric_expr* >0)	Maximum number of predictors, measured by their MDL ranking, to be considered for building an ABN model of type abns_single_feature or abns_multi_feature. Default is 25.
ABNS_MODEL_TYPE	ABNS_MULTI_FEATURE ABNS_NAIVE_BAYES ABNS_SINGLE_FEATURE	Type of ABN model. The default is multi_feature.

Algorithm Settings: Decision Tree

These settings affect the behavior of the Decision Tree algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 42–10 Decision Tree Settings

Setting	Value	Description
TREE_IMPURITY_METRIC	TREE_IMPURITY_ENTROPY TREE_IMPURITY_GINI	Tree impurity metric for Decision Tree. Tree algorithms seek the best test question for splitting data at each node. The best splitter and split value are those that result in the largest increase in target value homogeneity (purity) for the entities in the node. Purity is measured in accordance with a metric. Decision trees can use either gini (TREE_IMPURITY_GINI) or entropy (TREE_IMPURITY_ENTROPY) as the purity metric. By default, the algorithm uses gini.
TREE_TERM_MAX_DEPTH	TO_CHAR(2<= *numeric_expr* <=20)	Criteria for splits: maximum tree depth (the maximum number of nodes between the root and any leaf node, including the leaf node). Default is 7.
TREE_TERM_MINPCT_MODE	TO_CHAR(0<= *numeric_expr* <=10)	No child shall have fewer records than this number, which is expressed as a percentage of the training rows. Default is 0.05, indicating 0.05%.

Table 42–10 (Cont.) Decision Tree Settings

Setting	Value	Description
TREE_TERM_MINPCT_SPLIT	TO_CHAR(0 <= *numeric_expr* <=20)	Criteria for splits: minimum number of records in a parent node expressed as a percent of the total number of records used to train the model. No split is attempted if number of records is below this value. Default is 0.1, indicating 0.1%.
TREE_TERM_MINREC_NODE	TO_CHAR(*numeric_expr* >=0)	No child shall have fewer records than this number. Default is 10.
TREE_TERM_MINREC_SPLIT	TO_CHAR(numeric_expr >=0)	Criteria for splits: minimum number of records in a parent node expressed as a value. No split is attempted if number of records is below this value. Default is 20.

Algorithm Settings: Generalized Linear Models

These settings affect the behavior of GLM models. GLM can be used for classification (logistic regression) or regression (linear regression).

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 42–11 GLM Settings

Setting Name	Setting Value	Description
GLMS_CONF_LEVEL	TO_CHAR(0< *numeric_expr* <1)	The confidence level for coefficient confidence intervals. The default confidence level is 0.95.
GLMS_DIAGNOSTICS_TABLE_NAME	*table_name*	The name of a table to contain row-level diagnostic information for a GLM model. The table is created during model build. If you want to create a diagnostics table, you must specify a case ID when you build the model. (See the CREATE_MODEL Procedure.) If you specify a diagnostics table but do not provide a case ID, an exception is raised. For information on GLM diagnostics, see *Oracle Data Mining Concepts*.
GLMS_REFERENCE_CLASS_NAME	*target_value*	The target value to be used as the reference value in a logistic regression model. Probabilities will be produced for the other (non-reference) class. By default, the algorithm chooses the value with the highest prevalence (the most cases) for the reference class.

Table 42–11 (Cont.) GLM Settings

Setting Name	Setting Value	Description
GLMS_RIDGE_REGRESSION	GLMS_RIDGE_REG_ENABLE	Whether or not ridge regression will be enabled.
	GLMS_RIDGE_REG_DISABLE	By default, the algorithm determines whether or not to use ridge. You can explicitly enable ridge by setting GLMS_RIDGE_REGRESSION to GLMS_RIDGE_REG_ENABLE.
		Ridge applies to both regression and classification mining functions.
		When ridge is enabled, no prediction bounds are produced by the PREDICTION_BOUNDS SQL operator.
GLMS_RIDGE_VALUE	TO_CHAR(0< *numeric_expr)*	The value for the ridge parameter used by the algorithm. This setting is only used when you explicitly enable ridge regression by setting GLMS_RIDGE_REGRESSION to GLMS_RIDGE_REG_ENABLE.
		If ridge regression is enabled internally by the algorithm, the ridge parameter is determined by the algorithm.
GLMS_VIF_FOR_RIDGE	GLMS_VIF_RIDGE_ENABLE	(Linear regression only) Whether or not to produce Variance Inflation Factor (VIF) statistics when ridge is being used.
	GLMS_VIF_RIDGE_DISABLE	By default, VIF is not produced when ridge is enabled.
		When you explicitly enable ridge regression by setting GLMS_RIDGE_REGRESSION to GLMS_RIDGE_REG_ENABLE, you can request VIF statistics by setting GLMS_VIF_FOR_RIDGE to GLMS_VIF_RIDGE_ENABLE; the algorithm will produce VIF if enough system resources are available.

See Also: *Oracle Data Mining Concepts* for information about GLM.

Algorithm Settings: *k*-Means

These settings affect the behavior of the *k*-Means algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 42–12 k-Means Settings

Setting Name	Setting Value	Description
KMNS_BLOCK_GROWTH	TO_CHAR(1< *numeric_expr* <=5)	Growth factor for memory allocated to hold cluster data Default value is 2
KMNS_CONV_TOLERANCE	TO_CHAR(0< *numeric_expr* <=0.5)	Convergence tolerance for *k*-Means algorithm Default is 0.01
KMNS_DISTANCE	KMNS_COSINE KMNS_EUCLIDEAN KMNS_FAST_COSINE	Distance Function for *k*-Means Clustering. The default is euclidean.
KMNS_ITERATIONS	TO_CHAR(0< *numeric_expr* <=20)	Number of iterations for *k*-Means algorithm Default is 3

Table 42–12 (Cont.) k-Means Settings

Setting Name	Setting Value	Description
KMNS_MIN_PCT_ATTR_SUPPORT	TO_CHAR(0<= *numeric_expr* <=1)	The fraction of attribute values that must be non-null in order for the attribute to be included in the rule description for the cluster. Setting the parameter value too high in data with missing values can result in very short or even empty rules. Default is 0.1.
KMNS_NUM_BINS	TO_CHAR(*numeric_expr* >0)	Number of histogram bins. Specifies the number of bins in the attribute histogram produced by *k*-Means. The bin boundaries for each attribute are computed globally on the entire training data set. The binning method is equi-width. All attributes have the same number of bins with the exception of attributes with a single value that have only one bin. Default is 10.
KMNS_SPLIT_CRITERION	KMNS_SIZE KMNS_VARIANCE	Split criterion for *k*-Means Clustering. The default criterion is the variance.

See Also: *Oracle Data Mining Concepts* for information about *k*-Means.

Algorithm Settings: Naive Bayes

These settings affect the behavior of the Naive Bayes Algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 42–13 Naive Bayes Settings

Setting Name	Setting Value	Description
NABS_PAIRWISE_THRESHOLD	TO_CHAR(0<= *numeric_expr* <=1)	Value of pairwise threshold for NB algorithm Default is 0.01.
NABS_SINGLETON_THRESHOLD	TO_CHAR(0<= *numeric_expr* <=1)	Value of singleton threshold for NB algorithm Default value is 0.01

See Also: *Oracle Data Mining Concepts* for information about Naive Bayes

Algorithm Settings: Non-Negative Matrix Factorization

These settings affect the behavior of the Non-Negative Matrix Factorization algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 42–14 NMF Settings

Setting Name	Setting Value	Description
NMFS_CONV_TOLERANCE	TO_CHAR(0< *numeric_expr* <=0.5)	Convergence tolerance for NMF algorithm Default is 0.05
NMFS_NUM_ITERATIONS	TO_CHAR(1 <= *numeric_expr* <=500)	Number of iterations for NMF algorithm Default is 50
NMFS_RANDOM_SEED	TO_CHAR(*numeric_expr*)	Random seed for NMF algorithm. Default is –1.

See Also: *Oracle Data Mining Concepts* for information about NMF

Algorithm Settings: O-Cluster

These settings affect the behavior of the O-Cluster algorithm.

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 42–15 O-CLuster Settings

Setting Name	Setting Value	Description
OCLT_MAX_BUFFER	TO_CHAR(*numeric_expr* >0)	Buffer size for O-Cluster. Default is 50,000.
OCLT_SENSITIVITY	TO_CHAR(0 <=*numeric_expr* <=1)	A fraction that specifies the peak density required for separating a new cluster. The fraction is related to the global uniform density. Default is 0.5.

See Also: *Oracle Data Mining Concepts* for information about O-Cluster.

Algorithm Settings: Support Vector Machine

These settings affect the behavior of the Support Vector Machine algorithm. SVM can be used for classification or regression, or for anomaly detection (classification with a null target).

You can query the data dictionary view *_MINING_MODEL_SETTINGS (using the ALL, USER, or DBA prefix) to find the setting values for a model. See *Oracle Data Mining Application Developer's Guide* for information about *_ALL_MINING_MODEL_SETTINGS.

Table 42–16 SVM Settings

Setting Name	Setting Value	Description
SVMS_ACTIVE_LEARNING	SVMS_AL_DISABLE SVMS_AL_ENABLE	Whether active learning is enabled or disabled. By default, active learning is enabled. When active learning is enabled, the SVM algorithm uses active learning to build a reduced size model. When active learning is disabled, the SVM algorithm builds a standard model.
SVMS_COMPLEXITY_FACTOR	TO_CHAR(*numeric_expr* >0)	Value of complexity factor for SVM algorithm (both classification and regression). Default value estimated from the data by the algorithm.
SVMS_CONV_TOLERANCE	TO_CHAR(*numeric_expr* >0)	Convergence tolerance for SVM algorithm. Default is 0.001.
SVMS_EPSILON	TO_CHAR(*numeric_expr* >0)	Value of epsilon factor for SVM regression. Default value estimated from the data by the algorithm.
SVMS_KERNEL_CACHE_SIZE	TO_CHAR(*numeric_expr* >0)	Value of kernel cache size for SVM algorithm. Applies to Gaussian kernel only. Default is 50000000 bytes.
SVMS_KERNEL_FUNCTION	svm_gaussian svms_linear	Kernel for Support Vector Machine. The default is determined by the algorithm based on the number of attributes in the training data. When there are many attributes, the algorithm uses a linear kernel, otherwise it uses a nonlinear (Gaussian) kernel. The number of attributes does not correspond to the number of columns in the training data. The algorithm explodes categorical attributes to binary, numeric attributes. In addition, Oracle Data Mining handles each row in a nested column as a separate attribute. SVM takes these factors into account when choosing the kernel function.
SVMS_OUTLIER_RATE	TO_CHAR(*0*< *numeric_expr* <1)	The desired rate of outliers in the training data. Valid for One-Class SVM models only (anomaly detection). Default is.1.
SVMS_STD_DEV	TO_CHAR(*numeric_expr* >0)	Value of standard deviation for SVM algorithm. This is applicable only for Gaussian kernel. Default value estimated from the data by the algorithm.

See Also: *Oracle Data Mining Concepts* for information about SVM.

Data Types

The DBMS_DATA_MINING package uses object data types to store information about model attributes. Most of these types are returned by the table functions GET_*n*, where *n* identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows.

For a list of the GET functions, see "Summary of DBMS_DATA_MINING Subprograms" on page 42-22.

Oracle Data Mining also uses object data types for handling transactional data. These types, DM_NESTED_NUMERICALS and DM_NESTED_CATEGORICALS specify nested tables that can be used for storing a set of mining attributes in a single column. For more information on nested tables, see the *Oracle Data Mining Application Developer's Guide*.

All the table functions use **pipelining**, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the *Oracle Database PL/SQL Language Reference.*

The Data Mining object data types are described in Table 42–17.

Table 42–17 DBMS_DATA_MINING Summary of Data Types

Data Type	Description
DM_ABN_DETAIL	Information about an attribute in an Adaptive Bayes Network model.
DM_ABN_DETAILS	A collection of DM_ABN_DETAIL. Returned by GET_MODEL_DETAILS_ABN Function.
DM_CENTROID	The centroid of a cluster.
DM_CENTROIDS	A collection of DM_CENTROID. A member of DM_CLUSTER.
DM_CHILD	A child node of a cluster.
DM_CHILDREN	A collection of DM_CHILD. A member of DM_CLUSTER.
DM_CLUSTER	A cluster. A cluster includes DM_PREDICATES, DM_CHILDREN, DM_CENTROIDS, and DM_HISTOGRAMS. It also includes a DM_RULE.
DM_CLUSTERS	A collection of DM_CLUSTER. Returned by GET_MODEL_DETAILS_KM Function and GET_MODEL_DETAILS_OC Function.
DM_CONDITIONAL	The conditional probability of an attribute in a Naive Bayes model.
DM_CONDITIONALS	A collection of DM_CONDITIONAL. Returned by GET_MODEL_DETAILS_NB Function.
DM_COST_ELEMENT	The actual and predicted values in a cost matrix.
DM_COST_MATRIX	A collection of DM_COST_ELEMENT. Returned by GET_MODEL_COST_MATRIX Function.
DM_GLM_COEFF	The coefficient and associated statistics of an attribute in a Generalized Linear Model.
DM_GLM_COEFF_SET	A collection of DM_GLM_COEFF. Returned by GET_MODEL_DETAILS_GLM Function.
DM_HISTOGRAM_BIN	A histogram associated with a cluster.

Table 42–17 (Cont.) DBMS_DATA_MINING Summary of Data Types

Data Type	Description
DM_HISTOGRAMS	A collection of DM_HISTOGRAM_BIN. A member of DM_CLUSTER.
DM_ITEM	An item in an association rule.
DM_ITEMS	A collection of DM_ITEM.
DM_ITEMSET	A collection of DM_ITEMS.
DM_ITEMSETS	A collection of DM_ITEMSET. Returned by GET_FREQUENT_ITEMSETS Function.
DM_MODEL_GLOBAL_DETAIL	High-level statistics about a model.
DM_MODEL_GLOBAL_DETAILS	A collection of DM_MODEL_GLOBAL_DETAIL. Returned by GET_MODEL_DETAILS_GLOBAL Function.
DM_MODEL_SETTING	A model setting.
DM_MODEL_SETTINGS	A collection of DM_MODEL_SETTING. Returned by GET_MODEL_SETTINGS Function and GET_DEFAULT_SETTINGS Function.
DM_MODEL_SIGNATURE_ATTRIBUTE	An attribute in the model signature.
DM_MODEL_SIGNATURE	A collection of DM_MODEL_SIGNATURE. Returned by GET_MODEL_SIGNATURE Function.
DM_NB_DETAIL	Information about an attribute in a Naive Bayes model.
DM_NB_DETAILS	A collection of DM_DB_DETAIL. Returned by GET_MODEL_DETAILS_NB Function.
DM_NESTED_CATEGORICAL	The name and value of a categorical attribute.
DM_NESTED_CATEGORICALS	A collection of DM_NESTED_CATEGORICAL. A collection of attributes defined as a single model attribute. Transactional data must be defined as nested attributes for Data Mining.
DM_NESTED_NUMERICAL	The name and value of a numerical attribute.
DM_NESTED_NUMERICALS	A collection of DM_NESTED_NUMERICAL. A collection of attributes defined as a single model attribute. Transactional data must be defined as nested attributes for Data Mining.
DM_NMF_ATTRIBUTE	An attribute in a feature of a Non-Negative Matrix Factorization model.
DM_NMF_ATTRIBUTE_SET	A collection of DM_NMF_ATTRIBUTE. A member of DM_NMF_FEATURE.
DM_NMF_FEATURE	A feature in a Non-Negative Matrix Factorization model.
DM_NMF_FEATURE_SET	A collection of DM_NMF_FEATURE. Returned by GET_MODEL_DETAILS_NMF Function.
DM_PREDICATE	Antecedent and consequent attributes.
DM_PREDICATES	A collection of DM_PREDICATE. A member of DM_RULE, DM_CLUSTER, and DM_ABN_DETAIL.
DM_RANKED_ATTRIBUTE	An attribute ranked by its importance in an Attribute Importance model.
DM_RANKED_ATTRIBUTES	A collection of DM_RANKED_ATTRIBUTE. Returned by GET_MODEL_DETAILS_AI Function.

Table 42–17 (Cont.) DBMS_DATA_MINING Summary of Data Types

Data Type	Description
DM_RULE	A rule that defines a conditional relationship. The rule can be one of the association rules returned by GET_ASSOCIATION_RULES Function, or it can be a rule associated with a cluster in the collection of clusters returned by GET_MODEL_DETAILS_KM Function and GET_MODEL_DETAILS_OC Function.
DM_RULES	A collection of DM_RULE. Returned by GET_ASSOCIATION_RULES Function.
DM_SVM_ATTRIBUTE	The name, value, and coefficient of an attribute in a Support Vector Machine model.
DM_SVM_ATTRIBUTE_SET	A collection of DM_SVM_ATTRIBUTE. Returned by GET_MODEL_DETAILS_SVM Function. Also a member of DM_SVM_LINEAR_COEFF.
DM_SVM_LINEAR_COEFF	The linear coefficient of each attribute in a Support Vector Machine model.
DM_SVM_LINEAR_COEFF_SET	A collection of DM_SVM_LINEAR_COEFF. Returned by GET_MODEL_DETAILS_SVM Function for an SVM model built using the linear kernel.
DM_TRANSFORM	The transformation and reverse transformation expressions for an attribute.
DM_TRANSFORMS	A collection of DM_TRANSFORM. Returned by GET_MODEL_TRANSFORMATIONS Function.
TRANSFORM_LIST	A list of user-specified transformations for a model. Accepted as a parameter by the CREATE_MODEL Procedure. This collection type is defined in the DBMS_DATA_MINING_TRANSFORM package.

Summary of DBMS_DATA_MINING Subprograms

Table 42–18 summarizes the subprograms included in the `DBMS_DATA_MINING` package.

Table 42–18 DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
ADD_COST_MATRIX Procedure on page 42-24	Adds a cost matrix to a classification model
ALTER_REVERSE_EXPRESSION Procedure on page 42-26	Changes the reverse transformation expression to an expression that you specify
APPLY Procedure on page 42-28	Applies a model to a data set (scores the data)
COMPUTE_CONFUSION_MATRIX Procedure on page 42-32	Computes the confusion matrix from the `APPLY` results on test data for a classification model; also provides the accuracy of the model
COMPUTE_LIFT Procedure on page 42-38	Computes lift for a given positive target value from the `APPLY` results on test data for a classification model
COMPUTE_ROC Procedure on page 42-43	Computes Receiver Operating Characteristic (ROC) for a classification model
CREATE_MODEL Procedure on page 42-48	Creates (builds) a model
DROP_MODEL Procedure on page 42-52	Drops a model
EXPORT_MODEL Procedure on page 42-53	Exports a model to a dump file
GET_ASSOCIATION_RULES Function on page 42-56	Returns the rules from an association model
GET_DEFAULT_SETTINGS Function on page 42-59	Returns all the default settings for all mining functions and algorithms
GET_FREQUENT_ITEMSETS Function on page 42-60	Returns the frequent itemsets for an association model
GET_MODEL_COST_MATRIX Function on page 42-62	Returns the cost matrix for a model
GET_MODEL_DETAILS_ABN Function on page 42-64	Returns the details of an Adaptive Bayes Network model
GET_MODEL_DETAILS_AI Function on page 42-66	Returns the details of an Attribute Importance model
GET_MODEL_DETAILS_GLM Function on page 42-67	Returns the details of a Generalized Linear Model
GET_MODEL_DETAILS_GLOBAL Function on page 42-70	Returns high-level statistics about a model
GET_MODEL_DETAILS_KM Function on page 42-73	Returns the details of a *k*-Means model
GET_MODEL_DETAILS_NB Function on page 42-76	Returns the details of a Naive Bayes model
GET_MODEL_DETAILS_NMF Function on page 42-78	Returns the details of an NMF model

Table 42–18 (Cont.) DBMS_DATA_MINING Package Subprograms

Data Type	Purpose
GET_MODEL_DETAILS_OC Function on page 42-79	Returns the details of an O-Cluster model
GET_MODEL_DETAILS_SVM Function on page 42-82	Returns the details of an SVM model with a linear kernel
GET_MODEL_DETAILS_XML Function on page 42-84	Returns the details of a Decision Tree model
GET_MODEL_SETTINGS Function on page 42-86	Returns the settings used to build a model
GET_MODEL_SIGNATURE Function on page 42-87	Returns the signature of a model
GET_MODEL_TRANSFORMATIONS Function on page 42-89	Returns the user-specified transformation definitions embedded in the model, as well as many of the ADP transformations
GET_TRANSFORM_LIST Procedure on page 42-90	Converts between two different transformation specification formats
IMPORT_MODEL Procedure on page 42-91	Imports a model into a user schema
RANK_APPLY Procedure on page 42-94	Ranks the predictions from the `APPLY` results for a classification model
REMOVE_COST_MATRIX Procedure on page 42-97	Removes a cost matrix from a model
RENAME_MODEL Procedure on page 42-98	Renames a model

ADD_COST_MATRIX Procedure

This procedure associates a cost matrix table with a classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes.

The cost matrix is stored with the model and taken into account when the model is scored. The stored cost matrix is the default scoring matrix for the model.

You can also specify a cost matrix inline when you invoke a Data Mining SQL function for scoring. When an inline cost matrix is specified, it is used instead of the default, stored cost matrix (if one exists).

To obtain the default scoring matrix for a model, use the `GET_MODEL_COST_MATRIX` function. To remove the default scoring matrix from a model, use the `REMOVE_COST_MATRIX` procedure. See "GET_MODEL_COST_MATRIX Function" on page 42-62 and "REMOVE_COST_MATRIX Procedure" on page 42-97.

See Also:

- "Biasing a Classification Model" in *Oracle Data Mining Concepts* for more information about costs
- *Oracle Database SQL Language Reference* for syntax of inline cost matrix

Syntax

```
DBMS_DATA_MINING.ADD_COST_MATRIX (
       model_name                IN VARCHAR2,
       cost_matrix_table_name    IN VARCHAR2,
       cost_matrix_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 42–19 ADD_COST_MATRIX Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name.*]*model_name*. If you do not specify a schema, your own schema is assumed.
`cost_matrix_table_name`	Name of the cost matrix table (described in Table 42–20).
`cost_matrix_schema_name`	Schema of the cost matrix table. If no schema is specified, the current schema is used.

Usage Notes

1. If the model is not in your schema, then `ADD_COST_MATRIX` requires the `ALTER ANY MINING MODEL` system privilege or the `ALTER` object privilege for the mining model.
2. The cost matrix table must have the columns shown in Table 42–20. Note that the actual and predicted target values must have the same data type.

Table 42–20 Required Columns in a Cost Matrix Table

Column Name	Data Type
`ACTUAL_TARGET_VALUE`	`VARCHAR2(4000)` for categorical targets `NUMBER` for numeric targets

Table 42–20 (Cont.) Required Columns in a Cost Matrix Table

Column Name	Data Type
PREDICTED_TARGET_VALUE	VARCHAR2(4000) for categorical targets NUMBER for numeric targets
COST	NUMBER

3. Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the costs column of the cost matrix table.
4. All classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time.If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 42–7, " Mining Function Settings".

   The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.

Example

This example creates a cost matrix table called COSTS_NB and adds it to a Naive Bayes model called NB_SH_CLAS_SAMPLE. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of .25 to misclassifications of customers who do not respond and a cost of .75 to misclassifications of customers who do respond. This means that it is three times more costly to misclassify responders than it is to misclassify non-responders.

```
CREATE TABLE costs_nb (
  actual_target_value           NUMBER,
  predicted_target_value        NUMBER,
  cost                          NUMBER);
INSERT INTO costs_nb values (0, 0, 0);
INSERT INTO costs_nb values (0, 1, .25);
INSERT INTO costs_nb values (1, 0, .75);
INSERT INTO costs_nb values (1, 1, 0);
COMMIT;

EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');

SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
   FROM mining_data_apply_v
   WHERE PREDICTION(nb_sh_clas_sample COST MODEL
      USING cust_marital_status, education, household_size) = 1
   GROUP BY cust_gender
   ORDER BY cust_gender;

C        CNT    AVG_AGE
- ---------- ----------
F         72         39
M        555         44
```

ALTER_REVERSE_EXPRESSION Procedure

This procedure changes a reverse transformation expression to an expression that you specify.

A transformation expression specifies how an attribute will be changed before it is used to create a model. The reverse transformation expression specifies how the attribute will be returned to its original form (or some approximation of its original form) for purposes of model transparency.

The GET_MODEL_DETAILS functions apply reverse transformations before returning information about a model's attributes. When the target is transformed, its reverse transformation is applied to the results of scoring. See the Usage Notes.

You can use ALTER_REVERSE_EXPRESSION to associate a name/description with a cluster or feature; the descriptor that you specify will be displayed when the model is scored.You can use the CLUSTER_ID, CLUSTER_PROBABILITY, and CLUSTER_SET functions to score clustering models. You can use the FEATURE_ID, FEATURE_SET, or FEATURE_VALUE functions to score feature extraction models. See the example and *Oracle Database SQL Language Reference*.

You can use ALTER_REVERSE_EXPRESSION to associate a name/description with the results of an anomaly detection model. These models use One-Class SVM to predict either 1 or 0 for each record, indicating whether or not the record is anomalous. With ALTER_REVERSE_EXPRESSION, you can replace the zeros and ones with labels that are more meaningful.

Syntax

```
DBMS_DATA_MINING. ALTER_REVERSE_EXPRESSION (
         model_name             VARCHAR2,
         expression             CLOB,
         attribute_name         VARCHAR2 DEFAULT NULL,
         attribute_subname      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 42–21 ALTER_REVERSE_EXPRESSION Procedure Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
expression	A SQL expression.
attribute_name	Name of the attribute. Specify NULL if you wish to apply *expression* to a cluster, feature, or One-Class SVM prediction.
attribute_subname	Name of the nested attribute if *attribute_name* is a nested column, otherwise NULL.

Usage Notes

If you are using automatic data preparation, the transformations and reverse transformations are performed automatically by the system. When you create the model, you can specify transformations and reverse transformations to be applied in addition to the system-generated expressions. If you are not using automatic data preparation, the transformations and reverse transformations that you specify are the only ones that are applied.

Example

This example specifies labels for the clusters that result from the `sh_clus` model. The labels consist of the word "Cluster" and the internal numeric identifier for the cluster.

```
SQL> begin
  2    dbms_data_mining.alter_reverse_expression(
  3      'sh_clus', '''Cluster ''||value');
  4  end;
  5  /

SQL> select cust_id, cluster_id(sh_clus using *) cluster_id
  2    from sh_aprep_num
  3   where cust_id < 100011
  4   order by cust_id;

CUST_ID CLUSTER_ID
------- ----------------------------------------------
 100001 Cluster 18
 100002 Cluster 14
 100003 Cluster 14
 100004 Cluster 18
 100005 Cluster 19
 100006 Cluster 7
 100007 Cluster 18
 100008 Cluster 14
 100009 Cluster 8
 100010 Cluster 8
```

APPLY Procedure

This procedure applies a mining model to the data of interest, and generates the results in a table. The apply process is also referred to as **scoring**.

For predictive mining functions, the apply process generates predictions in a target column. For descriptive mining functions such as clustering, the apply process assigns each case to a cluster with a probability.

In Oracle Data Mining, the apply operation is not applicable to association models and attribute importance models.

> **Note:** Scoring can also be performed directly in SQL using the Data Mining functions. See "Scoring and Deployment" in *Oracle Data Mining Application Developer's Guide*.

Syntax

```
DBMS_DATA_MINING.APPLY (
      model_name           IN VARCHAR2,
      data_table_name      IN VARCHAR2,
      case_id_column_name  IN VARCHAR2,
      result_table_name    IN VARCHAR2,
      data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 42–22 APPLY Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
`data_table_name`	Name of table or view representing data to be scored
`case_id_column_name`	Name of the case identifier column
`result_table_name`	Name of the table to store apply results
`data_schema_name`	Name of the schema containing the data to be scored

Usage Notes

1. The data provided for `APPLY` must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model — both at build time and apply time. (See "Automatic Data Preparation" on page 42-10.)
2. `APPLY` creates a table in the user's schema to hold the results. The columns are algorithm-specific.

   The columns in the results table are listed in Table 42–23 through Table 42–27. The case ID column name in the results table will match the case ID column name provided by you. The type of the incoming case ID column is also preserved in `APPLY` output.

Note: Make sure that the case ID column does not have the same name as one of the columns that will be created by APPLY. For example, when applying a classification model, the case ID in the scoring data must not be 'PREDICTION' or 'PROBABILITY' (See Table 42–23).

3. The data type for the 'PREDICTION', 'CLUSTER_ID', and 'FEATURE_ID' output columns is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types will conform to the descriptions in the following tables. See "ALTER_REVERSE_EXPRESSION Procedure" on page 42-26.

Classification

The results table for classification has the columns described in Table 42–23. If the target of the model is categorical, the PREDICTION column will have a VARCHAR2 data type. If the target is numerical, the PREDICTION column will have a NUMBER data type.

Table 42–23 APPLY Results Table for Classification

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
PREDICTION	VARCHAR2 or NUMBER
PROBABILITY	NUMBER

One-Class SVM (Anomaly Detection)

The results table for anomaly detection has the columns described in Table 42–24.

Table 42–24 APPLY Results Table for Anomaly Detection

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
PREDICTION	NUMBER
PROBABILITY	NUMBER

Values in the PREDICTION column can be either 0 or 1. When the prediction is 1, the case is a typical example. When the prediction is 0, the case is an outlier.

Regression using SVM or GLM

The results table for regression has the columns described in Table 42–25.

Table 42–25 APPLY Results Table for Regression

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
PREDICTION	NUMBER

Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table has the columns described in Table 42–26.

Table 42–26 APPLY Results Table for Clustering

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
CLUSTER_ID	NUMBER
PROBABILITY	NUMBER

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in Table 42–27.

Table 42–27 APPLY Results Table for Feature Extraction

Column Name	Data Type
Case ID column name	VARCHAR2 or NUMBER
FEATURE_ID	NUMBER
MATCH_QUALITY	NUMBER

Examples

This example applies the GLM regression model GLMR_SH_REGR_SAMPLE to the data in the MINING_DATA_APPLY_V view. The apply results are output to the table REGRESSION_APPLY_RESULT.

```
SQL> BEGIN
       DBMS_DATA_MINING.APPLY (
       model_name     => 'glmr_sh_regr_sample',
       data_table_name     => 'mining_data_apply_v',
       case_id_column_name => 'cust_id',
       result_table_name   => 'regression_apply_result');
    END;
    /

SQL> SELECT * FROM regression_apply_result WHERE cust_id >  101485;

   CUST_ID PREDICTION
---------- ----------
    101486 22.8048824
    101487 25.0261101
    101488 48.6146619
    101489   51.82595
    101490 22.6220714
    101491 61.3856816
    101492 24.1400748
    101493  58.034631
    101494 45.7253149
    101495 26.9763318
```

```
101496 48.1433425
101497 32.0573434
101498 49.8965531
101499  56.270656
101500 21.1153047
```

COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The matrix is *n*-by-*n*, where *n* is the number of classes. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

`COMPUTE_CONFUSION_MATRIX` accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

See Also:

Oracle Data Mining Concepts for more details about confusion matrixes and other test metrics for classification

"COMPUTE_LIFT Procedure" on page 42-38

"COMPUTE_ROC Procedure" on page 42-43

Syntax

```
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
      accuracy                    OUT NUMBER,
      apply_result_table_name      IN  VARCHAR2,
      target_table_name            IN  VARCHAR2,
      case_id_column_name          IN  VARCHAR2,
      target_column_name           IN  VARCHAR2,
      confusion_matrix_table_name  IN  VARCHAR2,
      score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
      cost_matrix_table_name       IN  VARCHAR2 DEFAULT NULL,
      apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
      target_schema_name           IN  VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name      IN  VARCHAR2 DEFAULT NULL,
      score_criterion_type         IN  VARCHAR2 DEFAULT 'PROBABILITY');
```

Parameters

Table 42–28 COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
accuracy	Output parameter containing the overall percentage accuracy of the predictions.
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
confusion_matrix_table_name	Table containing the confusion matrix. The table will be created by the procedure in the user's schema. The columns in the confusion matrix table are described in the Usage Notes.
score_column_name	Column containing the predictions in the apply results table. The default column name is PREDICTION, which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 42-28).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 42-28). See the Usage Notes for additional information.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to 'COSTS', the costs in this table will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.

Table 42–28 (Cont.) COMPUTE_CONFUSION_MATRIX Procedure Parameters

Parameter	Description
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.

Usage Notes

- The predictive information you pass to COMPUTE_CONFUSION_MATRIX may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.
- Instead of passing a cost matrix to COMPUTE_CONFUSION_MATRIX, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_CONFUSION_MATRIX are in a table or view specified in apply_result_table_name.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name   VARCHAR2);
```

- A cost matrix must have the columns described in Table 42–29.

Table 42–29 Columns in a Cost Matrix

Column Name	Data Type
actual_target_value	NUMBER or VARCHAR2
predicted_target_value	NUMBER or VARCHAR2
cost	NUMBER

> **See Also:** *Oracle Data Mining Concepts* for more information about cost matrixes

- The confusion matrix created by COMPUTE_CONFUSION_MATRIX has the columns described in Table 42–30.

Table 42–30 Columns in a Confusion Matrix

Column Name	Data Type
actual_target_value	NUMBER or VARCHAR2

Table 42–30 (Cont.) Columns in a Confusion Matrix

Column Name	Data Type
predicted_target_value	NUMBER or VARCHAR2
value	NUMBER

See Also: *Oracle Data Mining Concepts* for more information about confusion matrixes

Examples

These examples use the Naive Bayes model nb_sh_clas_sample, which is created by one of the Oracle Data Mining sample programs.

Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
       SELECT cust_id,
              PREDICTION(nb_sh_clas_sample USING *) prediction,
              PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
       FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```
DECLARE
   v_accuracy    NUMBER;
      BEGIN
        DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
                  accuracy                     => v_accuracy,
                  apply_result_table_name      => 'nb_apply_results',
                  target_table_name            => 'mining_data_test_v',
                  case_id_column_name          => 'cust_id',
                  target_column_name           => 'affinity_card',
                  confusion_matrix_table_name  => 'nb_confusion_matrix',
                  score_column_name            => 'PREDICTION',
                  score_criterion_column_name  => 'PROBABILITY'
                  cost_matrix_table_name       =>  null,
                  apply_result_schema_name     =>  null,
                  target_schema_name           =>  null,
                  cost_matrix_schema_name      =>  null,
                  score_criterion_type         => 'PROBABILITY');
        DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
      END;
      /
```

The confusion matrix and model accuracy are shown as follows.

```
 **** MODEL ACCURACY ****: .7847

SQL>SELECT * from nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         60
                  0                      0        891
                  1                      1        286
                  0                      1        263
```

Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```
SQL> SELECT * from nb_cost_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE       COST
------------------- ---------------------- ----------
                  0                      0          0
                  0                      1        .75
                  1                      0        .25
                  1                      1          0
```

This statement shows how to generate the predictions using `APPLY`.

```
BEGIN
    DBMS_DATA_MINING.APPLY(
          model_name          => 'nb_sh_clas_sample',
          data_table_name     => 'mining_data_test_v',
          case_id_column_name => 'cust_id',
          result_table_name   => 'nb_apply_results');
 END;
/
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named '`PROBABILITY`', which is the name generated by `APPLY`.

```
DECLARE
  v_accuracy    NUMBER;
     BEGIN
       DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
                accuracy                     => v_accuracy,
                apply_result_table_name      => 'nb_apply_results',
                target_table_name            => 'mining_data_test_v',
                case_id_column_name          => 'cust_id',
                target_column_name           => 'affinity_card',
                confusion_matrix_table_name  => 'nb_confusion_matrix',
                score_column_name            => 'PREDICTION',
                score_criterion_column_name  => 'PROBABILITY',
                cost_matrix_table_name       => 'nb_cost_matrix',
                apply_result_schema_name     => null,
                target_schema_name           => null,
                cost_matrix_schema_name      => null,
                score_criterion_type         => 'COST');
       DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
    END;
    /
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```
**** MODEL ACCURACY ****: .798

SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         91
```

```
                  0                     0        942
                  1                     1        255
                  0                     1        212
```

Compute a Confusion Matrix Based on Embedded Costs

You can use the ADD_COST_MATRIX procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```
BEGIN
    DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');
END;
/
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```
CREATE TABLE nb_apply_results AS
         SELECT cust_id,
              PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
              PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
          FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```
DECLARE
   v_accuracy         NUMBER;
   BEGIN
       DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
            accuracy                     => v_accuracy,
            apply_result_table_name      => 'nb_apply_results',
            target_table_name            => 'mining_data_test_v',
            case_id_column_name          => 'cust_id',
            target_column_name           => 'affinity_card',
            confusion_matrix_table_name  => 'nb_confusion_matrix',
            score_column_name            => 'PREDICTION',
            score_criterion_column_name  => 'COST',
            cost_matrix_table_name       => null,
            apply_result_schema_name     => null,
            target_schema_name           => null,
            cost_matrix_schema_name      => null,
            score_criterion_type         => 'COST');
   END;
   /
```

The results are:

```
**** MODEL ACCURACY ****: .798

SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
                  1                      0         91
                  0                      0        942
                  1                      1        255
                  0                      1        212
```

COMPUTE_LIFT Procedure

This procedure computes lift and stores the results in a table in the user's schema.

Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. `COMPUTE_LIFT` compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

`COMPUTE_LIFT` calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, `COMPUTE_LIFT` accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

```

Parameters

Table 42–31 COMPUTE_LIFT Procedure Parameters

Parameter	Description
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
lift_table_name	Table containing the lift statistics. The table will be created by the procedure in the user's schema. The columns in the lift table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate lift. If the target column is a NUMBER, you can use the TO_CHAR() operator to provide the value as a string.
score_column_name	Column containing the predictions in the apply results table. The default column name is 'PREDICTION', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 42-28).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains either the probabilities or the costs that determine the predictions. By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted. The score_criterion_type parameter indicates whether probabilities or costs will be used for scoring. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 42-28). See the Usage Notes for additional information.
num_quantiles	Number of quantiles to be used in calculating lift. The default is 10.
cost_matrix_table_name	(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the score_criterion_type parameter is set to 'COSTS', the costs will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.

Table 42–31 (Cont.) COMPUTE_LIFT Procedure Parameters

Parameter	Description
cost_matrix_schema_name	Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.
score_criterion_type	Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If score_criterion_type is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.

Usage Notes

- The predictive information you pass to COMPUTE_LIFT may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the lift.
- Instead of passing a cost matrix to COMPUTE_LIFT, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.
- The predictions that you pass to COMPUTE_LIFT are in a table or view specified in apply_results_table_name.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name   VARCHAR2);
```

- A cost matrix must have the columns described in Table 42–32.

Table 42–32 Columns in a Cost Matrix

Column Name	Data Type
actual_target_value	NUMBER or VARCHAR2
predicted_target_value	NUMBER or VARCHAR2
cost	NUMBER

See Also: *Oracle Data Mining Concepts* for more information about cost matrixes

- The table created by COMPUTE_LIFT has the columns described in Table 42–33

Table 42–33 Columns in a Lift Table

Column Name	Data Type
quantile_number	NUMBER
probability_threshold	NUMBER
gain_cumulative	NUMBER
quantile_total_count	NUMBER
quantile_target_count	NUMBER
percent_records_cumulative	NUMBER
lift_cumulative	NUMBER
target_density_cumulative	NUMBER
targets_cumulative	NUMBER
non_targets_cumulative	NUMBER
lift_quantile	NUMBER
target_density	NUMBER

See Also: *Oracle Data Mining Concepts* for details about the information in the lift table

- When a cost matrix is passed to COMPUTE_LIFT, the cost threshold is returned in the probability_threshold column of the lift table.

Examples

This example uses the Naive Bayes model nb_sh_clas_sample, which is created by one of the Oracle Data Mining sample programs.

The example illustrates lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure" on page 42-32.

Compute Lift Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
   SELECT cust_id,
        PREDICTION(nb_sh_clas_sample USING *) prediction,
        PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
     FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute lift as follows.

```
BEGIN
   DBMS_DATA_MINING.COMPUTE_LIFT (
        apply_result_table_name        => 'nb_apply_results',
        target_table_name              => 'mining_data_test_v',
        case_id_column_name            => 'cust_id',
        target_column_name             => 'affinity_card',
        lift_table_name                => 'nb_lift',
        positive_target_value          =>  to_char(1),
        score_column_name              => 'PREDICTION',
        score_criterion_column_name    => 'PROBABILITY',
```

```
        num_quantiles                 =>  10,
        cost_matrix_table_name        =>  null,
        apply_result_schema_name      =>  null,
        target_schema_name            =>  null,
        cost_matrix_schema_name       =>  null,
        score_criterion_type          =>  'PROBABILITY');
  END;
  /
```

This query displays some of the statistics from the resulting lift table.

```
SQL>SELECT quantile_number, probability_threshold, gain_cumulative,
           quantile_total_count
           FROM nb_lift;

QUANTILE_NUMBER PROBABILITY_THRESHOLD GAIN_CUMULATIVE QUANTILE_TOTAL_COUNT
--------------- --------------------- --------------- --------------------
              1            .989335775       .15034965                   55
              2            .980534911       .26048951                   55
              3            .968506098      .374125874                   55
              4            .958975196      .493006993                   55
              5            .946705997      .587412587                   55
              6            .927454174       .66958042                   55
              7            .904403627      .748251748                   55
              8            .836482525      .839160839                   55
             10            .500184953               1                   54
```

COMPUTE_ROC Procedure

This procedure computes receiver operating characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. COMPUTE_ROC compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an X-Y axis. The false positive rate is placed on the X axis. The true positive rate is placed on the Y axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

COMPUTE_ROC accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

See Also:

Oracle Data Mining Concepts for more details about ROC and test metrics for classification

"COMPUTE_CONFUSION_MATRIX Procedure" on page 42-32

"COMPUTE_LIFT Procedure" on page 42-38

Syntax

```
DBMS_DATA_MINING.COMPUTE_ROC (
      roc_area_under_curve         OUT NUMBER,
      apply_result_table_name      IN  VARCHAR2,
      target_table_name            IN  VARCHAR2,
      case_id_column_name          IN  VARCHAR2,
      target_column_name           IN  VARCHAR2,
      roc_table_name               IN  VARCHAR2,
      positive_target_value        IN  VARCHAR2,
      score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',
      score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',
      apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,
      target_schema_name           IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 42–34 COMPUTE_ROC Procedure Parameters

Parameter	Description
roc_area_under_the_curve	Output parameter containing the area under the ROC curve (AUC). The AUC measures the likelihood that an actual positive will be predicted as positive. The greater the AUC, the greater the flexibility of the model in accommodating trade-offs between positive and negative class predictions. AUC can be especially important when one target class is rarer or more important to identify than another.
apply_result_table_name	Table containing the predictions.
target_table_name	Table containing the known target values from the test data.
case_id_column_name	Case ID column in the apply results table. Must match the case identifier in the targets table.
target_column_name	Target column in the targets table. Contains the known target values from the test data.
roc_table_name	Table containing the ROC output. The table will be created by the procedure in the user's schema. The columns in the ROC table are described in the Usage Notes.
positive_target_value	The positive class. This should be the class of interest, for which you want to calculate ROC. If the target column is a NUMBER, you can use the TO_CHAR() operator to provide the value as a string.
score_column_name	Column containing the predictions in the apply results table. The default column name is 'PREDICTION', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 42-28).
score_criterion_column_name	Column containing the scoring criterion in the apply results table. Contains the probabilities that determine the predictions. The default column name is 'PROBABILITY', which is the default name created by the APPLY procedure (See "APPLY Procedure" on page 42-28).
apply_result_schema_name	Schema of the apply results table. If null, the user's schema is assumed.
target_schema_name	Schema of the table containing the known targets. If null, the user's schema is assumed.

Usage Notes

- The predictive information you pass to COMPUTE_ROC may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.
- The predictions that you pass to COMPUTE_ROC are in a table or view specified in apply_results_table_name.

```
CREATE TABLE apply_result_table_name AS (
            case_id_column_name           VARCHAR2,
            score_column_name             VARCHAR2,
            score_criterion_column_name   VARCHAR2);
```

- The table created by COMPUTE_ROC has the columns shown in Table 42–35.

Table 42–35 COMPUTE_ROC Output

Column	Data Type
probability	NUMBER
true_positives	NUMBER
false_negatives	NUMBER
false_positives	NUMBER
true_negatives	NUMBER
true_positive_fraction	NUMBER
false_positive_fraction	NUMBER

> **See Also:** *Oracle Data Mining Concepts* for details about the output of COMPUTE_ROC

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

  Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```
SELECT case_id_column_name
       FROM apply_result_table_name
       WHERE probability > probability_threshold
       ORDER BY probability DESC;
```

- There are two approaches to identifying the most desirable probability threshold. Which approach you use depends on whether or not you know the relative cost of positive versus negative class prediction errors.

  If the costs are known, you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like this.

```
WITH cost AS (
  SELECT probability_threshold, 20 * false_negatives + false_positives cost
    FROM ROC_table
  GROUP BY probability_threshold),
    minCost AS (
      SELECT min(cost) minCost
        FROM cost)
      SELECT max(probability_threshold)probability_threshold
        FROM cost, minCost
    WHERE cost = minCost;
```

If relative costs are not well known, you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

```
SELECT * FROM ROC_table
         ORDER BY probability_threshold;
```

Examples

This example uses the Naive Bayes model nb_sh_clas_sample, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
   SELECT cust_id,
        PREDICTION(nb_sh_clas_sample USING *) prediction,
        PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
     FROM mining_data_test_v;
```

Using the predictions and the target values from the test data, you can compute ROC as follows.

```
DECLARE
     v_area_under_curve NUMBER;
  BEGIN
     DBMS_DATA_MINING.COMPUTE_ROC (
         roc_area_under_curve          => v_area_under_curve,
         apply_result_table_name       => 'nb_apply_results',
         target_table_name             => 'mining_data_test_v',
         case_id_column_name           => 'cust_id',
         target_column_name            => 'affinity_card',
         roc_table_name                => 'nb_roc',
         positive_target_value         => '1',
         score_column_name             => 'PREDICTION',
         score_criterion_column_name   => 'PROBABILITY');
     DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
     ROUND(v_area_under_curve,4));
  END;
 /
```

The resulting AUC and a selection of columns from the ROC table are shown as follows.

```
**** AREA UNDER ROC CURVE ****: .8212

SQL> SELECT probability, true_positive_fraction, false_positive_fraction
            FROM nb_roc;

PROBABILITY  TRUE_POSITIVE_FRACTION  FALSE_POSITIVE_FRACTION
-----------  ----------------------  -----------------------
     .00000                       1                        1
     .50018              .826589595               .227902946
     .53851              .823699422               .221837088
     .54991              .820809249               .217504333

      .                   .                        .
      .                   .                        .
```

. . .

CREATE_MODEL Procedure

This procedure creates a mining model with a given mining function.

By passing an `xform_list` to `CREATE_MODEL`, you can specify a list of transformations to be performed on the input data. If the `PREP_AUTO` setting is on, the transformations are used in addition to the automatic transformations. If the `PREP_AUTO` setting is off, the specified transformations are the only ones implemented by the model. In both cases, the transformation definitions are embedded in the model and executed automatically whenever the model is applied. See "Automatic Data Preparation" on page 42-10.

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
      model_name            IN VARCHAR2,
      mining_function       IN VARCHAR2,
      data_table_name       IN VARCHAR2,
      case_id_column_name   IN VARCHAR2,
      target_column_name    IN VARCHAR2 DEFAULT NULL,
      settings_table_name   IN VARCHAR2 DEFAULT NULL,
      data_schema_name      IN VARCHAR2 DEFAULT NULL,
      settings_schema_name  IN VARCHAR2 DEFAULT NULL,
      xform_list            IN TRANSFORM_LIST DEFAULT NULL);
```

Parameters

Table 42–36 CREATE_MODEL Procedure Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. See also "Mining Model Naming Restrictions" on page 42-5.
`mining_function`	The mining function. Values are listed in Table 42–2, " Mining Functions".
`data_table_name`	Table or view containing the build data.
`case_id_column_name`	Case identifier column in the build data.
`target_column_name`	For supervised models, the target column in the build data. `NULL` for unsupervised models.
`settings_table_name`	Table containing build settings for the model. `NULL` if there is no settings table (only default settings are used).
`data_schema_name`	Schema hosting the build data. If `NULL`, the user's schema is assumed.
`settings_schema_name`	Schema hosting the settings table. If `NULL`, the user's schema is assumed.

Table 42–36 (Cont.) CREATE_MODEL Procedure Parameters

Parameter	Description

xform_list	A list of transformations to be used in addition to or instead of automatic transformations, depending on the value of the PREP_AUTO setting. (See "Automatic Data Preparation" on page 42-10.)
	The data type is TRANSFORM_LIST, which consists of records of type TRANSFORM_REC.
	`TYPE`
	`  TRANFORM_REC  IS RECORD (`
	`  attribute_name  VARCHAR2(4000),`
	`  attribute_subname  VARCHAR2(4000),`
	`  expression  EXPRESSION_REC,`
	`  reverse_expression  EXPRESSION_REC,`
	`  attribute_spec  VARCHAR2(4000));`
	Each TRANSFORM_REC describes the transformation and reverse transformation for an attribute. EXPRESSION_REC stores a SQL expression.
	The SQL expression stored in EXPRESSION_REC can be manipulated using routines in the DBMS_DATA_MINING_TRANSFORM package. Examples are: SET_EXPRESSION, GET_EXPRESSION, and SET_TRANSFORM.
	You can use ATTRIBUTE_SPEC to disable Automatic Data Preparation (ADP) for an individual attribute. Specify 'NOPREP' to prevent automatic preparation of this attribute when ADP is on. When ADP is off, the 'NOPREP' value is ignored.
	The 'NOPREP' value cannot be used for an individual subname of a nested attribute. If 'NOPREP' is specified for an individual subname when ADP is on, an error is generated.

Usage Notes

You can obtain information about a model by querying these data dictionary views.

```
ALL_MINING_MODELS
ALL_MINING_MODEL_ATTRIBUTES
ALL_MINING_MODEL_SETTINGS
```

Specify the USER prefix instead of ALL to obtain information about models in your own schema only.

> **See Also:** *Oracle Data Mining Application Developer's Guide* for information on the data dictionary views

Examples

The first example builds a classification model using the Support Vector Machine algorithm.

```
-- Create the settings table
CREATE TABLE svm_model_settings (
  setting_name  VARCHAR2(30),
  setting_value VARCHAR2(30));

-- Populate the settings table
-- Specify SVM. By default, Naive Bayes is used for classification.
-- Specify ADP. By default, ADP is not used.
```

```
BEGIN
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
     (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);
  INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
     (dbms_data_mining.prep_auto,dbms_data_mining.prep_auto_on);
  COMMIT;
END;
/
-- Create the model using the specified settings
BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'svm_model',
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name  => 'affinity_card',
    settings_table_name => 'svm_model_settings');
END;
/
```

You can display the model settings with the following query.

```
SELECT * FROM user_mining_model_settings
       WHERE model_name IN 'SVM_MODEL';

MODEL_NAME     SETTING_NAME            SETTING_VALUE                  SETTING
-------------  ----------------------  -----------------------------  -------
SVM_MODEL      ALGO_NAME               ALGO_SUPPORT_VECTOR_MACHINES  INPUT
SVM_MODEL      SVMS_KERNEL_CACHE_SIZE  50000000                       DEFAULT
SVM_MODEL      SVMS_ACTIVE_LEARNING    SVMS_AL_ENABLE                 DEFAULT
SVM_MODEL      SVMS_STD_DEV            3.004524                       DEFAULT
SVM_MODEL      PREP_AUTO               ON                             INPUT
SVM_MODEL      SVMS_COMPLEXITY_FACTOR  1.887389                       DEFAULT
SVM_MODEL      SVMS_KERNEL_FUNCTION    SVMS_GAUSSIAN                  DEFAULT
SVM_MODEL      SVMS_CONV_TOLERANCE     .001                           DEFAULT
```

The second example creates an anomaly detection model. Anomaly detection uses SVM classification without a target. This example uses the same settings table created for the SVM classification model in the first example.

```
BEGIN
  DBMS_DATA_MINING.CREATE_MODEL(
    model_name          => 'anomaly_detect_model',
    mining_function     => dbms_data_mining.classification,
    data_table_name     => 'mining_data_build_v',
    case_id_column_name => 'cust_id',
    target_column_name  => null,
    settings_table_name => 'svm_model_settings');
END;
/
```

This query shows that the models created in these examples are the only ones in your schema.

```
SELECT model_name, mining_function, algorithm FROM user_mining_models;

MODEL_NAME              MINING_FUNCTION      ALGORITHM
----------------------  -------------------- ------------------------------
SVM_MODEL               CLASSIFICATION       SUPPORT_VECTOR_MACHINES
ANOMALY_DETECT_MODEL    CLASSIFICATION       SUPPORT_VECTOR_MACHINES
```

This query shows that only the SVM classification model has a target.

```
SELECT model_name, attribute_name, attribute_type, target
       FROM user_mining_model_attributes
       WHERE target = 'YES';

MODEL_NAME          ATTRIBUTE_NAME   ATTRIBUTE_TYPE     TARGET
------------------  ---------------  -----------------  ------
SVM_MODEL           AFFINITY_CARD    CATEGORICAL         YES
```

DROP_MODEL Procedure

This procedure deletes the specified mining model.

Syntax

```
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2,
                             force      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 42–37 DROP_MODEL Procedure Parameters

Parameter	Description
`model_name`	Name of the mining model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
`force`	Forces the mining model to be dropped even if it is invalid. A mining model may be invalid if a serious system error interrupted the model build process.

Usage Note

To drop a mining model, you must be the owner or you must have the `DROP ANY MINING MODEL` privilege. See *Oracle Data Mining Administrator's Guide* for information about privileges for data mining.

Example

You can use the following command to delete a valid mining model named `nb_sh_clas_sample` that exists in your schema.

```
BEGIN
  DBMS_DATA_MINING.DROP_MODEL(model_name => 'nb_sh_clas_sample');
END;
/
```

EXPORT_MODEL Procedure

This procedure exports the specified data mining models to a dump file set. You can import from the dump file set using the IMPORT_MODEL procedure. Both EXPORT_MODEL and IMPORT_MODEL use Oracle Data Pump technology.

> **See Also:** *Oracle Data Mining Administrator's Guide* for more information on model export and import

Syntax

```
DBMS_DATA_MINING.EXPORT_MODEL (
      filename          IN VARCHAR2,
      directory         IN VARCHAR2,
      model_filter      IN VARCHAR2 DEFAULT NULL,
      filesize          IN VARCHAR2 DEFAULT NULL,
      operation         IN VARCHAR2 DEFAULT NULL,
      remote_link       IN VARCHAR2 DEFAULT NULL,
      jobname           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 42–38 EXPORT_MODEL Procedure Parameters

Parameter	Description
filename	Name of the dump file set to which the models should be exported. The name must be unique within the schema. The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the filesize parameter, or you can use the operation parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created. When the export operation completes successfully, the name of the dump file set is automatically expanded to *filename01.dmp*, even if there is only one file in the dump set. If there are additional files, they are named sequentially as *filename02.dmp*, *filename03.dmp*, and so forth.
directory	Name of a pre-defined directory object that specifies where the dump file set should be created. You must have read/write privileges on the directory object and on the file system directory that it identifies.
model_filter	Optional parameter that specifies which model or models to export. If you do not specify a value for model_filter, all models in the schema are exported. You can also specify NULL (the default) or 'ALL' to export all models. You can export individual models by name and groups of models based on mining function or algorithm. For instance, you could export all regression models or all Naive Bayes models. Examples are provided in Table 42–39.
filesize	Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB. If the size of the models to export is larger than filesize, one or more additional files are created within the dump set. See the description of the filename parameter for more information.

Table 42–38 (Cont.) EXPORT_MODEL Procedure Parameters

Parameter	Description
operation	Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the filesize parameter determines the size of the files. You can specify either of the following values for operation: ■ 'EXPORT' — Export all or the specified models. (Default) ■ 'ESTIMATE' — Estimate the size of the exporting models.
remote_link	Optional parameter not used in this release. Set to NULL.
jobname	Optional parameter that specifies the name of the export job. By default, the name has the form *username*_exp_*nnnn*, where *nnnn* is a number. For example, a job name in the SCOTT schema might be SCOTT_exp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the export job, named *jobname*.log, is created in the same directory as the dump file set.

Usage Notes

The model_filter parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same mining function or algorithm. You can query the USER_MINING_MODELS view to list the models in your schema.

```
SQL> describe user_mining_models
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 MODEL_NAME                                NOT NULL VARCHAR2(30)
 MINING_FUNCTION                                    VARCHAR2(30)
 ALGORITHM                                          VARCHAR2(30)
 CREATION_DATE                             NOT NULL DATE
 BUILD_DURATION                                     NUMBER
 MODEL_SIZE                                         NUMBER
 COMMENTS                                           VARCHAR2(4000)
```

For more information on data dictionary views of mining models, see "Mining Model Objects" on page 42-5.

Examples of model filters are provided in Table 42–39.

Table 42–39 Sample Values for the Model Filter Parameter

Sample Value	Meaning
'mymodel'	Export the model named mymodel
'name= ''mymodel'''	Export the model named mymodel
'name IN (''mymodel2'',''mymodel3'')'	Export the models named mymodel2 and mymodel3
'ALGORITHM_NAME = ''NAIVE_BAYES'''	Export all Naive Bayes models. See Table 42–4 for a list of algorithm names.
'FUNCTION_NAME =''CLASSIFICATION'''	Export all classification models. See Table 42–2 for a list of mining functions.

Examples

The following statement exports all the models in the DMUSER3 schema to a dump file set called models_out in the directory $ORACLE_HOME/rdbms/log. This directory is mapped to a directory object called DATA_PUMP_DIR. The DMUSER3 user has read/write access to the directory and to the directory object.

```
SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');
```

You can exit SQL*Plus and list the resulting dump file and log file.

```
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
```

The following example uses the same directory object and is executed by the same user. It exports the models called NMF_SH_SAMPLE and SVMR_SH_REGR_SAMPLE to a different dump file set in the same directory.

```
SQL>execute dbms_data_mining.export_model ( 'models2_out', 'DATA_PUMP_DIR',
            'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');
SQL>exit
>cd $ORACLE_HOME/rdbms/log
>ls
>DMUSER3_exp_1027.log  models_out01.dmp
 DMUSER3_exp_924.log  models2_out01.dmp
```

GET_ASSOCIATION_RULES Function

This table function returns the rules from an association model.

You can specify filtering criteria to cause GET_ASSOCIATION_RULES to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, the greatest performance improvement will result from specifying the topn parameter.

Syntax

```
DBMS_DATA_MINING.GET_ASSOCIATION_RULES (
   model_name            IN VARCHAR2,
   topn                  IN NUMBER DEFAULT NULL,
   rule_id               IN INTEGER DEFAULT NULL,
   min_confidence        IN NUMBER DEFAULT NULL,
   min_support           IN NUMBER DEFAULT NULL,
   max_rule_length       IN INTEGER DEFAULT NULL,
   min_rule_length       IN INTEGER DEFAULT NULL,
   sort_order            IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,
   antecedent_items      IN DM_ITEMS DEFAULT NULL,
   consequent_items      IN DM_ITEMS DEFAULT NULL,
   min_lift              IN NUMBER DEFAULT NULL)
 RETURN DM_RULES PIPELINED;
```

Parameters

Table 42–40 GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. This is the only required parameter of GET_ASSOCIATION_RULES. All other parameters specify optional filters on the rules to return.
topn	Return the *n* top rules ordered by confidence and then support, both descending. If you specify a sort order, the top *n* rules are derived after the sort is performed. If topn is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are RULE_CONFIDENCE and RULE_SUPPORT. If *topn* is specified and a maximum or minimum rule length *is* specified, then RULE_CONFIDENCE, RULE_SUPPORT, and NUMBER_OF_ITEMS are allowed in the sort order.
rule_id	Identifier of the rule to return. If you specify a value for rule_id, do not specify values for the other filtering parameters.
min_confidence	Return the rules with confidence greater than or equal to this number
min_support	Return the rules with support greater than or equal to this number
max_rule_length	Return the rules with a length less than or equal to this number. Rule length refers to the number of items in the rule (See NUMBER_OF_ITEMS in Table 42–41). For example, in the rule A=>B (if A, then B), the number of items is 2. If max_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.

Table 42–40 (Cont.) GET_ASSOCIATION_RULES Function Parameters

Parameter	Description
min_rule_length	Return the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length. If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.
sort_order	Sort the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order. For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you would specify: ORA_MINING_VARCHAR2_NT('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC') If you specify topn, the results will vary depending on the sort order. By default, the results are sorted by confidence in descending order, then by support in descending order. See the examples.
antecedent_items	Return the rules with these items in the antecedent. See the examples.
consequent_items	Return the rules with this item in the consequent. See the examples.
min_lift	Return the rules with lift greater than or equal to this number.

Return Values

Table 42–41 GET_ASSOCIATION RULES Function Return Values

Return Value	Description
DM_RULES	Represents a set of rows of type DM_RULE. The rows have the following columns: (rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER, rule_lift NUMBER, antecedent_support NUMBER, consequent_support NUMBER, number_of_items INTEGER) The antecedent and consequent columns each return nested tables of type DM_PREDICATES.The rows, of type DM_PREDICATE, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)

Usage Notes

This table function pipes out rows of type DM_RULES. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

The ORA_MINING_VARCHAR2_NT type is defined as a table of VARCHAR2(4000).

Examples

The following example demonstrates an Association model build followed by several invocations of the GET_ASSOCIATION_RULES table function.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE census_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
  model_name => 'market_model',
  function => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name => 'market_build',
  case_id_column_name => 'item_id',
  target_column_name => NULL,
  settings_table_name => 'census_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));
```

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
       rule_confidence
  FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following example returns all the rules which have 'AQUATIC' or 'EGGS' in the antecedent, and has 'VENOMOUS' as the consequent. The rules are sorted first by NUMBER_OF_ITEMS in descending order, then by RULE_CONFIDENCE in descending order, and finally by RULE_SUPPORT in descending order.

```
SELECT * FROM TABLE
(    DBMS_DATA_MINING.GET_ASSOCIATION_RULES
       ('AR_Model_31', 120, NULL, 1, .51, 7,
         ORA_MINING_VARCHAR2_NT
          ('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
         ORA_MINING_VARCHAR2_NT('AQUATIC', 'EGGS'),
         ORA_MINING_VARCHAR2_NT('VENOMOUS')));
```

GET_DEFAULT_SETTINGS Function

The GET_DEFAULT_SETTINGS function is deprecated in 11*g* Release 2 (11.2). It is replaced with the data dictionary view, *_MINING_MODEL_SETTINGS. USER_, ALL_, and DBA_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

> **Note:** See "Deprecated Subprograms" on page 42-7

This table function returns the default settings for all mining functions and algorithms supported in the DBMS_DATA_MINING package.

Syntax

```
DBMS_DATA_MINING.GET_DEFAULT_SETTINGS
  RETURN DM_MODEL_SETTINGS PIPELINED;
```

Return Values

Table 42–42 GET_DEFAULT_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns: (setting_name VARCHAR2(30), setting_value VARCHAR2(128))

Usage Notes

This table function pipes out rows of type DM_MODEL_SETTING. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

This function is particularly useful if you do not know what settings are associated with a particular function or algorithm, and you want to override some or all of them.

Examples

For example, if you want to override some or all of *k*-Means clustering settings, you can create a settings table as shown, and update individual settings as required.

```
BEGIN
  CREATE TABLE mysettings AS
  SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
   WHERE setting_name LIKE 'KMNS%';
  -- now update individual settings as required
  UPDATE mysettings
     SET setting_value = 0.02
   WHERE setting_name = DBMS_DATA_MINING.KMNS_MIN_PCT_ATTR_SUPPORT;
END;
/
```

GET_FREQUENT_ITEMSETS Function

This table function returns a set of rows that represent the frequent itemsets from an Association model. For a detailed description of frequent itemsets, consult *Oracle Data Mining Concepts*.

Syntax

```
DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS (
    model_name          IN VARCHAR2,
    topn                IN NUMBER DEFAULT NULL,
    max_itemset_length  IN NUMBER DEFAULT NULL)
  RETURN DM_ITEMSETS PIPELINED;
```

Parameters

Table 42–43 GET_FREQUENT_ITEMSETS Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name.*]*model_name*. If you do not specify a schema, your own schema is used.
`topn`	When not `NULL`, return the top *n* rows ordered by support in descending order
`max_itemset_length`	Maximum length of an item set.

Return Values

Table 42–44 GET_FREQUENT_ITEMSETS Function Return Values

Return Value	Description

`DM_ITEMSETS`	Represents a set of rows of type `DM_ITEMSET`. The rows have the following columns:
	`(itemsets_id NUMBER,`
	`items DM_ITEMS,`
	`support NUMBER,`
	`number_of_items NUMBER)`
	The `items` column returns a nested table of type `DM_ITEMS`. The rows have type `DM_ITEM`:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000))`

Usage Notes

This table function pipes out rows of type `DM_ITEMSETS`. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

Examples

The following example demonstrates an Association model build followed by an invocation of `GET_FREQUENT_ITEMSETS` table function from Oracle SQL.

```
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
```

```
    SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
 WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
 WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

/* build a AR model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'market_model',
  function             => DBMS_DATA_MINING.ASSOCIATION,
  data_table_name      => 'market_build',
  case_id_column_name  => 'item_id',
  target_column_name   => NULL,
  settings_table_name  => 'census_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

```
-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
  FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
```

GET_MODEL_COST_MATRIX Function

This function returns the rows of the default scoring matrix associated with the specified model.

By default, this function returns the scoring matrix that was added to the model with the ADD_COST_MATRIX procedure. If you wish to obtain the cost matrix used to create a model, specify cost_matrix_type_create as the matrix_type. See Table 42–45.

See also ADD_COST_MATRIX Procedure.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_COST_MATRIX (
      model_name        IN VARCHAR2,
      matrix_type       IN VARCHAR2 DEFAULT cost_matrix_type_score)
RETURN DM_COST_MATRIX PIPELINED;
```

Parameters

Table 42–45 GET_MODEL_COST_MATRIX Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name.*]*model_name*. If you do not specify a schema, your own schema is used.
matrix_type	The type of cost matrix. COST_MATRIX_TYPE_SCORE — cost matrix used for scoring. (Default.) COST_MATRIX_TYPE_CREATE — cost matrix used to create the model (Decision Tree only).

Return Values

Table 42–46 GET_MODEL_COST_MATRIX Function Return Values

Return Value	Description
DM_COST_MATRIX	Represents a set of rows of type DM_COST_ELEMENT. The rows have the following columns: actual VARCHAR2(4000), predicted VARCHAR2(4000), cost NUMBER)

Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 42–7, " Mining Function Settings".

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can modify the values in the cost matrix table or you can use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one

Example

This example returns the scoring cost matrix associated with the Naive Bayes model NB_SH_CLAS_SAMPLE.

```
column actual format a10
column predicted format a10
SELECT *
    FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
    ORDER BY predicted, actual;

ACTUAL     PREDICTED   COST
---------- ---------- -----
0          0            .00
1          0            .75
0          1            .25
1          1            .00
```

GET_MODEL_DETAILS_ABN Function

The Adaptive Bayes Network algorithm ABN algorithm is deprecated in 11*g* Release 2 (11.2).

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

> **Note:** See "Deprecated Subprograms" on page 42-7

This table function returns a set of rows that provide the details of an Adaptive Bayes Network model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN (
    model_name          IN VARCHAR2)
  RETURN DM_ABN_DETAILS PIPELINED;
```

Parameters

Table 42–47 GET_MODEL_DETAILS_ABN Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–48 GET_MODEL_DETAILS_ABN Function Return Values

Return Value	Description

DM_ABN_DETAILS	Represents a set of rows of type DM_ABN_DETAIL. The rows have the following columns:
	`(rule_id INTEGER,`
	`antecedent DM_PREDICATES,`
	`consequent DM_PREDICATES,`
	`rule_support NUMBER)`
	The antecedent and consequent columns of DM_ABN_DETAIL each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`conditional_operator CHAR(2), /*=,<>,<,>,<=,>=*/`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

This table function pipes out rows of type DM_ABN_DETAIL. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

This function returns details only for a single feature ABN model.

Examples

The following example demonstrates an ABN model build followed by an invocation of GET_MODEL_DETAILS_ABN table function from Oracle SQL.

```
BEGIN
  -- prepare a settings table to override default algorithm and model type
  CREATE TABLE abn_settings (setting_name VARCHAR2(30),
  setting_value
VARCHAR2(128));
  INSERT INTO abn_settings VALUES (DBMS_DATA_MINING.ALGO_NAME,
    DBMS_DATA_MINING.ALGO_ADAPTIVE_BAYES_NETWORK);
  INSERT INTO abn_settings VALUES
    (DBMS_DATA_MINING.ABNS_MODEL_TYPE,
     DBMS_DATA_MINING.ABNS_SINGLE_FEATURE);
   COMMIT;
  -- create a model
  DBMS_DATA_MINING.CREATE_MODEL (
    model_name           => 'abn_model',
    function             => DBMS_DATA_MINING.CLASSIFICATION,
    data_table_name      => 'abn_build',
    case_id_column_name  => 'id',
    target_column_name   => NULL,
    settings_table_name  => 'abn_settings');
END;
/
-- View the (unformatted) results from SQL*Plus
SELECT *
    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_ABN('abn_model'));
```

GET_MODEL_DETAILS_AI Function

This table function returns a set of rows that provide the details of an Attribute Importance model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_AI (
  model_name          IN VARCHAR2)
 RETURN DM_RANKED_ATTRIBUTES PIPELINED;
```

Parameters

Table 42–49 GET_MODEL_DETAILS_AI Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–50 GET_MODEL_DETAILS_AI Function Return Values

Return Value	Description

`DM_RANKED_ATTRIBUTES`	Represents a set of rows of type `DM_RANKED_ATTRIBUTE`. The rows have the following columns:
	`(attribute_name VARCHAR2(4000,`
	`attribute_subname VARCHAR2(4000),`
	`importance_value NUMBER,`
	`rank NUMBER(38))`

GET_MODEL_DETAILS_GLM Function

This table function returns the coefficient statistics for a Generalized Linear Model.

The same set of statistics is returned for both linear and logistic regression, but statistics that do not apply to the mining function are returned as NULL. For more details, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLM (
             model_name              VARCHAR2)
RETURN DM_GLM_COEFF_SET PIPELINED;
```

Parameters

Table 42–51 GET_MODEL_DETAILS_GLM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–52 GET_MODEL_DETAILS_GLM Return Values

Return Value	Description
DM_GLM_COEFF_SET	Represents a set of rows of type DM_GLM_COEFF. The rows have the following columns: (class VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER, std_error NUMBER, test_statistic NUMBER, p_value NUMBER, VIF NUMBER, std_coefficient NUMBER, lower_coeff_limit NUMBER, upper_coeff_limit NUMBER, exp_coefficient BINARY_DOUBLE, exp_lower_coeff_limit BINARY_DOUBLE, exp_upper_coeff_limit BINARY_DOUBLE)

GET_MODEL_DETAILS_GLM returns a row of statistics for each attribute and one extra row for the intercept, which is identified by a null value in the attribute name. Each row has the DM_GLM_COEFF data type. The statistics are described in Table 42–53.

Table 42–53 DM_GLM_COEFF Data Type Description

Column	Description
`class`	The non-reference target class for logistic regression. The model is built to predict the probability of this class. The other class (the reference class) is specified in the model setting `GLMS_REFERENCE_CLASS_NAME`. See Table 42–11, " GLM Settings". For linear regression, `class` is null.
`attribute_name`	The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of `attribute_name` is also the name of the column in the case table that is the source for this attribute. For the intercept, `attribute_name` is null. Intercepts are equivalent to the bias term in SVM models.
`attribute_subname`	The name of an attribute in a nested table. The full name of a nested attribute has the form: *`attribute_name.attribute_subname`* where *`attribute_name`* is the name of the nested column in the case table that is the source for this attribute. If the attribute is not nested, `attribute_subname` is null. If the attribute is an intercept, both the `attribute_name` and the `attribute_subname` are null.
`attribute_value`	The value of the attribute (categorical attribute only). For numerical attributes, `attribute_value` is null.
`coefficient`	The linear coefficient estimate.
`std_error`	Standard error of the coefficient estimate.
`test_statistic`	For linear regression, the t-value of the coefficient estimate. For logistic regression, the Wald chi-square value of the coefficient estimate.
`p-value`	Probability of the `test_statistic`. Used to analyze the significance of specific attributes in the model.
`VIF`	Variance Inflation Factor. The value is zero for the intercept. For logistic regression, `VIF` is null.
`std_coefficient`	Standardized estimate of the coefficient.
`lower_coeff_limit`	Lower confidence bound of the coefficient.
`upper_coeff_limit`	Upper confidence bound of the coefficient.
`exp_coefficient`	Exponentiated coefficient for logistic regression. For linear regression, `exp_coefficient` is null.
`exp_lower_coeff_limit`	Exponentiated coefficient for lower confidence bound of the coefficient for logistic regression. For linear regression, `exp_lower_coeff_limit` is null.
`exp_upper_coeff_limit`	Exponentiated coefficient for upper confidence bound of the coefficient for logistic regression. For linear regression, `exp_lower_coeff_limit` is null.

Usage Notes

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:

- They do not apply to the mining function. For example, `exp_coefficient` does not apply to linear regression.
- They cannot be computed from a theoretical standpoint. For example, when ridge regression is enabled, the coefficient values are returned with no statistics except VIF if it is enabled. (For information on ridge regression, see Table 42–11, " GLM Settings".)
- They cannot be computed because of limitations in system resources.
- Their values would be infinity.

GET_MODEL_DETAILS_GLOBAL Function

This table function returns statistics about the model as a whole. Global details are available for GLM and for association rules.

Separate global details are returned for linear and logistic regression. When ridge regression is enabled, fewer global details are returned. For information about ridge, see Table 42–11, " GLM Settings".

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_GLOBAL (
      model_name     IN  VARCHAR2)
RETURN DM_MODEL_GLOBAL_DETAILS PIPELINED;
```

Parameters

Table 42–54 GET_MODEL_DETAILS_GLOBAL Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–55 GET_MODEL_DETAILS_GLOBAL Function Return Values

Return Value	Description
DM_MODEL_GLOBAL_DETAILS	A collection of rows of type DM_MODEL_GLOBAL_DETAIL. The rows have the following columns: (global_detail_name VARCHAR2(30), global_detail_value NUMBER)

Global Details for GLM: Linear Regression

Table 42–56 Global Details for Linear Regression

GLOBAL_DETAIL_NAME	Description
MODEL_DF	Model degrees of freedom
MODEL_SUM_SQUARES	Model sum of squares
MODEL_MEAN_SQUARE	Model mean square
F_VALUE	Model *F* value statistic
MODEL_F_P_VALUE	Model *F* value probability
ERROR_DF	Error degrees of freedom
ERROR_SUM_SQUARES	Error sum of squares
ERROR_MEAN_SQUARE	Error mean square
CORRECTED_TOTAL_DF	Corrected total degrees of freedom
CORRECTED_TOT_SS	Corrected total sum of squares
ROOT_MEAN_SQ	Root mean square error

Table 42–56 (Cont.) Global Details for Linear Regression

GLOBAL_DETAIL_NAME	Description
DEPENDENT_MEAN	Dependent mean
COEFF_VAR	Coefficient of variation
R_SQ	R-Square
ADJUSTED_R_SQUARE	Adjusted R-Square
AIC	Akaike's information criterion
SBIC	Schwarz's Bayesian information criterion
GMSEP	Estimated mean square error of the prediction, assuming multivariate normality
HOCKING_SP	Hocking Sp statistic
J_P	JP statistic (the final prediction error)
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)
NUM_ROWS	Number of rows
MODEL_CONVERGED	Whether or not the model converged. Value is 1 if it converged, or 0 if it did not converge
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if it was not computed

Global Details for GLM: Logistic Regression

Table 42–57 Global Details for Logistic Regression

GLOBAL_DETAIL_NAME	Description
AIC_INTERCEPT	Akaike's criterion for the fit of the intercept only model
AIC_MODEL	Akaike's criterion for the fit of the intercept and the covariates (predictors) mode
SC_INTERCEPT	Schwarz's Criterion for the fit of the intercept only model
SC_MODEL	Schwarz's Criterion for the fit of the intercept and the covariates (predictors) model
NEG2_LL_INTERCEPT	-2 log likelihood of the intercept only model
NEG2_LL_MODEL	-2 log likelihood of the model
LR_DF	Likelihood ratio degrees of freedom
LR_CHI_SQ	Likelihood ratio chi-square value
LR_CHI_SQ_P_VALUE	Likelihood ratio chi-square probability value
PSEUDO_R_SQ_CS	Pseudo R-square Cox and Snell
PSEUDO_R_SQ_N	Pseudo R-square Nagelkerke
DEPENDENT_MEAN	Dependent mean
PCT_CORRECT	Percent of correct predictions
PCT_INCORRECT	Percent of incorrectly predicted rows
PCT_TIED	Percent of cases where probability for both cases is the same
NUM_PARAMS	Number of parameters (the number of coefficients, including the intercept)

Table 42–57 (Cont.) Global Details for Logistic Regression

GLOBAL_DETAIL_NAME	Description
NUM_ROWS	Number of rows
MODEL_CONVERGED	Whether or not the model converged. Value is 1if it converged, or 0 if it did not converge.
VALID_COVARIANCE_MATRIX	Valid covariance matrix. Value is 1 if the covariance matrix was computed, or 0 if the covariance matrix not computed

Global Detail for Association Rules

A single global detail is produced by an Association model.

Table 42–58 Global Detail for Association Rules

GLOBAL_DETAIL_NAME	Description
RULE_COUNT	The number of association rules in the model.

GET_MODEL_DETAILS_KM Function

This table function returns a set of rows that provide the details of a *k*-Means clustering model.

You can provide input to GET_MODEL_DETAILS_KM to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODEL_DETAILS_KM returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_KM (
         model_name          VARCHAR2,
         cluster_id          NUMBER    DEFAULT NULL,
         attribute           VARCHAR2  DEFAULT NULL,
         centroid            NUMBER    DEFAULT 1,
         histogram           NUMBER    DEFAULT 1,
         rules               NUMBER    DEFAULT 2,
         attribute_subname   VARCHAR2  DEFAULT NULL)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 42–59 GET_MODEL_DETAILS_KM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
cluster_id	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
attribute	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
centroid	This parameter accepts the following values: ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
histogram	This parameter accepts the following values: ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
rules	This parameter accepts the following values: ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 42–60 GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description
DM_CLUSTERS	Represents a set of rows of type DM_CLUSTER. The rows have the following columns: (id NUMBER, cluster_id VARCHAR2(4000), record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE) The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child. The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER) The histogram column of DM_CLUSTER returns a nested table of type DM_HISTOGRAMS. The rows, of type DM_HISTOGRAM_BIN, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), bin_id NUMBER, lower_bound NUMBER, upper_bound NUMBER, label VARCHAR2(4000), count NUMBER)

Table 42–60 (Cont.) GET_MODEL_DETAILS_KM Function Return Values

Return Value	Description

	The `rule` column of `DM_CLUSTER` returns a single row of type `DM_RULE`. The columns are:
	`(rule_id INTEGER,`
	`antecedent DM_PREDICATES,`
	`consequent DM_PREDICATES,`
	`rule_support NUMBER,`
	`rule_confidence NUMBER,`
	`rule_lift NUMBER,`
	`antecedent_support NUMBER,`
	`consequent_support NUMBER,`
	`number_of_items INTEGER)`
	The `antecedent` and `consequent` columns of `DM_RULE` each return nested tables of type `DM_PREDICATES`. The rows, of type `DM_PREDICATE`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

The table function pipes out rows of type `DM_CLUSTERS`. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

Examples

The following example demonstrates a *k*-Means clustering model build followed by an invocation of `GET_MODEL_DETAILS_KM` table function from Oracle SQL.

```
BEGIN
-- create a settings table
UPDATE cluster_settings
   SET setting_value = 3
 WHERE setting_name = DBMS_DATA_MINING.KMEANS_BLOCK_GROWTH;

/* build a k-Means clustering model */
DBMS_DATA_MINING.CREATE_MODEL(
  model_name           => 'eight_clouds',
  function             => DBMS_DATA_MINING.CLUSTERING,
  data_table_name      => 'eight_clouds_build',
  case_id_column_name  => 'id',
  target_column_name   => NULL,
  settings_table_name  => 'cluster_settings');
END;
/

-- View the (unformatted) rules from SQL*Plus
SELECT id, record_count, parent, tree_level, dispersion,
       child, centroid, histogram, rule
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_KM('eight_clouds'));
```

GET_MODEL_DETAILS_NB Function

This table function returns a set of rows that provide the details of a Naive Bayes model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NB (
   model_name      IN       VARCHAR2)
 RETURN DM_NB_DETAILS PIPELINED;
```

Parameters

Table 42–61 GET_MODEL_DETAILS_NB Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name.*]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–62 GET_MODEL_DETAILS_NB Function Return Values

Return Value	Description
DM_NB_DETAILS	Represents a set of rows of type DM_NB_DETAIL. The rows have the following columns: (target_attribute_name VARCHAR2(30), target_attribute_str_value VARCHAR2(4000), target_attribute_num_value NUMBER, prior_probability NUMBER, conditionals DM_CONDITIONALS) The conditionals column of DM_NB_DETAIL returns a nested table of type DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_str_value VARCHAR2(4000), attribute_num_value NUMBER, conditional_probability NUMBER)

Usage Notes

The table function pipes out rows of type DM_NB_DETAILS. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

Examples

Assume that you have built a classification model census_model using the Naive Bayes algorithm. You can retrieve the model details as shown in this example.

```
-- You can view the Naive Bayes model details in many ways
-- Consult the Oracle Application Developer's Guide -
-- Object-Relational Features for different ways of
-- accessing Oracle Objects.
```

```
-- View the (unformatted) details from SQL*Plus
SELECT attribute_name, attribute_num_value, attribute_str_value,
       prior_probability, conditionals,
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('census_model');
```

See `nbdemo.sql` for generation of formatted rules.

GET_MODEL_DETAILS_NMF Function

This table function returns a set of rows that provide the details of a Non-Negative Matrix Factorization model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF (
   model_name        IN        VARCHAR2)
 RETURN DM_NMF_FEATURE_SET PIPELINED;
```

Parameters

Table 42–63 GET_MODEL_DETAILS_NMF Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name.*]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–64 GET_MODEL_DETAILS_NMF Function Return Values

Return Value	Description

`DM_NMF_FEATURE_SET`	Represents a set of rows of `DM_NMF_FEATURE`. The rows have the following columns:
	`(feature_id NUMBER,`
	`mapped_feature_id VARCHAR2(4000),`
	`attribute_set DM_NMF_ATTRIBUTE_SET)`
	The `attribute_set` column of `DM_NMF_FEATURE` returns a nested table of type `DM_NMF_ATTRIBUTE_SET`. The rows, of type `DM_NMF_ATTRIBUTE`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`attribute_value VARCHAR2(4000),`
	`coefficient NUMBER)`

Usage Notes

The table function pipes out rows of type `DM_NMF_FEATURE_SET`. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

Examples

Assume you have built an NMF model called `my_nmf_model`. You can retrieve model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT feature_id, attribute_set
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF(
        'my_nmf_model'));
```

GET_MODEL_DETAILS_OC Function

This table function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the clustering patterns generated during the creation of the model.

You can provide input to GET_MODEL_DETAILS_OC to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, GET_MODEL_DETAILS_OC returns all the information about the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_OC (
          model_name          VARCHAR2,
          cluster_id          NUMBER    DEFAULT NULL,
          attribute           VARCHAR2  DEFAULT NULL,
          centroid            NUMBER    DEFAULT 1,
          histogram           NUMBER    DEFAULT 1,
          rules               NUMBER    DEFAULT 2)
RETURN DM_CLUSTERS PIPELINED;
```

Parameters

Table 42–65 GET_MODEL_DETAILS_OC Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
cluster_id	The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.
attribute	The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise the details for all attributes are returned
centroid	This parameter accepts the following values: ■ 1 — Details about centroids are returned (default) ■ 0 — Details about centroids are not returned
histogram	This parameter accepts the following values: ■ 1 — Details about histograms are returned (default) ■ 0 — Details about histograms are not returned
rules	This parameter accepts the following values: ■ 2 — Details about rules are returned (default) ■ 1 — Rule summaries are returned ■ 0 — No information about rules is returned

Return Values

Table 42–66 GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description
DM_CLUSTERS	Represents a set of rows of type DM_CLUSTER. The rows have the following columns: (id NUMBER, cluster_id VARCHAR2(4000), record_count NUMBER, parent NUMBER, tree_level NUMBER, dispersion NUMBER, split_predicate DM_PREDICATES, child DM_CHILDREN, centroid DM_CENTROIDS, histogram DM_HISTOGRAMS, rule DM_RULE) The split_predicate column of DM_CLUSTER returns a nested table of type DM_PREDICATES. Each row, of type DM_PREDICATE, has the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) /*=,<>,<,>,<=,>=*/, attribute_num_value NUMBER, attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER) The child column of DM_CLUSTER returns a nested table of type DM_CHILDREN. The rows, of type DM_CHILD, have a single column of type NUMBER, which contains the identifiers of each child. The centroid column of DM_CLUSTER returns a nested table of type DM_CENTROIDS. The rows, of type DM_CENTROID, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER) The histogram column of DM_CLUSTER returns a nested table of type DM_HISTOGRAMS. The rows, of type DM_HISTOGRAM_BIN, have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), bin_id NUMBER, lower_bound NUMBER, upper_bound NUMBER, label VARCHAR2(4000), count NUMBER)

Table 42–66 (Cont.) GET_MODEL_DETAILS_OC Function Return Values

Return Value	Description

	The `rule` column of `DM_CLUSTER` returns a single row of type `DM_RULE`. The columns are:
	`(rule_id INTEGER,`
	`antecedent DM_PREDICATES,`
	`consequent DM_PREDICATES,`
	`rule_support NUMBER,`
	`rule_confidence NUMBER,`
	`rule_lift NUMBER,`
	`antecedent_support NUMBER,`
	`consequent_support NUMBER,`
	`number_of_items INTEGER)`
	The `antecedent` and `consequent` columns each return nested tables of type `DM_PREDICATES`.The rows, of type `DM_PREDICATE`, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	`attribute_subname VARCHAR2(4000),`
	`conditional_operator CHAR(2)/*=,<>,<,>,<=,>=*/,`
	`attribute_num_value NUMBER,`
	`attribute_str_value VARCHAR2(4000),`
	`attribute_support NUMBER,`
	`attribute_confidence NUMBER)`

Usage Notes

The table function pipes out rows of type `DM_CLUSTER`. For information about Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

Examples

Assume you have built an OC model called `my_oc_model`. You can retrieve information from the model details as shown:

```
--View (unformatted) details from SQL*Plus
SELECT T.id           clu_id,
       T.record_count rec_cnt,
       T.parent       parent,
       T.tree_level   tree_level
  FROM (SELECT *
          FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_OC(
                 'my_oc_model'))
        ORDER BY id) T
 WHERE ROWNUM < 11;
```

GET_MODEL_DETAILS_SVM Function

This table function returns a set of rows that provide the details of a linear Support Vector Machine (SVM) model. If invoked for nonlinear SVM, it returns ORA-40215.

In linear SVM models, only nonzero coefficients are stored. This reduces storage and speeds up model loading. As a result, if an attribute is missing in the coefficient list returned by GET_MODEL_DETAILS_SVM, then the coefficient of this attribute should be interpreted as zero.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM (
        model_name        VARCHAR2,
        reverse_coef      NUMBER DEFAULT 0)
 RETURN DM_SVM_LINEAR_COEFF_SET PIPELINED;
```

Parameters

Table 42–67 GET_MODEL_DETAILS_SVM Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.
reverse_coef	Whether or not GET_MODEL_DETAILS_SVM should transform the attribute coefficients using the original attribute transformations. When reverse_coef is set to 0 (default), GET_MODEL_DETAILS_SVM returns the coefficients directly from the model without applying transformations. When reverse_coef is set to 1, GET_MODEL_DETAILS_SVM transforms the coefficients and bias by applying the normalization shifts and scales that were generated using automatic data preparation. See Usage Note 4.

Return Values

Table 42–68 GET_MODEL_DETAILS_SVM Function Return Values

Return Value	Description

DM_SVM_LINEAR_COEFF_SET	Represents a set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:
	`(class VARCHAR2(4000),`
	` attribute_set DM_SVM_ATTRIBUTE_SET)`
	The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:
	`(attribute_name VARCHAR2(4000),`
	` attribute_subname VARCHAR2(4000),`
	` attribute_value VARCHAR2(4000),`
	` coefficient NUMBER)`
	See Usage Notes.

Usage Notes

1. This table function pipes out rows of type DM_SVM_LINEAR_COEFF. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.
2. The class column of DM_SVM_LINEAR_COEFF contains classification target values. For SVM regression models, class is null. For each classification target value, a set of coefficients is returned. For binary classification, one-class classifion, and regression models, only a single set of coefficients is returned.
3. The attribute_value column in DM_SVM_ATTRIBUTE_SET is used for categorical attributes.
4. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

   The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information. If you want GET_MODEL_DETAILS_SVM to transform the coefficients such that they relate to the original attributes, set the reverse_coef parameter to 1.

Examples

The following example demonstrates an SVM model build followed by an invocation of GET_MODEL_DETAILS_SVM table function from Oracle SQL:

```
 -- Create SVM model
BEGIN
  dbms_data_mining.create_model(
    model_name           => 'SVM_Clas_sample',
    mining_function      => dbms_data_mining.classification,
    data_table_name      => 'svmc_sample_build_prepared',
    case_id_column_name  => 'id',
    target_column_name   => 'affinity_card',
    settings_table_name  => 'svmc_sample_settings');
END;
/
-- Display model details
SELECT *
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_SVM('SVM_Clas_sample'))
ORDER BY class;
```

GET_MODEL_DETAILS_XML Function

This function returns an XML object that provides the details of a Decision Tree model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_DETAILS_XML (
         model_name      IN       VARCHAR2)
   RETURN XMLTYPE;
```

Parameters

Table 42–69 GET_MODEL_DETAILS_XML Function Parameters

Parameter	Description
`model_name`	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–70 GET_MODEL_DETAILS_XML Function Return Value

Return Value	Description
`XMLTYPE`	The XML definition for the decision tree model. The XML conforms to the Data Mining Group Predictive Model Markup Language (PMML) version 2.1 specification. The specification is available at `http://www.dmg.org`.

Usage Notes

Special characters that cannot be displayed by Oracle XML are converted to '#'.

Examples

The following statements in SQL*Plus return the details of the decision tree model `dt_sh_clas_sample`. This model is created by the program `dmdtdemo.sql`, one of the sample data mining programs provided with Oracle Database Examples.

Note: The "&quot" characters you will see in the XML output are a result of SQL*Plus behavior. To display the XML in proper format, cut and past it into a file and open the file in a browser.

```
column dt_details format a320
EXEC dbms_xdb_print.setPrintMode(dbms_xdb_print.PRINT_PRETTY, 2);
SELECT
 dbms_data_mining.get_model_details_xml('dt_sh_clas_sample')
 AS DT_DETAILS
FROM dual;

DT_DETAILS

GET_MODEL_SETTINGS Function

The GET_MODEL_SETTINGS function is deprecated in 11*g* Release 2 (11.2). It is replaced with the data dictionary view, *_MINING_MODEL_SETTINGS. USER_, ALL_, and DBA_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

> **Note:** See "Deprecated Subprograms" on page 42-7

This table function returns the list of settings that were used to build the model.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SETTINGS(
   model_name           IN VARCHAR2)
 RETURN DM_MODEL_SETTINGS PIPELINED;
```

Parameters

Table 42–71 GET_MODEL_SETTINGS Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–72 GET_MODEL_SETTINGS Function Return Values

Return Value	Description
DM_MODEL_SETTINGS	Represents a set of rows of type DM_MODEL_SETTING. The rows have the following columns: (setting_name VARCHAR2(30), setting_value VARCHAR2(128))

Usage Notes

The table function pipes out rows of type DM_MODEL_SETTING. For information about Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

You can use this table function to determine the settings that were used to build the model. This is purely for informational purposes only — you cannot alter the model to adopt new settings.

Examples

Assume that you have built a classification model census_model using the Naive Bayes algorithm. You can retrieve the model settings using Oracle SQL as follows:

```
SELECT setting_name, setting_value
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SETTINGS('census_model'));
```

GET_MODEL_SIGNATURE Function

The GET_MODEL_SIGNATURE function is deprecated in 11*g* Release 2 (11.2). It is replaced with the data dictionary view, *_MINING_MODEL_ATTRIBUTES. USER_, ALL_, and DBA_ versions of the view are available. See *Oracle Data Mining Application Developer's Guide*.

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

> **Note:** See "Deprecated Subprograms" on page 42-7

This table function returns the model signature, which lists the column attributes used to build the model and which should be present in the scoring data.

The case identifier is not considered a mining attribute. For classification and regression models, the target attribute is also not considered part of the model signature.

> **See Also:** Instead of using the GET_MODEL_SIGNATURE function, you can query the data dictionary view, ALL_MINING_MODEL_ATTRIBUTES. See the *Oracle Data Mining Application Developer's Guide*.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_SIGNATURE(
  model_name           IN VARCHAR2)
RETURN DM_MODEL_SIGNATURE PIPELINED;
```

Parameters

Table 42–73 GET_MODEL_SIGNATURE Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–74 GET_MODEL_SIGNATURE Function Return Values

Return Value	Description
DM_MODEL_SIGNATURE	Represents a set of rows of type DM_MODEL_SIGNATURE_ATTRIBUTE. The rows have the following columns: (attribute_name VARCHAR2(30), attribute_type VARCHAR2(106))

Usage Notes

This table function pipes out rows of type DM_MODEL_SIGNATURE. For information on Data Mining data types and piped output from table functions, see "Data Types" on page 42-19.

Examples

Assume that you have built a classification model `census_model` using the Naive Bayes algorithm. You can retrieve the model details using Oracle SQL as follows:

```
SELECT attribute_name, attribute_type
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_SIGNATURE('census_model');
```

GET_MODEL_TRANSFORMATIONS Function

This function returns the transformation definitions associated with a model.

The data is transformed and the transformation definitions are embedded in the model during the model training (create) process. The transformations can be automatically generated, user-specified, or both.

> **See Also:** "CREATE_MODEL Procedure" on page 42-48 and "Automatic Data Preparation" on page 42-10.

Syntax

```
DBMS_DATA_MINING.GET_MODEL_TRANSFORMATIONS (
      model_name     IN VARCHAR2)
RETURN DM_TRANSFORMS PIPELINED;
```

Parameters

Table 42–75 GET_MODEL_TRANSFORMATIONS Function Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Return Values

Table 42–76 GET_MODEL_TRANSFORMATIONS Function Return Values

Return Value	Description
DM_TRANSFORMS	Represents a set of rows of type DM_TRANSFORM. The rows have the following columns: (attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), expression CLOB, reverse_expression CLOB)

In addition to the transformation definitions, GET_MODEL_TRANSFORMATIONS returns the reverse transformation definitions. The reverse transformations are applied to the model attributes returned by the GET_MODEL_DETAILS functions. They are also applied to the target when a predictive model is applied. Reverse transformations enable model transparency, meaning that attribute information generated by the model is in its original, untransformed state, to the extent that it is possible.

GET_TRANSFORM_LIST Procedure

This function is used to convert a transformation specification from type DM_TRANSFORMS to type TRANSFORM_LIST.

DM_TRANSFORMS is used to output model transforms that are returned from the GET_MODEL_TRANSFORMATIONS function.

CREATE_MODEL and functions in the DBMS_DATA_MINING_TRANSFORM package accept TRANSFORM_LIST. To use them on the output of GET_MODEL_TANSFORMATIONS, you must first call GET_TRANSFORM_LIST to convert to TRANSFORM_LIST type.

Syntax

```
DBMS_DATA_MINING.GET_TRANSFORM_LIST (
      xform_list           OUT NOCOPY TRANSFORM_LIST,
      model_xforms         IN  DM_TRANSFORMS);
```

Parameters

Table 42–77 GET_TRANSFORM_LIST Procedure Parameters

Parameter	Description
xform_list	The transformation specification converted from model_xforms to type TRANSFORM_LIST.
model_xforms	A transformation specification returned by GET_MODEL_TRANSFORMATIONS

IMPORT_MODEL Procedure

This procedure imports the specified data mining models from a dump file set that was created with EXPORT_MODEL or with the expdp export utility. Both IMPORT_MODEL and EXPORT_MODEL use Oracle Data Pump technology.

> **See Also:** *Oracle Data Mining Administrator's Guide* for more information on model export and import

Syntax

```
DBMS_DATA_MINING.IMPORT_MODEL (
    filename             IN  VARCHAR2,
    directory            IN  VARCHAR2,
    model_filter         IN  VARCHAR2 DEFAULT NULL,
    operation            IN  VARCHAR2 DEFAULT NULL,
    remote_link          IN  VARCHAR2 DEFAULT NULL,
    jobname              IN  VARCHAR2 DEFAULT NULL,
    schema_remap         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 42–78 IMPORT_MODEL Procedure Parameters

Parameter	Description
filename	Name of the dump file set from which the models should be imported. The dump file set must have been created by the EXPORT_MODEL procedure or the expdp export utility of Oracle Data Pump. The dump file set can contain one or more files. (Refer to "EXPORT_MODEL Procedure" on page 42-53 for details.) If the dump file set contains multiple files, you can specify '*filename*%U' instead of listing them. For example, if your dump file set contains 3 files, archive01.dmp, archive02.dmp, and archive03.dmp, you can import them by specifying 'archive%U'.
directory	Name of a pre-defined directory object that specifies where the dump file set is located. You must have read/write privileges on the directory object and on the file system directory that it identifies.
model_filter	Optional parameter that specifies one or more models to import. If you do not specify a value for model_filter, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models. The value of model_filter can be one or more model names. The following are valid filters. 'mymodel1' 'name IN (''mymodel2'',''mymodel3'')' The first causes IMPORT_MODEL to import a single model named mymodel1. The second causes IMPORT_MODEL to import two models, mymodel2 and mymodel3.
operation	Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported. You can specify either of the following values for operation: ■ 'IMPORT' — Import the models (Default) ■ 'SQL_FILE'— Write the SQL DDL for creating the models to a text file. The text file is named *job_name*.sql and is located in the dump set directory.

Table 42–78 (Cont.) IMPORT_MODEL Procedure Parameters

Parameter	Description
remote_link	Optional parameter not used in this release. Set to NULL
jobname	Optional parameter that specifies the name of the import job. By default, the name has the form *username*_imp_*nnnn*, where *nnnn* is a number. For example, a job name in the SCOTT schema might be SCOTT_imp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the import job, named *jobname*.log, is created in the same directory as the dump file set.
schema_remap	Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema. If the dump file set belongs to a different schema, you must specify a schema mapping in the form *export_user*:*import_user*. For example, you would specify 'SCOTT:MARY' to import a model exported by SCOTT into the MARY schema. NOTE: In some cases, you may need to have the IMPORT_FULL_DATABASE privilege or the SYS role to import a model from a different schema.

Examples

This example shows a model being exported and imported within the schema dmuser2. Then the same model is imported into the dmuser3 schema. The dmuser3 user has the IMPORT_FULL_DATABASE privilege.

```
SQL> connect dmuser2
Enter password: dmuser2_password
Connected.
SQL> select model_name from user_mining_models;

MODEL_NAME
------------------------------
NMF_SH_SAMPLE
SVMO_SH_CLAS_SAMPLE
SVMR_SH_REGR_SAMPLE

-- export the model called NMF_SH_SAMPLE to a dump file in same schema
SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ('NMF_SH_SAMPLE_out', 'DATA_PUMP_DIR',
                            'name = ''NMF_SH_SAMPLE''');
-- import the model back into the same schema
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                            'DATA_PUMP_DIR', 'name = ''NMF_SH_SAMPLE''');

-- connect as different user
-- import same model into that schema
SQL> connect dmuser3
Enter password: dmuser3_password
Connected.
SQL>EXECUTE DBMS_DATA_MINING.IMPORT_MODEL ('NMF_SH_SAMPLE_out01.dmp',
                            'DATA_PUMP_DIR', 'name = ''NMF_SH_SAMPLE''',
                            'IMPORT', NULL, 'nmf_imp_job', 'dmuser2:dmuser3');
```

The following example shows user MARY importing all models from a dump file, model_exp_001.dmp, which was created by user SCOTT. The dump file is located in the file system directory mapped to a directory object called DM_DUMP. If user MARY does not have IMPORT_FULL_DATABASE privileges, IMPORT_MODEL will raise an error.

```
-- import all models
DECLARE
  file_name       VARCHAR2(40);
BEGIN
  file_name := 'model_exp_001.dmp';
  DBMS_DATA_MINING.IMPORT_MODEL(
               filename=>file_name,
              directory=>'DM_DUMP',
               schema_remap=>'SCOTT:MARY');
  DBMS_OUTPUT.PUT_LINE(
'DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/
```

RANK_APPLY Procedure

This procedure ranks the results of an APPLY operation based on a top-N specification for predictive and descriptive model results. For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

Syntax

```
DBMS_DATA_MINING.RANK_APPLY (
      apply_result_table_name        IN VARCHAR2,
      case_id_column_name            IN VARCHAR2,
      score_column_name              IN VARCHAR2,
      score_criterion_column_name    IN VARCHAR2,
      ranked_apply_table_name        IN VARCHAR2,
      top_N                          IN INTEGER DEFAULT 1,
      cost_matrix_table_name         IN VARCHAR2 DEFAULT NULL,
      apply_result_schema_name       IN VARCHAR2 DEFAULT NULL,
      cost_matrix_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 42–79 RANK_APPLY Procedure Parameters

Parameter	Description
apply_result_table_name	Name of the table or view containing the results of an APPLY operation on the test dataset (see Usage Notes)
case_id_column_name	Name of the case identifier column. This must be the same as the one used for generating APPLY results.
score_column_name	Name of the prediction column in the apply results table
score_criterion_column_name	Name of the probability column in the apply results table
ranked_apply_result_tab_name	Name of the table containing the ranked apply results
top_N	Top N predictions to be considered from the APPLY results for precision recall computation
cost_matrix_table_name	Name of the cost matrix table
apply_result_schema_name	Name of the schema hosting the APPLY results table
cost_matrix_schema_name	Name of the schema hosting the cost matrix table

Usage Notes

You can use RANK_APPLY to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of RANK_APPLY is similar to that of APPLY with respect to other DDL-like operations such as CREATE_MODEL, DROP_MODEL, and RENAME_MODEL. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from APPLY.

The main intended use of RANK_APPLY is for the generation of the final APPLY results against the scoring data in a production setting. You can apply the model against test

data using APPLY, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for RANK_APPLY.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The case_id column will be the same case identifier column as that of the apply results.

Classification Models — NB, ABN, SVM

For numerical targets, the ranked results table will have the definition as shown:

```
(case_id       VARCHAR2/NUMBER,
prediction     NUMBER,
probability    NUMBER,
cost           NUMBER,
rank           INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```
(case_id       VARCHAR2/NUMBER,
prediction     VARCHAR2,
probability    NUMBER,
cost           NUMBER,
rank           INTEGER)
```

Clustering using *k*-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```
(case_id       VARCHAR2/NUMBER,
cluster_id     NUMBER,
probability    NUMBER,
rank           INTEGER)
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```
(case_id        VARCHAR2/NUMBER,
feature_id      NUMBER,
match_quality   NUMBER,
rank            INTEGER)
```

Examples

```
BEGIN
/* build a model with name census_model.
 * (See example under CREATE_MODEL)
 */

/* if training data was pre-processed in any manner,
 * perform the same pre-processing steps on apply
 * data also.
 * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
```

```
 */

/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
  apply_result_table_name       => 'census_apply_result',
  case_id_column_name           => 'person_id',
  score_column_name             => 'prediction',
  score_criterion_column_name   => 'probability
  ranked_apply_result_tab_name  => 'census_ranked_apply_result',
  top_N                         => 3,
  cost_matrix_table_name        => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
  FROM census_ranked_apply_result;
```

REMOVE_COST_MATRIX Procedure

Removes the default scoring matrix from a classification model.

See Also:

- "ADD_COST_MATRIX Procedure" on page 42-24
- "REMOVE_COST_MATRIX Procedure" on page 42-97

Syntax

```
DBMS_DATA_MINING.REMOVE_COST_MATRIX (
      model_name   IN  VARCHAR2);
```

Parameters

Table 42–80 Remove_Cost_Matrix Procedure Parameters

Parameter	Description
model_name	Name of the model in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used.

Usage Notes

If the model is not in your schema, then REMOVE_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.

Example

The Naive Bayes model NB_SH_CLAS_SAMPLE has an associated cost matrix that can be used for scoring the model.

```
SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;

ACTUAL     PREDICTED        COST
---------- ---------- ----------
0          0                   0
1          0                 .75
0          1                 .25
1          1                   0
```

You can remove the cost matrix with REMOVE_COST_MATRIX.

```
SQL>EXECUTE dbms_data_mining.remove_cost_matrix('nb_sh_clas_sample');

SQL>SELECT *
      FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
      ORDER BY predicted, actual;

no rows selected
```

RENAME_MODEL Procedure

This procedure renames a mining model to a new name that you specify.

The model name is in the form [*schema_name*.]*model_name*. If you do not specify a schema, your own schema is used. For mining model naming restrictions, see "Mining Model Naming Restrictions" on page 42-5.

Syntax

```
DBMS_DATA_MINING.RENAME_MODEL (
     model_name            IN VARCHAR2,
     new_model_name        IN VARCHAR2);
```

Parameters

Table 42–81 RENAME_MODEL Procedure Parameters

Parameter	Description
`model_name`	Old name of the model
`new_model_name`	New name of the model.

Usage Notes

If an `APPLY` operation is using a model, and you attempt to rename the model during that time, the `RENAME` will succeed and `APPLY` will return indeterminate results.

Examples

Assume the existence of a model `census_model`. The following example shows how to rename this model.

```
BEGIN
  DBMS_DATA_MINING.RENAME_MODEL(
    model_name      => 'census_model',
    new_model_name  => 'census_new_model');
END;
/
```

DBMS_DBFS_CONTENT

The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide*

This chapter contains the following topics:

- Using DBMS_DBFS_CONTENT
  - Overview
  - Security Model
  - Constants
  - Exceptions
  - Operational Notes
- Data Structures
- Summary of DBMS_DBFS_CONTENT Subprograms

Using DBMS_DBFS_CONTENT

- Overview
- Security Model
- Constants
- Exceptions
- Operational Notes

Overview

The DBMS_DBFS_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers. The "Content" in the DBFS Content interface refers to a file including metadata, and it can map to a BLOB (and other columns) in a table or be dynamically created by user-written plug-ins in Java or PL/SQL that run inside the database. This latter form is referred to as a "Store Provider."

For applications that already use LOBs as columns in their schema, the DBFS Content interface comes with a default implementation to access the BLOB columns. This enables existing applications to easily add PL/SQL provider implementations and provide access through the DBFS Content interface without rewriting their schema or their business logic. Additionally, applications can read and write content that is stored in other (third party) stores through the standard DBFS Content programming interface.

Examples of providers include:

- Content applications like Content DB
- Packaged applications that want to surface data through file
- Custom applications that want to leverage the file system interface -- for example, an application that stores medical image

The DBS_DBFS_CONTENT package abstracts out the common features of various stores into a simple and minimalist interface used to build portable client applications while insulated from store-specific libraries and implementation.

The content interface aggregates the path namespace of one or more stores into a single unified namespace, using the first component of the path name as a disambiguator, and presents this namespace to client-applications.

This allows clients to access the underlying documents using either a full-absolute path name as a single string:

```
/store-name/store-specific-path-name
```

or a store-qualified path name as a string 2-tuple:

```
["store-name","/store-specific-path-name"]
```

The interface then takes care of correctly dispatching various operations on path names to the appropriate stores, and integrating the results back into the client-desired namespace.

Store service providers must conform to the Service Provider Interface (SPI) as declared by the package DBMS_DBFS_CONTENT_SPI - the SPI is not a client-side interface and serves as a private contract between the implementation of the content interface and various stores that wish to be pluggable into it.

The content interface defines client-visible behavior (normal and exceptional) of various store operations, while allowing different stores to implement as rich a set of features as they choose - the interface allows stores to self-describe their capabilities and allows intelligent client applications to tune their behavior based on these capabilities (rather than hard-code logic specific to stores identified by name or by implementation).

Security Model

The DBMS_DBFS_CONTENT package runs under AUTHID CURRENT_USER.

Constants

The DBMS_DBFS_CONTENT package uses the constants shown in the following tables:

- DBMS_DBFS_CONTENT Constants - Path Names
- DBMS_DBFS_CONTENT Constants - ContentID
- DBMS_DBFS_CONTENT Constants - Properties
- DBMS_DBFS_CONTENT Constants - Path Name Types
- DBMS_DBFS_CONTENT Constants - Store Features
- DBMS_DBFS_CONTENT Constants - Lock Types
- DBMS_DBFS_CONTENT Constants - Standard Properties
- DBMS_DBFS_CONTENT Constants - Optional Properties
- DBMS_DBFS_CONTENT Constants - Property Access Flags
- DBMS_DBFS_CONTENT Constants - Operation Codes

Path Name Constants and Types

The following constants are useful for declaring paths and item names. Paths are limited to 1024 characters and item names are limited to 256 characters.

Table 43–1 DBMS_DBFS_CONTENT Constants - Path Names

Constant	Type	Value	Description
NAME_MAX	PLS_INTEGER	256	Maximum length of an absolute path name visible to clients
NAME_T	VARCHAR2(256)	NAME_MAX	Portable alias for string that can represent component names
PATH_MAX	PLS_INTEGER	1024	Maximum length of any individual component of an absolute path name visible to clients
PATH_T	VARCHAR2(1024)	PATH_MAX	Portable alias for string that can represent path names

ContentID Constants

Stores may expose to the user a unique identifier that represents a particular path item in the store. These identifiers are limited to 128 characters.

Table 43–2 DBMS_DBFS_CONTENT Constants - ContentID

Constant	Type	Value	Description
CONTENT_ID_MAX	PLS_INTEGER	128	Maximum length of a store-specific provider-generated contentID that identifies a file-type content item

Table 43–2 (Cont.) DBMS_DBFS_CONTENT Constants - ContentID

Constant	Type	Value	Description
CONTENT_ID_T	RAW(128)	CONTENT_ID_MAX	Portable alias for raw buffers that can represent contentID values

Properties Constants

Every path name in a store is associated with a set of properties. For simplicity and to provide generic basis, each property is identified by a string "name", has a string "value" (which might be NULL if unset or undefined or unsupported by a specific store implementation) and a value "typecode" (a numeric discriminant for the actual type of value held in the "value" string.)

Coercing property values to strings has the advantage of making the various interfaces uniform and compact (and can even simplify implementation of the underlying stores), but has the disadvantage of the potential for information loss during conversions to and from strings.

It is expected that clients and stores use well-defined database conventions for these conversions, and use the typecode field as appropriate.

A typecode is a numeric value representing the true type of a string-coerced property value. Simple scalar types (numbers, dates, timestamps, etc.) can be depended on by clients and must be implemented by stores.

Since standard RDBMS typecodes are positive integers, the DBMS_DBFS_CONTENT interface allows negative integers to represent client-defined types by negative typecodes. These typecodes do not conflict with standard typecodes, are maintained persistently and returned to the client as needed, but need not be interpreted by the DBFS content API or any particular store. Portable client applications should not use user-defined typecodes as a back door way of passing information to specific stores.

Table 43–3 DBMS_DBFS_CONTENT Constants - Properties

Constant	Type	Value	Description
PROPNAME_MAX	PLS_INTEGER	32	Maximum length of a property name
PROPNAME_T	VARCHAR2(32)	PROPNAME_MAX	Portable alias for string that can represent property names
PROPVAL_MAX	PLS_INTEGER	1024	Maximum length of the string value of a property
PROPVAL_T	VARCHAR2(1024)	PATH_MAX	Portable alias for string that can represent property values

Path Name Types

Path items in a store have a item type associated with them. These types represent the kind of entry the item represents in the store.

Table 43–4 DBMS_DBFS_CONTENT Constants - Path Name Types

Constant	Type	Value	Description
TYPE_FILE	PLS_INTEGER	1	A regular file storing content (a logically linear sequence of bytes accessed as a BLOB
TYPE_DIRECTORY	PLS_INTEGER	2	A container of other path name types, including file types
TYPE_LINK	PLS_INTEGER	3	A symbolic link (that is, an uninterpreted string value associated with a path name). Since symbolic links may represent path names that fall outside the scope of any given store (or even the entire aggregation of stores managed by the DBMS_DBFS_CONTENT interface), or may not even represent path names, clients must be careful in creating symbolic links, and stores must be careful in trying to resolve these links internally.
TYPE_REFERENCE	PLS_INTEGER	4	A hard link which is always a valid path name alias to content

Store Features

In order to provide a common programmatic interface to as many different types of stores as possible, the DBFS content API leaves some of the behavior of various operations to individual store providers to define and implement.

However, it is still important to provide client-side programmers with an API that is sufficiently rich and conducive to portable applications.

The DBFS content API achieves this by allowing different store service providers (and different stores) to describe themselves through a "feature set" (a bitmask indicating which features they support and which ones they do not).

Using the feature set, it is possible, albeit tricky, for client applications to compensate for the feature deficiencies of specific stores by implementing additional logic on the client-side, and deferring complex operations to stores capable of supporting them.

Table 43–5 DBMS_DBFS_CONTENT Constants - Store Features

Constant	Type	Value	Description
FEATURE_FOLDERS	PLS_INTEGER	1	Set if the store supports folders (or directories) as part of hierarchical path names

Table 43–5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

Constant	Type	Value	Description
FEATURE_FOIAT	PLS_INTEGER	2	Set if implicit folder operations within the store (performed as part of a client-requested operation) runs inside autonomous transactions.In general, the use of autonomous transactions is a compromise between (a) simplicity in the implementation and client-controlled transaction scope for all operations, at the cost of greatly reduced concurrency (FEATURE_FOIAT not set), versus (b) more complex implementation and smaller client-controlled transaction scope, at the benefit of greatly increased concurrency (FEATURE_FOIAT set).
FEATURE_NOWAIT	PLS_INTEGER	4	Set if the store allows nowait gets of path elements. The default behavior is to wait for row locks; if nowait gets are implemented, the get operation raises an ORA-54 exception if the path element is already locked by another transaction.
FEATURE_ACLS	PLS_INTEGER	8	Set if the store supports Access Control Lists (ACLs) and internal authorization or checking based on these ACLs. ACLs are standard properties but a store may do nothing more than store and retrieve the ACLs without interpreting them in any way.
FEATURE_LINKS	PLS_INTEGER	16	Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself
FEATURE_LINK_ DEREF	PLS_INTEGER	32	Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself
FEATURE_ REFERENCES	PLS_INTEGER	64	Set if the store supports hard links

Table 43–5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

Constant	Type	Value	Description
FEATURE_LOCKING	PLS_INTEGER	128	Set if the store supports user-level locks (read-only, write-only, read-write) that can be applied on various items of the store, and if the store uses these lock settings to control various types of access to the locked items. User-level locks are orthogonal to transaction locks and persist beyond the scope of any specific transaction, session, or connection — this implies that the store itself may not be able to clean up after dangling locks, and client-applications need to perform any garbage collection.
FEATURE_LOCK_ HIERARCHY	PLS_INTEGER	256	Set if the store allows a user-lock to control access to the entire sub-tree under the locked path name. A simpler locking model would have locking semantics apply only to a specific path name, and depend on the locks placed on its parents or children (unless the requested operation would implicitly need to modify these parents or children).
FEATURE_LOCK_ CONVERT	PLS_INTEGER	512	Set if the store supports upgrade or downgrade of locks from one mode to another
FEATURE_ VERSIONING	PLS_INTEGER	1024	Set if the store supports at least a linear versioning and version management. Different versions of the same path name are identified by monotonic version numbers, with a version-nonqualified path name representing the latest version.
FEATURE_VERSION_ PATH	PLS_INTEGER	2048	Set if the store supports a hierarchical namespace for different versions of a path name
FEATURE_SOFT_ DELETES	PLS_INTEGER	4096	Set if the store supports a "soft-delete", that is, the ability to delete a path name and make it invisible to normal operations, but retain the ability to restore the path name later (as long as it has not been overwritten by a new create operation). The store also supports purging soft-deleted path names (making them truly deleted), and navigation modes that show soft-deleted items.
FEATURE_HASHING	PLS_INTEGER	8192	Set if the store automatically computes and maintains some type of a secure hash of the contents of a path name (typically a TYPE_FILE path).

Table 43–5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

Constant	Type	Value	Description
FEATURE_HASH_LOOKUP	PLS_INTEGER	16384	Set if the store allows "content-based addressing", that is, the ability to locate a content item based, not on its path name, but on its content hash.

FEATURE_FILTERING	PLS_INTEGER	32768	Set if the store allows clients to pass a filter function (a PL/SQL function conforming to the signature below) that returns a logical boolean indicating if a given store item satisfies a selection predicate. Stores that support filtering may be able to more efficiently perform item listing, directory navigation, and deletions by embedding the filtering logic inside their implementation. If filtering is not supported, clients can retrieve more items than necessary and perform the filtering checks themselves, albeit less efficiently.
			A filter predicate is a function with the following signature:
			`function filterFunction(`
			` path IN VARCHAR2,`
			` store_name IN VARCHAR2,`
			` opcode IN INTEGER,`
			` item_type IN INTEGER,`
			` properties IN DBMS_DBFS_CONTENT_PROPERTIES_T,`
			` content IN BLOB)`
			`  RETURN INTEGER;`
			Any PL/SQL function conforming to this signature can examine the contents and properties of a store item, and determine if the item satisfies the selection criterion for the current operation. Any nonzero return value results in the DBMS_DBFS_CONTENT interface processing the item as part of the current operation; a return value that is zero or NULL results in the item being skipped from processing.

FEATURE_SEARCHING	PLS_INTEGER	65536	Set if the store allows clients to pass a text-search filter query to locate type_file path names based on their content. Stores that support searching may use indexes to accelerate such searches; otherwise, clients need to build their own indexes, or else search a potentially larger set of items to locate the ones of interest for the current search.

Table 43–5 (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

Constant	Type	Value	Description
FEATURE_ASOF	PLS_INTEGER	131072	Set if the store allows clients to use a flashback timestamp in query operations (non-mutating GETPATH Procedures, LIST Function, SEARCH Function).
FEATURE_PROVIDER_PROPS	PLS_INTEGER	262144	Set if the store allows per-operation properties (that control the behavior of the store with regard to the current operation, as opposed to properties associated with individual items).
FEATURE_SNAPSHOTS	PLS_INTEGER	524288	Set if the store allows the use of named, read-only snapshots of its contents. It is up to the provider to implement snapshots using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between snapshots and its parent content view.
FEATURE_CLONES	PLS_INTEGER	1048576	Set if the store allows the use of named, writable clones of its contents. It is up to the provider to implement clones using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between clones and its parent content view.
FEATURE_LOCATOR	PLS_INTEGER	2097152	Set if the store allows direct access to file contents through a LOB locator. Stores that internally manipulate the file contents, perhaps by shredding or reassembling them in separate pieces, performing other transformations, and so on, cannot transparently give out a LOB locator to clients. The file contents of these stores should be accessed using the buffer-based interfaces.
FEATURE_CONTENT_ID	PLS_INTEGER	4194304	Set if the store allows a "pathless", contentID-based access to files (there is no notion of a directory, link, or reference in this model)
FEATURE_LAZY_PATH	PLS_INTEGER	8388608	Set if the store allows a lazy binding of a path name to file content elements that are otherwise identified by a contentID; this feature makes sense only in conjunction with FEATURE_CONTENT_ID

Lock types

Stores that support locking should implement 3 types of locks: LOCK_READ_ONLY, LOCK_WRITE_ONLY, and LOCK_READ_WRITE.

User-locks (of one of these 3 types) can be associated with a user-supplied lock_data. This is not interpreted by the store, but can be used by client applications for their own purposes. For example, the user-data could indicate the time at which the lock was placed, assuming some part of the client application is interested in later using this information to control its actions, such as garbage collect stale locks or explicitly break locks.

In the simplest locking model, a LOCK_READ_ONLY prevents all explicit modifications to a path name (but allows implicit modifications, and changes to parent/child path names). A LOCK_WRITE_ONLY prevents all explicit reads to the path name (but allows implicit reads, and reads to parent/child path names). A LOCK_WREAD_WRITE allows both.

All locks are associated with a "principal" performing the locking operation; stores that support locking are expected to preserve this information, and use it to perform read or write lock checking (see opt_locker).

More complex lock models: multiple read-locks, lock-scoping across path name hierarchies, lock conversions, group-locking, and other strategies, are possible but currently not defined by the content interface.

Table 43–6 DBMS_DBFS_CONTENT Constants - Lock Types

Constant	Type	Value	Description
LOCK_READ_ONLY	PLS_INTEGER	1	Locks as read-only
LOCK_WRITE_ONLY	PLS_INTEGER	2	Locks as write-only
LOCK_READ_WRITE	PLS_INTEGER	3	Locks as read-write

Standard properties

Standard properties are well-defined, mandatory properties associated with all content path names that all stores should support (in the manner described by the content interface), with some concessions. For example, a read-only store need not implement a modification_time or creation_time; stores created against tables with a fixed-schema may choose reasonable defaults for as many of these properties as needed, and so on.

All standard properties informally use the STD namespace. Clients and stores should avoid using this namespace to define their own properties since this can cause conflicts in future.

The menu of standard properties is expected to be fairly stable over time.

Table 43–7 DBMS_DBFS_CONTENT Constants - Standard Properties

Constant	Type	Value	Description
STD_ACCESS_TIME	VARCHAR2(32)	'std:access_time'	TYPECODE_TIMESTAMP in UTC: The time of last access of a path name's contents

Table 43–7 (Cont.) DBMS_DBFS_CONTENT Constants - Standard Properties

Constant	Type	Value	Description
STD_ACL	VARCHAR2(32)	'std:acl'	TYPECODE_VARCHAR2: The access control list (in standard ACL syntax) associated with the path name
STD_CANONICAL_PATH	VARCHAR2(32)	'std:canonical_path'	TYPECODE_VARCHAR2: The canonical store-specific path name of an item, suitably cleaned up (leading or trailing "/" collapsed or trimmed, and so on)
STD_CHANGE_TIME	VARCHAR2(32)	'std:change_time'	TYPECODE_TIMESTAMP in UTC: The time of last change to the metadata of a path name
STD_CHILDREN	VARCHAR2(32)	'std:children'	TYPECODE_NUMBER: The number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)
STD_CONTENT_TYPE	VARCHAR2(32)	'std:content_type'	TYPECODE_NUMBER: The number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)
STD_CREATION_TIME	VARCHAR2(32)	'std:creation_time'	TYPECODE_TIMESTAMP in UTC: The time at which the item was created (once set, this value never changes for the lifetime of the path name)
STD_DELETED	VARCHAR2(32)	'std:deleted'	TYPECODE_NUMBER as a BOOLEAN: Set to a nonzero number if the path name has been soft-deleted but not yet purged.
STD_GUID	VARCHAR2(32)	'std:guid'	TYPECODE_NUMBER: A store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given (*store-name*, *store-specific-path name*) has a stable and unique GUID for its lifetime.
STD_LENGTH	VARCHAR2(32)	'std:length'	TYPECODE_NUMBER: The length of the content (BLOB) of a TYPE_FILE/TYPE_REFERENCE path, or the length of the referent of a TYPE_LINK symbolic link. Directories do not have a well-defined length and stores are free to set this property to zero, NULL, or any other value.

Table 43–7 (Cont.) DBMS_DBFS_CONTENT Constants - Standard Properties

Constant	Type	Value	Description
STD_MODIFICATION_TIME	VARCHAR2(32)	'std:modification_time'	TYPECODE_TIMESTAMP in UTC: The time of last change to the data associated with a path name. Change to the content of a TYPE_FILE/TYPE_REFERENCE path, the referent of the TYPE_LINK path, and addition or deletion of immediate children in a TYPE_DIRECTORY path, all constitute data changes.
STD_OWNER	VARCHAR2(32)	'std:owner'	TYPECODE_VARCHAR2: A client-supplied (or implicit) owner name for the path name. The owner name may be used (along with the current "principal") for access checks by stores that support ACLs, locking, or both.
STD_PARENT_GUID	VARCHAR2(32)	'std:parent_guid'	TYPECODE_NUMBER: A store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given (*store-name*, *store-specific-path name*) has a stable and unique GUID for its lifetime. STD_PARENT_GUID(path name) == STD_GUID(parent(path name))
STD_REFERENT	VARCHAR2(32)	'std:referent'	TYPECODE_VARCHAR2: The content of the symbolic link of a TYPE_LINK path; NULL otherwise. As mentioned, the STD_REFERENT can be an arbitrary string and must not necessarily be interpreted as path name by clients (or such interpretation should be done with great care).

Optional Properties

Optional properties are well-defined but non-mandatory properties associated with all content path names that all stores are free to support (but only in the manner described by the DBFS content API). Clients should be prepared to deal with stores that support none of the optional properties.

All optional properties informally use the "opt:" namespace. Clients and stores should avoid using this namespace to define their own properties since this can cause conflicts in the future.

The menu of optional properties is expected to be expand over time.

Table 43–8 DBMS_DBFS_CONTENT Constants - Optional Properties

Constant	Type	Value	Description
OPT_HASH_TYPE	VARCHAR2(32)	'opt:hash_type'	TYPECODE_NUMBER: The number of (compatible) locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the opt_locker must specify all lockers (with repeats so that lock counts can be correctly maintained).
OPT_HASH_VALUE	VARCHAR2(32)	'opt:hash_value'	TYPECODE_NUMBER: The hash value of type OPT_HASH_TYPE describing the content of the path name.
OPT_LOCK_COUNT	VARCHAR2(32)	'opt:lock_count'	TYPECODE_NUMBER: The number of (compatible) locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the opt_locker must specify all lockers (with repeats so that lock counts can be correctly maintained).
OPT_LOCK_DATA	VARCHAR2(32)	'opt:lock_data'	TYPECODE_NUMBER: The client-supplied user-data associated with a user-lock, uninterpreted by the store.
OPT_LOCKER	VARCHAR2(32)	'opt:locker'	TYPECODE_NUMBER: One or more implicit or client-specified principals that applied a user-lock on a path name.
OPT_LOCK_STATUS	VARCHAR2(32)	'opt:lock_status'	TYPECODE_NUMBER: One of the LOCK_READ_ONLY, LOCK_WRITE_ONLY, LOCK_READ_WRITE values describing the type of lock currently applied on a path name.
OPT_VERSION	VARCHAR2(32)	'opt:version'	TYPECODE_NUMBER: A sequence number for linear versioning of a path name.
OPT_VERSION_PATH	VARCHAR2(32)	'opt:version_path'	TYPECODE_NUMBER: A version-path name for hierarchical versioning of a path name.
OPT_CONTENT_ID	VARCHAR2(32)	'opt:content_id'	TYPECODE_NUMBER: A provider-generated store-specific unique contentID in the form of a string for a file content element (that may optionally not be associated with a path; see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH).

Property Access Flags

Content interface methods to get or set properties can use combinations of property access flags to fetch properties from different name spaces in a single interface call.

Table 43–9 DBMS_DBFS_CONTENT Constants - Property Access Flags

Constant	Type	Value	Description
PROP_NONE	PLS_INTEGER	0	None: used when the client is not interested in any properties, and is invoking the content access method for other reasons (path name existence or lockability validation, data access, and so on)
PROP_STD	PLS_INTEGER	1	Mandatory: used when the client is interested in the standard properties; all standard properties are retrieved if this flag is specified.
PROP_OPT	PLS_INTEGER	2	Optional: used when the client is interested in the optional properties; all optional properties are retrieved if this flag is specified.
PROP_USR	PLS_INTEGER	3	User-defined: used when the client is interested in the user-defined properties; all user-defined properties are retrieved if this flag is specified.
PROP_ALL	PLS_INTEGER	PROP_ STD + PROP_ OPT + PROP_ USR;	All: an alias for the combination of all standard, optional, and user-defined properties
PROP_DATA	PLS_INTEGER	8	Content: used when the client is interested only in data access, and does not care about properties
PROP_SPC	PLS_INTEGER	16	Specific: used when the client is interested in a mix-and-match of different subsets of various property name spaces; the names of the specific properties to fetch are passed into the content interface method call as arguments, and only these property values are fetched and returned to the client. This is useful in cases where there are a very large number of properties potentially accessible, but the client is interested in only a small number of them (and knows the names of these "interesting" properties beforehand). PROP_SPC is applicable only to the various GETPATH operations. Other operations that specify properties ignore PROP_SPC specifications.

Operation Codes

All of the operations in the DBFS content API are represented as abstract opcodes.

Clients can use these opcodes to directly and explicitly by invoking the CHECKACCESS Function to verify if a particular operation can be invoked by a given principal on a particular path name.

Table 43–10 DBMS_DBFS_CONTENT Constants - Operation Codes

Constant	Type	Value	Description
OP_CREATE	PLS_INTEGER	1	Create a path item
OP_CREATEFILE	PLS_INTEGER	OP_CREATE	Create a file
OP_CREATELINK	PLS_INTEGER	OP_CREATE	Create a soft link
OP_CREATEREFERENCE	PLS_INTEGER	OP_CREATE	Create a reference (hard link)
OP_DELETE	PLS_INTEGER	2	Soft-deletion, purge, and restore operations are all represented by OP_DELETE
OP_DELETEFILE	PLS_INTEGER	OP_DELETE	Delete a file
OP_DELETEDIRECTORY	PLS_INTEGER	OP_DELETE	Delete a directory
OP_RESTORE	PLS_INTEGER	OP_DELETE	Restore a soft-deleted path item
OP_PURGE	PLS_INTEGER	OP_DELETE	Purge a soft-deleted path item
OP_READ	PLS_INTEGER	3	Read from a path item
OP_GET	PLS_INTEGER	OP_READ	Get a path item for either read or update operations
OP_WRITE	PLS_INTEGER	4	Write a path item
OP_PUT	PLS_INTEGER	OP_WRITE	Put (write) to a path item
OP_RENAME	PLS_INTEGER	5	Rename a path item
OP_RENAMEFROM	PLS_INTEGER	OP_RENAME	Operations performed on the source of a rename
OP_RENAMETO	PLS_INTEGER	OP_RENAME	Operations performed on the destination of a rename
OP_SETPATH	PLS_INTEGER	OP_RENAME	Set a path item name
OP_LIST	PLS_INTEGER	6	Perform a path listing
OP_SEARCH	PLS_INTEGER	7	Perform a search
OP_LOCK	PLS_INTEGER	8	Lock a path item
OP_UNLOCK	PLS_INTEGER	9	Unlock a path item
OP_ACL	PLS_INTEGER	10	An implicit operation invoked during an OP_CREATE or OP_PUT that specifies a STD_ACL property; the operation tests to see if the principal is allowed to set or change the ACL of a store item
OP_STORE	PLS_INTEGER	11	A catch-all category for miscellaneous store operations that do not fall under any of the other operational interfaces

Exceptions

DBFS content API operations can raise any one of the following top-level exceptions.

Clients can program against these specific exceptions in their error handlers without worrying about the specific store implementations of the underlying error signally code.

Store service providers, for their part, should do their best to trap or wrap any internal exceptions into one of the following exception types, as appropriate

Table 43–11 DBMS_DBFS_CONTENT Exceptions

Exception	Code	Description
PATH_EXISTS	64000	A specified path name already exists
INVALID_PARENT	64001	Parent of a specified path name does not exist
INVALID_PATH	64002	Specified path name does not exist, or is not valid
UNSUPPORTED_ OPERATION	64003	An operation unsupported by a store was invoked
INVALID_ARGUMENTS	64004	An operation was invoked with invalid arguments
INVALID_ACCESS	64005	Access control checks failed for the current operation
LOCK_CONFLICT	64006	Current operation failed lock conflict check
INVALID_STORE	64007	An invalid store name was specified
INVALID_MOUNT	64008	An invalid mount point was specified
INVALID_PROVIDER	64009	An invalid provider-package was specified
READONLY_PATH	64010	A mutating operation was invoked on a read-only mount or store

Operational Notes

- Implementation
- Path Names
- Creation Operations
- Deletion Operations
- Get (Retrieve) and Put (Insert) Operations
- Rename and Move Operations
- Directory Navigation and Search
- Locking Operations
- Access Check Operation

Implementation

Since the interconnection of the DBMS_DBFS_CONTENT interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a service provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

Path Names

All path names used in the provider SPI are store-qualified in pair form (`store_name`, `pathname`) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in DBMS_DBFS_CONTENT Constants - Store Features) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a `NULL` path name, and possibly a contentID specified as a parameter or by way of the `OPT_CONTENT_ID` (see DBMS_DBFS_CONTENT Constants - Optional Properties) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

Creation Operations

The provider SPI must allow the DBFS content API to create directory, file, link, and reference elements subject to store feature support.

All of the creation subprograms require a valid path name, but note the special exemption for contentID-based access. Creation subprograms can optionally specify properties to be associated with the path name as it is created. It is also possible for clients to returns item properties after the creation completes so that automatically generated properties, such as `STD_CREATION_TIME` (see DBMS_DBFS_CONTENT Constants - Standard Properties) are immediately available to clients. The exact set of properties fetched back is controlled by the various `PROP_XXX` bitmasks in the `prop_flags` parameter.

Links and references require an additional path name to associate with the primary path name.

File path names can optionally specify a `BLOB` value to use to initially populate the underlying file content (the provided `BLOB` may be any valid LOB). On creation, the underlying LOB is returned to the client, provided that `PROP_DATA` is specified in the `prop_flags` parameter.

Nondirectory path names require that their parent directory be created first. Directory path names themselves can be recursively created with the path name hierarchy leading up to a directory created in one call.

Attempts to create paths that already exist is an error; the sole exception is path names that are "soft-deleted" (as discussed in the context of Deletion Operations) In these cases, the soft-deleted item is implicitly purged, and the new item creation is attempted.

Stores and their providers that support contentID-based access accept an explicit store name and a `NULL` path to create a new content element. The contentID generated for this element is available by means of the `OPT_CONTENT_ID` property (see DBMS_DBFS_CONTENT Constants - Optional Properties), contentID-based creation being automatically implied by `PROP_OPT` property in the `prop_flags` parameter).

The newly created element may also have an internally generated path name if `FEATURE_LAZY_PATH` property is not supported (see DBMS_DBFS_CONTENT Constants - Store Features) and this path is available by way of the `STD_CANONICAL_PATH` property (see DBMS_DBFS_CONTENT Constants - Standard Properties).

Only file elements are candidates for contentID-based access.

Deletion Operations

The provider SPI must allow the DBFS content API to delete directory, file, link, and reference elements (subject to store feature support).

By default, the deletions are permanent, removing the successfully deleted items on transaction commit, but stores may also support "soft-delete" features. If requested by the client, soft-deleted items are retained by the store, although they are not typically visible in normal listings or searches.

Soft-deleted items can be restored, or explicitly purged.

Directory path names can be recursively deleted, with the path name hierarchy below a directory deleted in one call. Non-recursive deletions can be performed only on empty directories. Recursive soft-deletions apply the soft-delete to all of the items being deleted.

Individual path names, as well as all soft-deleted path names under a directory, can be restored or purged by means of the various restore and purge subprograms.

Providers that support filtering can use the provider filter to identify subsets of items to delete. This makes most sense for bulk operations such as the DELETEDIRECTORY Procedure, PROPVARCHAR2 Function, and RESTOREALL Procedure, but all of the deletion-related operations accept a `filter` argument.

Stores and their providers that support contentID-based access can also allow file items to be deleted by specifying their contentID.

Get (Retrieve) and Put (Insert) Operations

Existing path items can be accessed (for query or for update) and modified using simple get and put subprograms. All path names allow their metadata (properties) to

be read and modified. On completion of the call, the client can request specific properties to be fetched by means of the `prop_flags` parameter.

File path names allow their data (content) to be read and modified. On completion of the call, the client can use the `PROP_DATA` bitmasks in the `prop_flags` parameter to request a new `BLOB` locator to continue data access.

Files can also be read or written without using `BLOB` locators by explicitly specifying logical offsets, buffer amounts, and a suitably sized buffer.

Update accesses must specify the `forUpdate` flag. Access to link path names can be implicitly and internally de-referenced by stores (subject to feature support) if the `deref` flag is specified, however, this may have undetermined outcomes since symbolic links are not always resolvable.

The read methods, such as the GETPATH Procedures where `forUpdate` is specified as 0, also accepts a valid `asof` timestamp in the `ctx` parameter that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures and the PUTPATH Procedures methods do not support "as of" modes of operation.

The GETPATHNOWAIT Procedures implies that the operation is for an update, and, if implemented (see `FEATURE_NOWAIT` in DBMS_DBFS_CONTENT Constants - Store Features), this allows providers to return an exception (ORA-00054) rather than wait for row locks.

Rename and Move Operations

Path names can be renamed or moved, possibly across directory hierarchies and mount-points, but within the same store.

Nondirectory path names previously accessible by way of specifying the `oldPath` parameter are renamed as a single item subsequently accessible by specifying `newPath`, assuming that `newPath` does not already exist.

If `newPath` exists and is not a directory, the action of renaming implicitly deletes the existing item before renaming `oldPath`. If the `newPath` exists and is a directory, `oldPath` is moved into the target directory.

Directory path names previously accessible by way of `oldPath` are renamed by moving the directory and all of its children to `newPath` (if it does not already exist) or as children of `newPath` (if it exists and is a directory).

Stores and their providers that support contentID-based access and lazy path name binding also support the SETPATH Procedures that associates an existing contentID with a new "path".

Directory Navigation and Search

The `DBMS_DBFS_CONTENT` interface can list or search the contents of directory path names, optionally operating recursively into sub-directories, optionally seeing soft-deleted items, optionally using flashback "as of" a provided timestamp, and optionally filtering items in or out within the store based on list or search predicates.

Locking Operations

Clients of the `DBMS_DBFS_CONTENT` interface can apply user-level locks to any valid path name (subject to store feature support), associate the lock with user-data, and subsequently unlock these path names.

The status of locked items is available using various optional properties (note the previous discussion regarding `opt_lock`).

It is the responsibility of the store (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.

Access Check Operation

This operation ascertains if a given path name (`store_name`, `path`, `pathtype`) can be manipulated by operation (see the various `DBMS_DBFS_CONTENT.OP_XXX` opcodes in DBMS_DBFS_CONTENT Constants - Optional Properties) by the user acting on the store utilizing the `principal` parameter. This is a convenience function for the `DBMS_DBFS_CONTENT` interface; a store that supports access control still internally performs these checks to guarantee security.

Data Structures

The DBMS_DBFS_CONTENT package defines RECORD types and TABLE types.

RECORD Types

- FEATURE_T Record Type
- MOUNT_T Record Type
- PATH_ITEM_T Record Type

- PATH_ITEMS_T Table Type
- PROP_ITEMS_T Table Type
- PROPERTIES_T Table Type
- STORES_T Table Type

Usage Notes

There is an approximate correspondence between DBMS_DBFS_CONTENT_PROPERTY_T and PROPERTY_T — the former is a SQL object type that describes the full property tuple, while the latter is a PL/SQL record type that describes only the property value component.

Likewise, there is an approximate correspondence between DBMS_DBFS_CONTENT_PROPERTIES_T and PROPERTIES_T — the former is a SQL nested table type, while the latter is a PL/SQL hash table type.

Dynamic SQL calling conventions force the use of SQL types, but PL/SQL code may be implemented more conveniently in terms of the hash-table types.

The DBMS_DBFS_CONTENT interface provides convenient utility functions to convert between DBMS_DBFS_CONTENT_PROPERTIES_T and PROPERTIES_T (see propertiesT2H and propertiesH2T).

Clients can query the DBMS_DBFS_CONTENT interface for the list of available stores, determine which store is to handle access to a given path name, and determine the feature set for the store.

FEATURE_T Record Type

This type describes a store mount point and its properties.

Syntax

```
TYPE feature_t IS RECORD (
   feature_name    VARCHAR2(32),
   feature_mask    INTEGER,
   feature_state   VARCHAR2(3));
```

Fields

Table 43–12 MOUNT_T Fields

Field	Description
`feature_name`	Name of feature
`feature_mask`	Value used to mask off all other bits other than this feature in the feature value
`feature_state`	'YES' or 'NO' depending on whether the feature is supported on this store

MOUNT_T Record Type

This type describes a store mount point and its properties.

Syntax

```
TYPE mount_t IS RECORD (
   store_name          VARCHAR2(32),
   store_id            NUMBER,
   provider_name       VARCHAR2(32),
   provider_pkg        VARCHAR2(32),
   provider_id         NUMBER,
   provider_version    VARCHAR2(32),
   store_features      INTEGER,
   store_guid          NUMBER,
   store_mount         NAME_T,
   mount_properties    DBMS_DBFS_CONTENT_PROPERTIES_T);
```

Fields

Table 43–13 MOUNT_T Fields

Field	Description
store_name	Name of store
store_id	ID of store
provider_name	Name of the content store
provider_pkg	PL/SQL package name for the content store
provider_id	Unique identifier for the content store
provider_version	Version number for the content store
respos_features	Features supported by this content store
store_guid	Unique ID for this instance of the store
store_mount	Location at which this store instance is mounted
mount_properties	Properties for this mount point (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)

PATH_ITEM_T Record Type

A PATH_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

Syntax

```
TYPE path_item_t IS RECORD (
   store                    NAME_T,
   mount                    NAME_T,
   pathname                 PATH_T,
   pathtype                 VARCHAR2(32),
   filedata                 BLOB,
   std_access_time          TIMESTAMP,
   std_acl                  VARCHAR2(1024),
   std_change_time          TIMESTAMP,
   std_children             NUMBER,
   std_content_type         VARCHAR2(1024),
   std_creation_time        TIMESTAMP,
   std_deleted              INTEGER,
   std_guid                 INTEGER,
   std_modification_time    TIMESTAMP,
   std_owner                VARCHAR2(32),
   std_parent_guid          INTEGER,
   std_referent             VARCHAR2(1024),
   opt_hash_type            VARCHAR2(32),
   opt_hash_value           VARCHAR2(128),
   opt_lock_count           INTEGER,
   opt_lock_data            VARCHAR2(128),
   opt_locker               VARCHAR2(128),
   opt_lock_status          INTEGER,
   opt_version              INTEGER,
   opt_version_path         PATH_T,
   opt_content_id           CONTENT_ID_T);
```

Fields

Table 43–14 PATH_ITEM_T Fields

Field	Description
store	Name of store
mount	Location at which instance of store is mounted
pathname	Name of path to item
pathtype	Type of object path (see DBMS_DBFS_CONTENT Constants - Path Name Types)
filedata	BLOB locator that can be used to access data in the path item
std_access_time	Time of last access of a pathname's contents
std_acl	Access Control List (in standard ACL syntax)
std_change_time	Time of last change to the metadata of a path name
std_children	Number of child directories or folders a directory or folder path (this property should be available in providers that support the feature_folders feature).

Table 43–14 (Cont.) PATH_ITEM_T Fields

Field	Description
std_content_type	One or more client-supplied mime-types (in standard RFC syntax) describing the path name which is typically of type_file. The content type s not necessarily interpreted by the store.
std_creation_time	Time at which the item was created. Once set, this value remains the same for the lifetime of the path name.
std_deleted	Set to a nonzero number if the path name has been soft-deleted but not yet purged (see DBMS_DBFS_CONTENT Constants - Store Features)
std_guid	Store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given *store-name*, *store-specific-pathname* has a stable and unique GUID for its lifetime.
std_modification_time	Time of last change to the data associated with a path name. Changes to the content of a type_file or type_reference path, the referent of the type_link path, and addition or deletion of immediate children in a type_directory path, all constitute data changes.
std_owner	Client-supplied (or implicit) owner name for the path name
std_parent_guid	Store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given *store-name*, *store-specific-pathname* has a stable and unique GUID for its lifetime. std_parent_guid(pathname) == std_guid(parent(pathname))
std_referent	Content of the symbolic link of a type_link path, otherwise NULL. As mentioned before, the std_referent can be an arbitrary string and must not necessarily be interpreted as pathname by clients (or such interpretation should be done with great care).
opt_hash_type	Type of hash provided in the opt_hash_value property (see DBMS_CRYPTO for possible options)
opt_hash_value	Hash value of type opt_hash_type describing the content of the path name
opt_lock_count	Number of compatible locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the opt_locker must specify all lockers with repeats so that lock counts can be correctly maintained.
opt_lock_data	Client-supplied user-data associated with a user-lock, uninterpreted by the store
opt_locker	One or more implicit or client-specified principals that applied a user-lock on a path name
opt_lock_status	One of the lock_read_only, lock_write_only, lock_read_write values describing the type of lock currently applied on a path name
opt_version	Sequence number for linear versioning of a path name
opt_version_path	Version path name for hierarchical versioning of a path name
opt_content_id	Stringified provider-generated store-specific unique contentID for a file element (that may optionally not be associated with a path (see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH in DBMS_DBFS_CONTENT Constants - Store Features)

PROP_ITEM_T Record Type

A PROP_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all user-defined properties associated with it, expanded out into individual (name, value, type) tuples.

Syntax

```
TYPE prop_item_t IS RECORD (
   store               NAME_T,
   mount                    NAME_T,
   pathname                 PATH_T,
   property_name            PROPNAME_T,
   property_value           PROPVAL_T,
   property_type            INTEGER);
```

Fields

Table 43–15 PROP_ITEM_T Fields

Field	Description
store	Name of store
mount	Location at which instance of store is mounted
pathname	Name of path to item
property_name	Name of the property
property_value	Value of the property
property_type	PL/SQL typecode for the property value

PROPERTY_T Record Type

This type describes a single (`value`, `typecode`) property value tuple; the property name is implied (see PROPERTIES_T Table Type).

Syntax

```
TYPE property_t  IS RECORD (
   propvalue    PROPVAL_T,
   typecode     INTEGER);
```

Fields

Table 43–16 PROPERTY_T Fields

Field	Description
`propvalue`	Value of property
`typecode`	Typecode

STORE_T Record Type

This type describes a store registered with and managed by the DBMS_DBFS_CONTENT interface.

Syntax

```
TYPE store_t IS RECORD (
   store_name          VARCHAR2(32),
   store_id            NUMBER,
   provider_name       VARCHAR2(32),
   provider_pkg        VARCHAR2(32),
   provider_id         NUMBER,
   provider_version    VARCHAR2(32),
   store_features      INTEGER,
   store_guid          NUMBER);
```

Fields

Table 43–17 STORET_T Fields

Field	Description
store_name	Name of store
store_name	ID of store
provider_name	Name of the content store
provider_pkg	PL/SQL package name for the content store
provider_id	Unique identifier for the content store
provider_version	Version number for the content store
respos_features	Features supported by this content store
store_guid	Unique ID for this instance of the store

FEATURES_T Table Type

A table type of FEATURE_T Record Type.

Syntax

```
TYPE features_t IS TABLE OF feature_t;
```

MOUNTS_T Table Type

A table type of MOUNT_T Record Type.

Syntax

```
TYPE mounts_t IS TABLE OF mount_t;
```

PATH_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type

Syntax

```
TYPE path_items_t IS TABLE OF path_item_t;
```

PROP_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type.

Syntax

```
TYPE prop_items_t IS TABLE OF prop_item_t;
```

PROPERTIES_T Table Type

This is a name-indexed hash table of property tuples. The implicit hash-table association between the index and the value allows the client to build up the full `DBMS_DBFS_CONTENT_PROPERTY_T` tuples for a `PROPERTIES_T`.

Syntax

```
TYPE properties_t IS TABLE OF property_t INDEX BY propname_t;
```

STORES_T Table Type

This type describes a store registered with and managed by the DBMS_DBFS_CONTENT interface.

Syntax

```
TYPE stores_t IS TABLE OF store_t;
```

Summary of DBMS_DBFS_CONTENT Subprograms

Table 43–18 DBMS_DBFS_CONTENT Package Subprograms

Subprogram	Description
CHECKACCESS Function on page 43-40	Reports if the user (`principal`) can perform the specified operation on the given path
CHECKSPI Functions and Procedures on page 43-41	Checks if a user-provided package implements all of the `DBMS_DBFS_CONTENT_SPI` subprograms with the proper signatures, and reports on the conformance.
CREATEDIRECTORY Procedures on page 43-42	Creates a directory
CREATEFILE Procedures on page 43-43	Creates a file
CREATELINK Procedures on page 43-44	Creates a new reference to the source file system element
CREATEREFERENCE Procedures on page 43-45	Creates a physical link to an already existing file system element
DECODEFEATURES Function on page 43-46	Given a feature bit set integer value, returns a `FEATURES_T` table of the feature bits as `FEATURE_T` records
DELETECONTENT Procedure on page 43-47	Deletes the file specified by the given contentID
DELETEDIRECTORY Procedure on page 43-48	Deletes a directory
DELETEFILE Procedure on page 43-46	Deletes a file
FEATURENAME Function on page 43-50	Given a feature bit, returns a `VARCHAR2` of that feature's name
FLUSHSTATS Function on page 43-51	Flushes `DBMS_DBFS_CONTENT` statistics to disk
GETDEFAULTACL Procedure on page 43-52	Returns the ACL parameter of the default context
GETDEFAULTASOF Procedure on page 43-53	Returns the `asof` parameter of the default context
GETTDEFAULTCONTEXT Procedure on page 43-54	Returns the default context
GETDEFAULTOWNER Procedure on page 43-55	Returns the `owner` parameter of the default context
GETDEFAULTPRINCIPAL Procedure on page 43-56	Returns the `principal` parameter of the default context
GETFEATURESBYMOUNT Function on page 43-57	Returns features of a store by mount point
GETFEATURESBYNAME Function on page 43-58	Returns features of a store by store name
GETFEATURESBYPATH Function on page 43-59	Returns features of a store by path
GETPATHBYMOUNTID Function on page 43-63	Returns the full absolute path name

Table 43–18 (Cont.) DBMS_DBFS_CONTENT Package Subprograms

Subprogram	Description
GETPATH Procedures on page 43-63	Returns existing path items (such as files and directories)
GETPATHBYSTOREID Function on page 43-64	If the underlying GUID is found in the underlying store, returns the store-qualified path name
GETPATHNOWAIT Procedures on page 43-65	Implies that the operation is for an update, and, if implemented, allows providers to return an exception (`ORA-00054`) rather than wait for row locks.
GETSTOREBYMOUNT Function on page 43-67	Returns a store by way of its mount point
GETSTOREBYNAME Function on page 43-68	Returns a store by way of its name
GETSTOREBYPATH Function on page 43-69	Returns a store by way of its path
GETSTATS Procedure on page 43-70	Returns information about `DBMS_DBFS_CONTENT` statistics collection
GETTRACE Function on page 43-71	Returns whether or not `DBMS_DBFS_CONTENT` tracing is turned on
GETVERSION Function on page 43-72	Returns the version of the `DBMS_DBFS_CONTENT` interface in a standardized format associated with a store
LIST Function on page 43-73	Lists the path items in the specified path meeting the specified filter and other criteria
LISTALLCONTENT Function on page 43-75	Lists all path items in all mounts
LISTALLPROPERTIES Function on page 43-74	Returns a table of all properties for all path items in all mounts
LISTMOUNTS Function on page 43-76	Lists all available mount points, their backing stores, and the store features
LISTSTORES Function on page 43-77	Lists all available stores and their features
LOCKPATH Procedure on page 43-78	Applies user-level locks to the given valid path name
MOUNTSTORE Procedure on page 43-79	Mounts a previously registered store and binds it to the mount point
NORMALIZEPATH Functions on page 43-81	Converts a store-specific or full-absolute path name into normalized form
PROPANY Functions on page 43-82	Provides constructors that take one of a variety of types and return a PROPERTY_T
PROPERTIESH2T Function on page 43-83	Converts a `PROPERTY_T` hash to a `DBMS_DBFS_CONTENT_PROPERTIES_T` table
PROPERTIEST2H Function on page 43-84	Converts a `DBMS_DBFS_CONTENT_PROPERTIES_T` table to a `PROPERTY_T` hash
PROPNUMBER Function on page 43-85	Is a constructor that takes a `NUMBER` and returns a `PROPERTY_T`
PROPRAW Function on page 43-86	Is a constructor that takes a `RAW` and returns a `PROPERTY_T`
PROPTIMESTAMP Function on page 43-87	Is a constructor that takes a `TIMESTAMP` and returns a `PROPERTY_T`

Table 43–18 (Cont.) DBMS_DBFS_CONTENT Package Subprograms

Subprogram	Description
PROPVARCHAR2 Function on page 43-88	Is a constructor that takes a `VARCAHR2` and returns a `PROPERTY_T`
PURGEALL Procedure on page 43-89	Purges all soft-deleted entries matching the path and optional filter criteria
PURGEPATH Procedure on page 43-90	Purges any soft-deleted versions of the given path item
PUTPATH Procedures on page 43-91	Creates a new path item
REGISTERSTORE Procedure on page 43-93	Registers a new store
RENAMEPATH Procedures on page 43-94	Renames or moves a path
RESTOREALL Procedure on page 43-95	Restores all soft-deleted path items meeting the path and filter criteria
RESTOREPATH Procedure on page 43-96	Restores all soft-deleted path items that match the given path and filter criteria
SEARCH Function on page 43-97	Searches for path items matching the given path and filter criteria
SETDEFAULTACL Procedure on page 43-98	Sets the ACL parameter of the default context
SETDEFAULTASOF Procedure on page 43-99	Sets the "as of" parameter of the default context
SETDEFAULTCONTEXT Procedure on page 43-100	Sets the default context
SETDEFAULTOWNER Procedure on page 43-101	Sets the "owner" parameter of the default context
SETDEFAULTPRINCIPAL Procedure on page 43-102	Sets the "principal" parameter of the default context
SETPATH Procedures on page 43-103	Assigns a path name to a path item represented by contentID
SETSTATS Procedure on page 43-104	Enables and disables statistics collection
SETTRACE Procedure on page 43-105	Sets `DBMS_DBFS_CONTENT` tracing on or off
SPACEUSAGE Procedure on page 43-106	Queries file system space usage statistics
TRACE Procedure on page 43-107	Returns a `CLOB` that contains the evaluation results
TRACEENABLED Function on page 43-108	Determines if the current trace "severity" set by the SETTRACE Procedure is at least as high as the given trace level
UNLOCKPATH Procedure on page 43-109	Unlocks path items that were previously locked with the LOCKPATH Procedure
UNMOUNTSTORE Procedure on page 43-110	Unmounts a registered store
UNREGISTERSTORE Procedure on page 43-111	Unregisters a store

CHECKACCESS Function

This function reports if the user (`principal`) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

Syntax

```
DBMS_DBFS_CONTENT.CHECKACCESS (
   path           IN     VARCHAR2,
   pathtype       IN     INTEGER,
   operation      IN     VARCHAR2,
   principal      IN     VARCHAR2,
   store_name     IN     VARCHAR2  DEFAULT NULL)
  RETURN  BOOLEAN;
```

Parameters

Table 43–19 CHECKACCESS Procedure Parameters

Parameter	Description
`path`	Name of path to check for access
`pathtype`	Type of object `path` represents (see DBMS_DBFS_CONTENT Constants - Path Name Types)
`operation`	Operation to be checked (see DBMS_DBFS_CONTENT Constants - Optional Properties)
`principal`	File system user for whom the access check is made
`store_name`	Name of store

Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

CHECKSPI Functions and Procedures

Given the name of a putative DBMS_DBFS_CONTENT_SPI conforming package, this function or procedure checks whether the package implements all of the provider subprograms with the proper signatures, and reports on the conformance.

Syntax

```
DBMS_DBFS_CONTENT.CHECKSPI (
   package_name        IN              VARCHAR2)
  RETURN  CLOB;

DBMS_DBFS_CONTENT.CHECKSPI (
   schema_name         IN              VARCHAR2,
   package_name        IN              VARCHAR2)
  return  clob;

DBMS_DBFS_CONTENT.CHECKSPI (
   package_name        IN              VARCHAR2,
   chk                 IN OUT NOCOPY   CLOB);

DBMS_DBFS_CONTENT.CHECKSPI (
   schema_name         in              VARCHAR2,
   package_name        in              VARCHAR2,
   chk                 in out nocopy   CLOB);
```

Parameters

Table 43–20 CHECKSPI Procedure Parameters

Parameter	Description
package_name	Name of package
schema_name	Name of schema
chk	CLOB that contains the evaluation results

Usage Notes

- The functional form returns a cached temporary LOB of session duration with the results of the analysis. The caller is expected to manage the lifetime of this LOB, as needed.
- The procedural form generates the results of the analysis into the chk LOB parameter; if the value passed in is NULL, the results are written to the foreground trace file provided that DBMS_DBFS_CONTENT interface tracing is enabled. If neither tracing is enabled nor a valid LOB passed in, the checker does not provide any useful indication of the analysis (other than raise exceptions if it encounters a serious error).
- If schema_name is NULL, standard name resolution rules (current schema, private synonym, public synonym) are used to try and locate a suitable package to analyze.

CREATEDIRECTORY Procedures

This procedure creates a directory.

Syntax

```
DBMS_DBFS_CONTENT.CREATEDIRECTORY (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   recurse     IN              BOOLEAN     DEFAULT FALSE,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATEDIRECTORY (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   recurse     IN              BOOLEAN     DEFAULT FALSE,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–21 CREATEDIRECTORY Procedure Parameters

Parameter	Description
`path`	Name of path to the directory
`properties`	One or more properties and their values to be set, returned, or both, depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `PROP_SPC` (see DBMS_DBFS_CONTENT Constants - Property Access Flags), and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`recurse`	If 0, do not execute recursively; otherwise, recursively create the directories above the given directory
`store_name`	Name of store
`principal`	File system user for whom the access check is made

CREATEFILE Procedures

This procedure creates a file.

Syntax

```
DBMS_DBFS_CONTENT.CREATEFILE (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   content     IN OUT NOCOPY   BLOB,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD + PROP_DATA),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATEFILE (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   content     IN OUT NOCOPY   BLOB,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD + PROP_DATA),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–22 CREATEFILE Procedure Parameters

Parameter	Description
`path`	Name of path to the file
`properties`	One or more properties and their values to be set, returned, or both, depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`content`	`BLOB` holding data with which to populate the file (optional)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`store_name`	Name of store
`principal`	File system user for whom the access check is made

CREATELINK Procedures

This procedure creates a new reference to the source file system element (such as a file, or directory). The resulting reference points to the source element but does not directly share metadata with the source element. This is analogous to a UNIX file system symbolic link.

Syntax

```
DBMS_DBFS_CONTENT.CREATELINK (
   srcPath     IN              VARCHAR2,
   dstPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATELINK (
   srcPath     IN              VARCHAR2,
   dstPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–23 CREATELINK Procedure Parameters

Parameter	Description
`srcPath`	File system entry with which to link
`dstPath`	Path of the new link element to be created
`properties`	One or more properties and their values to be set, returned depending, or both, on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`store_name`	Name of store
`principal`	File system user for whom the access check is made

CREATEREFERENCE Procedures

This procedure creates a physical link to an already existing file system element (such as file or directory). The resulting entry shares the same metadata structures as the value of the `srcPath` parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

Syntax

```
DBMS_DBFS_CONTENT.CREATEREFERENCE (
   srcPath     IN              VARCHAR2,
   dstPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.CREATEREFERENCE (
   srcPath     IN              VARCHAR2,
   dstPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   prop_flags  IN              INTEGER     DEFAULT PROP_STD,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–24 CREATEREFERENCE Procedure Parameters

Parameter	Description
`srcPath`	File system entry with which to link
`dstPath`	Path of the new link element to be created
`properties`	One or more properties and their values to be set, returned, or both, depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`prop_flags`	Determines which properties are set, returned. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`store_name`	Name of store
`principal`	File system user for whom the access check is made

DECODEFEATURES Function

Given a feature bit set integer value, this function returns a FEATURES_T table of the feature bits as FEATURE_T records.

Syntax

```
DBMS_DBFS_CONTENT.DECODEFEATURES (
   featureSet          IN      INTEGER)
  RETURN FEATURES_T DETERMINISTIC PIPELINED;
```

Parameters

Table 43–25 DECODEFEATURES Function Parameters

Parameter	Description
featureSet	Feature set

Return Values

FEATURES_T Table Type

DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

Syntax

```
DBMS_DBFS_CONTENT.DELETECONTENT (
   store_name      IN     VARCHAR2    DEFAULT NULL,
   contentID       IN     RAW,
   filter          IN     VARCHAR2    DEFAULT NULL,
   soft_delete     IN     BOOLEAN     DEFAULT NULL,
   principal       IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–26 DELETECONTENT Procedure Parameters

Parameter	Description
store_name	Name of store
contentID	Unique identifier for the file to be deleted
filter	A filter, if any, to be applied
soft_delete	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see "Deletion Operations" on page 43-20).
principal	File system user for whom the access check is made

DELETEDIRECTORY Procedure

This procedure deletes a directory. If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

Syntax

```
DBMS_DBFS_CONTENT.DELETEDIRECTORY (
   path           IN     VARCHAR2,
   filter         IN     VARCHAR2    DEFAULT NULL,
   soft_delete    IN     BOOLEAN     DEFAULT NULL,
   recurse        IN     BOOLEAN     DEFAULT FALSE,
   store_name     IN     VARCHAR2    DEFAULT NULL,
   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–27 DELETEDIRECTORY Procedure Parameters

Parameter	Description
`path`	Name of path to the directory
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see "Deletion Operations" on page 43-20).
`recurse`	If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.
`store_name`	Name of store
`principal`	File system user for whom the access check is made

DELETEFILE Procedure

This procedure deletes the specified file.

Syntax

```
DBMS_DBFS_CONTENT.DELETEFILE (
   path           IN     VARCHAR2,
   filter         IN     VARCHAR2    DEFAULT NULL,
   soft_delete    IN     BOOLEAN     DEFAULT NULL,
   store_name     IN     VARCHAR2    DEFAULT NULL,
   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–28 DELETEFILE Procedure Parameters

Parameter	Description
`path`	Name of path to the file
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see "Deletion Operations" on page 43-20).
`store_name`	Name of store
`principal`	File system user for whom the access check is made

FEATURENAME Function

Given a feature bit, this function returns a VARCHAR2 of that feature's name.

Syntax

```
DBMS_DBFS_CONTENT.FEATURENAME (
   featureBit          IN      INTEGER)
  RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 43–29 FEATURENAME Function Parameters

Parameter	Description
featureBit	Bit representation of the feature (see DBMS_DBFS_CONTENT Constants - Store Features)

Return Values

Name of the feature

FLUSHSTATS Function

This procedure flushes `DBMS_DBFS_CONTENT` statistics to disk.

Syntax

```
DBMS_DBFS_CONTENT.FLUSHSTATS;
```

GETDEFAULTACL Procedure

This procedure returns the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTACL (
   acl    OUT NOCOPY     VARCHAR2);
```

Parameters

Table 43–30 GETDEFAULTACL Procedure Parameters

Parameter	Description
`acl`	ACL for all new elements created (implicitly or explicitly) by the current operation

GETDEFAULTASOF Procedure

This procedure returns the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTASOF (
  asof    OUT NOCOPY     TIMESTAMP);
```

Parameters

Table 43–31 GETDEFAULTASOF Procedure Parameters

Parameter	Description
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

GETTDEFAULTCONTEXT Procedure

This procedure returns the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

Syntax

```
DBMS_DBFS_CONTENT.GETTDEFAULTCONTEXT (
   principal    OUT NOCOPY     VARCHAR2,
   owner        OUT NOCOPY     VARCHAR2,
   acl          OUT NOCOPY     VARCHAR2,
   asof         OUT NOCOPY     TIMESTAMP);
```

Parameters

Table 43–32 GETTDEFAULTCONTEXT Procedure Parameters

Parameter	Description
`principal`	Agent (principal) invoking the current operation
`owner`	Owner for new elements created (implicitly or explicitly) by the current operation
`acl`	ACL for all new elements created (implicitly or explicitly) by the current operation
`asof`	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

GETDEFAULTOWNER Procedure

This procedure returns the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTOWNER (
   principal    IN     VARCHAR2);
```

Parameters

Table 43–33 GETDEFAULTOWNER Procedure Parameters

Parameter	Description
owner	Owner for new elements created (implicitly or explicitly) by the current operation

GETDEFAULTPRINCIPAL Procedure

This procedure returns the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.GETDEFAULTPRINCIPAL (
   principal    OUT NOCOPY     VARCHAR2);
```

Parameters

Table 43–34 GETDEFAULTPRINCIPAL Procedure Parameters

Parameter	Description
`principal`	Agent (principal) invoking the current operation

GETFEATURESBYMOUNT Function

This function returns features of a store by mount point.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYMOUNT (
   store_mount       IN      VARCHAR2)
  RETURN INTEGER;
```

Parameters

Table 43–35 GETFEATURESBYMOUNT Function Parameters

Parameter	Description
store_mount	Mount point

Return Values

A bit mask of supported features (see FEATURES_T Table Type)

GETFEATURESBYNAME Function

This function returns features of a store by store name.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYNAME (
   store_name       IN      VARCHAR2)
  RETURN INTEGER;
```

Parameters

Table 43–36 GETFEATURESBYNAME Function Parameters

Parameter	Description
store_name	Name of store

Return Values

A bit mask of supported features (see FEATURES_T Table Type)

GETFEATURESBYPATH Function

This function returns features of a store by path.

Syntax

```
DBMS_DBFS_CONTENT.GETFEATURESBYPATH (
   path       IN      PATH_T)
  RETURN INTEGER;
```

Parameters

Table 43–37 GETFEATURESBYPATH Function Parameters

Parameter	Description
path	PATH_T

Return Values

A bit mask of supported features (see FEATURES_T Table Type)

GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a `BLOB` locator using the `prop_data` bitmask in `prop_flags` (see DBMS_DBFS_CONTENT Constants - Property Access Flags) or by passing one or more `RAW` buffers.

When `forUpdate` is 0, this procedure also accepts a valid `asof` timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the `GETPATH` Procedures do not support these modes of operation.

Syntax

```
DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
        content     OUT    NOCOPY   BLOB,
        item_type   OUT             INTEGER,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        forUpdate   IN              BOOLEAN     DEFAULT FALSE,
        deref       IN              BOOLEAN     DEFAULT FALSE,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   PROPERTIES_T,
        content     OUT    NOCOPY   BLOB,
        item_type   OUT             INTEGER,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        forUpdate   IN              BOOLEAN     DEFAULT FALSE,
        deref       IN              BOOLEAN     DEFAULT FALSE,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
        amount      IN OUT          NUMBER,
        offset      IN              NUMBER,
        buffers     OUT    NOCOPY   RAW,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
```

```
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   PROPERTIES_T,
        amount      IN OUT          NUMBER,
        offset      IN              NUMBER,
        buffers     OUT    NOCOPY   RAW,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
        amount      IN OUT          NUMBER,
        offset      IN              NUMBER,
        buffers     OUT    NOCOPY   DBMS_DBFS_CONTENT_RAW_T,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   PROPERTIES_T,
        amount      IN OUT          NUMBER,
        offset      IN              NUMBER,
        buffers     OUT    NOCOPY   DBMS_DBFS_CONTENT_RAW_T,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        asof        IN              TIMESTAMP   DEFAULT NULL,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–38 GETPATH Procedure Parameters

Parameter	Description
`path`	Name of path to path items
`properties`	One or more properties and their values to be returned depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`content`	`BLOB` holding data which populates the file (optional)
`item_type`	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
`amount`	On input, number of bytes to be read. On output, number of bytes read
`offset`	Byte offset from which to begin reading
`buffer`	Buffer to which to write
`buffers`	Buffers to which to write

Table 43–38 (Cont.) GETPATH Procedure Parameters

Parameter	Description
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`asof`	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
`forUpdate`	Specifies that a lock should be taken to signify exclusive write access to the path item
`deref`	If nonzero, attempts to resolve the given path item to actual data provided it is a reference
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

GETPATHBYMOUNTID Function

If the underlying GUID is found in the underlying store, this function returns the full absolute path name.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYMOUNTID (
   store_mount         IN      VARCHAR2,
   guid                IN      INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 43–39 GETPATHBYMOUNTID Function Parameters

Parameter	Description
`store_mount`	Mount point in which the path item with `guid` resides
`guid`	Unique ID for the path item

Usage Notes

If the GUID is unknown, a `NULL` value is returned. Clients are expected to handle this as appropriate.

Return Values

Path of the path item represented by GUID in `store_mount`

GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYSTOREID (
   store_name          IN      VARCHAR2,
   guid                IN      INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 43–40 GETPATHBYSTOREID Function Parameters

Parameter	Description
`store_name`	Name of store
`guid`	Unique ID representing the desired path item

Usage Notes

If the GUID is unknown, a `NULL` value is returned. Clients are expected to handle this as appropriate.

Return Values

Store-qualified path name represented by the GUID

GETPATHNOWAIT Procedures

This procedure implies that the operation is for an update, and, if implemented (see FEATURE_NOWAIT in DBMS_DBFS_CONTENT Constants - Store Features), allows providers to return an exception (ORA-00054) rather than wait for row locks.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
        content     OUT    NOCOPY   BLOB,
        item_type   OUT             INTEGER,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        deref       IN              BOOLEAN     DEFAULT FALSE,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATHNOWAIT (
        path        IN              VARCHAR2,
        properties  IN OUT NOCOPY   PROPERTIES_T,
        content     OUT    NOCOPY   BLOB,
        item_type   OUT             INTEGER,
        prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                         PROP_OPT +
                                                         PROP_DATA),
        deref       IN              BOOLEAN     DEFAULT FALSE,
        store_name  IN              VARCHAR2    DEFAULT NULL,
        principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–41 GETPATHNOWAIT Procedure Parameters

Parameter	Description
path	Name of path to path items
properties	One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
prop_flags	Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference
store_name	Name of store

Table 43–41 (Cont.) GETPATHNOWAIT Procedure Parameters

Parameter	Description
`principal`	Agent (principal) invoking the current operation

GETSTOREBYMOUNT Function

This function returns a store by way of its name.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYMOUNT (
   store_mount       IN      VARCHAR2)
  RETURN STORE_T;
```

Parameters

Table 43–42 GETSTOREBYMOUNT Function Parameters

Parameter	Description
store_mount	[AWAITING INFORMATION]

Return Values

STORE_T Record Type

GETSTOREBYNAME Function

This function returns a store by way of its name.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYNAME (
   store_name       IN      VARCHAR2)
  RETURN STORE_T;
```

Parameters

Table 43–43 GETSTOREBYNAME Function Parameters

Parameter	Description
store_name	Name of store

Return Values

STORE_T Record Type

GETSTOREBYPATH Function

This function returns a store by way of its path.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYPATH (
   path       IN      PATH_T)
  RETURN STORE_T;
```

Parameters

Table 43–44 GETSTOREBYPATH Function Parameters

Parameter	Description
path	PATH_T s

Return Values

STORE_T Record Type

GETSTATS Procedure

This procedure returns information about DBMS_DBFS_CONTENT statistics collection.

Syntax

```
DBMS_DBFS_CONTENT.GETSTATS (
   enabled         OUT    BOOLEAN,
   flush_time      OUT    INTEGER,
   flush_count     OUT    INTEGER);
```

Parameters

Table 43–45 GETSTATS Procedure Parameters

Parameter	Description
enabled	Whether statistics collection is enabled
flush_time	How often to flush the statistics to disk in centiseconds
flush_count	Number of operations to allow between statistics flushes

GETTRACE Function

This function returns whether DBMS_DBFS_CONTENT tracing is turned on or not.

Syntax

```
DBMS_DBFS_CONTENT.GETTRACE
  RETURN INTEGER.
```

Return Values

Returns 0 if tracing is off, non-zero if tracing is on.

GETVERSION Function

This function marks each version of the DBMS_DBFS_CONTENT interface.

Syntax

```
DBMS_DBFS_CONTENT.GETVERSION (
  RETURN VARCHAR2;
```

Return Values

A string enumerating the version of the DBMS_DBFS_CONTENT interface in standard naming convention: string: *a.b.c* corresponding to *major*, *minor*, and *patch* components.

LIST Function

This function lists the path items in the specified path meeting the specified filter and other criteria.

Syntax

```
DBMS_DBFS_CONTENT.LIST (
   path          IN     VARCHAR2,
   filter        IN     VARCHAR2    DEFAULT NULL,
   recurse       IN     INTEGER     DEFAULT 0,
   asof          IN     TIMESTAMP   DEFAULT NULL,
   store_name    IN     VARCHAR2    DEFAULT NULL,
   principal     IN     VARCHAR2    DEFAULT NULL)
  RETURN  DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

Table 43–46 LIST Function Parameters

Parameter	Description
`path`	Name of path to directories
`filter`	A filter, if any, to be applied
`recurse`	If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.
`asof`	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
`store_name`	Name of respository
`principal`	Agent (principal) invoking the current operation

Return Values

`DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type`

LISTALLPROPERTIES Function

This function returns a table of all properties for all path items in all mounts

Syntax

```
DBMS_DBFS_CONTENT.LISTALLPROPERTIES
  RETURN  PROP_ITEMS_T PIPELINED;
```

Return Values

PROP_ITEMS_T Table Type

LISTALLCONTENT Function

This function lists all path items in all mounts.

Syntax

```
DBMS_DBFS_CONTENT.LISTALLCONTENT
  RETURN  PATH_ITEMS_T PIPELINED;
```

Return Values

PATH_ITEMS_T Table Type

LISTMOUNTS Function

This function lists all available mount points, their backing stores, and the store features.

Syntax

```
DBMS_DBFS_CONTENT.LISTMOUNTS
  RETURN MOUNTS_T PIPELINED;
```

Return Values

MOUNTS_T Table Type

Usage Notes

A single mount results in a single returned row, with its `store_mount` field of the returned records set to `NULL`.

LISTSTORES Function

This function lists all available stores and their features.

Syntax

```
DBMS_DBFS_CONTENT.LISTSTORES
  RETURN STORES_T PIPELINED;
```

Return Values

STORES_T Table Type

Usage Notes

The `store_mount` field of the returned records is set to `NULL` (since mount-points are separate from stores themselves).

LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

Syntax

```
DBMS_DBFS_CONTENT.LOCKPATH (
   path           IN     VARCHAR2,
   lock_type      IN     INTEGER     DEFAULT LOCK_READ_ONLY,
   lock_data      IN     VARCHAR2    DEFAULT NULL,
   store_name     IN     VARCHAR2    DEFAULT NULL,
   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–47 LOCKPATH Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`lock_type`	One of the available lock types (see DBMS_DBFS_CONTENT Constants - Lock Types)
`lock_data`	Optional user data to be associated with the lock
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

MOUNTSTORE Procedure

This procedure mounts a previously registered store and binds it to the mount point.

Syntax

```
DBMS_DBFS_CONTENT.MOUNTSTORE (
   store_mount     in      VARCHAR2   DEFAULT NULL,
   singleton       in      BOOLEAN    DEFAULT FALSE,
   principal       in      VARCHAR2   DEFAULT NULL,
   owner           in      VARCHAR2   DEFAULT NULL,
   acl             in      VARCHAR2   DEFAULT NULL,
   asof            in      TIMESTAMP  DEFAULT NULL,
   read_only       in      BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 43–48 MOUNTSTORE Procedure Parameters

Parameter	Description
`store_mount`	Path name to use to mount this store
`singleton`	Whether the mount is a single backend store on the system
`principal`	Agent (principal) invoking the current operation
`owner`	Owner for new elements created (implicitly or explicitly) by the current operation
`acl`	ACL for all new elements created (implicitly or explicitly) by the current operation
`asof`	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
`read_only`	Whether the mount is read-only

Usage Notes

- Once mounted, accesses to path names of the form `/store_mount/xyz...` are redirected to *store_name* and its content provider.
- Store mount points must be unique, and a syntactically valid path name component (specifically, a `NAME_T` with no embedded `/`).
- If a mount point is not specified (`NULL`), the invoked subprogram attempts to use the store name itself as the mount point name (subject to the uniqueness and syntactic constraints).
- A special empty mount point is available for single stores, specifically a scenario where the content interface manages a single backend store - in such cases, the client can directly deal with full path names of the form `/xyz...` since there is no ambiguity in how to redirect these accesses.
- Singleton mount points are indicated by the "singleton" boolean argument, and the `store_mount` argument is ignored.
- The same store can be mounted multiple times, obviously at different mount points.
- Mount properties can be used to specify the execution environment, specifically, the default values of the principal, owner, ACL, and `asof` for a particular mount

point. Mount properties can also be used to specify a read-only mount. If a flashback mount is specified (through `asof`), it implies a read-only mount.

NORMALIZEPATH Functions

This function converts a store-specific or full-absolute path name into normalized form:

- verifies that the path name is absolute, and so starts with "/"
- collapses multiple consecutive "/" into a single "/"
- strips trailing "/"
- breaks up a store-specific normalized path name into 2 components - parent pathname, trailing component name
- breaks up a full-absolute normalized path name into 3 components - store name, parent pathname, trailing component name

Syntax

```
DBMS_DBFS_CONTENT.NORMALIZEPATH (
   path        IN              VARCHAR2,
   parent      OUT NOCOPY      VARCHAR2,
   tpath       OUT NOCOPY      VARCHAR2)
  RETURN VARCHAR2;

DBMS_DBFS_CONTENT.NORMALIZEPATH (
   path        IN              VARCHAR2,
   store_name  OUT NOCOPY      VARCHAR2,
   parent      OUT NOCOPY      VARCHAR2,
   tpath       OUT NOCOPY      VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 43–49 NORMALIZEPATH Function Parameters

Parameter	Description
path	Name of path to file items
store_name	Name of store
parent	Parent path name
tpath	Name of trailing path item

Return Values

The completely normalized store-specific or full-absolute path name

PROPANY Functions

This function provides constructors that take one of a variety of types and return a PROPERTY_T.

Syntax

```
DBMS_DBFS_CONTENT.PROPANY (
   val      IN      NUMBER)
RETURN PROPERTY_T;

DBMS_DBFS_CONTENT.PROPANY (
   val      IN      VARCHAR2)
RETURN PROPERTY_T;

DBMS_DBFS_CONTENT.PROPANY (
   val      IN      TIMESTAMP)
RETURN PROPERTY_T;

DBMS_DBFS_CONTENT.PROPANY (
   val      IN      RAW)
RETURN PROPERTY_T;
```

Parameters

Table 43–50 PROPANY Function Parameters

Parameter	Description
`val`	Value

Return Values

PROPERTY_T Record Type

PROPERTIESH2T Function

This function converts a PROPERTY_T hash to a DBMS_DBFS_CONTENT_PROPERTIES_T table.

Syntax

```
DBMS_DBFS_CONTENT.PROPERTIEST2H (
   pprops      IN      PROPERTIES_T)
RETURN DBMS_DBFS_CONTENT_PROPERTIES_T;
```

Parameters

Table 43–51 PROPERTIEST2H Function Parameters

Parameter	Description
sprops	A PROPERTIES_T hash

Return Values

DBMS_DBFS_CONTENT_PROPERTIES_T Table Type

PROPERTIEST2H Function

This function converts a DBMS_DBFS_CONTENT_PROPERTIES_T table to a PROPERTY_T hash.

Syntax

```
DBMS_DBFS_CONTENT.PROPERTIEST2H (
   sprops      IN      DBMS_DBFS_CONTENT_PROPERTIES_T)
RETURN properties_t;
```

Parameters

Table 43–52 PROPERTIEST2H Function Parameters

Parameter	Description
sprops	A DBMS_DBFS_CONTENT_PROPERTIES_T table

Return Values

PROPERTIES_T Table Type

PROPNUMBER Function

This function is a constructor that takes a number and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPNUMBER (
   val      IN      NUMBER)
RETURN PROPERTY_T;
```

Parameters

Table 43–53 PROPNUMBER Function Parameters

Parameter	Description
`val`	Value

Return Values

PROPERTY_T Record Type

PROPRAW Function

This function is a constructor that takes a `RAW` and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPRAW (
   val      IN      RAW)
RETURN PROPERTY_T;
```

Parameters

Table 43–54 PROPRAW Function Parameters

Parameter	Description
`val`	Value

Return Values

PROPERTY_T Record Type

PROPTIMESTAMP Function

This function is a constructor that takes a `TIMESTAMP` and returns a `PROPERTY_T`.

Syntax

```
DBMS_DBFS_CONTENT.PROPTIMESTAMP (
   val      IN      TIMESTAMP)
RETURN PROPERTY_T;
```

Parameters

Table 43–55 PROPTIMESTAMP Function Parameters

Parameter	Description
`val`	Value

Return Values

PROPERTY_T Record Type

PROPVARCHAR2 Function

This function is a constructor that takes a VARCHAR2 and returns a PROPERTY_T.

Syntax

```
DBMS_DBFS_CONTENT.PROPVARCHAR2 (
   val      IN      VARCHAR2)
RETURN PROPERTY_T;
```

Parameters

Table 43–56 PROPNUMBER Function Parameters

Parameter	Description
val	Value

Return Values

PROPERTY_T Record Type

PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT.PURGEALL (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2    DEFAULT NULL,
   store_name     IN      VARCHAR2    DEFAULT NULL,
   principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–57 PURGEALL Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`filter`	A filter, if any, to be applied based on specified criteria
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

Syntax

```
DBMS_DBFS_CONTENT.PURGEPATH (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2    DEFAULT NULL,
   store_name     IN      VARCHAR2    DEFAULT NULL,
   principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–58 PURGEPATH Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`filter`	A filter, if any, to be applied
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

PUTPATH Procedures

This procedure creates a new path item.

Syntax

```
DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   content     IN OUT NOCOPY   BLOB,
   item_type   OUT             INTEGER,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT +
                                                    PROP_DATA),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   content     IN OUT NOCOPY   BLOB,
   item_type   OUT             INTEGER,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT +
                                                    PROP_DATA),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   amount      IN              NUMBER,
   offset      IN              NUMBER,
   buffer      IN              RAW,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   amount      IN              NUMBER,
   offset      IN              NUMBER,
   buffer      IN              RAW,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   written     OUT             NUMBER,
   offset      IN              NUMBER,
   buffers     IN             DBMS_DBFS_CONTENT_RAW_T,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT),
   store_name  IN              VARCHAR2    DEFAULT NULL,
```

```
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.PUTPATH (
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   written     OUT             NUMBER,
   offset      IN              NUMBER,
   buffers     IN              DBMS_DBFS_CONTENT_RAW_T,
   prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                                    PROP_OPT),
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–59 PUTPATH Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`content`	`BLOB` holding data which populates the file (optional)
`item_type`	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
`amount`	Number of bytes to be read
`offset`	Byte offset from which to begin reading
`buffer`	Buffer to which to write
`buffers`	Buffers to which to write
`prop_flags`	Determines which properties are set. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

REGISTERSTORE Procedure

This procedure registers a new store backed by a provider that uses a store service provider (conforming to the DBMS_DBFS_CONTENT_SPI package signature). This method is to be used primarily by service providers after they have created a new store.

Syntax

```
DBMS_DBFS_CONTENT.REGISTERSTORE (
   store_name          IN      VARCHAR2,
   provider_name       IN      VARCHAR2,
   provider_package    IN      VARCHAR2);
```

Parameters

Table 43–60 REGISTERSTORE Procedure Parameters

Parameter	Description
store_name	Name of store, must be unique
provider_name	Name of provider
provider_package	Store service provider

RENAMEPATH Procedures

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

Note: See "Rename and Move Operations" on page 43-21

Syntax

```
DBMS_DBFS_CONTENT.RENAMEPATH (
   oldPath     IN              VARCHAR2,
   newPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.RENAMEPATH (
   oldPath     IN              VARCHAR2,
   newPath     IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   store_name  IN              VARCHAR2    DEFAULT NULL,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–61 RENAMEPATH Procedure Parameters

Parameter	Description
`oldPath`	Name of path prior to renaming
`newPath`	Name of path after renaming
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`store_name`	Name of store, must be unique
`principal`	Agent (principal) invoking the current operation

RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT.RESTOREALL (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2    DEFAULT NULL,
   store_name     IN      VARCHAR2    DEFAULT NULL,
   principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–62 RESTOREALL Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`filter`	A filter, if any, to be applied
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT.RESTOREPATH (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2    DEFAULT NULL,
   store_name     IN      VARCHAR2    DEFAULT NULL,
   principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–63 RESTOREPATH Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`filter`	A filter, if any, to be applied
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

SEARCH Function

This function...

Syntax

```
DBMS_DBFS_CONTENT.SEARCH (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2    DEFAULT NULL,
   recurse        IN      INTEGER     DEFAULT 0,
   asof           IN      TIMESTAMP   DEFAULT NULL,
   store_name     IN      VARCHAR2    DEFAULT NULL,
   principal      IN      VARCHAR2    DEFAULT NULL)
 RETURN  DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

Table 43–64 LIST Function Parameters

Parameter	Description
`path`	Name of path to file items
`filter`	A filter, if any, to be applied
`recurse`	If 0, do not execute recursively. Otherwise, recursively search the contents of directories and files below the given directory.
`asof`	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

Return Values

`DBMS_DBFS_CONTENT_LIST_ITEMS_T`

SETDEFAULTACL Procedure

This procedure sets the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTACL (
   acl    IN     VARCHAR2);
```

Parameters

Table 43–65 SETDEFAULTACL Procedure Parameters

Parameter	Description
acl	ACL for all new elements created (implicitly or explicitly) by the current operation

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

SETDEFAULTASOF Procedure

This procedure sets the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTASOF (
  asof    IN     TIMESTAMP);
```

Parameters

Table 43–66 SETDEFAULTASOF Procedure Parameters

Parameter	Description
asof	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

SETDEFAULTCONTEXT Procedure

This procedure sets the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTCONTEXT (
   principal    IN     VARCHAR2,
   owner        IN     VARCHAR2,
   acl          IN     VARCHAR2,
   asof         IN     TIMESTAMP);
```

Parameters

Table 43–67 SETDEFAULTCONTEXT Procedure Parameters

Parameter	Description
`principal`	Agent (principal) invoking the current operation
`owner`	Owner for new elements created (implicitly or explicitly) by the current operation
`acl`	ACL for all new elements created (implicitly or explicitly) by the current operation
`asof`	The "as of" timestamp at which the underlying read-only operation (or its read-only sub-components) executes

Usage Notes

- All of the context parameters are `NULL` by default, and be can be cleared by setting them to `NULL`.
- The context parameters, once set, remain as defaults for the duration of the session, and are inherited by all operations for which the defaults are not explicitly overridden.

SETDEFAULTOWNER Procedure

This procedure sets the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTOWNER (
   principal    IN     VARCHAR2);
```

Parameters

Table 43–68 SETDEFAULTOWNER Procedure Parameters

Parameter	Description
owner	Owner for new elements created (implicitly or explicitly) by the current operation

Usage Notes

- NULL by default, this parameter be can be cleared by setting it to NULL.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

SETDEFAULTPRINCIPAL Procedure

This procedure sets the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTPRINCIPAL (
   principal    IN     VARCHAR2);
```

Parameters

Table 43–69 SETDEFAULTPRINCIPAL Procedure Parameters

Parameter	Description
`principal`	Agent (principal) invoking the current operation

Usage Notes

- `NULL` by default, this parameter be can be cleared by setting it to `NULL`.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

SETPATH Procedures

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the `SETPATH Procedure` that associates an existing `contentID` with a new path.

> **Note:** See "Rename and Move Operations" on page 43-21

Syntax

```
DBMS_DBFS_CONTENT.SETPATH (
   store_name  IN              VARCHAR2,
   contentID   IN              RAW,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
   principal   IN              VARCHAR2    DEFAULT NULL);

DBMS_DBFS_CONTENT.SETPATH (
   store_name  IN              VARCHAR2,
   contentID   IN              RAW,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   PROPERTIES_T,
   principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–70 SETPATH Procedure Parameters

Parameter	Description
`store_name`	Name of the store
`contentID`	Unique identifier for the item to be associated
`path`	Name of path to path item
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`principal`	Agent (principal) invoking the current operation

SETSTATS Procedure

This procedure enables and disables statistics collection. The client can optionally control the flush settings by specifying non-NULL values for the time, count or both parameters.

Syntax

```
DBMS_DBFS_CONTENT.SETSTATS (
   enable          IN    BOOLEAN,
   flush_time      IN    INTEGER,
   flush_count     IN    INTEGER);
```

Parameters

Table 43–71 SETSTATS Procedure Parameters

Parameter	Description
enable	If TRUE, enable statistics collection. If FALSE, disable statistics collection.
flush_time	How often to flush the statistics to disk in centiseconds
flush_count	Number of operations to allow between statistics flushes

Usage Notes

The SETSTATS Procedure buffers statistics in-memory for a maximum of flush_time centiseconds or a maximum of flush_count operations (whichever limit is reached first), or both, at which time the buffers are implicitly flushed to disk.

SETTRACE Procedure

This procedure sets the DBMS_DBFS_CONTENT tracing severity to the given level, 0 being "off".

Syntax

```
DBMS_DBFS_CONTENT.SETTRACE
     trclvl      IN         INTEGER);
```

Parameters

Table 43–72 SETTRACE Procedure Parameters

Parameter	Description
trclvl	Level of the tracing, higher values implying more tracing

SPACEUSAGE Procedure

This procedure queries file system space usage statistics. Providers are expected to support this subprogram for their stores (and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on).

Syntax

```
DBMS_DBFS_CONTENT.SPACEUSAGE (
   path          IN        VARCHAR2,
   blksize       OUT       INTEGER,
   tbytes        OUT       INTEGER,
   fbytes        OUT       INTEGER,
   nfile         OUT       INTEGER,
   ndir          OUT       INTEGER,
   nlink         OUT       INTEGER,
   nref          OUT       INTEGER,
   store_name    IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 43–73 SPACEUSAGE Procedure Parameters

Parameter	Description
path	Name of path to file items
blksize	Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable.
tbytes	Total size of the store in bytes computed over all segments that comprise the store
fbytes	Free or unused size of the store in bytes computed over all segments that comprise the store
nfile	Number of currently available files in the store
ndir	Number of currently available directories in the store
nlink	Number of currently available links in the store
nref	Number of currently available references in the store
store_name	Name of store

Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

TRACE Procedure

This procedure outputs tracing to the current foreground trace file.

Syntax

```
DBMS_DBFS_CONTENT.TRACE
   sev          IN              INTEGER,
   msg0         IN              VARCHAR2,
   msg1         IN              VARCHAR     DEFAULT '',
   msg2         IN              VARCHAR     DEFAULT '',
   msg3         IN              VARCHAR     DEFAULT '',
   msg4         IN              VARCHAR     DEFAULT '',
   msg5         IN              VARCHAR     DEFAULT '',
   msg6         IN              VARCHAR     DEFAULT '',
   msg7         IN              VARCHAR     DEFAULT '',
   msg8         IN              VARCHAR     DEFAULT '',
   msg9         IN              VARCHAR     DEFAULT '',
   msg10        IN              VARCHAR     DEFAULT '');
```

Parameters

Table 43–74 TRACE Procedure Parameters

Parameter	Description
sev	Severity at which trace message is output
msg*	One or more message strings to be output. If more than one message is specified, all are output.

Usage Notes

- Trace information is written to the foreground trace file, with varying levels of detail as specified by the trace level arguments.
- The global trace level consists of 2 components: "severity" and "detail". These can be thought of as additive bitmasks.

  The "severity" allows the separation of top level as compared to low-level tracing of different components, and allows the amount of tracing to be increased as needed. There are no semantics associated with different levels, and users are free to set trace at any severity they choose, although a good rule of thumb would use severity "1" for top level API entry and exit traces, "2" for internal operations, and "3" or greater for very low-level traces.

  The "detail" controls how much additional information: timestamps, short-stack, etc. is dumped along with each trace record.

TRACEENABLED Function

This function determines if the current trace "severity" set by the SETTRACE Procedure is at least as high as the given trace level.

Syntax

```
DBMS_DBFS_CONTENT.TRACEENABLED(
   sev          IN              INTEGER)
  RETURN  INTEGER;
```

Parameters

Table 43–75 TRACEENABLED Procedure Parameters

Parameter	Description
sev	Severity at which trace message is output

Return Values

Returns 0 if the requested severity level is lower than the currently set trace severity level; 1 otherwise.

UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

Syntax

```
DBMS_DBFS_CONTENT.UNLOCKPATH (
   path           IN     VARCHAR2,
   store_name     IN     VARCHAR2    DEFAULT NULL,
   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 43–76 UNLOCKPATH Procedure Parameters

Parameter	Description
`path`	Name of path to file items
`store_name`	Name of store
`principal`	Agent (principal) invoking the current operation

UNMOUNTSTORE Procedure

This procedure unmounts a registered store, either by name or by mount point.

Syntax

```
DBMS_DBFS_CONTENT.UNMOUNTSTORE (
   store_name       IN      VARCHAR2   DEFAULT NULL,
   store_mount      IN      VARCHAR2   DEFAULT NULL,
   ignore_unknown   IN      BOOLEAN    DEFAULT FALSE);
```

Parameters

Table 43–77 UNMOUNTSTORE Procedure Parameters

Parameter	Description
`store_name`	Name of store
`store_mount`	Location at which the store instance is mounted
`ignore_unknown`	If `TRUE`, attempts to unregister unknown stores will not raise an exception.

Usage Notes

- Single stores can be unmounted only by store name (since they have no mount-points).
- Attempting to unmount a store by name unmounts all mount points associated with the store.
- Once unmounted all access to the store (or mount point) are not guaranteed to work.
- If the `ignore_unknown` argument is `TRUE`, attempts to unregister unknown stores or mounts do not raise an exception.

UNREGISTERSTORE Procedure

This procedure unregisters a previously registered store (invalidating all mount points associated with it).

Syntax

```
DBMS_DBFS_CONTENT.UNREGISTERSTORE (
   store_name          IN      VARCHAR2,
   ignore_unknown      IN      BOOLEAN DEFAULT FALSE);
```

Parameters

Table 43–78 UNREGISTERSTORE Procedure Parameters

Parameter	Description
store_name	Name of store
ignore_unknown	

Usage Notes

- Once unregistered all access to the store (and its mount points) are not guaranteed to work
- If the ignore_unknown argument is TRUE, attempts to unregister unknown stores do not raise an exception.

44

DBMS_DBFS_CONTENT_SPI

The `DBMS_DBFS_CONTENT_SPI` package provides the Application Programming Interface (API) specification for DBMS_DBFS_CONTENT service providers. Application designers can create PL/SQL packages conforming to this API to extend `DBMS_CONTENT` to utilize custom service providers.

  - Security Model
  - Operational Notes
- Summary of DBMS_DBFS_CONTENT_SPI Subprograms

Using DBMS_DBFS_CONTENT_SPI

- Overview
- Security Model
- Operational Notes

Overview

The DBMS_DBFS_CONTENT_SPI package describes an internal contract between the implementation of the DBMS_DBFS_CONTENT interface and individual service providers, and whichever package contains their code.

Since PL/SQL does not allow a compile-time, declarative type-conformation between package signatures, store providers should informally conform to the SPI, which is to say, they should implement the SPI by means of a package that contains all of the methods specified in package DBMS_DBFS_CONTENT_SPI, with the same method signatures and semantics.

Obviously, these provider packages can implement other methods and expose other interfaces, however, these interfaces are not to be used by the DBMS_CONTENT interface itself.

Since the provider SPI is merely a contract specification, there is no package body for DBMS_DBFS_CONTENT_SPI, and it is not possible to actually invoke any methods using this package.

The SPI references various elements (constants, types, exceptions) defined by the DBMS_CONTENT interface.

Additionally, there is an almost one-to-one correspondence between the client API exported by the DBMS_CONTENT interface and the provider interface that the DBMS_CONTENT interface itself expects to work against.

The main distinction in the method naming conventions is that all path name references are always store-qualified. That is, the notion of mount-points and full-absolute path names have been normalized and converted to store-qualified path names by the DBMS_CONTENT interface before it invokes any of the provider SPI methods.

Since the interconnection of the DBMS_DBFS_CONTENT interface and the provider SPI is a 1-to-many pluggable architecture, and the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

Security Model

Implementations of the DBMS_DBFS_CONTENT_SPI package should be created as AUTHID CURRENT_USER.

Operational Notes

- Implementation
- Path Names
- Creation Operations
- Deletion Operations
- Get (Retrieve) and Put (Insert) Operations
- Rename and Move Operations
- Directory Navigation and Search
- Locking Operations
- Access Check Operation

Implementation

Since the interconnection of the DBMS_DBFS_CONTENT interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a service provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

Path Names

All path names used in the provider SPI are store-qualified in pair form (`store_name`, `pathname`) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in DBMS_DBFS_CONTENT Constants - Store Features) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a `NULL` path name, and possibly a contentID specified as a parameter or by way of the `OPT_CONTENT_ID` (see DBMS_DBFS_CONTENT Constants - Optional Properties) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

Creation Operations

The provider SPI must allow the DBFS content API to create directory, file, link, and reference elements subject to store feature support.

All of the creation subprograms require a valid path name, but note the special exemption for contentID-based access. Creation subprograms can optionally specify properties to be associated with the path name as it is created. It is also possible for clients to returns item properties after the creation completes so that automatically generated properties, such as `STD_CREATION_TIME` (see DBMS_DBFS_CONTENT Constants - Standard Properties) are immediately available to clients. The exact set of properties fetched back is controlled by the various `PROP_XXX` bitmasks in the `prop_flags` parameter.

Links and references require an additional path name to associate with the primary path name.

File path names can optionally specify a `BLOB` value to use to initially populate the underlying file content (the provided `BLOB` may be any valid LOB). On creation, the underlying LOB is returned to the client, provided that `PROP_DATA` is specified in the `prop_flags` parameter.

Non-directory path names require that their parent directory be created first. Directory path names themselves can be recursively created with the path name hierarchy leading up to a directory created in one call.

Attempts to create paths that already exist is an error; the sole exception is path names that are "soft-deleted" (as discussed in the context of Deletion Operations) In these cases, the soft-deleted item is implicitly purged, and the new item creation is attempted.

Stores and their providers that support contentID-based access accept an explicit store name and a `NULL` path to create a new content element. The contentID generated for this element is available by means of the `OPT_CONTENT_ID` property (see DBMS_DBFS_CONTENT Constants - Optional Properties), contentID-based creation being automatically implied by `PROP_OPT` property in the `prop_flags` parameter).

The newly created element may also have an internally generated path name if `FEATURE_LAZY_PATH` property is not supported (see DBMS_DBFS_CONTENT Constants - Store Features) and this path is available by way of the `STD_CANONICAL_PATH` property (see DBMS_DBFS_CONTENT Constants - Standard Properties).

Only file elements are candidates for contentID-based access.

Deletion Operations

The provider SPI must allow the DBFS content API to delete directory, file, link, and reference elements (subject to store feature support).

By default, the deletions are permanent, removing the successfully deleted items on transaction commit, but stores may also support "soft-delete" features. If requested by the client, soft-deleted items are retained by the store, although they are not typically visible in normal listings or searches.

Soft-deleted items can be restored, or explicitly purged.

Directory path names can be recursively deleted, with the path name hierarchy below a directory deleted in one call. Non-recursive deletions can be performed only on empty directories. Recursive soft-deletions apply the soft-delete to all of the items being deleted.

Individual path names, as well as all soft-deleted path names under a directory, can be restored or purged by means of the various restore and purge subprograms.

Providers that support filtering can use the provider filter to identify subsets of items to delete. This makes most sense for bulk operations such as the DELETEDIRECTORY Procedure, PURGEALL Procedure, and RESTOREALL Procedure, but all of the deletion-related operations accept a `filter` argument.

Stores and their providers that support contentID-based access can also allow file items to be deleted by specifying their contentID.

Get (Retrieve) and Put (Insert) Operations

Existing path items can be accessed (for query or for update) and modified using simple get and put subprograms. All path names allow their metadata (properties) to

be read and modified. On completion of the call, the client can request specific properties to be fetched by means of the `prop_flags` parameter.

File path names allow their data (content) to be read and modified. On completion of the call, the client can use the `PROP_DATA` bitmasks in the `prop_flags` parameter to request a new `BLOB` locator to continue data access.

Files can also be read or written without using `BLOB` locators by explicitly specifying logical offsets or buffer-amounts and a suitably sized buffer.

Update accesses must specify the `forUpdate` flag. Access to link path names can be implicitly and internally de-referenced by stores (subject to feature support) if the `deref` flag is specified, however, this may have undetermined outcomes since symbolic links are not always resolvable.

The read methods, such as the GETPATH Procedures where `forUpdate` is specified as 0, also accepts a valid `asof` timestamp in the `ctx` parameter that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures and the PUTPATH Procedures methods do not support "as of" modes of operation.

The GETPATHNOWAIT Procedure implies that the operation is for an update, and, if implemented (see `FEATURE_NOWAIT` in DBMS_DBFS_CONTENT Constants - Store Features), this allows providers to return an exception (ORA-00054) rather than wait for row locks.

Rename and Move Operations

Path names can be renamed or moved, possibly across directory hierarchies and mount-points, but within the same store.

Non-directory path names previously accessible by way of specifying the `oldPath` parameter are renamed as a single item subsequently accessible by specifying `newPath`, assuming that `newPath` does not already exist.

If `newPath` exists and is not a directory, the action of renaming implicitly deletes the existing item before renaming `oldPath`. If the `newPath` exists and is a directory, `oldPath` is moved into the target directory.

Directory path names previously accessible by way of `oldPath` are renamed by moving the directory and all of its children to `newPath` (if it does not already exist) or as children of `newPath` (if it exists and is a directory).

Stores and their providers that support contentID-based access and lazy path name binding also support the SETPATH Procedure that associates an existing contentID with a new "path".

Directory Navigation and Search

The `DBMS_CONTENT` interface can list or search the contents of directory path names, with the option of doing so recursively into sub-directories, optionally seeing soft-deleted items, optionally using flashback "as of" a provided timestamp, and optionally filtering items in or out within the store based on list or search predicates.

Locking Operations

Clients of the `DBMS_CONTENT` interface can apply user-level locks to any valid path name (subject to store feature support), associate the lock with user-data, and subsequently unlock these path names.

The status of locked items is available using various optional properties (note the previous discussion regarding `opt_lock`).

It is the responsibility of the store (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.

Access Check Operation

This operation ascertains if a given path name (`store_name`, `path`, `pathtype`) can be manipulated by operation (see the various `DBMS_CONTENT.OP_XXX` opcodes in DBMS_DBFS_CONTENT Constants - Optional Properties) by the user acting on the store utilizing the `principal` parameter. This is a convenience function for the `DBMS_CONTENT` interface; a store that supports access control still internally performs these checks to guarantee security.

Summary of DBMS_DBFS_CONTENT_SPI Subprograms

Table 44–1 DBMS_DBFS_CONTENT_SPI Package Subprograms

Subprogram	Description
CHECKACCESS Function on page 44-11	Reports if the user (`principal`) can perform the specified operation on the given path
CREATEDIRECTORY Procedure on page 44-12	Creates a directory
CREATEFILE Procedure on page 44-13	Creates a file
CREATELINK Procedure on page 44-14	Creates a physical link to an already existing file system element
CREATEREFERENCE Procedure on page 44-15	Creates a new reference to the source file system element
DELETECONTENT Procedure on page 44-16	Deletes the file specified by the given contentID
DELETEDIRECTORY Procedure on page 44-17	Deletes a directory
DELETEFILE Procedure on page 44-18	Deletes a file
GETFEATURES Function on page 44-19	Returns the features of a store
GETPATH Procedures on page 44-20	Returns existing path items (such as files and directories)
GETPATHBYSTOREID Function on page 44-22	If the underlying GUID is found in the underlying store, returns the store-qualified path name
GETPATHNOWAIT Procedure on page 44-23	Implies that the operation is for an update, and, if implemented, allows providers to return an exception (`ORA-00054`) rather than wait for row locks.
GETSTOREID Function on page 44-24	Returns the ID of a store
GETVERSION Function on page 44-25	Returns the version associated with a store
LIST Function on page 44-26	Lists the contents of a directory path name
LOCKPATH Procedure on page 44-27	Applies user-level locks to the given valid path name
PURGEALL Procedure on page 44-28	Purges all soft-deleted entries matching the path and optional filter criteria
PURGEPATH Procedure on page 44-29	Purges any soft-deleted versions of the given path item
PUTPATH Procedures on page 44-30	Creates a new path item
RENAMEPATH Procedure on page 44-32	Renames or moves a path
RESTOREALL Procedure on page 44-33	Restores all soft-deleted path items meeting the path and filter criteria

Table 44–1 (Cont.) DBMS_DBFS_CONTENT_SPI Package Subprograms

Subprogram	Description
RESTOREPATH Procedure on page 44-34	Restores all soft-deleted path items that match the given path and filter criteria
SEARCH Function on page 44-35	Searches for path items matching the given path and filter criteria
SETPATH Procedure on page 44-36	Assigns a path name to a path item represented by contentID
SPACEUSAGE Procedure on page 44-37	Queries file system space usage statistics
UNLOCKPATH Procedure on page 44-38	Unlocks path items that were previously locked with the LOCKPATH Procedure

CHECKACCESS Function

This function reports if the user (`principal`) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If `CHECKACCESS` returns 0, then the subprogram invoked to implement that operation should fail with an error.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CHECKACCESS (
   store_name     IN     VARCHAR2  DEFAULT NULL,
   path           IN     VARCHAR2,
   pathtype       IN     INTEGER,
   operation      IN     VARCHAR2,
   principal      IN     VARCHAR2)
  RETURN  INTEGER;
```

Parameters

Table 44–2 CHECKACCESS Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to check for access
`pathtype`	Type of object `path` represents (see DBMS_DBFS_CONTENT Constants - Path Name Types)
`operation`	Operation to be checked (see DBMS_DBFS_CONTENT Constants - Optional Properties)
`principal`	File system user for whom the access check is made

Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

CREATEDIRECTORY Procedure

This procedure creates a directory.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEDIRECTORY (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   prop_flags  IN              INTEGER,
   recurse     IN              INTEGER,
   ctx         IN              DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–3 CREATEDIRECTORY Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to the directory
`properties`	One or more properties and their values to be set, returned, or both, depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `PROP_SPC` (see DBMS_DBFS_CONTENT Constants - Property Access Flags), and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`recurse`	If 0, do not execute recursively; otherwise, recursively create the directories above the given directory
`ctx`	Context with which to create the directory (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

CREATEFILE Procedure

This procedure creates a file.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEFILE (
   store_name     IN              VARCHAR2,
   path           IN              VARCHAR2,
   properties     IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   content        IN OUT NOCOPY   BLOB,
   prop_flags     IN              INTEGER,
   ctx            IN              DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–4 CREATEFILE Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to the file
properties	One or more properties and their values to be set, returned or both depending, or both on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
content	BLOB holding data with which to populate the file (optional)
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
ctx	Context with which to create the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

CREATELINK Procedure

This procedure creates a physical link to an already existing file system element (such as file or directory). The resulting entry shares the same metadata structures as the value of the `srcPath` parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATELINK (
   store_name    IN              VARCHAR2,
   srcPath       IN              VARCHAR2,
   dstPath       IN              VARCHAR2,
   properties    IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   prop_flags    IN              INTEGER,
   ctx           IN              DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–5 CREATELINK Procedure Parameters

Parameter	Description
`store_name`	Name of store
`srcPath`	File system entry with which to link
`dstPath`	Path of the new link element to be created
`properties`	One or more properties and their values to be set, returned, or both, depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`prop_flags`	Determines which properties are set, returned, or both. Default is `PROP_STD`. Specify properties to be returned by setting `prop_spec`, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
`ctx`	Context with which to create the link (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

CREATEREFERENCE Procedure

This procedure creates a new reference to the source file system element (such as a file, or directory). The resulting reference points to the source element but does not directly share metadata with the source element. This is analogous to a UNIX file system symbolic link.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CREATEREFERENCE (
   srcPath       IN              VARCHAR2,
   dstPath       IN              VARCHAR2,
   properties    IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   prop_flags    IN              INTEGER,
   store_name    IN              VARCHAR2,
   ctx           IN              DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–6 CREATEREFERENCE Procedure Parameters

Parameter	Description
store_name	Name of store
srcPath	File system entry with which to link
dstPath	Path of the new link element to be created
properties	One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
ctx	Context with which to create the reference (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETECONTENT (
   store_name     IN     VARCHAR2,
   contentID      IN     RAW,
   filter         IN     VARCHAR2,
   soft_delete    IN     INTEGER,
   ctx            IN     DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–7 DELETECONTENT Procedure Parameters

Parameter	Description
`store_name`	Name of store
`contentID`	Unique identifier for the file to be deleted
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see "Deletion Operations" on page 44-6).
`ctx`	Context with which to delete the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

DELETEDIRECTORY Procedure

This procedure deletes a directory. If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETEDIRECTORY (
   store_name     IN     VARCHAR2,
   path           IN     VARCHAR2,
   filter         IN     VARCHAR2,
   soft_delete    IN     INTEGER,
   recurse        IN     INTEGER,
   ctx            IN     DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–8 DELETEDIRECTORY Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to the directory
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see "Deletion Operations" on page 44-6).
`recurse`	If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.
`ctx`	Context with which to delete the directory (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

DELETEFILE Procedure

This procedure deletes the specified file.

Syntax

```
DBMS_DBFS_CONTENT_SPI.DELETEFILE (
   store_name     IN     VARCHAR2,
   path           IN     VARCHAR2,
   filter         IN     VARCHAR2,
   soft_delete    IN     BOOLEAN,
   ctx            IN     DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–9 DELETEFILE Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to the file
`filter`	A filter, if any, to be applied
`soft_delete`	If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see "Deletion Operations" on page 44-6).
`ctx`	Context with which to delete the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

GETFEATURES Function

This function returns the features of a store.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETFEATURES (
   store_name          IN      VARCHAR2)
  RETURN  INTEGER;
```

Parameters

Table 44–10 GETFEATURES Function Parameters

Parameter	Description
store_name	Name of store

Return Values

DBMS_CONTENT.FEATURE_* features supported by the Service Provider

GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a `BLOB` locator using the `prop_data` bitmask in `prop_flags` (see DBMS_DBFS_CONTENT Constants - Property Access Flags) or by passing one or more `RAW` buffers.

When `forUpdate` is 0, this procedure also accepts a valid "as of" timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the `GETPATH` Procedures do not support these modes of operation.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATH (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   content     OUT    NOCOPY   BLOB,
   item_type   OUT             INTEGER,
   prop_flags  IN              INTEGER,
   forUpdate   IN              INTEGER,
   deref       IN              INTEGER,
   ctx         IN              DBMS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.GETPATH (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   amount      IN OUT          NUMBER,
   offset      IN              NUMBER,
   buffer      OUT    NOCOPY   RAW,
   prop_flags  IN              INTEGER,
   ctx         IN              DBMS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.GETPATH (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   amount      IN OUT          NUMBER,
   offset      IN              NUMBER,
   buffers     OUT    NOCOPY   DBMS_CONTENT_RAW_T,
   prop_flags  IN              INTEGER,
   ctx         IN              DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–11 GETPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to path items

Table 44–11 (Cont.) GETPATH Procedure Parameters

Parameter	Description
properties	One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
amount	On input, number of bytes to be read. On output, number of bytes read
offset	Byte offset from which to begin reading
buffer	Buffer to which to write
buffers	Buffers to which to write
prop_flags	Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
forUpdate	Specifies that a lock should be taken to signify exclusive write access to the path item
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATHBYSTOREID (
   store_name          IN      VARCHAR2,
   guid                IN      INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 44–12 GETPATHBYSTOREID Function Parameters

Parameter	Description
`store_name`	Name of store
`guid`	Unique ID representing the desired path item

Return Values

Store-qualified path name represented by the GUID

Usage Notes

If the `STD_GUID` is unknown, a `NULL` value is returned. Clients are expected to handle this as appropriate.

GETPATHNOWAIT Procedure

This procedure implies that the operation is for an update, and, if implemented (see FEATURE_NOWAIT in DBMS_DBFS_CONTENT Constants - Store Features), allows providers to return an exception (ORA-00054) rather than wait for row locks.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETPATHNOWAIT (
   store_name  IN              VARCHAR2,
   path        IN              VARCHAR2,
   properties  IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   content     OUT    NOCOPY   BLOB,
   item_type   OUT             INTEGER,
   prop_flags  IN              INTEGER,
   deref       IN              INTEGER,
   ctx         IN              DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–13 GETPATHNOWAIT Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to path items
properties	One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
content	BLOB holding data which populates the file (optional)
item_type	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
prop_flags	Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
deref	If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

GETSTOREID Function

This function returns the ID of a store.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETSTOREID (
   store_name          IN      VARCHAR2)
  RETURN  NUMBER;
```

Parameters

Table 44–14 GETSTOREID Function Parameters

Parameter	Description
store_name	Name of store

Return Values

ID of the Store

Usage Notes

A store ID identifies a provider-specific store, across registrations and mounts, but independent of changes to the store contents. For this reason, changes to the store table or tables should be reflected in the store ID, but re-initialization of the same store table or tables should preserve the store ID.

GETVERSION Function

This function returns the version associated with a store.

Syntax

```
DBMS_DBFS_CONTENT_SPI.GETVERSION (
   store_name          IN      VARCHAR2)
  RETURN  VARCHAR2;
```

Parameters

Table 44–15 GETVERSION Function Parameters

Parameter	Description
`store_name`	Name of store

Return Values

A "version" (either specific to a provider package, or to an individual store) based on a standard *a.b.c* naming convention (for *major*, *minor*, and *patch* components)

LIST Function

This function lists the contents of a directory path name.

The invoker of the subprogram has the option to investigate recursively into sub-directories, to make soft-deleted items visible, to use a flashback "as of" a specified timestamp, and to filter items within the store based on list predicates.

Syntax

```
DBMS_DBFS_CONTENT_SPI.LIST (
   store_name    IN     VARCHAR2,
   path          IN     VARCHAR2,
   filter        IN     VARCHAR2,
   recurse       IN     INTEGER,
   ctx           IN     DBMS_CONTENT_CONTEXT_T)
  RETURN  DBMS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

Table 44–16 LIST Function Parameters

Parameter	Description
`store_name`	Name of respository
`path`	Name of path to directories
`filter`	A filter, if any, to be applied
`recurse`	If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

Return Values

Path items found that match the path, filter and criteria for executing recursively (see DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type)

Usage Notes

This function returns only list items; the client is expected to explicitly use one of the GETPATH Procedures to access the properties or content associated with an item.

LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

Syntax

```
DBMS_DBFS_CONTENT_SPI.LOCKPATH (
   store_name     IN     VARCHAR2,
   path           IN     VARCHAR2,
   lock_type      IN     INTEGER,
   lock_data      IN     VARCHAR2,
   ctx            IN     DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–17 LOCKPATH Procedure Parameters

Parameter	Description
store_name	Name of store
path	Path name of items to be locked
lock_type	One of the available lock types (see DBMS_DBFS_CONTENT Constants - Lock Types)
lock_data	Optional user data to be associated with the lock
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

Usage Notes

- It is the responsibility of the store and its providers (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.
- The status of locked items is available by means of various optional properties (see OPT_LOCK* in DBMS_DBFS_CONTENT Constants - Optional Properties).

PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEALL (
   store_name     IN      VARCHAR2,
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   ctx            IN      DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–18 PURGEALL Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to file items
`filter`	A filter, if any, to be applied based on specified criteria
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

Syntax

```
DBMS_DBFS_CONTENT_SPI.PURGEPATH (
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   store_name     IN      VARCHAR2,
   ctx            IN      DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–19 PURGEPATH Procedure Parameters

Parameter	Description
store_name	Name of store
path	Name of path to file items
filter	A filter, if any, to be applied
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

PUTPATH Procedures

This procedure creates a new path item.

Syntax

```
DBMS_DBFS_CONTENT_SPI.PUTPATH (
   store_name     IN              VARCHAR2,
   path           IN              VARCHAR2,
   properties     IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   content        IN OUT NOCOPY   BLOB,
   item_type      OUT             INTEGER,
   prop_flags     IN              INTEGER,
   ctx            IN              DBMS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.PUTPATH (
   store_name     IN              VARCHAR2,
   path           IN              VARCHAR2,
   properties     IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   amount         IN              NUMBER,
   offset         IN              NUMBER,
   buffer         IN              RAW,
   prop_flags     IN              INTEGER,
   ctx            IN              DBMS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.PUTPATH (
   store_name     IN              VARCHAR2,
   path           IN              VARCHAR2,
   properties     IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   written        OUT             NUMBER,
   offset         IN              NUMBER,
   buffers        IN              DBMS_CONTENT_RAW_T,
   prop_flags     IN              INTEGER,
   ctx            IN              DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–20 PUTPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Path name of item to be put
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`content`	`BLOB` holding data which populates the file (optional)
`item_type`	Type of the path item specified (see DBMS_DBFS_CONTENT Constants - Path Name Types)
`amount`	Number of bytes to be read
`written`	Number of bytes written
`offset`	Byte offset from which to begin reading
`buffer`	Buffer to which to write
`buffers`	Buffers to which to write

Table 44–20 (Cont.) PUTPATH Procedure Parameters

Parameter	Description
prop_flags	Determines which properties are set. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.
ctx	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

Usage Notes

- All path names allow their metadata (properties) to be read and modified. On completion of the call, the client can access specific properties using prop_flags (see DBMS_DBFS_CONTENT Constants - Property Access Flags).
- On completion of the call, the client can request a new BLOB locator that can be used to continue data access using the prop_data bitmask in prop_flags (see DBMS_DBFS_CONTENT Constants - Property Access Flags).
- Files can also be written without using BLOB locators, by explicitly specifying logical offsets or buffer-amounts, and a suitably sized buffer.

RENAMEPATH Procedure

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

Note: See "Rename and Move Operations" on page 44-7

Syntax

```
DBMS_DBFS_CONTENT_SPI.RENAMEPATH (
   store_name     IN              VARCHAR2,
   oldPath        IN              VARCHAR2,
   newPath        IN              VARCHAR2,
   properties     IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   ctx            IN              DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–21 RENAMEPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store, must be unique
`oldPath`	Name of path prior to renaming
`newPath`	Name of path after renaming
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.RESTOREALL (
   store_name     IN      VARCHAR2,
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   ctx            IN      DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–22 RESTOREALL Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to path items
`filter`	A filter, if any, to be applied
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.RESTOREPATH (
   store_name     IN      VARCHAR2,
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   ctx            IN      DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–23 RESTOREPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to path items
`filter`	A filter, if any, to be applied
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

SEARCH Function

This function searches for path items matching the given path and filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.SEARCH (
   store_name     IN      VARCHAR2,
   path           IN      VARCHAR2,
   filter         IN      VARCHAR2,
   recurse        IN      INTEGER,
   ctx            IN      DBMS_CONTENT_CONTEXT_T)
 RETURN  DBMS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

Table 44–24 LIST Function Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to the path items
`filter`	A filter, if any, to be applied
`recurse`	If 0, do not execute recursively. Otherwise, recursively search the contents of directories and files below the given directory.
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

Return Values

Path items matching the given path and filter criteria (see DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type)

SETPATH Procedure

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the `SETPATH Procedure` that associates an existing `contentID` with a new path.

> **Note:** See "Rename and Move Operations" on page 44-7

Syntax

```
DBMS_DBFS_CONTENT_SPI.SETPATH (
   store_name     IN              VARCHAR2,
   contentID      IN              RAW,
   path           IN              VARCHAR2,
   properties     IN OUT NOCOPY   DBMS_CONTENT_PROPERTIES_T,
   ctx            IN              DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–25 SETPATH Procedure Parameters

Parameter	Description
`store_name`	Name of the store
`contentID`	Unique identifier for the item to be associated
`path`	Name of path to path item
`properties`	One or more properties and their values to be set depending on `prop_flags` (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)
`ctx`	Context with which to access the path items (seE DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

SPACEUSAGE Procedure

This procedure queries file system space usage statistics. Providers are expected to support this subprogram for their stores and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on.

Syntax

```
DBMS_DBFS_CONTENT_SPI.SPACEUSAGE (
   store_name    IN        VARCHAR2,
   blksize       OUT       INTEGER,
   tbytes        OUT       INTEGER,
   fbytes        OUT       INTEGER,
   nfile         OUT       INTEGER,
   ndir          OUT       INTEGER,
   nlink         OUT       INTEGER,
   nref          OUT       INTEGER);
```

Parameters

Table 44–26 SPACEUSAGE Procedure Parameters

Parameter	Description
store_name	Name of store
blksize	Natural tablespace blocksize that holds the store. If multiple tablespaces with different blocksizes are used, any valid blocksize is acceptable.
tbytes	Total size of the store in bytes computed over all segments that comprise the store
fbytes	Free or unused size of the store in bytes computed over all segments that comprise the store
nfile	Number of currently available files in the store
ndir	Number of currently available directories in the store
nlink	Number of currently available links in the store
nref	Number of currently available references in the store

Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, it is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

Syntax

```
DBMS_DBFS_CONTENT_SPI.UNLOCKPATH (
   store_name     IN     VARCHAR2,
   path           IN     VARCHAR2,
   ctx            IN     DBMS_CONTENT_CONTEXT_T);
```

Parameters

Table 44–27 UNLOCKPATH Procedure Parameters

Parameter	Description
`store_name`	Name of store
`path`	Name of path to the path items
`ctx`	Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)

45

DBMS_DBFS_HS

The Oracle Database File System Hierarchical Store is implemented in the `DBMS_DBFS_HS` package. This package provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables.

This chapter contains the following topics:

- Using DBMS_DBFS_HS
  - Overview
  - Security Model
  - Constants
  - Operational Notes
- Summary of DBMS_DBFS_HS Subprograms

Using DBMS_DBFS_HS

- Overview
- Security Model
- Constants
- Operational Notes

Overview

The DBMS_DBFS_HS package is a service provider underneath the DBMS_DBFS_CONTENT package that enables use of tape or Amazon S3 Web service as storage for data.

The data on tape or Amazon S3 Web service is part of the Oracle Database and can be accessed through all standard interfaces, but only through the database. The package allows users to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management of their content.

The package initially stores all content files in level-1 cache. As the level-1 cache fills up, content files are moved to level-2 cache and then to an external storage device using bulk writes.

Security Model

The DBMS_DBFS_HS package runs with invoker's rights.

Constants

The DBMS_DBFS_HS package uses the constants shown in following tables:

- DBMS_DBFS_HS Constants - Used by the CREATESTORE Procedure
- DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function
- DBMS_DBFS_HS Constants - Used by the REGISTERSTORECOMMAND Function
- DBMS_DBFS_HS Constants - Failure/Success/Error

Table 45–1 DBMS_DBFS_HS Constants - Used by the CREATESTORE Procedure

Constant	Type	Value	Description
STORETYPE_TAPE	VARCHAR2(50)	'HS_TAPE'	Use tape as a storage tier
STORETYPE_AMAZONS3	VARCHAR2(50)	'HS_S3'	Use Amazon S3 Web service as a storage tier

Table 45–2 DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

Constant	Type	Value	Description
PROPNAME_BUCKET	VARCHAR2(50)	'BUCKET'	Specifies the AWS bucket to be used as a storage tier by the Hierarchical Store. Restrictions on bucket name are: 1) Bucket names can only contain lowercase letters, numbers, periods (.) and dashes(-). Note that underscores (_) are invalid. 2) Bucket names must start with a number or letter. 3) Bucket names cannot be in an IP address style (192.168.5.4). 4) Bucket names must be between 3 and 63 characters long. 5) Bucket names should not end with a dash. 6) Dashes cannot appear next to periods. For example, my-.bucket.com is invalid.
PROPNAME_CACHESIZE	VARCHAR2(50)	'CACHE_SIZE'	Specifies the cumulative cache size used for the Hierarchical Store. This property is set by the CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure. It cannot be modified by the SETSTOREPROPERTY Procedure, though its value can be queried by the GETSTOREPROPERTY Function.

Table 45–2 (Cont.) DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

Constant	Type	Value	Description
PROPNAME_ COMPRESSLEVEL	VARCHAR2(50)	'COMPRESSION _LEVEL'	Use to enable compression of files stored in the DBFS hierarchical store. It specifies the compression level to be used for compressing the files
PROPNAME_ ENABLECLEANUPO NDELETE	VARCHAR2(50)	'ENABLE_ CLEANUP_ON_ DELETE'	If this property is set to 'TRUE', whenever the user invokes the DELETEFILE Procedure in the DBMS_DBFS_CONTENT interface on a file residing in the DBMS_DBFS_ HS store, the DBMS_DBFS_HS removes the file on the external storage that contains this user file provided that the file has no other useful data.By default, the property is set to 'TRUE' for STORETYPE_ AMAZONS3 and 'FALSE' for STORETYPE_TAPE.
PROPNAME_ HTTPPROXY	VARCHAR2(50)	'HTTP_PROXY'	Specifies the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service
PROPNAME_ LICENSEID	VARCHAR2(50)	'LICENSE_ID'	Specifies the license ID associated with the library libosbws11.so.
PROPNAME_ LOBCACHE_QUOTA	VARCHAR2(50)	'LOBCACHE_ QUOTA'	Specifies fraction of the cache_ size which is allocated for level 1 cache. The default value of this parameter is NULL which means that 0.8 (= 80%) of the cache_size is used for level 1 cache. This property cannot be modified by the SETSTOREPROPERTY Procedurethough its value can be queried by the GETSTOREPROPERTY Function. Its value is set by CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure.
PROPNAME_ MEDIAPOOL	VARCHAR2(50)	'MEDIA_POOL'	Specifies the media pool number to use for storing the content
PROPVAL_ COMPLVL_NONE	VARCHAR2(50)	'NONE'	Indicates no compression
PROPVAL_ COMPLVL_LOW	VARCHAR2(50)	'LOW'	Use to set the compression level to LOW. This is expected to have the best performance while still providing a good compression ratio.
PROPVAL_ COMPLVL_MEDIUM	VARCHAR2(50)	'MEDIUM'	Use to set the compression level to MEDIUM. This compression level is expected to provide better compression ratio than LOW but the time required for compression will be higher than compression level LOW.

Table 45–2 (Cont.) DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

Constant	Type	Value	Description
PROPVAL_ COMPLVL_HIGH	VARCHAR2(50)	'HIGH'	Use to set the compression level to HIGH. This compression level is expected to provide the best compression ratio but compression time will in general be highest among the 3 compression levels.
PROPNAME_ OPTTARBALLSIZE	VARCHAR2(50)	'OPTIMAL_ TARBALL_ SIZE'	Specifies optimal_tarball_size as the maximum possible size of an archive file. Multiple content files are bundled together into one archive file and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation. This property cannot be modified by the SETSTOREPROPERTY Procedurethough its value can be queried by the GETSTOREPROPERTY Function. Its value is set by CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure.
PROPNAME_ READCHUNKSIZE	VARCHAR2(50)	'READ_CHUNK_ SIZE'	Specifies the size used by the SBT protocol to transfer data from tape or S3.This chunk is allocated in memory per transaction for retrieval of content files from an archive store, so the value of this property should be conservative. The default size of 1MB is typically good for most users.
PROPNAME_ S3HOST	VARCHAR2(50)	'S3_HOST'	Specifies the HOST name of the Amazon S3 storage service. It must be s3.amazonaws.com.
PROPNAME_SBT_ LIBRARY	VARCHAR2(50)	'SBT_ LIBRARY'	Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named libosbws11.so and is available in rdbms/lib directory.
PROPNAME_ STREAMABLE	VARCHAR2(50)	'STREAMABLE'	Indicates whether buffer-based PUT or GET should be done on this store. Valid values for are TRUE and FALSE. The default value of this property is TRUE.

Table 45–2 (Cont.) DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

Constant	Type	Value	Description
PROPNAME_ WALLET	VARCHAR2(50)	'WALLET'	The value of this property should be of the form: LOCATION=file:*filename* CREDENTIAL_ ALIAS=*access/secret_alias* PROXY_AUTH_ ALIAS=*proxyusername/password alias* Defines the Oracle Wallet which contains the credentials of the Amazon S3 account associated with the store under consideration. LOCATION: The directory path that contains the Oracle wallet. The format is file:*directory-path* The format of wallet_path in Windows is, for example: file:c:\WINNT\Profiles*username*\WALLETS In UNIX or Linux it is, for example: file:/home/*username*/wallets When the package is executed in the Oracle database server, the wallet is accessed from the database server. PASSWORD: Defines the wallet password. If auto-login is enabled in wallet (this can be changed using the OWM utility), this parameter does not have to be specified. By default, the mkstore utility enables auto-login. CREDENTIAL_ALIAS: Defines the credential alias for ACCESS_KEY and SECRET_KEY
PROPNAME_ WRITECHUNKSIZ	VARCHAR2(50)	'WRITE_ CHUNK_SIZE'	Specifies the size used by the SBT protocol to transfer data to tape or S3. This chunk is allocated in memory per transaction for PUT of Content Files to an archive store so the value should be conservative. The default size of 1MB is typically good for most users.

Table 45–3 DBMS_DBFS_HS Constants - Used by the REGISTERSTORECOMMAND Function

Constant	Type	Value	Description
BEFORE_PUT	NUMBER	'1'	Specified operation must be performed before writing a SECUREFILE to the remote store

Table 45–3 (Cont.) DBMS_DBFS_HS Constants - Used by the REGISTERSTORECOMMAND Function

Constant	Type	Value	Description
BEFORE_GET	NUMBER	'2'	Specified operation must be performed before a retrieval operation such as reading a SECUREFILE from the remote device

Table 45–4 DBMS_DBFS_HS Constants - Failure/Success/Error

Constant	Type	Value	Description
FAIL	NUMBER	'0'	Procedure or function did not execute successfully
SUCCESS	NUMBER	'1'	Procedure or function completed successfully
ERROR	NUMBER	'2'	Procedure or function returned an error

Operational Notes

When the DBMS_DBFS_HS package is executed in the Oracle database server, the wallet is accessed from the database server.

Summary of DBMS_DBFS_HS Subprograms

Table 45–5 DBMS_DBFS_HS Package Subprograms

Subprogram	Description
CLEANUPUNUSEDBACKUPFILES Procedure on page 45-12	Removes files created on the external storage device that hold no currently used data
CREATEBUCKET Procedure on page 45-13	Creates an AWS bucket, associated with a store of type `STORETYPE_AMAZONS3` into which the Hierarchical Store can then move data
CREATESTORE Procedure on page 45-14	Creates a new hierarchical store
DEREGSTORECOMMAND Function on page 45-16	Removes a command that had been previously associated with a store through the RECONFIGCACHE Procedure
DROPSTORE Procedure on page 45-16	Deletes a previously created hierarchical store
FLUSHCACHE Procedure on page 45-18	Flushes (writes out) dirty contents from the level-1 cache.
GETSTOREPROPERTY Function on page 45-19	Retrieves the values of a property of a store
RECONFIGCACHE Procedure on page 45-20	Reconfigures the parameters of the database cache used by the store
REGISTERSTORECOMMAND Procedure on page 45-21	Registers commands for a store with the Hierarchical Store to be sent to the Media Manager for the external storage device associated with the store
SENDCOMMAND Procedures on page 45-22	Sends a command to be executed on the external storage device's Media Manager
SETSTOREPROPERTY Procedure on page 45-23	Stores properties of a store in the database
STOREPUSH Procedure on page 45-26	Pushes locally staged data to the remote storage

CLEANUPUNUSEDBACKUPFILES Procedure

This procedure removes files created on the external storage device that hold no currently used data in them.

Syntax

```
DBMS_DBFS_HS.CLEANUPUNUSEDBACKUPFILES (
   store_name     IN     VARCHAR2);
```

Parameters

Table 45–6 CLEANUPUNUSEDBACKUPFILES Procedure Parameters

Parameter	Description
store_name	Name of store

Usage Notes

- The action of removing files from external storage device can not be rolled back.
- This method can be executed periodically to clear space on the external storage device. Asynchronously deleting content from the external storage device is useful because it has minimal impact on the OLTP performance. The periodic scheduling can be accomplished using the DBMS_SCHEDULER package.

CREATEBUCKET Procedure

This procedure creates an AWS bucket, associated with a store of type STORETYPE_AMAZONS3 into which the Hierarchical Store can then move data.

Syntax

```
DBMS_DBFS_HS.CREATEBUCKET  (
   store_name    IN     VARCHAR2);
```

Parameters

Table 45–7 CREATEBUCKET Procedure Parameters

Parameter	Description
store_name	Name of store

Usage Notes

- The PROPNAME_BUCKET property of the store should be set before this subprogram is called.
- Once this procedure has successfully created a bucket in Amazon S3, the bucket can only be deleted using out-of-band methods, such as logging-in to S3 and deleting data (directories, files, and other items) for the bucket.

CREATESTORE Procedure

This procedure creates a new hierarchical store `store_name` of type `STORE_TYPE` (`STORETYPE_TAPE` or `STORETYPE_AMAZONS3`) in schema `schema_name` (defaulting to current schema) under the ownership of the invoking session user.

Syntax

```
DBMS_DBFS_HS.CREATESTORE  (
   store_name              IN     VARCHAR2,
   store_type              IN     VARCHAR2,
   tbl_name                IN     VARCHAR2,
   tbs_name                IN     VARCHAR2,
   cache_size              IN     NUMBER,
   lob_cache_quota         IN     NUMBER DEFAULT NULL,
   optimal_tarball_size    IN     NUMBER DEFAULT NULL,
   schema_name             IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–8 CREATESTORE Procedure Parameters

Parameter	Description
`store_name`	Name of store
`store_type`	`STORETYPE_TAPE` or `STORETYPE_AMAZONS3`
`tbl_name`	Table for store entries
`tbs_name`	Tablespace for the store
`cache_size`	Amount of space used by the store to cache content in given tablespace
`lob_cache_quota`	Fraction of the cache_size which is allocated for level 1 cache. The default value of this parameter is `NULL` which means that 0.8 (= 80%) of the `cache_size` is used for level 1 cache.
`optimal_tarball_size`	Maximum possible size of the archive file. Multiple content files are bundled together into one archive file, and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation. The value of is set by default to 10GB for tape and to 100MB for Amazon S3.
`schema_name`	Schema for the store

Usage Notes

- Store names must be unique for an owner. The same store names can be used for different stores owned by different owners.
- Once a table space has been specified to store the store's content in a database, it cannot be changed later.
- This subprogram will execute like a DDL statement, performing an automatic `COMMIT` before and after execution.
- Stores using `DBMS_DBFS_HS` must not use singleton mount. This means that the singleton parameter should be `FALSE` and the `store_mount` parameter should

have a non-NULL value in a call to the DBMS_DBFS_CONTENT.MOUNTSTORE Procedure.

DEREGSTORECOMMAND Function

This procedure removes a command that had been previously associated with a store through the RECONFIGCACHE Procedure.

Syntax

```
DBMS_DBFS_HS.DEREGSTORECOMMAND (
   store_name      IN     VARCHAR2,
   message         IN     VARCHAR2);
```

Parameters

Table 45–9 DEREGSTORECOMMAND Procedure Parameters

Parameter	Description
`store_name`	Name of store
`message`	Message to be deregistered

Usage Notes

If this subprogram successfully executes, its actions cannot be rolled back by the user. If the user wants to restore the previous state, the user must call the REGISTERSTORECOMMAND Procedure.

DROPSTORE Procedure

This procedure deletes a previously created hierarchical store specified by name and owned by the invoking session user.

Syntax

```
DBMS_DBFS_HS.DROPSTORE  (
   store_name   IN     VARCHAR2,
   opt_flags    IN     INTEGER DEFAULT 0);
```

Parameters

Table 45–10 DROPSTORE Procedure Parameters

Parameter	Description
`store_name`	Name of store owned by the invoking session user
`opt_flags`	User can specify optional flags. If `DISABLE_CLEANUPBACKUPFILES` is specified as one of the optional flags, the call to the CLEANUPUNUSEDBACKUPFILES Procedure is not issued. By default, when this flag is not set, the procedure implicitly cleans-up all unused backup files.

Usage Notes

- The procedure executes like a DDL in that it auto-commits before and after its execution.
- If `CLEANUPBACKUPFILES` is disabled during the procedure, the user must resort to out-of-band techniques to cleanup unused backup files. No further invocations of `CLEANUPBACKFILES` for a dropped store are possible through hierarchical store.
- This subprogram will un-register the store from `DBMS_DBFS_CONTENT` package. All files in the given store are deleted from the store (Tape or Amazon S3 Web service). The database table holding the store's entries in the database, is also dropped by this subprogram.

FLUSHCACHE Procedure

This procedure flushes out dirty contents from level-1 cache, which can be locked, to level-2 cache, thereby freeing-up space in level 1 cache.

Syntax

```
DBMS_DBFS_HS.FLUSHCACHE  (
   store_name    IN     VARCHAR2);
```

Parameters

Table 45–11 FLUSHCACHE Procedure Parameters

Parameter	Description
store_name	Name of store

GETSTOREPROPERTY Function

This function retrieves the values of a property.

Syntax

```
DBMS_DBFS_HS.GETSTOREPROPERTY  (
   store_name      IN     VARCHAR2,
   property_name   IN     VARCHAR2,
   noexcp          IN     BOOLEAN DEFAULT FALSE) RETURN VARCHAR2;
```

Parameters

Table 45–12 GETSTOREPROPERTY Function Parameters

Parameter	Description
`store_name`	Name of store
`property_name`	Name of property
`noexcp`	If set to `FALSE`, raises an exception if the property does not exist in the database. If `noexcp` is set to `TRUE`, returns `NULL` if the property does not exist.

Return Values

The values of a property.

Usage Notes

The specified store must already have been created.

RECONFIGCACHE Procedure

This procedure reconfigures the parameters of the database cache being used by the store.

Syntax

```
DBMS_DBFS_HS.RECONFIGCACHE (
   store_name              IN    VARCHAR2,
   cache_size              IN    NUMBER DEFAULT NULL,
   lobcache_quota          IN    NUMBER DEFAULT NULL,
   optimal_tarball_size    IN    NUMBER DEFAULT NULL);
```

Parameters

Table 45–13 RECONFIGCACHE Procedure Parameters

Parameter	Description
`store_name`	Name of store
`cache_size`	Cumulative cache size used for the Hierarchical Store
`lobcache_quota`	Fraction of the cache size that are assigned to level 1 cache
`optimal_tarball_size`	Maximum possible size of an archive file. Since creating one file for every content file in the store is a prohibitively expensive operation, multiple content files are bundled together into one archive file for transfer to tape or Amazon S3.

Usage Notes

- The specified store must already have been created before reconfiguration.
- The Hierarchical Store uses a level 1 cache and a level 2 cache. The level 1 cache subsumes most of the working set and the level 2 cache is used to perform bulk writes to the backend device.
- If any of the last 3 parameters is `NULL`, its value specified during store creation is used. If the parameter was `NULL` when the call to the CREATESTORE Procedure was issued, the `DBMS_DBFS_HS` package assigns a default value.

  The `DBMS_DBFS_HS` package optimistically tries to allocate more than 1 tarball's worth of size for level 2 cache to facilitate concurrency, though a minimum of 1 tarball size is necessary for level 2 cache.

  The values for cumulative cache size and LOB cache quota decide allocation of space for the two caches. If values are not provided, a user might see an `INSUFFICIENT_CACHE` exception. In that case, it is better to revise the cache parameters in order to have a working store.
- If this subprogram successfully executes, its actions cannot be rolled back by the user. In that case, the user should call `RECONFIGCACHE` again with new or modified parameters.

REGISTERSTORECOMMAND Procedure

This procedure registers commands for a store with the Hierarchical Store. These commands are sent to the Media Manager for the external storage device associated with the store.

Syntax

```
DBMS_DBFS_HS.REGISTERSTORECOMMAND (
   store_name      IN     VARCHAR2,
   message         IN     VARCHAR2,
   flags           IN     NUMBER);
```

Parameters

Table 45–14 REGISTERSTORECOMMAND Procedure Parameters

Parameter	Description
`store_name`	Name of store
`message`	Message to be sent to the Media Manager of the external store
`flags`	Valid values: ■ `BEFORE_PUT CONSTANT NUMBER := 1;` ■ `BEFORE_GET CONSTANT NUMBER := 2;`

Usage Notes

- These commands are sent before the next read or write of content. When the Hierarchical Store wants to push (or get) data to (or from) the storage device, it begins a session (to communicate with the device). After beginning the session, it sends all registered commands for the to the relevant device before writing (or getting) any data.
- If this method successfully executes, its actions cannot be rolled back by the user. To restore the previous state the user must call the DEREGSTORECOMMAND Function.

SENDCOMMAND Procedures

This procedure sends a command to be executed on the external storage device's Media Manager.

Syntax

```
DBMS_DBFS_HS.SENDCOMMAND (
   store_name    IN       VARCHAR2,
   message       IN       VARCHAR2);
```

Parameters

Table 45–15 SENDCOMMAND Procedure Parameters

Parameter	Description
`store_name`	Name of store
`message`	Message string to be executed

SETSTOREPROPERTY Procedure

This procedure stores properties of a store in the database as name-value pairs.

Syntax

```
DBMS_DBFS_HS.SETSTOREPROPERTY  (
   store_name      IN     VARCHAR2,
   property_name   IN     VARCHAR2,
   property_value  IN     VARCHAR2);
```

Parameters

Table 45–16 SETSTOREPROPERTY Procedure Parameters

Parameter	Description
store_name	Name of store
property_name	For a store using Tape device, there are three properties whose values must be set by the user, and four properties that have default values. Stores of type STORETYPE_AMAZONS3 have properties with default values. The various options for both types of stores are detailed under property_value.
property_value	**Stores using a Tape Device** The values for the following properties must be set by the user: ■ PROPNAME_SBTLIBRARY - This should point to the shared library used by RMAN to communicate with the external tape device. It is usually named libobk.so. ■ PROPNAME_MEDIAPOOL - Media pool number for storing content ■ PROPNAME_CACHE_SIZE - Amount of space, in bytes, used for the cache of this store The following properties, which have default values assigned to them when a store is created, benefit from tuning: ■ PROPNAME_READCHUNKSIZE and PROPNAME_WRITECHUNKSIZE - These are the sizes used by the SBT protocol to transfer data to and from the tapes. These chunks are allocated in memory per transaction, so the values should be conservative. The default size is 1MB. ■ PROPNAME_STREAMABLE – Indicates whether DBFS_LINKs can perform read operations (for example SELECT or DBMS_LOB.READ) directly from the store, or if the data must be copied back into the database before it can be read ■ PROPNAME_ENABLECLEANUPONDELETE - Indicates if unused files on the external storage device should be deleted by DBMS_DBFS_HS. Valid values for this property are 'FALSE' for STORETYPE_TAPE. ■ PROPNAME_COMPRESSLEVEL - Describes how files written to Tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.

Table 45–16 (Cont.) SETSTOREPROPERTY Procedure Parameters

Parameter	Description
(cont) property_value	**Stores of type STORETYPE_AMAZONS3** It is mandatory that the following properties have assigned values, and default values are provided: ■ PROPNAME_SBTLIBRARY - Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named libosbws11.so and is available in rdbms/lib directory. ■ PROPNAME_S3HOST - Defines the HOST name of the Amazon S3 storage service. It must be s3.amazonaws.com. ■ PROPNAME_BUCKET - Defines the AWS bucket used as a storage tier by the Hierarchical Store. Restrictions on bucket names are: -- Bucket names can only contain lowercase letters, numbers, periods (.) and dashes (-). Use of an underscore (_) is invalid. -- Bucket names must start with a number or letter -- Bucket names cannot be in an IP address style ("192.168.5.4") -- Bucket names must be between 3 and 63 characters in length -- Bucket names should not end with a dash -- Dashes cannot appear next to periods. For example, "my-.bucket.com" is invalid. ■ PROPNAME_LICENSEID - Specifies the license ID associated with the library libosbws11.so. ■ PROPNAME_WALLET - Has the form: 'LOCATION=file:<filename> CREDENTIAL_ALIAS=<access/secret_alias> PROXY_AUTH_ALIAS=<proxyusername/password alias>' -- LOCATION - Directory path that contains the Oracle wallet. The format is file:*directory-path*. See Examples for variations in format. -- PASSWORD - Defines the wallet password. If auto-login is enabled in the wallet (this can be changed using the user's own utility), and does not have to be specified. By default, the mkstore utility enables auto-login. -- CREDENTIAL_ALIAS - Defines the credential alias for ACCESS_KEY and SECRET_KEY -- PROXY_AUTH_ALIAS - Defines authentication credentials for the proxy server, if applicable.

Table 45–16 (Cont.) SETSTOREPROPERTY Procedure Parameters

Parameter	Description
(property_value (contd.)	The following properties are optional: ■ PROPNAME_HTTPPROXY - Defines the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service. ■ PROPNAME_STREAMABLE – Indicates whether buffer-based PUT or GET operation should be done on this store. Valid values for this property are TRUE (default) and FALSE. ■ PROPNAME_ENABLECLEANUPONDELETE - Indicates if unused files on the external storage device should be deleted by DBMS_DBFS_HS. Valid values for this property are 'FALSE' for STORETYPE_TAPE. ■ PROPNAME_COMPRESSLEVEL - Describes how files written to Tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.

Usage Notes

- The specified store must already have been created.
- If this subprogram successfully executes, its actions cannot be rolled back by the user.
- The same property can be set multiple times to the same or different values using this subprogram

Examples

Format

The format of wallet_path in Windows is, for example:

```
file:c:\WINNT\Profiles\<username>\WALLETS
```

The format of wallet_path in UNIX or Linux is, for example:

```
file:/home/username/wallets
```

STOREPUSH Procedure

This procedure pushes locally staged data to the remote storage.

Syntax

```
DBMS_DBFS_HS.STOREPUSH (
   store_name   IN        VARCHAR2,
   path         IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45–17 STOREPUSH Procedure Parameters

Parameter	Description
store_name	Name of store whose content the client writes from local cache to the external store
path	A non-mount qualified (without mount point) path within the store. By default, its value is NULL which corresponds to the root path of the store.

Usage Notes

- The Hierarchical Store caches the content files locally in database tables. When enough content is amassed in the cache to make it efficient to write to the external storage device (or the cache is completely filled), the Hierarchical Store creates a tarball out of the local content and writes these tarballs as files on the external device. The size of the tarball created by the Hierarchical Store is controlled by the store property PROPNAME_OPTTARBALLSIZE.
- When the amount of free space in the cache is such that the caching of a content file will push the space used above cache_size, the Hierarchical Store will internally call STOREPUSH. The STOREPUSH Procedure creates tarball(s) out of the existing dirty or modified content files in the cache and writes them out to the external device. A STOREPUSH call is not guaranteed to write all the dirty content from local cache to the external storage, since some files may be locked by other sessions.
- STOREPUSH has a built-in ability feature allowing it to automatically resume operation. If a STOREPUSH call is interrupted (say by a network outage) after it has transferred some tarballs to the external device, it can be restarted after the outage and will then resume transferring data from the point it was interrupted. In other words, work done before the outage is not lost. STOREPUSH can safely be restarted and the effect is such as if the outage never occurred.
- If this method successfully executes, its actions cannot be rolled back by the user.
- By default, when path is NULL, all files in the store are candidates for STOREPUSH. If path has a valid input value, all files which are under the namespace of given path are written from the local cache to the external store. If a given path is an existing file, it is pushed out again to the remote store.

46

DBMS_DBFS_SFS

The DBMS_DBFS_SFS package provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

This chapter contains the following topics:

- Using DBMS_DBFS_SFS
  - Overview
  - Security Model
  - Constants
- Summary of DBMS_DBFS_SFS Subprograms

Using DBMS_DBFS_SFS

- Overview
- Security Model
- Constants

Overview

The DBMS_DBFS_SFS package is a sample implementation of a package that implements and extends the DBMS_DBFS_CONTENT_SPI interface. It provides a POSIX-compliant file system stored in the RDBMS.

Security Model

The DBMS_DBFS_SFS package runs with AUTHID CURRENT_USER.

Constants

The DBMS_DBFS_SFS package uses the constants shown in following tables:

- DBMS_DBFS_SFS Constants - Compression Levels
- DBMS_DBFS_SFS Constants - Used by the encryption Parameter
- DBMS_DBFS_SFS Constants - Used by the npartitions Parameter
- DBMS_DBFS_SFS Constants - Used by the partition_key Parameter

Table 46–1 DBMS_DBFS_SFS Constants - Compression Levels

Constant	Type	Value	Description
COMPRESSION_DEFAULT	VARCHAR2(32)	''	Use the default SecureFile compression level
COMPRESSION_LOW	VARCHAR2(32)	'LOW'	Use compression level 'LOW'
COMPRESSION_MEDIUM	VARCHAR2(32)	'MEDIUM'	Use compression level 'MEDIUM'
COMPRESSION_HIGH	VARCHAR2(32)	'HIGH'	Use compression level 'HIGH'

Table 46–2 DBMS_DBFS_SFS Constants - Used by the encryption Parameter

Constant	Type	Value	Description
ENCRYPTION_DEFAULT	VARCHAR2(32)	''	Use the default SecureFile encryption algorithm
ENCRYPTION_3DES168	VARCHAR2(32)	'3DES168'	Use encryption 3DES 168 bit
ENCRYPTION_AES128	VARCHAR2(32)	'AES128'	Use encryption AES 128 bit
ENCRYPTION_AES192	VARCHAR2(32)	'AES192'	Use encryption AES 192 bit
ENCRYPTION_AES256	VARCHAR2(32)	'AES256'	Use encryption AES 256 bit

Table 46–3 DBMS_DBFS_SFS Constants - Used by the npartitions Parameter

Constant	Type	Value	Description
DEFAULT_PARTITIONS	INTEGER	16	Default to 16 partitions

Table 46–4 DBMS_DBFS_SFS Constants - Used by the partition_key Parameter

Constant	Type	Value	Description
PARTITION_BY_ITEM	INTEGER	1	Use a hash of the item name for the partition key
PARTITION_BY_PATH	INTEGER	2	Use a hash of the path name for the partition key
PARTITION_BY_GUID	INTEGER	3	Use a hash of the GUID as the partition key

Summary of DBMS_DBFS_SFS Subprograms

Table 46–5 DBMS_DBFS_SFS Package Subprograms

Subprogram	Description
CREATEFILESYSTEM Procedure on page 46-7	Creates a file system store
CREATESTORE Procedure on page 46-9	Creates a new DBFS SFS store
DROPFILESYSTEM Procedures on page 46-10	Drops the DBFS SFS store
INITFS Procedure on page 46-11	Initializes a POSIX file system store

CREATEFILESYSTEM Procedure

This procedure creates a file system store.

Syntax

```
DBMS_DBFS_SFS.CREATEFILESYSTEM (
   store_name          IN     VARCHAR2,
   schema_name         IN     VARCHAR2    DEFAULT NULL,
   tbl_name            IN     VARCHAR2    DEFAULT NULL,
   tbl_tbs             IN     VARCHAR2    DEFAULT NULL,
   lob_tbs             IN     VARCHAR2    DEFAULT NULL,
   use_bf              IN     BOOLEAN     DEFAULT FALSE,
   properties          IN     DBMS_DBFS_CONTENT_PROPERTIES_T DEFAULT NULL,
   create_only         IN     BOOLEAN     FALSE,
   use_objects         IN     BOOLEAN     DEFAULT FALSE,
   with_grants         IN     BOOLEAN     DEFAULT FALSE,
   do_dedup            IN     BOOLEAN     DEFAULT FALSE,
   do_compress         IN     BOOLEAN     DEFAULT FALSE
   compression         IN     VARCHAR2    DEFAULT COMPRESSION_DEFAULT,
   do_encrypt          IN     BOOLEAN     DEFAULT FALSE,
   encryption          IN     VARCHAR2    DEFAULT ENCRYPTION_DEFAULT,
   do_partition        IN     BOOLEAN     DEFAULT FALSE,
   npartitions         IN     NUMBER      DEFAULTDEFAULT_PARTITIONS,
   partition_key       IN     NUMBER      DEFAULT PARTITION_BY_ITEM,
   partition_guidi     IN     BOOLEAN     DEFAULT FALSE,
   partition_pathi     IN     BOOLEAN     DEFAULT FALSE,
   partition_prop      IN     BOOLEAN     DEFAULT TRUE);
```

Parameters

Table 46–6 CREATEFILESYSTEM Procedure Parameters

Parameter	Description
store_name	Name of store
schema_name	Schema for the store, defaulting to the current schema
tbl_name	Table for store entries. If not specified, an internally generated name is used.
tbl_tb	Tablespace for the store, defaulting to the schema's default tablespace
lob_tbs	Tablespace in which to create the LOB segment. It defaults to the user's default tablespace.
use_bf	If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used.
properties	Table of (name, value, typecode) tuples used to configure the store properties. Currently no such properties are defined or used.
create_only	If TRUE, the file system is created, but not registered with the current user
use_objects	If TRUE, a single base-table with an object-type column (using a nested table) is created to backup the new file system. Otherwise, a pair of (parent, child) tables is used to backup the file system. In both cases, the object type nested table or the child table is used only for user-defined properties.

Table 46–6 (Cont.) CREATEFILESYSTEM Procedure Parameters

Parameter	Description
with_grants	If TRUE, DML and query access permissions are granted to the DBFS_ROLE as part of creating the file system. Otherwise, explicit grants (or existing permissions) are required to access the file system.
do_dedup	If TRUE, do deduplication the underlying SecureFile column
do_compress	If TRUE, do compression the underlying SecureFile column
compression	Compression algorithm to use (see DBMS_DBFS_SFS Constants - Compression Levels)
do_encrypt	If TRUE, encrypt the underlying SecureFile column
encryption	encryption algorithm to use (see DBMS_DBFS_SFS Constants - Used by the encryption Parameter)
do_partition	If TRUE, partition the table used for storage
npartitions	Number of partitions to create for the table (see DBMS_DBFS_SFS Constants - Used by the npartitions Parameter).
partition_key	How to partition the table: by item name, by path name, or by GUID (see DBMS_DBFS_SFS Constants - Used by the partition_key Parameter).
partition_guidi	If TRUE, build an index on GUID
partition_pathi	If TRUE, build an index on path name
partition_prop	If TRUE, partition the properties table

Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

CREATESTORE Procedure

This procedure creates a new DBFS SFS store owned by the invoking session user.

Syntax

```
DBMS_DBFS_SFS.CREATESTORE  (
   store_name     IN     VARCHAR2,
   tbl_name       IN     VARCHAR2  DEFAULT NULL,
   tbs_name       in     VARCHAR2  DEFAULT NULL,
   use_bf         in     BOOLEAN   DEFAULT FALSE,
   stgopts        in     VARCHAR2 DEFAULT '');
```

Parameters

Table 46–7 CREATESTORE Procedure Parameters

Parameter	Description
`store_name`	Name of store
`store_type`	`STORETYPE_TAPE` or `STORETYPE_AMAZONS3`
`tbl_name`	Placeholder for the store content cached in database
`tbs_name`	Named tablespace
`use_bf`	If `TRUE`, a BasicFile `LOB` is used; otherwise a SecureFile `LOB` is used.
`stgopts`	Currently non-operational, reserved for future use

DROPFILESYSTEM Procedures

This procedure drops the DBFS SFS store, purging all dictionary information associated with the store, and dropping the underlying file system table.

Syntax

```
DBMS_DBFS_SFS.DROPFILESYSTEM  (
   schema_name    IN      VARCHAR2 DEFAULT NULL,
   tbl_name       IN      INTEGER);

DBMS_DBFS_SFS.DROPFILESYSTEM  (
   store_name     IN      VARCHAR2);
```

Parameters

Table 46–8 DROPFILESYSTEM Procedure Parameters

Parameter	Description
schema_name	Name of schema
tbl_name	Name of tablespace
store_name	Name of store path

Usage Notes

- If the specified store table is registered by the current user, it will be unregistered from the content interface described in the DBMS_DBFS_CONTENT package and the POSIX metadata tables.
- Subsequent to unregistration, an attempt will be made to store table(s). This operation may fail if other users are currently using this store table.
- The user attempting a drop of the tables underlying the store must actually have the privileges to complete the drop operation (either as the owner of the tables, or as a sufficiently privileged user for cross-schema operations).
- The procedure executes like a DDL in that it auto-commits before and after its execution.

INITFS Procedure

This procedure initialize a POSIX file system store. The table associated with the POSIX file system store `store_name` is truncated and reinitialized with a single "root" directory entry.

Syntax

```
DBMS_DBFS_SFS.INITFS (
   store_name     IN      VARCHAR2);
```

Parameters

Table 46–9 INITFS Procedure Parameters

Parameter	Description
`store_name`	Name of store

Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

47

DBMS_DATA_MINING_TRANSFORM

The DBMS_DATA_MINING_TRANSFORM package contains transformation routines that can be used to prepare data for mining.

See Also:

- Chapter 42, "DBMS_DATA_MINING"
- *Oracle Data Mining Concepts* for information about automatic and embedded data transformation in Oracle Data Mining

This chapter contains the following topics:

- Using DBMS_DATA_MINING_TRANSFORM
  - Data Transformation with Oracle Data Mining
  - Types of Transformations
  - The DBMS_DATA_MINING_TRANSFORM Framework
  - Data Types
- Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Using DBMS_DATA_MINING_TRANSFORM

This section contains topics that relate to using the `DBMS_DATA_MINING_TRANSFORM` package.

- Data Transformation with Oracle Data Mining
- Types of Transformations
- The DBMS_DATA_MINING_TRANSFORM Framework
- Data Types

Data Transformation with Oracle Data Mining

A **transformation** is a SQL expression that modifies one or more of the columns used in data mining.

Most data mining algorithms require some form of data transformation. Some transformations may be needed for categorical attributes, for numerical attributes, or for both. Data sets used for creating, testing, and scoring the model must all undergo the same transformations. To replicate these changes in each data set can be very time consuming.

Oracle Data Mining embeds transformation expressions in the model. The transformations used to create the model are automatically performed on any data sets to which the model is applied. This ability to deploy a model together with its transformations significantly enhances the model's usability while simplifying the process of model management.

Oracle Data Mining further simplifies the data transformation process by offering an **Automatic Data Preparation** mode (ADP). When you create a model using ADP, the training data is automatically transformed according to the requirements of the algorithm; the automatic transformations are embedded in the model. To enable ADP, set the `PREP_AUTO` setting to `PREP_AUTO_ON` in the settings table for the model.

> **See Also:** Table 42–6 in Chapter 42, "DBMS_DATA_MINING" for information about the `PREP_AUTO` setting

You can supplement automatic transformations by passing a list of transformation expressions to `DBMS_DATA_MINING.CREATE_MODEL`. Your transformations are embedded in the model along with the automatic transformations. If ADP is turned off, only the transformations that you pass to `CREATE_MODEL` are embedded.

> **See Also:** "CREATE_MODEL Procedure" in Chapter 42, "DBMS_DATA_MINING" for information about the transformation list parameter

The routines in `DBMS_DATA_MINING_TRANSFORM` are convenience routines to assist you in creating your own transformations. If these routines do not suit your needs, you can write SQL to modify them, or you can write your own routines.

Note on Notation:

This chapter uses standard interval notation for number sets:

- **[a,b]** is the set of all real numbers greater than or equal to **a** and less than or equal to **b**
- **[a,b)** is the set of all real numbers greater than or equal to **a** and less than **b**.

(**b** is in the set [**a,b**]; **b** is not in the set [**a,b**).)

Types of Transformations

The DBMS_DATA_MINING_TRANSFORM package supports transformations that are typically used in data mining: binning, normalization, outlier treatment, missing value treatment, and column removal.

Binning

Binning involves mapping both continuous and discrete values to discrete values of reduced cardinality. For example, the age of persons could be binned into discrete numeric bins: 1-20 to 1, 21-40 to 2, and so on. Popular car manufacturers such as Ford, Chrysler, BMW, Volkswagen could be binned into discrete categorical bins: {Ford, Chrysler} to US_Car_Makers, and {BMW, Volkswagen} to European_Car_Makers.

DBMS_DATA_MINING_TRANSFORM supports binning for both categorical and numerical attributes.

Supervised Binning (Categorical and Numerical)

The bin contents are groupings calculated by a Decision Tree model.

Top-N Frequency Categorical Binning

The bin contents are based on the frequency of each value in the column. The number of bins is user-specified. The first bin contains the most frequent values, the second bin contains the second-most frequent values, and so on. The final bin contains all the remaining values.

Equi-Width Numerical Binning

Each bin contains the same number of values. The number of bins is user-specified or estimated from the data.The first bin contains the highest values, the second bin contains the next highest values, and so on.

Quantile Numerical Binning

Each bin contains the numbers in a quantile that is computed using the SQL NTILE function. Quantiles are partitions of a data distribution.

Normalization

Normalization is the process of scaling continuous values down to a specific range, typically between zero and one. Normalization applies only to numerical attributes.

Normalization transforms each number by subtracting a given number (**shift**) and dividing the result by the **scale**. For example:

```
x_new = (x_old-shift)/scale
```

Min-Max Normalization

Min-max normalization is computed based on the minimum and maximum values of the data. The values for shift and scale are:

```
shift = min
scale = max-min
```

Scale Normalization

Scale normalization is computed based on the minimum and maximum values of the data. The values for shift and scale are:

```
shift = 0
scale = max{abs(max), abs(min)}
```

Z-Score Normalization

Z-score normalization is computed based on the values for mean and standard deviation that are computed from the data. The values for shift and scale are:

```
shift = mean
scale = standard_deviation
```

Outlier Treatment

Some computations can be significantly affected by extreme values. One approach to achieving a more robust computation is to winsorize or trim (clip) the data as a preprocessing step.

Winsorizing involves setting the tail values to some specified value. For example, for a 90% winsorization, the bottom 5% could be set to the minimum value in the 6th percentile, while the upper 5% could be set to the maximum value in the 95th percentile.

Trimming sets the tail values to NULL.

Missing Value Treatment

Oracle Data Mining distinguishes between **sparse data** and data that contains **random missing values**. The latter means that some attribute values are unknown. Sparse data, on the other hand, contains values that are assumed to be known, although they are not represented in the data.

NULLs in columns with simple data types (not nested) are assumed to represent random missing values. Values that are not present in nested columns indicate sparsity. Oracle Data Mining automatically replaces numerical data that is missing at random with the mean and categorical data that is missing at random with the mode. Missing numerical values in sparse data are replaced with zeros. Missing categorical values in sparse data are replaced with a zero vector or a special value `DM$SPARSE`, depending on the algorithm.

`DBMS_DATA_MINING_TRANSFORM` provides routines for handling missing values. These routines are available for anyone who wishes to manage missing value treatment explicitly, instead of relying on the default treatment.

> **See Also:** *Oracle Data Mining Application Developer's Guide* for more information about missing value treatment by Oracle Data Mining

The DBMS_DATA_MINING_TRANSFORM Framework

DBMS_DATA_MINING_TRANSFORM provides a framework for transforming columns of data for mining. The framework is composed of CREATE, INSERT, STACK, and XFORM operations. You can modify the output or implement your own version of any of these operations.

The DBMS_DATA_MINING_TRANSFORM framework consists of the following operations:

1. **CREATE** — Create a transformation table.

   A transformation table has the columns needed for specifying one of the following transformations:

   - Binning
   - Column removal
   - Normalization
   - Outlier treatment
   - Missing value treatment

   For example, the binning transformation table has columns for listing the original column values with their bin assignments.

   The columns of the transformation table are empty until they are populated by an INSERT routine.

2. **INSERT** — Populate a transformation table for a given data source.

   For example, you could use an INSERT routine to populate a transformation table with bin assignments for the categorical attributes in a specified data source. Bin assignments could be calculated using supervised binning or top-n frequency binning.

   You can invoke CREATE and INSERT routines several times until the transformation tables fully represent all the data attributes for a given mining problem.

3. **STACK** — Add the transformation instructions to a list (stack) of transformation instructions.

   For example, you could use a STACK routine to add the transformation instructions that populated the binning transformation table to a list of transformation instructions. With STACK routines, you can assemble all the transformation instructions for a given data source into a single list.

   The list of transformation instructions can be passed to CREATE_MODEL or to other STACK routines. (See "CREATE_MODEL Procedure" on page 42-48.) .

4. **XFORM** — Create a view of the data table that includes the transformed columns.

   For example, you could use an XFORM routine to create a view that includes the binned columns from the binning transformation table.

   The view created by an XFORM routine includes the transformed values for the columns in the transformation table and the original values for all other columns. The view can be used for creating, testing, or scoring a model.

Data Types

DBMS_DATA_MINING_TRANSFORM defines the data types described in this section.

COLUMN LIST Collection Type

This type is used to store quoted and non-quoted identifiers for column names.

```
TYPE
    COLUMN_LIST                    IS VARRAY(1000) OF VARCHAR2(32);
```

DESCRIBE LIST Collection Type

This type holds the results of describe operations.

```
SUBTYPE
    DESCRIBE_LIST                  IS dbms_sql.DESC_TAB2;
```

EXPRESSION Record Type

This type is used for storing transformation expressions.

```
  TYPE
    EXPRESSION_REC                 IS RECORD (
                                        ..........);,
```

Unlike VARCHAR2, EXPRESSION_REC can be used for expressions that can grow larger than 32K.

Use SET_EXPRESSION to write to an EXPRESSION_REC. Use GET_EXPRESSION to retrieve the contents of an EXPRESSION_REC.

TRANSFORMATION Record Type

This type is used for storing the in-memory transformation stack definition for a single attribute.

```
TYPE
    TRANSFORM_REC                  IS RECORD (
      attribute_name                 VARCHAR2(30),
      attribute_subname              VARCHAR2(4000),
      expression                     EXPRESSION_REC,
      reverse_expression             EXPRESSION_REC,
      attribute_spec                 VARCHAR2(4000));
```

The attribute_spec field is used to specify additional information and actions for an attribute. You can specify the value NOPREP for attribute_spec.

NOPREP disables ADP for an individual attribute. NOPREP can be used in the transformation list passed to DBMS_DATA_MINING.CREATE_MODEL. (See "CREATE_MODEL Procedure" on page 42-48.)

TRANSFORMATION LIST Collection Type

This type is used for storing the in-memory stack definition.

```
TYPE
    TRANSFORM_LIST                   IS TABLE OF TRANSFORM_REC;
```

NESTED COLUMN Constants

These constants are used for specifying data types of nested columns.

```
NEST_NUM_COL_TYPE                CONSTANT NUMBER := 100001;
NEST_CAT_COL_TAYPE               CONSTANT NUMBER := 100002;
```

Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

Table 47–1 DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
CREATE_BIN_CAT Procedure on page 47-11	Creates a categorical bin definition table
CREATE_BIN_NUM Procedure on page 47-12	Creates a numerical bin definition table
CREATE_CLIP Procedure on page 47-13	Creates a clipping definition table
CREATE_COL_REM Procedure on page 47-14	Creates a column removal definition table
CREATE_MISS_CAT Procedure on page 47-15	Creates a categorical missing value treatment definition table
CREATE_MISS_NUM Procedure on page 47-16	Creates a numerical missing value treatment definition table
CREATE_NORM_LIN Procedure on page 47-17	Creates a normalization definition table
DESCRIBE_STACK Procedure on page 47-18	Describes the stack definition
GET_EXPRESSION Function on page 47-19	Returns a transformation expression
INSERT_AUTOBIN_NUM_ EQWIDTH Procedure on page 47-20	Populates the numerical bin definition table, using the number of bins estimated from the data
INSERT_BIN_CAT_FREQ Procedure on page 47-22	Populates the categorical bin definition table, applying frequency-based binning to the categorical input data
INSERT_BIN_NUM_EQWIDTH Procedure on page 47-24	Populates the numerical bin definition table, applying equi-width binning to the numerical input data
INSERT_BIN_NUM_QTILE Procedure on page 47-26	Populates the numerical bin definition table, applying quantile binning to the numerical input data
INSERT_BIN_SUPER Procedure on page 47-28	Populates a binning definition table, applying supervised binning to both numerical and categorical data
INSERT_CLIP_TRIM_TAIL Procedure on page 47-29	Populates the clipping definition table, applying trimming based on tail fraction to the numerical input data
INSERT_CLIP_WINSOR_TAIL Procedure on page 47-31	Populates the clipping definition table, applying Winsorizing based on tail fraction to the numerical input data
INSERT_MISS_CAT_MODE Procedure on page 47-33	Populates the categorical missing value treatment definition table, applying the mode to each missing value
INSERT_MISS_NUM_MEAN Procedure on page 47-34	Populates the numerical missing value treatment definition table, applying the mean to each missing value
INSERT_NORM_LIN_MINMAX Procedure on page 47-35	Populates the normalization definition table, applying min-max normalization to the numerical input data

Table 47–1 (Cont.) DBMS_DATA_MINING_TRANSFORM Package Subprograms

Subprogram	Purpose
INSERT_NORM_LIN_SCALE Procedure on page 47-36	Populates the normalization definition table, applying scale normalization to the numerical input data
INSERT_NORM_LIN_ZSCORE Procedure on page 47-37	Populates the normalization definition table applying z-score normalization to the numerical input data
SET_EXPRESSION Procedure	Appends to a transformation expression
SET_TRANSFORM Procedure on page 47-39	Specifies a transformation expression
STACK_BIN_CAT Procedure on page 47-40	Add categorical binning expressions to the transformation list
STACK_BIN_NUM Procedure on page 47-43	Add numerical binning expressions to the transformation list
STACK_CLIP Procedure on page 47-46	Add clipping expressions to the transformation list
STACK_COL_REM Procedure on page 47-48	Add column removal expressions to the transformation list
STACK_MISS_CAT Procedure on page 47-49	Add categorical missing value treatment expressions to the transformation list
STACK_MISS_NUM Procedure on page 47-51	Add numerical missing value treatment expressions to the transformation list
STACK_NORM_LIN Procedure on page 47-53	Add linear normalization expressions to the transformation list
XFORM_BIN_CAT Procedure on page 47-55	Creates a view that applies a categorical binning transformation to the data
XFORM_BIN_NUM Procedure on page 47-57	Creates a view that applies a numerical binning transformation to the data
XFORM_CLIP Procedure on page 47-60	Creates a view that applies a clipping transformation to the data
XFORM_COL_REM Procedure on page 47-62	Creates a view that removes the specified columns from the data
XFORM_EXPR_NUM Procedure on page 47-63	Creates a view that applies a transformation expression to a numerical column in the data
XFORM_EXPR_STR Procedure on page 47-65	Creates a view that applies a transformation expression to a character column in the data
XFORM_MISS_CAT Procedure on page 47-66	Creates a view that performs missing value treatment on the categorical attributes in the data
XFORM_MISS_NUM Procedure on page 47-67	Creates a view that performs missing value treatment on the numerical attributes in the data
XFORM_NORM_LIN Procedure on page 47-68	Creates a view that performs linear normalization to numerical attributes in the data
XFORM_STACK Procedure on page 47-70	Creates a view that transforms the data as specified by the stack definition (transformation list)

CREATE_BIN_CAT Procedure

This procedure creates a categorical binning transformation table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (
     bin_table_name     IN VARCHAR2,
     bin_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–2 CREATE_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the binning transformation table
bin_schema_name	Name of the schema hosting the binning transformation table

Usage Notes

The table created by this procedure can be used to store bin assignments for categorical attributes. The following INSERT routines are available for populating the table:

- INSERT_BIN_CAT_FREQ Procedure for frequency-based binning
- INSERT_BIN_SUPER Procedure for supervised binning

The columns in the categorical bin definition table are described in Table 47–3.

Table 47–3 Categorical Binning Definition Table

Column	Data Type	Description
col	VARCHAR2(30)	Column containing the categorical values to be binned
att	VARCHAR2(4000)	Attribute name if the column is nested
val	VARCHAR2(4000)	A value in the column to be binned
bin	VARCHAR2(4000)	The bin that contains the value

Examples

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('build_bin_cat_table');
END;
/

DESCRIBE build_bin_cat_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                VARCHAR2(4000)
 BIN                                                VARCHAR2(4000)
```

CREATE_BIN_NUM Procedure

This procedure creates a numerical binning transformation table. This table is used as input to the INSERT_BIN_NUM_EQWIDTH, INSERT_BIN_NUM_QTILE, INSERT_AUTOBIN_NUM_EQWIDTH, and XFORM_BIN_NUM procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
     bin_table_name    IN VARCHAR2,
     bin_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–4 CREATE_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table
bin_schema_name	Name of the schema hosting the bin definition table

Usage Notes

The generated bin definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)
val	NUMBER
bin	VARCHAR2(4000)

Examples

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('build_bin_num_table');
END;
/

DESCRIBE build_bin_num_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                NUMBER
 BIN                                                VARCHAR2(4000)
```

CREATE_CLIP Procedure

This procedure creates a clipping definition table. This table is used as input to the INSERT_CLIP_WINSOR_TAIL, INSERT_CLIP_TRIM_TAIL, and XFORM_CLIP procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (
     clip_table_name    IN VARCHAR2,
     clip_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–5 CREATE_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table
clip_schema_name	Name of the schema hosting the clipping definition table

Usage Notes

The generated clipping definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)
lcut	NUMBER
lval	NUMBER
rcut	NUMBER
rval	NUMBER

Examples

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('build_clip_table');
END;
/

DESCRIBE build_clip_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 LCUT                                               NUMBER
 LVAL                                               NUMBER
 RCUT                                               NUMBER
 RVAL                                               NUMBER
```

CREATE_COL_REM Procedure

This procedure creates a column removal definition table. This table is used by the STACK_COL_REM, XFORM_COL_REM, INSERT_BIN_SUPER, and INSERT_AUTOBIN_NUM_EQWIDTH procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM (
      rem_table_name           VARCHAR2,
      rem_schema_name          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–6 CREATE_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the column removal definition table.
rem_schema_name	Schema of the column removal definition table.

Usage Notes

The generated column removal definition table has the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)

The column removal definition table lists the column names and the associated attribute names to remove from the data source. The col column is case sensitive, since it generates quoted identifiers. There can be multiple entries in the column removal definition table for the same col when it is a nested column.

Examples

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('col_rem_tbl');
END;
 /

DESCRIBE col_rem_tbl
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
```

CREATE_MISS_CAT Procedure

This procedure creates a categorical missing value treatment definition table. This table is used as input to the INSERT_MISS_CAT_MODE procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
     miss_table_name       IN VARCHAR2,
     miss_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–7 CREATE_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table

Usage Notes

The generated categorical missing value treatment definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)
val	VARCHAR2(4000)

Examples

```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('build_miss_cat_table');
END;
/

DESCRIBE build_miss_cat_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                VARCHAR2(4000)
```

CREATE_MISS_NUM Procedure

This procedure creates a numerical missing value treatment definition table. This table is used as input to the INSERT_MISS_NUM_MEAN procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (
     miss_table_name       IN VARCHAR2,
     miss_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–8 CREATE_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the numeric missing value treatment definition table
miss_schema_name	Name of the schema hosting the numeric missing value treatment definition table

Usage Notes

The generated numeric missing value definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR(4000)
val	NUMBER

Example

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('build_miss_num_table');
END;
/

DESCRIBE build_miss_num_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 VAL                                                NUMBER
```

CREATE_NORM_LIN Procedure

This procedure creates a linear normalization definition table. This table is used as input to the INSERT_NORM_LIN_MINMAX, INSERT_NORM_LIN_SCALE, INSERT_NORM_LIN_ZSCORE, and XFORM_NORM_LIN procedures.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN (
     norm_table_name       IN VARCHAR2,
     norm_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–9 CREATE_NORMALIZE_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table
norm_schema_name	Name of the schema hosting the normalization definition table

Usage Notes

The generated linear normalization definition table will have the following columns.

Column Name	Data Type
col	VARCHAR2(30)
att	VARCHAR2(4000)
shift	NUMBER
scale	NUMBER

Examples

```
BEGIN
     DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('build_norm_table');
END;
/

DESCRIBE build_norm_table
 Name                                      Null?    Type
 ----------------------------------------- -------- ----------------------------
 COL                                                VARCHAR2(30)
 ATT                                                VARCHAR2(4000)
 SHIFT                                              NUMBER
 SCALE                                              NUMBER
```

DESCRIBE_STACK Procedure

This procedure describes the transformation of the data table specified by the stack definition.

Only the columns that are specified in the stack definition are transformed. The remaining columns do not change.

All columns in the stack definition are applied. Columns with NULL in the expression field are excluded. Columns in the stack definition that do not have a matching column in the data are added to the describe list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (
     xform_list           IN TRANSFORM_LIST,
     data_table_name      IN VARCHAR2,
     describe_list        OUT DESCRIBE_LIST
     data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–10 DESCRIBE_STACK Procedure Parameters

Parameter	Description
`xform_list`	List of stacked transformations
`data_table_name`	Table that contains the mining data
`describe_list`	Descriptions of stacked transformations
`data_schema_name`	Schema of table that contains the mining data. If you do not specify a schema, your own schema is used.

Usage Notes

For `DM_NESTED_NUMERICALS`, the value of `col_type` is `nest_num_col_type`. For `DM_NESTED_CATEGORICALS`, the value of `col_type` is `nest_cat_col_type`.

GET_EXPRESSION Function

This procedure returns a VARCHAR2 chunk from the expression.

Chunk numbering starts with one. For chunks outside of the range, the return value is NULL. When a chunk number is NULL the whole expression is returned as a string. If the expression is too big, a VALUE_ERROR is raised.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (
     expression           IN EXPRESSION_REC,
     chunk_num            IN PLS_INTEGER DEFAULT NULL);
 RETURN VARCHAR2;
```

Parameters

Table 47–11 GET_EXPRESSION Function Parameters

Parameter	Description
expression	Transformation expression
chunk_num	Number of the chunk

INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every numerical column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using CREATE_BIN_NUM. Based on the statistical information it collects on the input data, this procedure calculates the number of bins.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table.

N, the number of bins, is computed for each column separately and is based on the number of non-NULL values (cnt), the maximum (max), the minimum (min), the standard deviation (dev) and the constant C=3.49/0.9 as follows:

```
N=floor(power(cnt,1/3)*(max-min)/(c*dev))
```

Each of the bin_num (= N) bins bin_1,..., bin_N span ranges of equal width inc = (max – min) / N where bin_I = I when N > 0 or bin_I = N+1–I when N < 0, and bin_0 = bin_(N+1) = NULL. The values of the val column are rounded to round_num significant digits prior to scoring them in the definition table.

The parameter bin_num is used to adjust N to be at least bin_num. No adjustment is done when bin_num is NULL or 0. The parameter max_bin_num is used to adjust N to be at most max_bin_num. No adjustment is done when bin_num is NULL or 0. For columns with all integer values (discrete columns), N is adjusted to be at most the maximum number of distinct values in the observed range max-min+1.

The parameter sample_size is used to adjust cnt to be at most sample_size. No adjustment is done when sample_size is NULL or 0.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (
     bin_table_name        IN VARCHAR2,
     data_table_name       IN VARCHAR2,
     bin_num               IN PLS_INTEGER DEFAULT 3,
     max_bin_num           IN PLS_INTEGER DEFAULT 100,
     exclude_list          IN Column_List DEFAULT NULL,
     round_num             IN PLS_INTEGER DEFAULT 6,
     sample_size           IN PLS_INTEGER DEFAULT 50000,
     bin_schema_name       IN VARCHAR2 DEFAULT NULL,
     data_schema_name      IN VARCHAR2 DEFAULT NULL,
     rem_table_name        IN VARCHAR2 DEFAULT NULL,
     rem_schema_name       IN VARCHAR2 DEFAULT NULL));
```

Parameters

Table 47–12 INSERT_AUTOBIN_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorical bin table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Minimum number of bins; default number is 3
max_bin_num	Maximum number of bins that sets the upper limit for estimates of bin numbers; default is 100

Table 47–12 (Cont.) INSERT_AUTOBIN_EQWIDTH Procedure Parameters

Parameter	Description
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process; categorical attributes are automatically excluded
round_num	Number of significant digits; default is 6
sample_size	Size of the data sample; default is 50,000
bin_schema_name	Name of the schema hosting the bin definition table; default is user schema
data_schema_name	Name of the schema hosting the table with data; default is user schema
rem_table_name	Name of the column removal definition table created with CREATE_COL_REM.
rem_schema_name	Schema of the column removal definition table.

Usage Notes

For a given input table, you can call this routine several times with different specifications for number of bins for a given input table. For each call, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. The sign of bin_num, max_bin_num, and sample_size have no effect on the result; absolute values are used. The value adjustment of N is done in the following order: First bin_num, next, max_bin_num, and, finally, discrete column adjustment.

Examples

The simplest invocation of this routine populates bin definitions in the num_bin_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQUIWIDTH(
      'num_bin_table', 'build_data_table');
END;
/
```

INSERT_BIN_CAT_FREQ Procedure

This procedure finds the categorical binning definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the categorical binning definition table created using CREATE_BIN_CAT.

Definition for each relevant column is computed based on the occurrence frequency of column values that are computed from the data table. Each of the bin_num(N) bins bin_1, ..., bin_N corresponds to the values with top frequencies when N > 0 or bottom frequencies when N < 0, and bin_(N+1) to all remaining values, where bin_I = I. Ordering ties among identical frequencies are broken by ordering on column values (ASC for N > 0 or DESC for N < 0). When the number of distinct values C < N only C+1 bins will be created.

The parameter default_num (D) is used for pruning based on the number of values that fall into the default bin. When D > 0 only columns that have at least D defaults are kept while others are ignored. When D < 0 only columns that have at most D values are kept. No pruning is done when D is NULL or D = 0. Parameter bin_support (SUP) is used for restricting bins to frequent (SUP > 0) values frq >= SUP*tot, or infrequent (SUP < 0) ones frq <= –SUP*tot, where frq is a given value count and tot is a sum of all counts as computed from the data. No support filtering is done when SUP is NULL or when SUP = 0.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (
     bin_table_name       IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     bin_num              IN PLS_INTEGER DEFAULT 9,
     exclude_list         IN Column_List DEFAULT NULL,
     default_num          IN PLS_INTEGER DEFAULT 2,
     bin_support          NUMBER DEFAULT NULL,
     bin_schema_name      IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–13 INSERT_BIN_CAT_FREQ Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorical bin table generated using CREATE_BIN_CAT procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
default_num	Number of default values
bin_support	Bin support as a fraction
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the `exclude_list` parameter for a particular binning specification.

Columns with all `NULL`s are ignored. No bin definitions are populated when bin_num = 0, or bin_num, is `NULL`.

Examples

The simplest invocation of this routine populates bin definitions in the `cat_bin_table` for all the categorical attributes found in `build_table`.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
      'cat_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_EQWIDTH Procedure

This procedure finds the numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the numerical binning definition table that was created using CREATE_BIN_NUM.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table. Each of the bin_num (= N) bins bin_1,..., bin_N span ranges of equal width inc = (max – min) / N where bin_I = I when N > 0 or bin_I = N+1–I when N < 0, and bin_0 = bin_(N+1) = NULL.

The values of the val column in the bin definition table are rounded to round_num significant digits. For more information, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (
     bin_table_name        IN VARCHAR2,
     data_table_name       IN VARCHAR2,
     bin_num               IN PLS_INTEGER DEFAULT 10,
     exclude_list          IN Column_List DEFAULT NULL,
     round_num             IN PLS_INTEGER DEFAULT 6,
     bin_schema_name       IN VARCHAR2 DEFAULT NULL,
     data_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–14 INSERT_BIN_EQWIDTH Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical bin table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
round_num	Number of significant digits. See Usage Notes.
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine with different specifications for number of bins for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular binning specification.

Columns with all NULL values or only one unique value are ignored. No bin definitions are populated when bin_num = 0, or bin_num is NULL.

For example, when N=2, col='mycol', min=10, and max = 21, the following three rows are inserted into the definition table (inc = 5.5):

```
COL     VAL  BIN
----- -----  -----
mycol    10  NULL
```

```
 mycol  15.5  1
 mycol    21  2
```

The round_num parameter specifies how to round the number in the VAL column of the definition table. When round_num is positive, it specifies the most significant digits to retain. When round_num is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. When round_num is 0, the value is unchanged.

For example, a value of 308.162 would be rounded as follows.

```
For a value of 308.162:
     when round_num = 1       result is 300
     when round_num = 2       result is 310
     when round_num = 3       result is 308
     when round_num =  0      result is 308.162
     when round_num = -1      result is 308.16
     when round_num = -2      result is 308.2
     when round_num = NULL    result is NULL
```

Examples

The simplest invocation of this routine populates bin definitions in the num_bin_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM(
      'num_bin_table', 'build_table');
END;
/
```

INSERT_BIN_NUM_QTILE Procedure

This procedure finds a numerical binning definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the binning definition table that was created using CREATE_BIN_NUM.

The definition for each relevant column is computed based on the minimum values for each quantile, where quantiles are computed from the data using NTILE function. Bins bin_1,..., bin_N span the following ranges: bin_1 spans [min_1,min_2]; bin_2,..., bin_i,..., bin_N-1 span (min_i, min_(i+1)] and bin_N spans (min_N, max_N]. Bins with equal left and right boundaries are collapsed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (
    bin_table_name       IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    bin_num              IN PLS_INTEGER DEFAULT 10,
    exclude_list         IN Column_List DEFAULT NULL,
    bin_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–15 INSERT_BIN_NUM_QTILE Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using the CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
bin_num	Number of bins
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process
bin_schema_name	Name of the schema hosting the numerical binning definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for bin_num for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When N = 4, col='mycol', and data is {1,2,2,2,2,3,4}, the following three rows are inserted into the definition table:

```
COL     VAL   BIN
----- -----  -----
mycol     1   NULL
mycol     2   1
mycol     4   2
```

Here quantities are {1,2}, {2,2}, {2,3}, {4} and min(1) = 1, min(2) = 2, min(3) = 2, min(4) = 4, max(4) = 4, and ranges are [1,2], (2,2], (2,4], (4,4]. After collapsing [1,2] and (2,4].

Examples

The simplest invocation of this routine populates numerical binning definitions in the `num_bin_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE(
       'num_bin_table', 'build_table');
END;
```

INSERT_BIN_SUPER Procedure

This procedure finds a numerical and categorical binning definition for every NUMBER, FLOAT, VARCHAR2, or CHAR column in the data table that is not in the exclusion list and inserts the definition into the numerical or categorical binning definition table.

The bin boundaries are computed using a technique called **Supervised Binning**. The definition for each relevant column is computed based on the splits found by a Decision Tree model built on a single predictor. Columns that have no interesting splits are inserted into the column removal definition table (if one is specified).

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (
    num_table_name        IN VARCHAR2,
    cat_table_name        IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    target_column_name    IN VARCHAR2,
    max_bin_num           IN PLS_INTEGER  DEFAULT 1000,
    exclude_list          IN COLUMN_LIST  DEFAULT NULL,
    num_schema_name       IN VARCHAR2     DEFAULT NULL,
    cat_schema_name       IN VARCHAR2     DEFAULT NULL,
    data_schema_name      IN VARCHAR2     DEFAULT NULL,
    rem_table_name        IN VARCHAR2     DEFAULT NULL,
    rem_schema_name       IN VARCHAR2     DEFAULT NULL);
```

Parameters

Table 47–16 INSERT_BIN_SUPER Procedure Parameters

Parameter	Description
num_table_name	Name of the numerical bin definition table generated using the CREATE_BIN_NUM procedure.
cat_table_name	Name of the categorical bin definition table generated using the CREATE_BIN_CAT procedure.
data_table_name	Name of the table containing the data.
target_column_name	Name of the target column.
max_bin_num	The maximum number of bins.
exclude_list	List of columns (attributes) to be excluded from this iteration of the binning process.
num_schema_name	Schema of the numerical bin definition table.
cat_schema_name	Schema of the categorical bin definition table.
data_schema_name	Schema of the table containing the data.
rem_table_name	Name of the column removal definition table created with CREATE_COL_REM.
rem_schema_name	Schema of the column removal definition table.

INSERT_CLIP_TRIM_TAIL Procedure

This procedure finds the trimming definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

The definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that val(1) < val(2) <... < val(N), where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = NULL
rcut = val(N-floor(*N*q))
rval = NULL
```

where q = ABS(NVL(tail_frac,0)). Nothing is done when q >= 0.5.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (
    clip_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    tail_frac           IN NUMBER DEFAULT 0.025,
    exclude_list        IN Column_List DEFAULT NULL,
    clip_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–17 INSERT_CLIP_TRIM_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using the CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attributes (that is, column names) using the exclude_list parameter for a particular specification.

Example 1. When q = 0.2, col='mycol', and data is {1,2,2,2,3,4,4}, the following row is inserted into the definition table:

```
COL    LCUT   LVAL   RCUT   RVAL
----- -----  -----  -----  -----
mycol     2    NULL     4   NULL
```

Here 1 + floor(N*q) = 1 + floor(7*0.2) = 2, lcut = val(2) = 2.

N – floor(N*q) = 7 – floor(7*0.2) = 6, rcut = val(6) = 4.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL(
       'clip_table', 'build_table');
END;
```

INSERT_CLIP_WINSOR_TAIL Procedure

This procedure finds the Winsorizing definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the clipping definition table that was created using CREATE_CLIP.

Definition for each relevant column is computed based on the non-NULL values sorted in ascending order such that val(1) < val(2) <... < val(N), where N is a total number of non-NULL values in a column:

```
lcut = val(1+floor(N*q))
lval = lcut
rcut = val(N-floor(N*q))
rval = rcut
```

where q = ABS(NVL(tail_fraq,0)). Nothing is done when q >= 0.5.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (
    clip_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    tail_frac          IN NUMBER DEFAULT 0.025,
    exclude_list       IN Column_List DEFAULT NULL,
    clip_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–18 INSERT_CLIP_WINSOR_TAIL Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP procedure
data_table_name	Name of the table containing the data
tail_frac	Tail fraction
exclude_list	List of columns (attributes) to be excluded from this iteration of the clipping process
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with different specifications for tail_frac for a given input table. For each iteration, you can selectively exclude attribute (that is, column names using the exclude_list parameter for a particular specification. Columns with all NULL values are ignored.

Example 1. When q = 0.2, col='mycol', and data is {1,2,2,2,3,4,4}, the following row is inserted into the definition table:

```
COL    LCUT   LVAL   RCUT  RVAL
----- -----  -----  ----- -----
mycol     2      2      4      4
```

Here 1 + floor(N*q) = 1 + floor(7*0.2) = 2, lcut = val(2) = 2.

N – floor(N*q) = 7 – floor(7*0.2) = 6, rcut = val(6) = 4.

Examples

The simplest invocation of this routine populates clipping definitions in the `clip_table` for all the numerical attributes found in `build_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL(
       'clip_table', 'build_table');
END;
```

INSERT_MISS_CAT_MODE Procedure

This procedure finds the categorical missing value treatment definition for every VARCHAR2 and CHAR column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_CAT.

The definition for each selected column is computed based on the mode value that is computed from the data table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–19 INSERT_MISS_CAT_MODE Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the missing value treatment. See "Data Types" on page 47-7 for the definition of COLUMN_LIST.
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the categorical attributes that will receive missing value treatment by using the exclude_list parameter. NULL values in all the selected attributes will be replaced with the mode (the most commonly occurring value) for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in miss_table for all categorical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE(
       'miss_table', 'build_table');
END;
```

INSERT_MISS_NUM_MEAN Procedure

This procedure finds the numerical missing value treatment definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition into the definition table that was created using CREATE_MISS_NUM.

The definition for each selected column is computed based on the mean value that is computed from the data table. The value of mean is rounded to round_num significant digits prior to storing it in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name    IN VARCHAR2,
    data_table_name    IN VARCHAR2,
    exclude_list       IN COLUMN_LIST DEFAULT NULL,
    round_num          IN PLS_INTEGER DEFAULT 6,
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–20 INSERT_MISS_NUM_MEAN Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the miss value treatment. See "Data Types" on page 47-7 for the definition of COLUMN_LIST.
round_num	The number of significant digits
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the table containing the data

Usage Notes

You can choose the numerical attributes that will receive missing value treatment by using the exclude_list parameter. NULL values in all the selected attributes will be replaced with the mean (average) value for the attribute.

If you wish to replace NULLs with some other value, you can edit the definition table.

Example

The simplest invocation of this routine populates missing value definitions (the mode) in miss_table for all numerical attributes found in build_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_CAT_MODE(
       'miss_table', 'build_table');
END;
```

INSERT_NORM_LIN_MINMAX Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the mean and standard deviation that are computed from the data table, such that shift = mean and scale = standard deviation. The values of shift and scale are rounded to round_num significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN Column_List DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–21 INSERT_NORM_LIN_MINMAX Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_minmax_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX(
      'norm_minmax_table', 'build_table');
END;
```

INSERT_NORM_LIN_SCALE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on min-max normalization into the table that was created using CREATE_NORM_LIN.

The normalization definition for each attribute is computed based on the minimum and maximum values of the data. The values for shift and scale are shift = 0 and scale = max{abs(max), abs(min)}.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN Column_List DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–22 INSERT_NORM_LIN_SCALE Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_minmax_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE(
      'norm_scale_table', 'build_table');
END;
```

INSERT_NORM_LIN_ZSCORE Procedure

This procedure finds the normalization definition for every NUMBER column in the data table that is not specified in the exclusion list and inserts the definition based on z-score normalization into the table that was created using CREATE_NORM_LIN.

Definition for each relevant column is computed based on the minimum and maximum values that are computed from the data table, such that shift = min and scale = max – min. The values of shift and scale are rounded to round_num significant digits prior to storing them in the definition table.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
     norm_table_name     IN VARCHAR2,
     data_table_name     IN VARCHAR2,
     exclude_list        IN Column_List DEFAULT NULL,
     round_num           IN PLS_INTEGER DEFAULT 6,
     norm_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–23 INSERT_NORM_LIN_ZSCORE Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
exclude_list	List of columns (attributes) to be excluded from this iteration of the normalization process
round_num	Number of significant digits
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the table with data

Usage Notes

For a given input table, you can iteratively call this routine several times with selective exclusion of attributes (that is, column names) using the exclude_list parameter for a particular normalization specification.

Columns with all NULL values or only one unique value are ignored.

Examples

The simplest invocation of this routine populates normalization definitions in the norm_zscore_table for all the numerical attributes found in build_table.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE(
      'norm_zscore_table', 'build_table');
END;
/
```

SET_EXPRESSION Procedure

This procedure appends a VARCHAR2 chunk to the expression. Appending NULL clears the expression.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION (
           expression       IN OUT NOCOPY EXPRESSION_REC,
           chunk            VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–24 SET_EXPRESSION Procedure Parameters

Parameter	Description
expression	Transformation expression
chunk	Chunk to add to the expression

SET_TRANSFORM Procedure

This procedure specifies a transformation expression and a reverse transformation expression for an attribute.

The new transformation specification is appended to the transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (
          xform_list               IN OUT NOCOPY TRANSFORM_LIST,
          attribute_name           VARCHAR2,
          attribute_subname        VARCHAR2,
          expression               VARCHAR2,
          reverse_expression       VARCHAR2,
          attribute_spec           VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–25 SET_TRANSFORM Procedure Parameters

Parameter	Description
`xform_list`	The transformation list for the attribute
`attribute_name`	Name of the attribute
`attribute_subname`	Name of the nested attribute if *`attribute_name`* is a nested column, otherwise `NULL`.
`expression`	A SQL expression.
`reverse_expression`	SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target)
`attribute_spec`	You can specify the value `NOPREP` for `attribute_spec` to prevent this attribute from being automatically transformed in `DBMS_DATA_MINING.CREATE_MODEL`. (See "CREATE_MODEL Procedure" on page 42-48.)

STACK_BIN_CAT Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks a categorical binning expression on top of the existing expression and updates the stack definition.

Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When a reverse expression is NULL, it is treated as an identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, {expr} has the following form after stacking:

```
DECODE({expr}, '{val1}', '{bin1}',
                ...
               '{valN}', '{binN}',
                NULL,     NULL,
                         '{bin(N+1)}')
```

and {rexp} has the following form:

```
DECODE("{attr}", '{bin1}',     '{rev1}',
                  ...
                  '{binN}',     '{revN}',
                  NULL,         'NULL',
                  '{bin(N+1)}', 'DEFAULT')
```

where {revI} is the result of applying reverse expression to {valI}.

If {binI} and {binJ} are equal, then the corresponding entries of the DECODE function above are merged into:

```
'{binI}', '{revI}, {revJ}'
```

If more than one entry maps to the default bin {bin(N+1)}, they are all merged to

```
 '{bin(N+1)}', 'DEFAULT'
```

Note that the reverse expression implicitly maps invalid bins to NULL.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (
     bin_table_name     IN       VARCHAR2,
     transform_list     IN/OUT   DM_TRANSFORMS,
     literal_flag       IN       BOOLEAN  DEFAULT FALSE,
     bin_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–26 STACK_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table
transform_list	List of stacked transformations

Table 47–26 (Cont.) STACK_BIN_CAT Procedure Parameters

Parameter	Description
literal_flag	Literal flag (See the Usage Notes)
bin_schema_name	Schema of the bin definition table

Usage Notes

The Literal flag indicates whether the values in {bin} are valid SQL literals. When the the flag is set to TRUE, the value of {bin} is used "as is" in the expression generation, otherwise it is converted into a valid text literal (surrounded by quotes and double the quotes inside). By default the flag is set to FALSE. One example when it can be set to TRUE is in cases when all {bin} are numbers. In that case the transformed column will remain numeric as opposed to textual (default behavior). For example, for the following transform definition:

```
COL   VAL            BIN
----- -------------- ----
mycol Waltham        1
mycol Burlington     1
mycol Redwood Shores 2
```

the following {expr} and {rexp} are generated when the flag is FALSE:

```
expr = DECODE("mycol", 'Waltham',        '1',
                       'Burlington',     '1',
                       'Redwood Shores', '2')
rexp = DECODE("COL1", '1',  '''Waltham'', ''Burlington''',
                      '2',  '''Redwood Shores''',
                        NULL, 'DEFAULT')
```

and when the flag is set to TRUE:

```
expr = DECODE("mycol", 'Waltham',        1,
                       'Burlington',     1,
                       'Redwood Shores', 2)
 rexp = DECODE("COL1", 1,    '''Waltham'', ''Burlington''',
                       2,    '''Redwood Shores''',
                       NULL, 'DEFAULT')
```

Example

Given transformation definition:

```
{col = COL1, val = waltham,        bin = MA}
{col = COL1, val = burlington,     bin = MA}
{col = COL1, val = redwood shores, bin = CA}
{col = COL2, val = MA,             bin = East}
{col = COL2, val = CA,             bin = West}
{col = COL2, val = NULL,           bin = USA}
```

and stack definition:

```
{attr = COL1, expr = lower(COL1), rexp = initcap(COL1)}
{attr = COL3, expr = upper(COL3), rexp = initcap(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = DECODE(lower(COL1), 'waltham',        'MA',
                            'burlington',     'MA',
```

```
                              'redwood shores', 'CA'),
 rexp = DECODE("COL1", 'MA', '''Waltham'', ''Burlington''',
                       'CA', '''Redwood Shores''',
                        NULL, 'DEFAULT')}
{attr = COL3,
 expr = upper(COL3),
 rexp = initcap(COL3)}
{attr = COL2,
 expr = DECODE("COL2", 'MA', 'East',
                       'NY', 'East',
                       'CA', 'West',
                        NULL, NULL,
                             'USA')
 rexp = DECODE("COL2", 'East', '''MA''',
                       'West', '''CA''',
                        NULL,   'NULL',
                       'USA',  'DEFAULT')}
```

STACK_BIN_NUM Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks numerical a binning expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added, or remains unchanged, then a corresponding reverse expression is also updated, added, or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, {expr} has the following form after stacking:

```
CASE WHEN ({expr}) <  {val0}   THEN '{bin0}'
     WHEN ({expr}) <= {val1}   THEN '{bin1}'
     ...
     WHEN ({expr}) <= {valN}   THEN '{binN}'
     WHEN ({expr}) IS NOT NULL THEN '{bin(N+1)}'
END
```

and {rexp} has the following form:

```
DECODE("{attr}", '{bin0}',     '( ; {rev0})',
                 '{bin1}',     '[{rev0}; {rev1})',
                 ...
                 '{binN}',     '[{rev(N-1)}; {revN}]',
                 '{bin(N+1)}', '({revN}; )',
                   NULL,         'NULL')
```

where {revI} is the result of applying reverse expression to {valI}.

If {binI} and {binJ} are equal then the corresponding entries of the DECODE function above are merged into:

```
       '{binI}', '[{rev(I-1)}; {revI}), [{rev(J-1)}; {revJ})'
```

Note that reverse expression implicitly maps invalid bins to NULL.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (
     bin_table_name     IN       VARCHAR2,
     transform_list     IN/OUT   DM_TRANSFORMS,
     literal_flag       IN       BOOLEAN  DEFAULT FALSE,
     bin_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–27 STACK_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the bin definition table.

Table 47–27 (Cont.) STACK_BIN_NUM Procedure Parameters

Parameter	Description
transform_list	Stack definition.
literal_flag	Literal flag (See Usage Notes)
bin_schema_name	Schema of the bin definition table

Usage Notes

Literal flag indicates whether the values in {bin} are valid SQL literals. When the flag is set to TRUE the value of {bin} is used "as is" in the expression generation, otherwise it is converted into a valid text literal (surround by quotes and double the quotes inside. By default the flag is set to FALSE. One example when it can be set to TRUE is in cases when all {bin} are numbers. In that case the transformed column will remain numeric as opposed to textual (default behavior). For example, for the following xform definition:

```
COL     VAL BIN
----- ----- -----
mycol    10 NULL
mycol    15 1
mycol    20 2
```

the following {expr} and {rexp} are generated when the flag is FALSE:

```
expr = CASE WHEN "mycol" <  10 THEN NULL
            WHEN "mycol" <= 15 THEN '1'
            WHEN "mycol" <= 20 THEN '2' END

rexp = DECODE("mycol", '1',  '[10; 15)',
                       '2',  '[15; 20]'
                       NULL, '( ; 10) OR (20; ) OR NULL')
```

and when the flag is set to TRUE:

```
expr = CASE WHEN "mycol" <  10 THEN NULL
            WHEN "mycol" <= 15 THEN 1
            WHEN "mycol" <= 20 THEN 2 END
rexp = DECODE("mycol", 1,    '[10; 15)',
                       2,    '[15; 20]',
                       NULL, '( ; 10) OR (20; ) OR NULL')
```

Examples

Given transformation definition:

```
{col = COL1, val = 0,   bin = NULL}
{col = COL1, val = 1,   bin = A}
{col = COL1, val = 2,   bin = B}
{col = COL1, val = 3,   bin = A}
{col = COL2, val = 10,  bin = NULL}
{col = COL2, val = 15,  bin = 1}
{col = COL2, val = 20,  bin = 2}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = CASE WHEN (log(10, COL1)) <  0 THEN NULL
             WHEN (log(10, COL1)) <= 1 THEN 'A'
             WHEN (log(10, COL1)) <= 2 THEN 'B'
             WHEN (log(10, COL1)) <= 3 THEN 'A' END,
 rexp = DECODE("COL1", 'A',   '[1; 10), [100; 1000]',
                       'B',   '[10; 100)',
                       NULL, '( ; 1), (1000; ), NULL')}
 {attr = COL3,
  expr = ln(COL3),
  rexp = exp(COL3)}
 {attr = COL2,
  expr = CASE WHEN "COL2" <  10 THEN NULL
              WHEN "COL2" <= 15 THEN '1'
              WHEN "COL2" <= 20 THEN '2' END
  rexp = DECODE("COL2", '1',  '[10; 15)',
                        '2',  '[15; 20]',
                         NULL, '( ; 10) OR (20; ) OR NULL')}
```

STACK_CLIP Procedure

For every column in the stack definition that has a matching entry in the transformation definition. Stacks clipping expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed.

Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When the reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
CASE WHEN {expr} < {lcut} THEN {lval}
     WHEN {expr} > {rcut} THEN {rval}
                          ELSE {expr}
  END
```

and {rexp} remains unchanged

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_CLIP (
          clip_table_name       VARCHAR2,
          xform_list            IN OUT NOCOPY TRANSFORM_LIST,
          clip_schema_name       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–28 STACK_CLIP Procedure Parameters

Parameter	Description
`clip_table_name`	Clipping definition table
`xform_list`	Stack definition
`clip_schema_list`	Schema of the clipping definition table. If you do not specify a schema, you own schema is assumed.

Example

Given transformation definition:

```
{col = COL1, lcut = -1.5, lval = -1.5, rcut = 4.5, rval = 4.5}
{col = COL2, lcut = 0,    lval = 0,    rcut = 1,   rval = 1}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
  expr = CASE WHEN log(10, COL1) < -1.5 THEN -1.5
              WHEN log(10, COL1) > 4.5  THEN 4.5
                                        ELSE log(10, COL1)
         END,
  rexp = power(10, COL1)}
 {attr = COL3,
  expr = ln(COL3),
  rexp = exp(COL3)}
 {attr = COL2,
  expr = CASE WHEN COL2 < 0 THEN 0
              WHEN COL2 > 1 THEN 1
                            ELSE COL2
         END,
  rexp = NULL}
```

STACK_COL_REM Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks column removal expression (NULL expression) instead of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (with NULL expression).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as "{attr}" (identity function) or "VALUE" for nested columns.

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} and {rexp} are both changed to NULL.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_COL_REM (
     rem_table_name     IN       VARCHAR2,
     transform_list     IN/OUT   DM_TRANSFORMS,
     rem_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–29 STACK_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the column removal definition table.
transform_list	Stack definition
rem_schema_name	Schema of the column removal definition table.

Examples

Given transformation definition:

```
{col = COL1, att = NULL}
{col = COL2, att = NULL}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1, expr = NULL,     rexp = NULL}
{attr = COL3, expr = ln(COL3), rexp = exp(COL3)}
{attr = COL2, expr = NULL,     rexp = NULL}
```

STACK_MISS_CAT Procedure

For every column in the stack definition that has a matching entry in the transformation definition, this procedure stacks categorical missing value treatment expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes). Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
NVL({expr}, {val})
```

and {rexp} remains unchanged.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_CAT (
     miss_table_name     IN       VARCHAR2,
     transform_list      IN/OUT   DM_TRANSFORMS,
     miss_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–30 STACK_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the missing value definition table.
transform_list	Stack definition.
miss_schema_name	Schema of the missing value definition table.

Examples

Given transformation definition:

```
{col = COL1, val = 'ma'}
{col = COL2, val = 'CA'}
```

and stack definition:

```
{attr = COL1, expr = lower(COL1), rexp = initcap(COL1)}
{attr = COL3, expr = upper(COL3), rexp = initcap(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = NVL(lower(COL1), 'ma'),
 rexp = initcap(COL1)}
{attr = COL3,
expr = upper(COL3),
```

```
 rexp = initcap(COL3)}
{attr = COL2,
 expr = NVL(COL2, 'CA'),
 rexp = NULL}
```

STACK_MISS_NUM Procedure

For every column in the stack definition that has a matching entry in the transformation definition, stacks numerical missing value treatment expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
NVL({expr}, {val})
```

and {rexp} remains unchanged

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_NUM (
     miss_table_name     IN       VARCHAR2,
     transform_list      IN/OUT   DM_TRANSFORMS,
     miss_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–31 STACK_MISS_NUM Procedure Parameters

Parameter	Description
`miss_table_name`	Name of the missing value definition table.
`transform_list`	Stack definition.
`miss_schema_name`	Schema of the missing value definition table.

Examples

Given transformation definition:

```
{col = COL1, val = 4.5}
{col = COL2, val = 0}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = NVL(log(10, COL1), 4.5),
 rexp = power(10, COL1)}
{attr = COL3,
 expr = ln(COL3),
```

```
 rexp = exp(COL3)}
{attr = COL2,
 expr = NVL(COL2, 0),
 rexp = NULL}
```

STACK_NORM_LIN Procedure

For every column in the stack definition that has a matching entry in the transformation definition, stacks linear normalization expression on top of the existing expression and updates the stack definition.

Columns in the stack definition that have no matching entries in the transformation definition or have NULL expression are not changed. Columns in the transformation definition that have no matching entries in the stack definition are added to the stack definition (using "{col}" in place of the original expression or "VALUE" for nested attributes).

Reverse expressions in the stack definition are updated accordingly, that is if an expression is updated, added or remains unchanged then a corresponding reverse expression is also updated, added or remains unchanged. When reverse expression is NULL it is treated as identity function ("{attr}" or "VALUE" for nested attributes).

Given an entry ({attr}, {expr}, {rexp}) in the stack definition and a matching entry in the transformation definition, after stacking {expr} has the following form:

```
({expr} - {shift})/{scale}
```

and {rexp} maintains the following form with every occurrence of {attr} replaced with:

```
{attr}*{scale} + {shift}
```

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_NORM_LIN (
     norm_table_name     IN       VARCHAR2,
     transform_list      IN/OUT   DM_TRANSFORMS,
     norm_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–32 STACK_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the linear normalization definition table.
transform_list	Stack definition.
norm_schema_name	Schema of the linear normalization definition table.

Examples

Given transformation definition:

```
{col = COL1, shift = -1.5, scale = 20}
{col = COL2, shift = 0,    scale = 10}
```

and stack definition:

```
{attr = COL1, expr = log(10, COL1), rexp = power(10, COL1)}
{attr = COL3, expr = ln(COL3),      rexp = exp(COL3)}
```

the following updated stack definition is generated:

```
{attr = COL1,
 expr = (log(10, COL1) - (-1.5)) / 20,
 rexp = power(10, COL1*20 + (-1.5))}
```

```
{attr = COL3,
 expr = ln(COL3),
 rexp = exp(COL3)}
{attr = COL2,
 expr = (COL2 - 0) / 10,
 rexp = COL2*10 + 0}
```

XFORM_BIN_CAT Procedure

This procedure creates the view that performs categorical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
     bin_table_name       IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     xform_view_name      IN VARCHAR2,
     literal_flag         IN BOOLEAN DEFAULT FALSE,
     bin_schema_name      IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL,
     xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–33 XFORM_BIN_CAT Procedure Parameters

Parameter	Description
bin_table_name	Name of the categorized binning definition table generated using CREATE_BIN_CAT procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
literal_flag	Literal flag
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by CREATE_BIN_CAT and populated with bin definitions by INSERT_BIN_CAT_FREQ is used to guide the query generation process to construct categorical binning expressions of the following form:

```
DECODE("col", val_1, bin_1,
              ...
              val_N, bin_N,
              NULL,   NULL,
              bin_(N+1)) "col"
```

This expression maps values val_1,..., val_N into N bins bin_1,..., bin_N, and other values into bin_(N+1), while NULL values remain unchanged. bin_(N+1) is optional. If not specified, it defaults to NULL. To specify bin_(N+1) provide a row with val set to NULL.

The literal_flag parameter indicates whether the values in bin are valid SQL literals. When the flag is set to TRUE, the value of bin is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all bin are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Set `literal_flag` to TRUE when the data is binned for an O-Cluster model build.

The `col` parameter is case-sensitive since it generates quoted identifiers. In cases when there are multiple entries with the same `col`,`val` combination with different `bin`, the behavior is undefined — any one of the `bin` values might be used.

Examples

Example 1. bin_cat contains four rows with col = 'mycol':

```
{col = 'mycol', val = 'Waltham',        bin = 'MA'}
{col = 'mycol', val = 'Burlington',     bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
{col = 'mycol', val = NULL,             bin = 'OTHER'}
```

the following expression is generated:

```
 DECODE("mycol", 'Waltham',        'MA',
                 'Burlington',     'MA',
                 'Redwood Shores', 'CA',
                  NULL,             NULL,
                                   'OTHER') "mycol"
```

Example 2. bin_cat contains three rows with col = 'mycol':

```
{col = 'mycol', val = 'Waltham',        bin = 'MA'}
{col = 'mycol', val = 'Burlington',     bin = 'MA'}
{col = 'mycol', val = 'Redwood Shores', bin = 'CA'}
```

the following expression is generated:

```
DECODE("mycol", 'Waltham',        'MA',
                'Burlington',     'MA',
                'Redwood Shores', 'CA') "mycol"
```

Example 3. For the definition:

```
COL   VAL            BIN
----- ----------     ---
mycol Waltham        1
mycol Burlington     1
mycol Redwood Shores 2
```

the following expression is generated when the literal flag is set to FALSE:

```
DECODE ("mycol", 'Waltham',        '1',
                 'Burlington'      '1',
                 'Redwood Shores', '2') "mycol"
```

and when the flag is set to TRUE:

```
DECODE("mycol", 'Waltham',        1,
                'Burlington',     1,
                'Redwood Shores', 2) "mycol"
```

The simplest invocation of this routine generates a view build_view that represents the transformation query on build_table based on bin definitions in the cat_bin_table.

```
BEGIN
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT(
'cat_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_BIN_NUM Procedure

This procedure creates the view that performs numerical binning. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (
     bin_table_name     IN VARCHAR2,
     data_table_name    IN VARCHAR2,
     xform_view_name    IN VARCHAR2,
     literal_flag       IN BOOLEAN DEFAULT FALSE,
     bin_schema_name    IN VARCHAR2 DEFAULT NULL,
     data_schema_name   IN VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–34 XFORM_BIN_NUM Procedure Parameters

Parameter	Description
bin_table_name	Name of the numerical binning definition table generated using CREATE_BIN_NUM procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
literal_flag	Literal flag
bin_schema_name	Name of the schema hosting the bin definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The bin table created by CREATE_BIN_NUM and populated with bin definitions by INSERT_BIN_NUM_EQWIDTH or INSERT_BIN_NUM_QTILE is used to guide the query generation process to construct numerical binning expressions of the following form:

```
CASE WHEN "col" <  val_0   THEN 'bin0_0
     WHEN "col" <= val_1   THEN 'bin_1'
     ...
     WHEN "col" <= val_N   THEN 'bin_N'
     WHEN "col" IS NOT NULL THEN 'bin_(N+1)'
END "col"
```

This expression maps values in the range [val_0;val_N] into N bins bin_1,..., bin_N, values outside of this range into bin_0 or bin_(N+1), such that

```
(-inf; val_0)  -> bin_0
[val_0; val_1)  -> bin_1
...
(val_(N-1); val_N] -> bin_N
(val_N; +inf)  -> bin_(N+1)
```

NULL values remain unchanged. bin_(N+1) is optional. If it is not specified, the values ("col" > val_N) are mapped to NULL. To specify bin_(N+1), provide a row with val set to NULL. The order of the WHEN... THEN pairs is based on the ascending order of val for a given col.

The literal_flag parameter indicates whether the values in bin are valid SQL literals. When the flag is set to TRUE, the value of bin is used as is in query generation; otherwise it is converted into a valid text literal (surrounded by quotes and each single quote is replaced by two single quotes). By default, the flag is set to FALSE. One example of when it can be set to TRUE is in cases when all bin are numbers. In that case the transformed column will be numeric as opposed to textual (default behavior).

Note that col is case-sensitive since it generates quoted identifiers. In cases where there are multiple entries with the same col,val combination with different bin, the behavior is undefined — any one of the bin values might be used.

Examples

Example 1. bin_num contains four rows with col = 'mycol':

```
{col = 'mycol', val = 15.5, bin = 'small'}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
{col = 'mycol', val = NULL, bin = 'huge'}
```

the following expression is generated:

```
CASE WHEN "mycol" <  10       THEN 'tiny'
     WHEN "mycol" <= 15.5     THEN 'small'
     WHEN "mycol" <= 20       THEN 'large'
     WHEN "mycol" IS NOT NULL THEN 'huge'
 END "mycol"
```

Example 2. bin_num contains three rows with col = 'mycol':

```
{col = 'mycol', val = 15.5, bin = NULL}
{col = 'mycol', val = 10,   bin = 'tiny'}
{col = 'mycol', val = 20,   bin = 'large'}
```

the following expression is generated:

```
CASE WHEN "mycol" <  10   THEN NULL
     WHEN "mycol" <= 15.5 THEN 'small'
     WHEN "mycol" <= 20   THEN 'large'
END "mycol"
```

Example 3. For the definition:

```
COL   VAL  BIN
----- ---- ---
mycol   10 NULL
mycol 15.5 1
mycol   21 2
```

the following expression is generated when the literal flag is set to FALSE:

```
CASE WHEN "mycol" <  10   THEN NULL
     WHEN "mycol" <= 15.5 THEN '1'
     WHEN "mycol" <= 20   THEN '2'
 END "mycol"
```

and when the flag is set to TRUE:

```
CASE WHEN "mycol" <   10  THEN NULL
     WHEN "mycol" <= 15.5 THEN 1
     WHEN "mycol" <=  20  THEN 2
     END "mycol"
```

The simplest invocation of this routine generates a view `build_view` that represents the transformation query on `build_table` based on transform definitions in bin definitions in the `num_bin_table`.

```
BEGIN
   DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM(
      'num_bin_table', 'build_table', 'build_view');
END;
/
```

XFORM_CLIP Procedure

This procedure creates the view that performs clipping. Only the columns that are specified in the transform definition are clipped; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (
    clip_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    clip_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2,DEFAULT NULL,
    xform_schema_name     IN VARCHAR2,DEFAULT NULL;
```

Parameters

Table 47–35 XFORM_CLIP Procedure Parameters

Parameter	Description
clip_table_name	Name of the clipping definition table generated using CREATE_CLIP
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
clip_schema_name	Name of the schema hosting the clipping definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The clipping definition table created by CREATE_CLIP and populated with clipping definitions by INSERT_CLIP_WINSOR_TAIL or INSERT_CLIP_TRIM_TAIL is used to guide query generation process to construct clipping expressions of the following form:

```
CASE WHEN "col" < lcut THEN lval
     WHEN "col" > rcut THEN rval
                       ELSE "col"
END "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

Example 1 (Winsorizing). When col = 'my_col', lcut = –1.5, lval = –1.5, and rcut = 4.5 and rval = 4.5, the following expression is generated:

```
CASE WHEN "my_col" < -1.5 THEN -1.5
     WHEN "my_col" >  4.5 THEN 4.5
                          ELSE "my_col"
END "my_col"
```

Examples

The simplest invocation of this routine generates a view object `build_view` that represents the transformation query on `build_table` based on transform definitions in clipping definitions in the `clip_table`.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP(
    'clip_table', 'build_table', 'build_view');
END;
```

XFORM_COL_REM Procedure

This procedure creates a view that removes columns from the data table. Only the columns that are specified in the transform definition are removed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM (
     rem_table_name     IN       VARCHAR2,
     data_table_name    IN       VARCHAR2,
     xform_view_name    IN       VARCHAR2,
     rem_schema_name    IN       VARCHAR2 DEFAULT NULL,
     data_schema_name   IN       VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–36 XFORM_COL_REM Procedure Parameters

Parameter	Description
rem_table_name	Name of the column removal definition table.
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
rem_schema_name	Schema of the column removal definition table.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transforming view.

XFORM_EXPR_NUM Procedure

Creates a view that applies a given expression for every NUMBER column in the data table that is not in the exclusion list and in the inclusion list. The remaining columns do not change.

Expressions are constructed from the expression pattern by replacing every occurrence of the column pattern with an actual column name.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM (
     expr_pattern       IN       VARCHAR2,
     data_table_name    IN       VARCHAR2,
     xform_view_name    IN       VARCHAR2,
     exclude_list       IN       COLUMN_LIST DEFAULT NULL,
     include_list       IN       COLUMN_LIST DEFAULT NULL,
     col_pattern        IN       VARCHAR2 DEFAULT ':col',
     data_schema_name   IN       VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–37 XFORM_EXPR_NUM Procedure Parameters

Parameter	Description
expr_pattern	Expression pattern
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
exclude_list	List of columns to exclude.
include_list	List of columns to include.
col_pattern	Column pattern.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transformation view.

Examples

1. For a table TAB with two NUMBER columns CN1, CN3 and one CHAR columns CC2 and expression pattern TO_CHAR(:col), the following query is generated:

```
SELECT TO_CHAR("CN1") "CN1", "CC2", TO_CHAR("CN3") "CN3"
       FROM TAB
```

2. This procedure can be used for clipping (winsorizing) normalized data to a [0..1] range, that is values x > 1 become 1 and values x < 0 become 0.

   For the table in example 1 and pattern

   ```
   CASE WHEN :col < 0 THEN 0 WHEN :col > 1 THEN 1 ELSE :col END
   ```

   the following query is generated:

```
SELECT CASE WHEN "CN1" < 0 THEN 0 WHEN "CN1" > 1 THEN 1
            ELSE "CN1" END "CN1",
       "CC2",
     CASE WHEN "CN3" < 0 THEN 0 WHEN "CN3" > 1 THEN 1
```

```
     ELSE "CN3" END "CN3"
FROM TAB
```

XFORM_EXPR_STR Procedure

This procedure creates a view that applies a given expression for every VARCHAR2 or CHAR column in the data table that is not in the exclusion list and in the inclusion list. The remaining columns do not change.

Similar to xform_expr_num, except that it applies to CHAR and VARCHAR2 columns instead of NUMBER. See "XFORM_EXPR_NUM Procedure" on page 47-63

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR (
     expr_pattern       IN       VARCHAR2,
     data_table_name    IN       VARCHAR2,
     xform_view_name    IN       VARCHAR2,
     exclude_list       IN       COLUMN_LIST DEFAULT NULL,
     include_list       IN       COLUMN_LIST DEFAULT NULL,
     col_pattern        IN       VARCHAR2 DEFAULT ':col',
     data_schema_name   IN       VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–38 XFORM_EXPR_STR Procedure Parameters

Parameter	Description
expr_pattern	Expression pattern
data_table_name	Name of the table containing the data.
xform_view_name	View representing the transformed output.
exclude_list	List of columns to exclude.
include_list	List of columns to include.
col_pattern	Column pattern.
data_schema_name	Schema of the data table.
xform_schema_name	Schema of the transformation view.

XFORM_MISS_CAT Procedure

This procedure creates a view that performs categorical missing value treatment. Only the columns that are specified in the xform definition are treated; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (
    miss_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 47–39 XFORM_MISS_CAT Procedure Parameters

Parameter	Description
miss_table_name	Name of the categorical missing value treatment definition table generated using CREATE_MISS_CAT
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the categorical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The data type of the transformed columns is preserved by putting a CAST expression around the NVL function. For example, when col = 'state', val = 'MA' the data type is CHAR(2) the following expression is generated:

```
CAST (NVL("state", 'MA') AS CHAR(2)) "state"
```

Examples

The simplest invocation of this routine generates a view object build_view that represents the transformation query on build_table based on transform definitions in missing value definitions in miss_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT(
       'miss_table', 'build_table', 'build_view');
END;
```

XFORM_MISS_NUM Procedure

This procedure creates a view that performs numerical missing value treatment of the data table. Only the columns that are specified in the xform definition are treated, the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
    miss_table_name       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    xform_view_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    xform_schema_name     IN VARCHAR2 DEFAULT NULL;
```

Parameters

Table 47–40 XFORM_MISS_NUM Procedure Parameters

Parameter	Description
miss_table_name	Name of the numeric missing value treatment definition table generated using CREATE_MISS_NUM
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
miss_schema_name	Name of the schema hosting the numerical missing value treatment definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Examples

The simplest invocation of this routine generates a view object build_view that represents the transformation query on build_table based on transform definitions in missing value definitions in miss_table.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM(
    'miss_table', 'build_table', 'build_view');
END;
```

XFORM_NORM_LIN Procedure

This procedure creates the view that performs linear normalization. Only the columns that are specified in the definition table are transformed; the remaining columns do not change.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
     norm_table_name      IN VARCHAR2,
     data_table_name      IN VARCHAR2,
     xform_view_name      IN VARCHAR2,
     norm_schema_name     IN VARCHAR2 DEFAULT NULL,
     data_schema_name     IN VARCHAR2 DEFAULT NULL,
     xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–41 XFORM_NORM_LIN Procedure Parameters

Parameter	Description
norm_table_name	Name of the normalization definition table generated using CREATE_NORM_LIN procedure
data_table_name	Name of the table containing the data
xform_view_name	View representing the transformed output
norm_schema_name	Name of the schema hosting the normalization definition table
data_schema_name	Name of the schema hosting the data table
xform_schema_name	Name of the schema hosting the view representing the transformed output

Usage Notes

The normalization table created by CREATE_NORM_LIN is populated with definitions by either INSERT_NORM_LIN_ZSCORE or INSERT_NORM_LIN_MINMAX is used to guide the query generation process to construct normalization expressions of the following form:

```
("col" - shift)/scale "col"
```

Note that col is case-sensitive since it generates quoted identifiers. When there are multiple entries in the transform definition table for the same col, the behavior is undefined. Any one of the definitions may be used in query generation. NULL values remain unchanged.

For example, when col = 'my_col', shift = -1.5, and scale = 20. The following expression is generated:

```
("my_col" - (-1.5))/20 "my_col"
```

Examples

The simplest invocation of this routine generates a view build_view that represents the transformation query on build_table based on normalization definitions in the norm_minmax_table.

```
BEGIN
```

```
   DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN(
      'norm_minmax_table', 'build_table', 'build_view');
END;
```

XFORM_STACK Procedure

Creates a view that performs transformation of the data table specified by the stack definition. Only the columns that are specified in the stack definition are transformed, the remaining columns do not change.

All columns in the stack definition are applied. Columns with NULL value in the expression field are excluded. Columns in the stack definition that do not have a matching column in the data are added to the view.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_STACK (
     transform_list     IN     DM_TRANSFORMS,
     data_table_name    IN     VARCHAR2,
     xform_view_name    IN     VARCHAR2,
     data_schema_name   IN     VARCHAR2 DEFAULT NULL,
     xform_schema_name  IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 47–42 XFORM_STACK Procedure Parameters

Parameter	Description
`transform_list`	Stack definition.
`data_table_name`	Name of the table containing the data.
`xform_view_name`	View representing the transformed output.
`data_schema_name`	Schema of the data table.
`xform_schema_name`	Schema of the transformation view.

DBMS_DATAPUMP

The DBMS_DATAPUMP package is used to move all, or part of, a database between databases, including both data and metadata.

> **See Also:** *Oracle Database Utilities* for more information on the concepts behind the DBMS_DATAPUMP API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

- Using DBMS_DATAPUMP
  - Overview
  - Security Model
  - Constants
- Data Structures
  - Data Structures - Object Types
- Summary of DBMS_DATAPUMP Subprograms

Using DBMS_DATAPUMP

This section contains topics that relate to using the `DBMS_DATAPUMP` package.

- Overview
- Security Model
- Constants

Overview

The support and functionality provided by DBMS_DATAPUMP is as follows:

- The source and target databases can have different hardware, operating systems, character sets, and time zones.
- All object types and data types existing in Oracle Database 11*g* are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, datafile names, and tablespace names can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.

Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

Roles

The DATAPUMP_EXP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE roles allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

DATAPUMP_EXP_FULL_DATABASE

The DATAPUMP_EXP_FULL_DATABASE role affects only Export operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the DATAPUMP_EXP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_EXP_FULL_DATABASE role will also grant access to the SYS schema.

DATAPUMP_IMP_FULL_DATABASE

The DATAPUMP_IMP_FULL_DATABASE role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:

- Perform the operation outside of the scope of their schema
- Monitor jobs that were initiated by another user
- Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the DATAPUMP_IMP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_IMP_FULL_DATABASE role will also grant access to the SYS schema.

Constants

There are several public constants defined for use with the DBMS_DATAPUMP.GET_STATUS procedure. All such constants are defined as part of the DBMS_DATAPUMP package. Any references to these constants must be prefixed by DBMS_DATAPUMP. and followed by the symbols in the following lists:

Mask Bit Definitions

The following mask bit definitions are used for controlling the return of data through the DBMS_DATAPUMP.GET_STATUS procedure.

- KU$_STATUS_WIP CONSTANT BINARY_INTEGER := 1;
- KU$_STATUS_JOB_DESC CONSTANT BINARY_INTEGER := 2;
- KU$_STATUS_JOB_STATUS CONSTANT BINARY_INTEGER := 4;
- KU$_STATUS_JOB_ERROR CONSTANT BINARY_INTEGER := 8;

Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the DBMS_DATAPUMP.GET_STATUS procedure.

- KU$_DUMPFILE_TYPE_DISK CONSTANT BINARY_INTEGER := 0;
- KU$_DUMPFILE_TYPE_TEMPLATE CONSTANT BINARY_INTEGER := 3;

Data Structures

The DBMS_DATAPUMP package defines OBJECT types. The types described in this section are defined in the SYS schema for use by the GET_STATUS function. *The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.*

The collection of types defined for use with the GET_STATUS procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 10*g*, release 1 (10.1), there is a sys.ku$_Status1010 type, and in the next Oracle Database release, there could be a sys.ku$_Status1110 type defined. Both types could be used with the GET_STATUS procedure.

Public synonyms have been defined for each of the types used with the GET_STATUS procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym ku$_Status1010 is defined for the sys.ku$_Status1010 type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 10*g*, release 1, the generic synonym ku$_Status is defined as ku$_Status1010. In a future release, there might be a ku$_Status1110 synonym for sys.ku$Status1110. Because the ku$_Status generic synonym always points to the latest definition, it would now point to ku$_Status1110 rather than to ku$_Status1010.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.

Note: Languages other than PL/SQL must ensure that their type definitions are properly aligned with the version-specific definitions.

See Also: GET_STATUS Procedure on page 48-26 for additional information about how types are used

Data Structures - Object Types

The DBMS_DATAPUMP package defines the following kinds of OBJECT types:

- Worker Status Types
- Log Entry and Error Types
- Job Status Types
- Job Description Types
- Status Types

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The percent_done refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```
CREATE TYPE sys.ku$_WorkerStatus1010 AS OBJECT (
               worker_number      NUMBER,
               process_name       VARCHAR2(30),
               state              VARCHAR2(30),
               schema             VARCHAR2(30),
               name               VARCHAR2(4000),
               object_type        VARCHAR2(200),
               partition          VARCHAR2(30),
               completed_objects  NUMBER,
               total_objects      NUMBER,
               completed_rows     NUMBER,
               completed_bytes    NUMBER,
               percent_done       NUMBER)

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1010
  FOR sys.ku$_WorkerStatus1010;

CREATE TYPE sys.ku$_WorkerStatus1020 AS OBJECT (
               worker_number     NUMBER,        --  Worker process identifier
               process_name      VARCHAR2(30),  --  Worker process name
               state             VARCHAR2(30),  --  Worker process state
               schema            VARCHAR2(30),  --  Schema name
               name              VARCHAR2(4000),--  Object name
               object_type       VARCHAR2(200), --  Object type
               partition         VARCHAR2(30),  --  Partition name
               completed_objects NUMBER,        --  Completed number of objects
               total_objects     NUMBER,        --  Total number of objects
               completed_rows    NUMBER,        --  Number of rows completed
               completed_bytes   NUMBER,        --  Number of bytes completed
               percent_done      NUMBER,        --  Percent done current object
               degree            NUMBER         --  Degree of parallelism)

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus1020
  FOR sys.ku$_WorkerStatus1020;
```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatus FOR ku$_WorkerStatus1020;

CREATE TYPE sys.ku$_WorkerStatusList1010 AS TABLE OF sys.ku$_WorkerStatus1010

CREATE TYPE sys.ku$_WorkerStatusList1020 AS TABLE OF sys.ku$_WorkerStatus1020

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1010
  FOR sys.ku$_WorkerStatusList1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList1020
  FOR sys.ku$_WorkerStatusList1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_WorkerStatusList
  FOR ku$_WorkerStatusList1020;
```

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The `ku$LogLine.errorNumber` type is set to `NULL` for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:

```
CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (
              logLineNumber   NUMBER,
              errorNumber     NUMBER,
              LogText         VARCHAR2(2000))

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1020 FOR sys.ku$_LogLine1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;
```

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (`percent_done` applies to data only):

```
CREATE TYPE sys.ku$_DumpFile1010 IS OBJECT (
              file_name          VARCHAR2(4000), -- Fully-qualified name
              file_type          NUMBER,         -- 0=Disk, 1=Pipe, etc.
              file_size          NUMBER,         -- Its length in bytes
              file_bytes_written NUMBER          -- Bytes written so far)

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1010 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile1020 FOR sys.ku$_DumpFile1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFile FOR ku$_DumpFile1010;

CREATE TYPE sys.ku$_DumpFileSet1010 AS TABLE OF sys.ku$_DumpFile1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1010 FOR
  sys.ku$_DumpFileSet1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet1020 FOR
```

```
  sys.ku$_DumpFileSet1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_DumpFileSet FOR ku$_DumpFileSet1010;

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT (
               job_name            VARCHAR2(30),
               operation           VARCHAR2(30),
               job_mode            VARCHAR2(30),
               bytes_processed     NUMBER,
               percent_done        NUMBER,
               degree              NUMBER,
               error_count         NUMBER,
               state               VARCHAR2(30),
               phase               NUMBER,
               restart_count       NUMBER,
               worker_status_list  ku$_WorkerStatusList1010,
               files               ku$_DumpFileSet1010)

CREATE PUBLIC SYNONYM ku$_JobStatus1010 FOR
   sys.ku$_JobStatus1010;

CREATE TYPE sys.ku$_JobStatus1020 IS OBJECT (
             job_name           VARCHAR2(30),             -- Name of the job
             operation          VARCHAR2(30),             -- Current operation
             job_mode           VARCHAR2(30),             -- Current mode
             bytes_processed    NUMBER,                   -- Bytes so far
             total_bytes        NUMBER,                   -- Total bytes for job
             percent_done       NUMBER,                   -- Percent done
             degree             NUMBER,                   -- Of job parallelism
             error_count        NUMBER,                   -- #errors so far
             state              VARCHAR2(30),             -- Current job state
             phase              NUMBER,                   -- Job phase
             restart_count      NUMBER,                   -- #Job restarts
             worker_status_list ku$_WorkerStatusList1020, -- job worker processes
             files              ku$_DumpFileSet1010       -- Dump file info)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1020 FOR   sys.ku$_JobStatus1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus FOR ku$_JobStatus1020;
```

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

```
CREATE TYPE sys.ku$_ParamValue1010 AS OBJECT (
               param_name     VARCHAR2(30),
               param_op       VARCHAR2(30),
               param_type     VARCHAR2(30),
               param_length   NUMBER,
               param_value_n  NUMBER,
               param_value_t  VARCHAR2(4000));

CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1010 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue1020 FOR sys.ku$_ParamValue1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValue FOR ku$_ParamValue1010;

CREATE TYPE sys.ku$_ParamValues1010 AS TABLE OF sys.ku$_ParamValue1010;
```

```
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1010 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues1020 FOR
  sys.ku$_ParamValues1010;
CREATE OR REPLACE PUBLIC SYNONYM ku$_ParamValues FOR ku$_ParamValues1010;

CREATE TYPE sys.ku$_JobDesc1010 AS OBJECT (
               job_name       VARCHAR2(30),
               guid           RAW(16),
               operation      VARCHAR2(30),
               job_mode       VARCHAR2(30),
               remote_link    VARCHAR2(4000),
               owner          VARCHAR2(30),
               instance       VARCHAR2(16),
               db_version     VARCHAR2(30),
               creator_privs  VARCHAR2(30),
               start_time     DATE,
               max_degree     NUMBER,
               log_file       VARCHAR2(4000),
               sql_file       VARCHAR2(4000),
               params         ku$_ParamValues1010)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1010 FOR sys.ku$_JobDesc1010;

CREATE TYPE sys.ku$_JobDesc1020 IS OBJECT (
               job_name        VARCHAR2(30),     -- The job name
               guid            RAW(16),          -- The job GUID
               operation       VARCHAR2(30),     -- Current operation
               job_mode        VARCHAR2(30),     -- Current mode
               remote_link     VARCHAR2(4000),   -- DB link, if any
               owner           VARCHAR2(30),     -- Job owner
               platform        VARCHAR2(101),    -- Current job platform
               exp_platform    VARCHAR2(101),    -- Export platform
               global_name     VARCHAR2(4000),   -- Global name of DB
               exp_global_name VARCHAR2(4000),   -- Export global name
               instance        VARCHAR2(16),     -- The instance name
               db_version      VARCHAR2(30),     -- Version of objects
               exp_db_version  VARCHAR2(30),     -- Export version
               scn             NUMBER,           -- Job SCN
               creator_privs   VARCHAR2(30),     -- Privs of job
               start_time      DATE,             -- This job start time
               exp_start_time  DATE,             -- Export start time
               term_reason     NUMBER,           -- Job termination code
               max_degree      NUMBER,           -- Max. parallelism
               log_file        VARCHAR2(4000),   -- Log file name
               sql_file        VARCHAR2(4000),   -- SQL file name
               params          ku$_ParamValues1010  -- Parameter list)

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1020 FOR sys.ku$_JobDesc1020;
CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc FOR ku$_JobDesc1020;
```

Status Types

The status type is an aggregate of some the previous types defined and is the return value for the `GET_STATUS` call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the ku$_LogEntry that is returned has already had its log lines ordered for proper output. That is, the original ku$_LogEntry objects have been ordered from outermost context to innermost.

The status types are defined as follows:

```
CREATE TYPE sys.ku$_Status1010 AS OBJECT
(
mask NUMBER,         /* Indicates which status types are present*/
wip ku$_LogEntry1010,  /* Work-In-Progress: std. exp/imp msgs */
job_description    ku$_JobDesc1010,   /* Complete job description */
job_status         ku$_JobStatus1010, /* Detailed job status + per-worker sts */
error              ku$_LogEntry1010   /* Multi-level contextual errors */
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;

CREATE TYPE sys.ku$_Status1020 IS OBJECT
        (
               mask             NUMBER,            -- Status types present
               wip              ku$_LogEntry1010,  -- Work in progress
               job_description  ku$_JobDesc1020,   -- Complete job description
               job_status       ku$_JobStatus1020, -- Detailed job status
               error            ku$_LogEntry1010   -- Multi-level context errors
        )

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1020 FOR sys.ku$_Status1020;

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status FOR ku$_Status1020;
```

Summary of DBMS_DATAPUMP Subprograms

Table 48–1 DBMS_DATAPUMP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 48-13	Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the `FILETYPE` parameter provided with this procedure.
ATTACH Function on page 48-16	Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state
DATA_FILTER Procedures on page 48-18	Specifies restrictions on the rows that are to be retrieved
DETACH Procedure on page 48-23	Specifies that the user has no further interest in using the handle
GET_DUMPFILE_INFO Procedure on page 48-24	Retrieves information about a specified dump file
GET_STATUS Procedure on page 48-26	Monitors the status of a job or waits for the completion of a job or for more details on API errors
LOG_ENTRY Procedure on page 48-29	Inserts a message into the log file
METADATA_FILTER Procedure on page 48-30	Provides filters that allow you to restrict the items that are included in a job
METADATA_REMAP Procedure on page 48-33	Specifies a remapping to be applied to objects as they are processed in the specified job
METADATA_TRANSFORM Procedure on page 48-36	Specifies transformations to be applied to objects as they are processed in the specified job
OPEN Function on page 48-39	Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures (but not to the `ATTACH` function)
SET_PARALLEL Procedure on page 48-42	Adjusts the degree of parallelism within a job
SET_PARAMETER Procedures on page 48-44	Specifies job-processing options
START_JOB Procedure on page 48-53	Begins or resumes execution of a job
STOP_JOB Procedure on page 48-55	Terminates a job, but optionally, preserves the state of the job
WAIT_FOR_JOB Procedure on page 48-57	Runs a job until it either completes normally or stops for some other reason

ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

Syntax

```
DBMS_DATAPUMP.ADD_FILE (
   handle     IN NUMBER,
   filename   IN VARCHAR2,
   directory  IN VARCHAR2,
   filesize   IN VARCHAR2 DEFAULT NULL,
   filetype   IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE),
   reusefile  IN NUMBER DEFAULT NULL;
```

Parameters

Table 48–2 ADD_FILE Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
filename	The name of the file being added. filename must be a simple filename without any directory path information. For dump files, the filename can include a substitution variable, %U, which indicates that multiple files may be generated with the specified filename as a template. The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of export%U would cause export01, export02, export03, and so on, to be created depending on how many files are needed to perform the export. For filenames containing the % character, the % must be represented as %% to avoid ambiguity. Any % in a filename must be followed by either a % or a U.
directory	The name of a directory object within the database that is used to locate filename. A directory must be specified. See the Data Pump Export chapter in *Oracle Database Utilities* for information about the DIRECTORY command-line parameter.
filesize	The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M) or number of gigabytes (if followed by G). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes, the Export operation will fail, but it can be restarted. If not specified, filesize will default to an unlimited size. For Import and SQL_FILE operations, filesize is ignored. The minimum value for filesize is ten times the default Data Pump block size, which is 4 kilobytes. A filesize can only be specified for dump files.
filetype	The type of the file to be added. The legal values are as follows and must be preceded by DBMS_DATAPUMP.: ■ KU$_FILE_TYPE_DUMP_FILE (dump file for a job) ■ KU$_FILE_TYPE_LOG_FILE (log file for a job) ■ KU$_FILE_TYPE_SQL_FILE (output for SQL_FILE job)

Table 48–2 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
reusefile	If 0, a preexisting file will cause an error. If 1, a preexisting file will be overwritten. If NULL, the default action for the file type will be applied (that is, dump files will not be overwritten). This parameter should only be non-NULL for dump files. The reusefile parameter is restricted to export jobs.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- INVALID_STATE. The job is completing, or the job is past the defining state for an import or SQL_FILE job or is past the defining state for LOG and SQL files.
- INVALID_OPERATION. A dump file was specified for a Network Import or ESTIMATE_ONLY export operation.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a SQL_FILE operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
- Import and SQL_FILE operations require that all dump files be specified during the definition phase of the job. For Export operations, dump files can be added at any time. For example, if the user ascertains that the file space is running low during an Export, additional dump files may be added through this API. If the specified dump file already exists for an Export operation and reusefile is not set to 1, an error will be returned.
- For Export operations, the parallelism setting should be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the job will not be able to maximize parallelism to the degree specified by the SET_PARALLEL procedure.
- For Import operations, the parallelism setting should also be less than or equal to the number of dump files in the dump file set. If there are not enough dump files, the performance will not be optimal as multiple threads of execution try to access the same dump file.
- If the substitution variable (%U) is included in a filename, multiple dump files may be specified through a single call to ADD_FILE. For Export operations, the new dump files will be created as they are needed. Enough dump files will be created to allow all of the processes specified by the current SET_PARALLEL value to be active. If one of the dump files fills, it will be closed and a new dump file (with a new generated name) will be created to take its place. If multiple ADD_FILEs with substitution variables have been specified for dump files in a job, they will be used to generate dump files in a round robin fashion. For example, if expa%U, expb%U and expc%U were all specified for a job having a parallelism of 6, the initial dump

files created would look like: `expa01`, `expb01`, `expc01`, `expa02`, `expb02`, and `expc02`.

- If presented with dump file specifications, `expa%U`, `expb%U` and `expc%U`, an Import or SQL_FILE operation will begin by attempting to open the dump files, `expa01`, `expb01`, and `expc01`. If the dump file containing the master table is not found in this set, the operation will expand its search for dump files by incrementing the substitution variable and looking up the new filenames (for example, `expa02`, `expb02`, and `expc02`). The DataPump API will keep expanding the search until it locates the dump file containing the master table. If the DataPump API determines that the dump file does not exist or is not part of the current dump set at any iteration, the DataPump API will stop incrementing the substitution variable for the dump file specification that was in error. Once the master table is found, the master table will be used to ascertain when all of dump files in the dump file set have been located.

ATTACH Function

This function gains access to a previously-created job.

Syntax

```
DBMS_DATAPUMP.ATTACH(
   job_name    IN VARCHAR2 DEFAULT NULL,
   job_owner    IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 48–3 ATTACH Function Parameters

Parameter	Description
job_name	The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).
job_owner	The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the DATAPUMP_EXP_FULL_DATABASE role (for export operations) or the DATAPUMP_IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- OBJECT_NOT_FOUND. The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The function succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.

- If the ATTACH fails, use a null handle in a subsequent call to GET_STATUS for more information about the failure.

DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```
DBMS_DATAPUMP.DATA_FILTER (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.DATA_FILTER(
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN VARCHAR2,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.DATA_FILTER(
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN CLOB,
   table_name  IN VARCHAR2 DEFAULT NULL,
   schema_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48–4 DATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle that is returned from the OPEN function
name	The name of the filter
value	The value of the filter
table_name	The name of the table on which the data filter is applied. If no table name is supplied, the filter applies to all tables in the job.
schema_name	The name of the schema that owns the table on which the filter is applied. If no schema name is specified, the filter applies to all schemas in the job. If you supply a schema name you must also supply a table name.

Exceptions

- INVALID_ARGVAL. There can be several reasons for this message:
  - A bad filter name is specified
  - The mode is TRANSPORTABLE, which does not support data filters
  - The specified table does not exist
  - The filter has already been set for the specified values of schema_name and table_name
- INVALID_STATE. The user called DATA_FILTER when the job was not in the Defining state.

- INCONSISTENT_ARGS. The value parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- PRIVILEGE_ERROR. A schema name was supplied, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Each data filter can only appear once in each table (for example, you cannot supply multiple SUBQUERY filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

  With the exception of the INCLUDE_ROWS filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

  The available data filters are described in Table 48–5.

Table 48–5 Data Filters

Name	Datatype	Operations that Support Filter	Description
INCLUDE_ ROWS	NUMBER	EXPORT, IMPORT	If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.
PARTITION_ EXPR PARTITION_ LIST	text	EXPORT, IMPORT	For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for PARTITION_EXPR) or are included in the list (for PARTITION_LIST). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names. Double quotation marks around partition names are required only if the partition names contain special characters. PARTITION_EXPR is not supported on jobs across a network link. Default=All partitions are processed
SAMPLE	NUMBER	EXPORT, IMPORT	For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.

Table 48–5 (Cont.) Data Filters

Name	Datatype	Operations that Support Filter	Description
SUBQUERY	text	EXPORT, IMPORT	Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.

DATA_REMAP Procedure

This procedure specifies transformations to be applied to column data as it is exported from, or imported into, a database.

Syntax

```
DBMS_DATAPUMP.DATA_REMAP(
   handle          IN NUMBER,
   name            IN VARCHAR2,
   table_name      IN VARCHAR2,
   column          IN VARCHAR2,
   remap_function  IN VARCHAR2),
   schema          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48–6 DATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle of the current job. The current session must have previously attached to the handle through a call to an OPEN function.
name	The name of the remap
table_name	The table containing the column to be remapped
column	The name of the column to be remapped
remap_function	The meaning of remap_function is dependent upon the value of name. See Table 48–7 for a list of possible names.
schema	The schema containing the column to be remapped. If NULL, the remapping applies to all schemas moved in the job that contain the specified table.

Exceptions

- INVALID_ARGVAL. The mode is transportable (which does not support data modifications) or it has specified that no data to be included in the job. An invalid remap name was supplied.
- INVALID_OPERATION. Data remaps are only supported for Export and Import operations.
- INVALID_STATE. The DATA_REMAP procedure was called after the job started (that is, it was not in the defining state).
- NO_SUCH_JOB. The job handle is no longer valid.

Usage Notes

- The DATA_REMAP procedure is only supported for Export and Import operations. It allows you to manipulate user data being exported or imported. The name of the remap determines the remap operation to be performed.
- For export operations, you might wish to define a data remap to obscure sensitive data such as credit card numbers from a dump file, but leave the remainder of the data so that it can be read. To accomplish this, the remapping should convert each unique source number into a distinct generated number. So that the mapping is

consistent across the dump file set, the same function should be called for every column that contains the credit card number.

- For import operations, you might wish to define a data remap to reset the primary key when data is being merged into an existing table that contains colliding primary keys. A single remapping function should be provided for all columns defining or referencing the primary key to ensure that remapping is consistent.

> **Note:** If the called function uses package state variables, then to ensure that remapping is performed consistently across all tables, the job should be run with a SET_PARALLEL value of 1 and no restart operations should be performed.

The Data Remap functions are listed in Table 48–7.

Table 48–7 Names of Data Remap Functions

Name	Meaning of `remap_function`	Meaning
`COLUMN_FUNCTION`	String having the format: `[schema.]package.function`	The `name` parameter references a PL/SQL package function which is called to modify the data for the specified column. The function accepts a single parameter, which has the same datatype as the remapped column, and returns a value having the same datatype as the remapped column. Note that the default for the schema is the schema of the user performing the export.

DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```
DBMS_DATAPUMP.DETACH(
   handle  IN NUMBER);
```

Parameters

Table 48–8 DETACH Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through a call to either an OPEN or ATTACH function.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user's session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a STOP_JOB that was applied to the job referenced by the handle. All previously allocated DBMS_DATAPUMP handles are released when an instance is restarted.

GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
   filename    IN VARCHAR2,
   directory   IN VARCHAR2,
   info_table  OUT ku$_dumpfile_info,
   filetype    OUT NUMBER);
```

Parameters

Table 48–9 GET_DUMPFILE_INFO Procedure Parameters

Parameter	Description
filename	A simple filename with no directory path information
directory	A directory object that specifies where the file can be found
info_table	A PL/SQL table for storing information about the dump file
filetype	The type of file (Data Pump dump file, original Export dump file, or unknown)

Exceptions

The GET_DUMPFILE_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

- NO_DUMPFILE_INFO. Unable to retrieve dump file information as specified.

Usage Notes

You can use the GET_DUMPFILE_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of zero will be returned and the dump file info_table will remain empty.

A filetype value of one indicates a Data Pump dump file. A file type value of two indicates an original Export dump file. In both cases, the dump file info_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (
               item_code       NUMBER,           -- Identifies header item
               value           VARCHAR2(2048)    -- Text string value)
/

GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;

CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item
/
```

```
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;
```

The item codes, which can easily be extended to provide more information as needed, are currently defined as follows (prepended with the package name, `DBMS_DATAPUMP.`):

```
KU$_DFHDR_FILE_VERSION          CONSTANT NUMBER := 1;
KU$_DFHDR_MASTER_PRESENT        CONSTANT NUMBER := 2;
KU$_DFHDR_GUID                  CONSTANT NUMBER := 3;
KU$_DFHDR_FILE_NUMBER           CONSTANT NUMBER := 4;
KU$_DFHDR_CHARSET_ID            CONSTANT NUMBER := 5;
KU$_DFHDR_CREATION_DATE         CONSTANT NUMBER := 6;
KU$_DFHDR_FLAGS                 CONSTANT NUMBER := 7;
KU$_DFHDR_JOB_NAME              CONSTANT NUMBER := 8;
KU$_DFHDR_PLATFORM              CONSTANT NUMBER := 9;
KU$_DFHDR_INSTANCE              CONSTANT NUMBER := 10;
KU$_DFHDR_LANGUAGE              CONSTANT NUMBER := 11;
KU$_DFHDR_BLOCKSIZE             CONSTANT NUMBER := 12;
KU$_DFHDR_DIRPATH               CONSTANT NUMBER := 13;
KU$_DFHDR_METADATA_COMPRESSED   CONSTANT NUMBER := 14;
KU$_DFHDR_DB_VERSION            CONSTANT NUMBER := 15;
KU$_DFHDR_MAX_ITEM_CODE         CONSTANT NUMBER := 20;
KU$_DFHDR_MASTER_PIECE_COUNT    CONSTANT NUMBER := 16;
KU$_DFHDR_MASTER_PIECE_NUMBER   CONSTANT NUMBER := 17;
KU$_DFHDR_DATA_COMPRESSED       CONSTANT NUMBER := 18;
KU$_DFHDR_METADATA_ENCRYPTED    CONSTANT NUMBER := 19;
KU$_DFHDR_DATA_ENCRYPTED        CONSTANT NUMBER := 20;
```

GET_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

Syntax

```
DBMS_DATAPUMP.GET_STATUS(
   handle    IN NUMBER,
   mask      IN BINARY_INTEGER,
   timeout   IN NUMBER DEFAULT NULL,
   job_state OUT VARCHAR2,
   status    OUT ku$_Status1010);
```

Parameters

Table 48–10 GET_STATUS Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. A null handle can be used to retrieve error information after OPEN and ATTACH failures.
mask	A bit mask that indicates which of four types of information to return: ■ KU$_STATUS_WIP ■ KU$_STATUS_JOB_DESC ■ KU$_STATUS_JOB_STATUS ■ KU$_STATUS_JOB_ERROR Each status has a numerical value. You can request multiple types of information by adding together different combinations of values. See Data Structures - Object Types on page 48-7.
timeout	Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.
job_state	Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full ku$_Status structure.
status	A ku$_Status is returned. The ku$_Status mask indicates what kind of information is included. This could be none if only KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and the timeout period expires. This can be a ku$_Status1010 or ku$_Status1020 object type.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_VALUE. The mask or timeout contains an illegal value.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The GET_STATUS procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The KU$_STATUS_JOB_DESC and KU$_STATUS_JOB_STATUS values are classified as synchronous information because the information resides in the master table. The KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information *only* is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a *maximum* of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the job_state returned by GET_STATUS does not indicate a terminating job, it is possible that the job could still terminate before the next call to GET_STATUS. This would result in an INVALID_HANDLE exception. Alternatively, the job could terminate during the call to GET_STATUS, which would result in a NO_SUCH_JOB exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the GET_STATUS procedure:

- Errors resulting from other procedure calls: For example, the SET_PARAMETER procedure may produce an INCONSISTENT_ARGS exception. The client should immediately call GET_STATUS with mask=8 (errors) and timeout=0. The returned ku$_Status.error will contain a ku$_LogEntry that describes the inconsistency in more detail.
- Errors resulting from events asynchronous to the client(s): An example might be Table already exists when trying to create a table. The ku$_Status.error will contain a ku$_LogEntry with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to GET_STATUS with an infinite timeout (-1) "listening" for KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages. If status was requested, then JOB_STATUS information will also be in the request.

When the ku$_Status is interpreted, the following guidelines should be used:

- ku$_Status.ku$_JobStatus.percent_done refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
  - EXPORT or network IMPORT--(bytes_processed/estimated_bytes) * 100
  - IMPORT--(bytes_processed/total_expected_bytes) * 100
  - SQL_FILE or estimate-only EXPORT--0.00 if not done or 100.00 if done

  The effects of the QUERY and PARTITION_EXPR data filters are not considered in computing percent_done.

It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

```
((SYSDATE - start time) / ku$_Status.ku$_JobStatus.percent_done) * 100
```

- The caller should not use `ku$_Status.ku$_JobStatus.percent_done` for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in `job_state`.

LOG_ENTRY Procedure

This procedure inserts a message into the log file.

Syntax

```
DBMS_DATAPUMP.LOG_ENTRY(
   handle         IN NUMBER,
   message        IN VARCHAR2
   log_file_only  IN NUMBER DEFAULT 0);
```

Parameters

Table 48–11 LOG_ENTRY Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
message	A text line to be added to the log file
log_file_only	Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU$_STATUS_WIP) messages.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The message is added to the log file. If log_file_only is zero (the default), the message is also broadcast as a KU$_STATUS_WIP message through the GET_STATUS procedure to all users attached to the job.

The LOG_ENTRY procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports INCLUDE and EXCLUDE parameters defined by the user. Identifying these values as calls to the underlying METADATA_FILTER procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the INCLUDE and EXCLUDE parameters.

Lines entered in the log stream from LOG_ENTRY are prefixed by the string, ";;; "

METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

```
DBMS_DATAPUMP.METADATA_FILTER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN VARCHAR2,
   object_path  IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.METADATA_FILTER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN CLOB,
   object_path  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48–12 METADATA_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from the OPEN function
name	The name of the filter. See Table 48–13 for descriptions of the available filters.
value	The value of the filter
object_path	The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.

Table 48–13 describes the name, the object type, and the meaning of the filters available with the METADATA_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

Table 48–13 Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
NAME_EXPR NAME_LIST	Named objects	Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed.

Table 48–13 (Cont.) Filters Provided by METADATA_FILTER Procedure

Name	Object Type	Meaning
SCHEMA_EXPR SCHEMA_LIST	Schema objects	Restricts the job to objects whose owning schema name is satisfied by the expression. For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN (''SCOTT'')'). For Schema mode, identifies which users are to be processed.
TABLESPACE_EXPR TABLESPACE_LIST	TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT	Restricts the job to objects stored in a tablespace whose name is satisfied by the expression. For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job. For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.
INCLUDE_PATH_EXPR INCLUDE_PATH_LIST EXCLUDE_PATH_EXPR EXCLUDE_PATH_LIST	All	Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_*) or excluded (EXCLUDE_PATH_*) from the operation. The object_path parameter is not supported for these filters.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception can indicate any of the following conditions:
  - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
  - The specified object_path is not supported for the current mode.
  - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- INVALID_STATE. The user called the METADATA_FILTER procedure after the job left the defining state.
- INCONSISTENT_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS_WITH_INFO. The procedure succeeded but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE_PATH_EXPR and INCLUDE_PATH_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter,

grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.

- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:
  - NAME_EXPR
  - SCHEMA_EXPR
  - TABLESPACE_EXPR
  - INCLUDE_PATH_EXPR
  - EXCLUDE_PATH_EXPR

  The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:
  - NAME_LIST
  - SCHEMA_LIST
  - TABLESPACE_LIST
  - INCLUDE_PATH_LIST
  - EXCLUDE_PATH_LIST
- Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.
- If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).
- The same filter name can be specified multiple times within a job. For example, specifying `NAME_EXPR as '!=''EMP'''` and `NAME_EXPR as '!=''DEPT'''` on a Table mode export would produce a file set containing all of the tables except for `EMP` and `DEPT`.

METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_REMAP (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   old_value   IN VARCHAR2,
   value       IN VARCHAR2,
   object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48–14 METADATA_REMAP Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.
name	The name of the remap. See Table 48–15 for descriptions of the available remaps.
old_value	Specifies which value in the dump file set should be reset to value
value	The value of the parameter for the remap. This signifies the new value that old_value should be translated into.
object_type	Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.

Table 48–15 describes the remaps provided by the METADATA_REMAP procedure.

Table 48–15 Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_SCHEMA	Text	Schema objects	Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema. Privileged users can perform unrestricted schema remaps. Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap. For example, SCOTT can remap his BLAKE's objects to SCOTT, but SCOTT cannot remap SCOTT's objects to BLAKE.

Table 48–15 (Cont.) Remaps Provided by the METADATA_REMAP Procedure

Name	Datatype	Object Type	Meaning
REMAP_TABLESPACE	Text	TABLE, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG,TABLE_SPACE	Any storage segment in the job that matches the object_type parameter and was located in the old_value tablespace will be relocated to the value tablespace.
REMAP_DATAFILE	Text	LIBRARY, TABLESPACE, DIRECTORY	Any datafile reference in the job that matches the object_type parameter and referenced the old_value datafile will be redefined to use the value datafile.
REMAP_TABLE	Text	TABLE	Any reference to a table in the job that matches the old_value table name will be replaced with the value table name. The old_value parameter may refer to a partition such as employees.low. This allows names for tables constructed the by PARTITION_OPTIONS=DEPARTITION parameter to be specified by the user.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The job's mode does not include the specified object_type.
  - The remap has already been specified for the specified old_value and object_type.
- INVALID_OPERATION. Remaps are only supported for SQL_FILE and Import operations. The job's operation was Export, which does not support the use of metadata remaps.
- INVALID_STATE. The user called METADATA_REMAP after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the remap.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_REMAP procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing

the DDL directly and then executing it, you can produce any remappings that you need.

- Transforms for the DataPump API are a subset of the remaps implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according its parameters. That is, two remaps cannot specify conflicting or redundant remaps.

METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

Syntax

```
DBMS_DATAPUMP.METADATA_TRANSFORM (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN VARCHAR2,
   object_type IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.METADATA_TRANSFORM (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER,
   object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48–16 METADATA_TRANSFORM Procedure Parameters

Parameter	Description
handle	The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.
name	The name of the transformation. See Table 48–17 for descriptions of the available transforms.
value	The value of the parameter for the transform
object_type	Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the transform applies to all applicable objects within the job. The object_type parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.

Table 48–17 describes the transforms provided by the METADATA_TRANSFORM procedure.

Table 48–17 Transforms Provided by the METADATA_TRANFORM Procedure

Name	Datatype	Object Type	Meaning
PCTSPACE	NUMBER	TABLE INDEX TABLESPACE	Specifies a percentage multiplier used to alter extent allocations and datafile sizes. Used to shrink large tablespaces for testing purposes. Defaults to 100.
SEGMENT_ATTRIBUTES	NUMBER	TABLE, INDEX	If nonzero (TRUE), emit storage segment parameters. Defaults to 1.

Table 48–17 (Cont.) Transforms Provided by the METADATA_TRANFORM Procedure

Name	Datatype	Object Type	Meaning
STORAGE	NUMBER	TABLE	If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.) Defaults to nonzero (TRUE).
OID	NUMBER	TYPE TABLE	If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned. Use of this transform on Object Tables will cause breakage in REF columns that point to the table. Defaults to 1.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The mode is transportable, which doesn't support transforms.
  - The job's mode does not include the specified object_type.
  - The transform has already been specified for the specified value and object_type.
- INVALID_OPERATION. Transforms are only supported for SQL_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- INVALID_STATE. The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the transform.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique

according its parameters. That is, two transforms cannot specify conflicting or redundant transformations.

OPEN Function

This function is used to declare a new job using the Data Pump API. The handle that is returned is used as a parameter for calls to all other procedures (but not to the ATTACH function).

Syntax

```
DBMS_DATAPUMP.OPEN (
   operation    IN VARCHAR2,
   mode         IN VARCHAR2,
   remote_link  IN VARCHAR2 DEFAULT NULL,
   job_name     IN VARCHAR2 DEFAULT NULL,
   version      IN VARCHAR2 DEFAULT 'COMPATIBLE'
 RETURN NUMBER;
```

Parameters

Table 48–18 OPEN Function Parameters

Parameter	Meaning
operation	The type of operation to be performed. Table 48–19 contains descriptions of valid operation types.
mode	The scope of the operation to be performed. Table 48–20 contains descriptions of valid modes. Specifying NULL generates an error.
remote_link	If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.
job_name	The name of the job. The name is limited to 30 characters; it will be truncated if more than 30 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN function and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name). The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: "SYS_<OPERATION>_<MODE>_%N". The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, "SYS_IMPORT_FULL_03"). The name supplied for the job will also be used to name the master table and other resources associated with the job.
version	The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows: ■ COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher. ■ LATEST - the version of the metadata corresponds to the database version. ■ A specific database version, for example, '10.0.0'. In Oracle Database10*g*, this value cannot be lower than 10.0.0.

Table 48–19 describes the valid operation types for the OPEN function.

Table 48–19 Valid Operation Types for the OPEN Function

Operation	Description
EXPORT	Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.
IMPORT	Restores data and metadata from a dump file set or across a database link.
SQL_FILE	Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure.

Table 48–20 describes the valid modes for the OPEN function.

Table 48–20 Valid Modes for the OPEN Function

Mode	Description
FULL	Operates on the full database or full dump file set except for the SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, and LBACSYS schemas.
SCHEMA	Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. Users cannot specify SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDPLUGINS, or LBACSYS schemas for this mode.
TABLE	Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed.
TABLESPACE	Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.
TRANSPORTABLE	Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, CREATE_JOB_VIEW, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, LOG_ERROR, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB

Exceptions

- INVALID_ARGVAL. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- JOB_EXISTS. A table already exists with the specified job name.
- PRIVILEGE_ERROR. The user does not have the necessary privileges or roles to use the specified mode.
- INTERNAL_ERROR. The job was created under the wrong schema or the master table was of the wrong format.

- SUCCESS_WITH_INFO. The function succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the ATTACH function.
- If the call to the OPEN function fails, call the GET_STATUS procedure with a null handle to retrieve additional information about the failure.

SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(
   handle      IN NUMBER,
   degree      IN NUMBER);
```

Parameters

Table 48–21 SET_PARALLEL Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
degree	The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_OPERATION. The SET_PARALLEL procedure is only valid for export and import operations.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
- To parallelize an Export job to a degree of *n*, the user should supply *n* files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

- SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

```
DBMS_DATAPUMP.SET_PARAMETER(
   handle       IN NUMBER,
   name         IN VARCHAR2,
   value        IN VARCHAR2);

DBMS_DATAPUMP.SET_PARAMETER (
   handle      IN NUMBER,
   name        IN VARCHAR2,
   value       IN NUMBER);
```

Parameters

Table 48–22 SET_PARAMETER Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to the OPEN function.
name	The name of the parameter. Table 48–23 describes the valid parameter names.
value	The value for the specified parameter

Table 48–23 describes the valid options for the name parameter of the SET_PARAMETER procedure.

Table 48–23 Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
CLIENT_COMMAND	Text	All	An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job.
COMPRESSION	Text	Export	Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations. The DATA_ONLY option compresses only user data in the dump file set. The METADATA_ONLY option compresses only metadata in the dump file set. The ALL option compresses both user data and metadata. The NONE option stores the dump file set in an uncompressed format. The METADATA_ONLY and NONE options require a job version of 10.2 or later. All other options require a job version of 11.1 or later. Default=METADATA_ONLY
DATA_OPTIONS	Number	Export and Import	A bitmask to supply special options for processing the job. The possible values are as follows: ■ KU$_DATAOPT_SKIP_CONST_ERR ■ KU$_DATAOPT_XMLTYPE_CLOB ■ KU$_DATAOPT_DISABL_APPEND_HINT Export supports the value KU$_DATAOPT_XMLTYPE_CLOB. This option stores compressed XMLType columns in the dump file as CLOBs rather than as XML documents. Import supports the value KU$_DATAOPT_SKIP_CONST_ERR. This option specifies that if constraint violations occur while data is being imported into user tables, the rows that cause the violations will be rejected and the load will continue. If this option is not set, a constraint error will abort the loading of the entire partition (or table for unpartitioned tables). Setting this option may affect performance, especially for pre-existing tables with unique indexes or constraints. Import also supports the value KU$_DATAOPT_DISABL_APPEND_HINT. This option prevents the append hint from being applied to the data load. Disabling the APPEND hint can be useful if there is a small set of data objects to load that already exist in the database and some other application may be concurrently accessing one or more of the data objects. Use of this parameter requires that the version on the OPEN function be set to 11.1 or later. Default=0

Table 48–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION	Text	Export	Specifies what to encrypt in the dump file set, as follows: ALL enables encryption for all data and metadata in the export operation. DATA_ONLY specifies that only data is written to the dump file set in encrypted format. ENCRYPTED_COLUMNS_ONLY specifies that only encrypted columns are written to the dump file set in encrypted format. METADATA_ONLY specifies that only metadata is written to the dump file set in encrypted format. NONE specifies that no data is written to the dump file set in encrypted format. This parameter requires a job version of 11.1 or later. The default value depends upon the combination of encryption-related parameters that are used. To enable encryption, either ENCRYPTION or ENCRYPTION_PASSWORD or both, must be specified. If only ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to ALL. If neither ENCRYPTION nor ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to NONE. To specify ALL, DATA_ONLY, or METADATA_ONLY, the COMPATIBLE initialization parameter must be set to at least 11.1. **NOTE**: If the data being exported includes SecureFiles that you want to be encrypted, then you must specify ENCRYPTION=ALL to encrypt the entire dump file set. Encryption of the entire dump file set is the only way to achieve encryption security for SecureFiles during a Data Pump export operation.
ENCRYPTION_ALGORITHM	Text	Export	Identifies which cryptographic algorithm should be used to perform encryption. Possible values are AES128, AES192, and AES256. The ENCRYPTION_ALGORITHM parameter requires that you also specify either ENCRYPTION or ENCRYPTION_PASSWORD; otherwise an error is returned. See *Oracle Database Advanced Security Administrator's Guide* for information about encryption algorithms. This parameter requires a job version of 11.1 or later. Default=AES128

Table 48–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION_MODE	Text	Export	Identifies the types of security used for encryption and decryption. The values are as follows: PASSWORD requires that you provide a password when creating encrypted dump file sets. You will need to provide the same password when you import the dump file set. PASSWORD mode requires that you also specify the ENCRYPTION_PASSWORD parameter. The PASSWORD mode is best suited for cases in which the dump file set will be imported into a different or remote database, but which must remain secure in transit. TRANSPARENT allows an encrypted dump file set to be created without any intervention from a database administrator (DBA), provided the required Oracle Encryption Wallet is available. Therefore, the ENCRYPTION_PASSWORD parameter is not required, and will in fact, cause an error if it is used in TRANSPARENT mode. This encryption mode is best suited for cases in which the dump file set will be imported into the same database from which it was exported. DUAL creates a dump file set that can later be imported using either the Oracle Encryption Wallet or the password that was specified with the ENCRYPTION_PASSWORD parameter. DUAL mode is best suited for cases in which the dump file set will be imported on-site using the Oracle Encryption Wallet, but which may also need to be imported offsite where the Oracle Encryption Wallet is not available. When you use the ENCRYPTION_MODE parameter, you must also use either the ENCRYPTION or ENCRYPTION_PASSWORD parameter. Otherwise, an error is returned. To use DUAL or TRANSPARENT mode, the COMPATIBLE initialization parameter must be set to at least 11.1. The default mode depends on which other encryption-related parameters are used. If only ENCRYPTION is specified, then the default mode is TRANSPARENT. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is open, then the default is DUAL. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is closed, then the default is PASSWORD.

Table 48–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ENCRYPTION_ PASSWORD	Text	Export and Import	Specifies a key for re-encrypting encrypted table columns, metadata, or table data so that they are not written as clear text in the dump file set. If the export operation involves encrypted table columns, but an encryption password is not supplied, then the encrypted columns will be written to the dump file set as clear text and a warning will be issued. **NOTE**: Data Pump encryption functionality has changed as of Oracle Database 11g release 1 (11.1). Prior to release 11.1, the ENCRYPTION_PASSWORD parameter applied only to encrypted columns. However, as of release 11.1, the new ENCRYPTION parameter provides options for encrypting other types of data. This means that if you now specify ENCRYPTION_PASSWORD without also specifying ENCRYPTION and a specific option, then *all* data written to the dump file will be encrypted (equivalent to specifying ENCRYPTION=ALL). If you want to re-encrypt *only* encrypted columns, you must now specify ENCRYPTION=ENCRYPTED_COLUMNS_ONLY in addition to ENCRYPTION_PASSWORD. For export operations, this parameter is required if ENCRYPTION_MODE is set to either PASSWORD or DUAL. If ENCRYPTION_PASSWORD is specified but ENCRYPTION_MODE is not specified, then it is not necessary to have Transparent Data Encryption set up since ENCRYPTION_MODE will default to PASSWORD. The ENCRYPTION_PASSWORD parameter is not valid if the requested encryption mode is TRANSPARENT. To use the ENCRYPTION_PASSWORD parameter if ENCRYPTION_MODE is set to DUAL, you must have Transparent Data Encryption set up. See *Oracle Database Advanced Security Administrator's Guide* for more information about Transparent Data Encryption. For network exports, the ENCRYPTION_PASSWORD parameter in conjunction with ENCRYPTION=ENCRYPTED_COLUMNS_ONLY is not supported with user-defined external tables that have encrypted columns. The table will be skipped and an error message will be displayed, but the job will continue. Encryption attributes for all columns must match between the exported table definition and the target table. This parameter requires a job version of 10.2 or later.
ESTIMATE	Text	Export and Import	Specifies that the estimate method for the size of the tables should be performed before starting the job. If BLOCKS, a size estimate for the user tables is calculated using the count of blocks allocated to the user tables. If STATISTICS, a size estimate for the user tables is calculated using the statistics associated with each table. If no statistics are available for a table, the size of the table is estimated using BLOCKS. The ESTIMATE parameter cannot be used in Transportable Tablespace mode. Default=BLOCKS

Table 48–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
ESTIMATE_ONLY	Number	Export	Specifies that only the estimation portion of an export job should be performed. This option is useful for estimating the size of dump files when the size of the export is unknown.
FLASHBACK_SCN	NUMBER	Export and network Import	System change number (SCN) to serve as transactionally consistent point for reading user data. If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions, except for logical standby databases and Streams targets. FLASHBACK_SCN is not supported in Transportable mode.
FLASHBACK_ TIME	Text	Export and network Import	Either the date and time used to determine a consistent point for reading user data or a string of the form TO_ TIMESTAMP(...). If neither FLASHBACK_SCN nor FLASHBACK_TIME is specified, there will be no transactional consistency between partitions. FLASHBACK_SCN and FLASHBACK_TIME cannot both be specified for the same job. FLASHBACK_TIME is not supported in Transportable mode.
INCLUDE_ METADATA	NUMBER	Export and Import	If nonzero, metadata for objects will be moved in addition to user table data. If zero, metadata for objects will not moved. This parameter converts an Export operation into an unload of user data and an Import operation into a load of user data. INCLUDE_METADATA is not supported in Transportable mode. Default=1
PARTITION_ OPTIONS	Text	Import	Specifies how partitioned tables should be handled during an import operation. The options are as follows: NONE means that partitioning is reproduced on the target database as it existed in the source database. DEPARTITION means that each partition or subpartition that contains storage in the job is reproduced as a separate unpartitioned table. Intermediate partitions that are subpartitioned are not re-created (although their subpartitions are converted into tables). The names of the resulting tables are system-generated from the original table names and partition names unless the name is overridden by the REMAP_TABLE metadata transform. MERGE means that each partitioned table is re-created in the target database as an unpartitioned table. The data from all of the source partitions is merged into a single storage segment. This option is not supported for transportable jobs or when the TRANSPORTABLE parameter is set to ALWAYS. This parameter requires a job version of 11.1 or later. Default=NONE
SKIP_ UNUSABLE_ INDEXES	NUMBER	Import	If nonzero, rows will be inserted into tables having unusable indexes. SKIP_UNUSABLE_INDEXES is not supported in Transportable mode. Default=1

Table 48–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
SOURCE_EDITION	Text	Export and network Import	The application edition that will be used for determining the objects that will be unloaded for export and for network import.
TABLE_EXISTS_ACTION	Text	Import	Specifies the action to be performed when data is loaded into a preexisting table. The possible actions are: TRUNCATE, REPLACE, APPEND, and SKIP. If INCLUDE_METADATA=0, only TRUNCATE and APPEND are supported. If TRUNCATE, rows are removed from a preexisting table before inserting rows from the Import. Note that if TRUNCATE is specified on tables referenced by foreign key constraints, the TRUNCATE will be modified into a REPLACE. If REPLACE, preexisting tables are replaced with new definitions. Before creating the new table, the old table is dropped. If APPEND, new rows are added to the existing rows in the table. If SKIP, the preexisting table is left unchanged. TABLE_EXISTS_ACTION is not supported in Transportable mode. The default is SKIP if metadata is included in the import. The default is APPEND if INCLUDE_METADATA is set to 0.
TABLESPACE_DATAFILE	Text	Import	Specifies the full file specification for a datafile in the transportable tablespace set. TABLESPACE_DATAFILE is only valid for transportable mode imports. TABLESPACE_DATAFILE can be specified multiple times, but the value specified for each occurrence must be different.
TARGET_EDITION	Text	Import	The application edition that will be used for determining where the objects will be loaded for import and for network import.

Table 48–23 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

Parameter Name	Datatype	Supported Operations	Meaning
TRANSPORTABLE	Text	Export	For export operations done in table mode, allows the data to be moved using transportable tablespaces. Storage segments in the moved tablespaces that are not associated with the parent schemas (tables) will be reclaimed at import time. If individual partitions are selected in a table-mode job, only the tablespaces referenced by those partitions will be moved. During import, the moved partitions can only be reconstituted as tables by using the PARTITION_OPTIONS=DEPARTITION parameter. Use of the TRANSPORTABLE parameter prohibits the subsequent import of the dump file into a database at a lower version or using different character sets. Additionally, the data files may need to be converted if the target database is on a different platform. The TRANSPORTABLE parameter is not allowed if a network link is supplied on the OPEN call. The possible values for this parameter are as follows: ALWAYS - data is always moved by moving data files NEVER - data files are never used for copying user data This parameter requires a job version of 11.1 or later Default=NEVER
TTS_FULL_CHECK	NUMBER	Export	If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports. Default=0
USER_METADATA	NUMBER	Export and network Import	For schema-mode operations, specifies that the metadata to re-create the users' schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter. The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode. Default=1 if user has DATAPUMP_EXP_FULL_DATABASE role; 0 otherwise.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception could be due to any of the following causes:
  - An invalid name was supplied for an input parameter
  - The wrong datatype was used for value
  - A value was not supplied
  - The supplied value was not allowed for the specified parameter name
  - A flashback parameter had been established after a different flashback parameter had already been established
  - A parameter was specified that did not support duplicate definitions
- INVALID_OPERATION. The operation specified is invalid in this context.

- INVALID_STATE. The specified job is not in the Defining state.
- INCONSISTENT_ARGS. Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
- PRIVILEGE_ERROR. The user does not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role required for the specified parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARAMETER procedure is used to specify optional features for the current job. See Table 48–23 for a list of supported options.

START_JOB Procedure

This procedure begins or resumes execution of a job.

Syntax

```
DBMS_DATAPUMP.START_JOB (
   handle       IN NUMBER,
   skip_current    IN  NUMBER DEFAULT 0,
   abort_step      IN  NUMBER DEFAULT 0,
   cluster_ok      IN  NUMBER DEFAULT 1,
   service_name    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48–24 START_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.
skip_ current	If nonzero, causes actions that were 'in progress' on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index. A description of the actions skipped is entered into the log file. skip_ current is ignored for the initial START_JOB in a job. If zero, no data or metadata is lost upon a restart.
abort_step	Value must be 0. Inserting values other than 0 into this argument will have unintended consequences.
cluster_ok	If = 0, all workers are started on the current instance. Otherwise, workers are started on instances usable by the job.
service_ name	If specified, indicates a service name used to constrain the job to specific instances or to a specific resource group.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_STATE. The causes of this exception can be any of the following:
  - No files have been defined for an Export, non-network Import, or SQL_FILE job
  - An ADD_FILE procedure has not been called to define the output for a SQL_ FILE job
  - A TABLESPACE_DATAFILE parameter has not been defined for a Transportable Import job
  - A TABLESPACE_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
  - The dump file set on an Import or SQL_FILE job was either incomplete or missing a master table specification

- INVALID_OPERATION. Unable to restore master table from a dump file set.
- INTERNAL_ERROR. An inconsistency was detected when the job was started. Additional information may be available through the GET_STATUS procedure.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the SET_PARALLEL procedure was not called prior to the START_JOB procedure, the initial level of parallelism used in the job will be 1. If SET_PARALLEL was called prior to the job starting, the degree specified by the last SET_PARALLEL call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another SET_PARALLEL call.
- To restart a stopped job, an ATTACH function must be performed prior to executing the START_JOB procedure.

STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```
DBMS_DATAPUMP.STOP_JOB (
   handle      IN NUMBER,
   immediate   IN NUMBER DEFAULT 0,
   keep_master IN NUMBER DEFAULT NULL,
   delay       IN NUMBER DEFAULT 60);
```

Parameters

Table 48–25 STOP_JOB Procedure Parameters

Parameter	Description
handle	The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. At the end of the procedure, the user is detached from the handle.
immediate	If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work.
keep_master	If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.
delay	The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID STATE. The job is already in the process of being stopped or completed.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the DETACH procedure.

- Once a job is stopped, it can be restarted using the `ATTACH` function and `START_JOB` procedures, provided the master table and the dump file set are left intact.
- If the `KEEP_MASTER` parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.

WAIT_FOR_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

Syntax

```
DBMS_DATAPUMP.WAIT_FOR_JOB (
  handle      IN   NUMBER,
  job_state   OUT  VARCHAR2);
```

Parameters

Table 48–26 WAIT_FOR_JOB Procedure Parameters

Parameter	Description
handle	The handle of the job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. At the end of the procedure, the user is detached from the handle.
job_state	The state of the job when it has stopped executing. This will be either Stopped or Completed.

Exceptions

- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS API.
- INVALID_HANDLE. The job handle is no longer valid.

Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling WAIT_FOR_JOB. When WAIT_FOR_JOB returns, the job will no longer be executing. If the job completed normally, the final status will be Completed. If the job stopped executing because of a STOP_JOB request or an internal error, the final status will be Stopped.

49

DBMS_DB_VERSION

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

> **See Also:** *PL/SQL Users Guide and Reference* regarding conditional compilation

This package contains the following topics

- Using DBMS_DB_VERSION
  - Overview
  - Constants
  - Examples

Using DBMS_DB_VERSION

- Overview
- Constants

Overview

The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The package for the Oracle Database 11g Release 1 version is shown below.

```
PACKAGE DBMS_DB_VERSION IS
   VERSION CONSTANT PLS_INTEGER := 11; -- RDBMS version number
   RELEASE CONSTANT PLS_INTEGER := 1;  -- RDBMS release number
   ver_le_9_1    CONSTANT BOOLEAN := FALSE;
   ver_le_9_2    CONSTANT BOOLEAN := FALSE;
   ver_le_9      CONSTANT BOOLEAN := FALSE;
   ver_le_10_1   CONSTANT BOOLEAN := FALSE;
   ver_le_10_2   CONSTANT BOOLEAN := FALSE;
   ver_le_10     CONSTANT BOOLEAN := FALSE;
   ver_le_11_1   CONSTANT BOOLEAN := TRUE;
   ver_le_11     CONSTANT BOOLEAN := TRUE;
END DBMS_DB_VERSION;
```

The boolean constants follow a naming convention. Each constant gives a name for a boolean expression. For example:

- VER_LE_9_1 represents version <= 9 and release <= 1
- VER_LE_10_2 represents version <= 10 and release <= 2
- VER_LE_10 represents version <= 10

A typical usage of these boolean constants is:

```
$IF DBMS_DB_VERSION.VER_LE_10 $THEN
   version 10 and earlier code
$ELSIF DBMS_DB_VERSION.VER_LE_11 $THEN
   version 11 code
$ELSE
   version 12 and later code
$END
```

This code structure will protect any reference to the code for hypothetical version 12. It also prevents the controlling package constant DBMS_DB_VERSION.VER_LE_11 from being referenced when the program is compiled under version 10. A similar observation applies to version 11. This scheme works even though the static constant VER_LE_11 is not defined in version 10 database because conditional compilation protects the $ELSIF from evaluation if DBMS_DB_VERSION.VER_LE_10 is TRUE.

Constants

The DBMS_DB_VERSION package contains different constants for different Oracle Database releases. The Oracle Database 11g Release 1 version of the DBMS_DB_VERSION package uses the constants shown in Table 49–1.

Table 49–1 DBMS_DB_VERSION Constants

Name	Type	Value	Description
VERSION	PLS_INTEGER	10	Current version
RELEASE	PLS_INTEGER	2	Current release
VER_LE_9	BOOLEAN	FALSE	Version <= 9
VER_LE_9_1	BOOLEAN	FALSE	Version <= 9 and release <= 1
VER_LE_9_2	BOOLEAN	FALSE	Version <= 9 and release <= 2
VER_LE_10	BOOLEAN	TRUE	Version <= 10
VER_LE_10_1	BOOLEAN	FALSE	Version <= 10 and release <= 1
VER_LE_10_2	BOOLEAN	TRUE	Version <=10 and release <= 2
VER_LE_11	BOOLEAN	FALSE	Version <= 11
VER_LE_11_1	BOOLEAN	TRUE	Version <=11 and release <= 1

Examples

This example uses conditional compilation to guard new features.

```
CREATE OR REPLACE PROCEDURE whetstone IS

 -- Notice that conditional compilation constructs
 -- can interrupt a regular PL/SQL statement.
 -- You can locate a conditional compilation directive anywhere
 -- there is whitespace in the regular statement.

 SUBTYPE my_real IS
    $IF DBMS_DB_VERSION.VER_LE_9 $THEN NUMBER
                                 $ELSE BINARY_DOUBLE
    $END;

 t  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 0.499975
                                                     $ELSE 0.499975d
                        $END;

 t2 CONSTANT my_real := $if DBMS_DB_VERSION.VER_LE_9 $THEN 2.0
                                                     $ELSE 2.0d
                        $END;

 x  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                                     $ELSE 1.0d
                        $END;

 y  CONSTANT my_real := $IF DBMS_DB_VERSION.VER_LE_9 $THEN 1.0
                                                     $ELSE 1.0d
                        $END;

 z  MY_REAL;

 PROCEDURE P(x IN my_real, y IN my_real, z OUT NOCOPY my_real) IS
   x1 my_real;
   y1 my_real;
 BEGIN
   x1 := x;
   y1 := y;
   x1 := t * (x1 + y1);
   y1 := t * (x1 + y1);
   z := (x1 + y1)/t2;
 END P;
BEGIN
 P(x, y, z);
 DBMS_OUTPUT.PUT_LINE ('z = '|| z);
END whetstone;

DBMS_DDL

This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

- Using DBMS_DDL
  - Deprecated Subprograms
  - Security Model
  - Operational Notes
- Summary of DBMS_DDL Subprograms

Using DBMS_DDL

This section contains topics which relate to using the `DBMS_DDL` package.

- Deprecated Subprograms
- Security Model
- Operational Notes

Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only

The following subprograms are deprecated with release Release 10gR2:

- ALTER_COMPILE Procedure

Security Model

This package runs with the privileges of the calling user, rather than the package owner `SYS`.

Operational Notes

The `ALTER_COMPILE` procedure commits the current transaction, performs the operation, and then commits again.

Summary of DBMS_DDL Subprograms

Table 50–1 DBMS_DDL Package Subprograms

Subprogram	Description
ALTER_COMPILE Procedure on page 50-7	Compiles the PL/SQL object
ALTER_TABLE_NOT_ REFERENCEABLE Procedure on page 50-8	Reorganizes object tables
ALTER_TABLE_REFERENCEABLE Procedure on page 50-9	Reorganizes object tables
CREATE_WRAPPED Procedures on page 50-10	Takes as input a single `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a `CREATE OR REPLACE` statement with the PL/SQL source text obfuscated and executes the generated statement
IS_TRIGGER_FIRE_ONCE Function on page 50-12	Returns `TRUE` if the specified DML or DDL trigger is set to fire once. Otherwise, returns `FALSE`
SET_TRIGGER_FIRING_PROPERTY Procedures on page 50-13	Sets the specified DML or DDL trigger's firing property
WRAP Functions on page 50-15	Takes as input a `CREATE OR REPLACE` statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a `CREATE OR REPLACE` statement where the text of the PL/SQL unit has been obfuscated

ALTER_COMPILE Procedure

This procedure is equivalent to the following SQL statement:

```
ALTER PROCEDURE|FUNCTION|PACKAGE [<schema>.] <name> COMPILE [BODY]
```

> **Note:** This procedure is deprecated in Release 10gR2. While the procedure remains available in the package, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

Syntax

```
DBMS_DDL.ALTER_COMPILE (
   type             VARCHAR2,
   schema           VARCHAR2,
   name             VARCHAR2
   reuse_settings   BOOLEAN := FALSE);
```

Parameters

Table 50–2 ALTER_COMPILE Procedure Parameters

Parameter	Description
type	Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER
schema	Schema name If NULL, then use current schema (case-sensitive)
name	Name of the object (case-sensitive)
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 50–3 ALTER_COMPILE Procedure Exceptions

Exception	Description
ORA-20000:	Insufficient privileges or object does not exist
ORA-20001:	Remote object, cannot compile
ORA-20002:	Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, or TRIGGER

ALTER_TABLE_NOT_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.]<table_name> NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (
   table_name        IN           VARCHAR2,
   table_schema      IN  DEFAULT  NULL,
   affected_schema   IN  DEFAULT  NULL);
```

Parameters

Table 50–4 ALTER_TABLE_NOT_REFERENCEABLE Procedure Parameters

Parameter	Description
`table_name`	Name of the table to be altered. Cannot be a synonym. Must not be `NULL`. Case sensitive.
`table_schema`	Name of the schema owning the table to be altered. If `NULL` then the current schema is used. Case sensitive.
`affected_schema`	Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for `PUBLIC`; that is., it simply undoes the previous `ALTER_TABLE_REFERENCEABLE` call for this specific schema. The affected schema must a particular schema (cannot be `PUBLIC`).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has `ALTER ANY TABLE` and `SELECT ANY TABLE` and `DROP ANY TABLE` privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

ALTER_TABLE_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes the referenceable table for the given schema `affected_schema`. This is equivalent to SQL

```
ALTER TABLE [<table_schema>.]<table_name>  REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
   table_name       IN  VARCHAR2,
   table_schema     IN  DEFAULT  NULL,
   affected_schema  IN  DEFAULT  NULL);
```

Parameters

Table 50–5 ALTER_TABLE_REFERENCEABLE Procedure Parameters

Parameter	Description
`table_name`	Name of the table to be altered. Cannot be a synonym. Must not be `NULL`. Case sensitive.
`table_schema`	Name of the schema owning the table to be altered. If `NULL` then the current schema is used. Case sensitive.
`affected_schema`	Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.

Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same `EOID`; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.

If you execute this procedure on the new table, it makes the new table the referenceable table replacing the original one; thus, those references now point to the objects in the new table instead of the original table.

CREATE_WRAPPED Procedures

The procedure takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body. It then generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement. In effect, this procedure bundles together the operations of wrapping the text and creating the PL/SQL unit.

See Also: WRAP Functions on page 50-15

This procedure has 3 overloads. Each of the three functions provides better performance than using a combination of individual WRAP Functions and DBMS_SQL.PARSE (or EXECUTE IMMEDIATE) calls. The different functionality of each form of syntax is presented with the definition.

Syntax

Is a shortcut for EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(*ddl*):

```
DBMS_DDL.CREATE_WRAPPED (
   ddl     VARCHAR2);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
   ddl     DBMS_SQL.VARCHAR2A,
   lb      PLS_INTEGER,
   ub      PLS_INTEGER);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED(
   ddl     DBMS_SQL.VARCHAR2S,
   lb      PLS_INTEGER,
   ub      PLS_INTEGER);
```

Parameters

Table 50–6 CREATE_WRAPPED Procedure Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS_DDL.CREATE_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name

DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.

- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a entire SQL*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus "/" termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    SYS.DBMS_DDL.CREATE_WRAPPED(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

IS_TRIGGER_FIRE_ONCE Function

This function returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, it returns FALSE.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS_APPLY_ADM package
- For changes made by a Logical Standby apply process

Note: Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: "SET_TRIGGER_FIRING_PROPERTY Procedures" on page 50-13

Syntax

```
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
   trig_owner          IN  VARCHAR2,
   trig_name           IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 50–7 IS_TRIGGER_FIRE_ONCE Function Parameters

Parameter	Description
trig_owner	Schema of trigger
trig_name	Name of trigger

SET_TRIGGER_FIRING_PROPERTY Procedures

This procedure sets the specified DML or DDL trigger's firing property whether or not the property is set for the trigger. Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the `EXECUTE_ERROR` or `EXECUTE_ALL_ERRORS` procedure in the `DBMS_APPLY_ADM` package.
- Applied by a Logical Standby apply process

Syntax

```
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
   trig_owner         IN  VARCHAR2,
   trig_name          IN  VARCHAR2,
   fire_once          IN  BOOLEAN);

DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (
   trig_owner         IN  VARCHAR2,
   trig_name          IN  VARCHAR2,
   property           IN INTEGER,
   setting            IN BOOLEAN);
```

Parameters

Table 50–8 SET_TRIGGER_FIRING_PROPERTY Procedure Parameters

Parameter	Description
`trig_owner`	Schema of the trigger to set
`trig_name`	Name of the trigger to set
`fire_once`	If `TRUE`, the trigger is set to fire once. By default, the `fire_once` parameter is set to `TRUE` for DML and DDL triggers. If `FALSE`, the trigger is set to always fire.
`property`	`DBMS_DDL.fire_once` to set the `fire_once` property of the trigger `DBMS_DDL.apply_server_only` to indicate whether trigger fires only in the context of SQL Apply processes maintaining a logical standby database or Streams Apply processes
`setting`	Value of property being set

Usage Notes

You can specify one of the following settings for a trigger's firing property:

- If the `fire_once` parameter is set to `TRUE` for a trigger, the trigger only fires when the modification is performed by a user process, and not when the change is made in the context of a Streams Apply or a Logical Standby Apply process.
- If the `fire_once` parameter is set to `FALSE` for a trigger, the trigger does not fir for these types of changes.

Regardless of the firing property set by this procedure, a trigger continues to fire when changes are made by means other than the apply process or apply error execution. For example, if a user session or an application makes a change, then the trigger continues to fire, regardless of the firing property.

DML triggers created on a table have their fire-once property set to TRUE.In this case, the triggers only fire when the table is modified by an user process, and they are automatically disabled inside Oracle processes maintaining either a logical standby database (SQL Apply) or Oracle processes doing replication (Streams Apply) processes, and thus do not fire when a SQL Apply or a Streams Apply process modifies the table. There are two ways for a user to fire a trigger as a result of SQL Apply or a Streams Apply process making a change to a maintained table: (a) setting the fire-once property of a trigger to FALSE, which allows it fire both in the context of a user process or a SQL or Streams Apply process, or (b) by setting the apply-server-only property to TRUE and thus making the trigger fire only in the context of a SQL Apply or a Streams Apply process and not in the context of a user process.

- FIRE_ONCE=TRUE, APPLY_SERVER_ONLY=FALSE

  This is the default property setting for a DML trigger. The trigger only fires when user process modifies the base table.

- FIRE_ONCE=TRUE or FALSE, APPLY_SERVER_ONLY=TRUE

  The trigger only fires when SQL Apply or Streams Apply process modifies the base table. The trigger does not fire when a user process modifies the base table.Thus the apply-server-only property overrides the fire-once property of a trigger.

Note:

- If you dequeue an error transaction from the error queue and execute it without using the DBMS_APPLY_ADM package, then relevant changes resulting from this execution cause a trigger to fire, regardless of the trigger firing property.
- Only DML and DDL triggers can be fire once. All other types of triggers always fire.

See Also: *Oracle Streams Concepts and Administration* for more information about the apply process and controlling a trigger's firing property

WRAP Functions

This function takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to DBMS_SQL or EXECUTE IMMEDIATE. The different functionality of each form of syntax is presented with the definition.

See Also: CREATE_WRAPPED Procedures on page 50-10

Syntax

Provides basic functionality:

```
DBMS_DDL.WRAP(
   ddl      VARCHAR2)
  RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the PARSE Procedures in the DBMS_SQL package and its argument list follows the convention of DBMS_SQL.PARSE:

```
DBMS_DDL.WRAP(
   ddl      DBMS_SQL.VARCHAR2S,
   lb       PLS_INTEGER,
   ub       PLS_INTEGER)
  RETURN DBMS_SQL.VARCHAR2S;
```

Provides the same functionality as the second form and is provided for compatibility with multiple forms of the PARSE Procedures in the DBMS_SQL package:

```
DBMS_DDL.WRAP(
   ddl      DBMS_SQL.VARCHAR2A,
   lb       PLS_INTEGER,
   ub       PLS_INTEGER)
  RETURN DBMS_SQL.VARCHAR2A;
```

Parameters

Table 50–9 WRAP Function Parameters

Parameter	Description
ddl	A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body
lb	Lower bound for indices in the string table that specify the CREATE OR REPLACE statement
ub	Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.

Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL's dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus "/" termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```
DECLARE
   ddl VARCHAR2(32767);
BEGIN
   ddl := GENERATE_PACKAGE(...);
EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```

51

DBMS_DEBUG

DBMS_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This API is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

> **Note:** The term *program unit* refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

This chapter contains the following topics:

- Using DBMS_DEBUG
  - Overview
  - Constants
  - Variables
  - Exceptions
  - Operational Notes
- Data Structures
  - RECORD Types
  - TABLE Types
- Summary of DBMS_DEBUG Subprograms

Using DBMS_DEBUG

- Overview
- Constants
- Variables
- Exceptions
- Operational Notes

Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with DBMS_DEBUG. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using DBMS_DEBUG: This tells it which target session to supervise. The debug session may then call entry points in DBMS_DEBUG to read events that were posted from the target session and to communicate with the target session.

The following subprograms are run in the target session (the session that is to be debugged):

- SYNCHRONIZE Function
- DEBUG_ON Procedure
- DEBUG_OFF Procedure

DBMS_DEBUG does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

Constants

A breakpoint status may have the following value:

- `breakpoint_status_unused`—breakpoint is not in use

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

Variables

The DBMS_DEBUG uses the variables shown in Table 51–1.

Table 51–1 DBMS_DEBUG Variables

Variable	Description
default_timeout	The timeout value (used by both sessions).The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.

Exceptions

These values are returned by the various functions called in the debug session (SYNCHRONIZE, CONTINUE, SET_BREAKPOINT, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

Value	Description
success	Normal termination

Statuses returned by GET_VALUE and SET_VALUE:

Status	Description
error_bogus_frame	No such entrypoint on the stack
error_no_debug_info	Program was compiled without debug symbols
error_no_such_object	No such variable or parameter
error_unknown_type	Debug information is unreadable
error_indexed_table	Returned by GET_VALUE if the object is a table, but no index was provided
error_illegal_index	No such element exists in the collection
error_nullcollection	Table is atomically NULL
error_nullvalue	Value is NULL

Statuses returned by SET_VALUE:

Status	Description
error_illegal_value	Constraint violation
error_illegal_null	Constraint violation
error_value_malformed	Unable to decipher the given value
error_other	Some other error
error_name_incomplete	Name did not resolve to a scalar

Statuses returned by the breakpoint functions:

Status	Description
error_no_such_breakpt	No such breakpoint
error_idle_breakpt	Cannot enable or disable an unused breakpoint
error_bad_handle	Unable to set breakpoint in given program (nonexistent or security violation)

General error codes (returned by many of the DBMS_DEBUG subprograms):

Status	Description
error_unimplemented	Functionality is not yet implemented
error_deferred	No program running; operation deferred
error_exception	An exception was raised in the DBMS_DEBUG or Probe packages on the server
error_communication	Some error other than a timeout occurred
error_timeout	Timout occurred

Exception	Description
illegal_init	DEBUG_ON was called prior to INITIALIZE

The following exceptions are raised by procedure SELF_CHECK:

Exception	Description
pipe_creation_failure	Could not create a pipe
pipe_send_failure	Could not write data to the pipe
pipe_receive_failure	Could not read data from the pipe
pipe_datatype_mismatch	Datatype in the pipe was wrong
pipe_data_error	Data got garbled in the pipe

Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

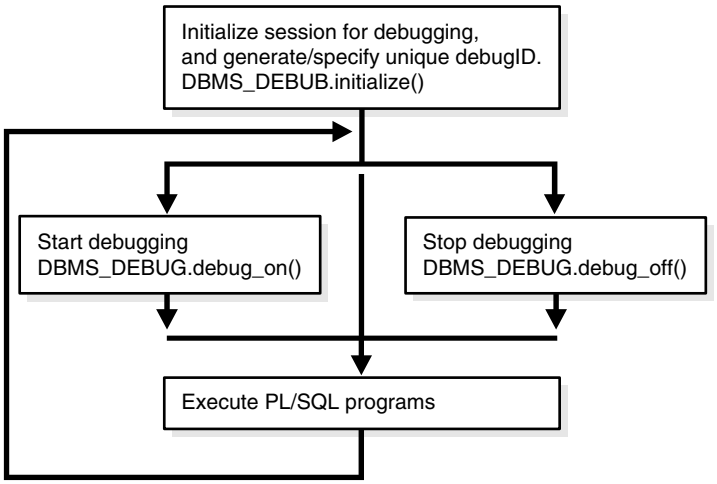
This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

Figure 51–1 and Figure 51–2 illustrate the flow of operations in the session to be debugged and in the debugging session.

Figure 51–1 Target Session



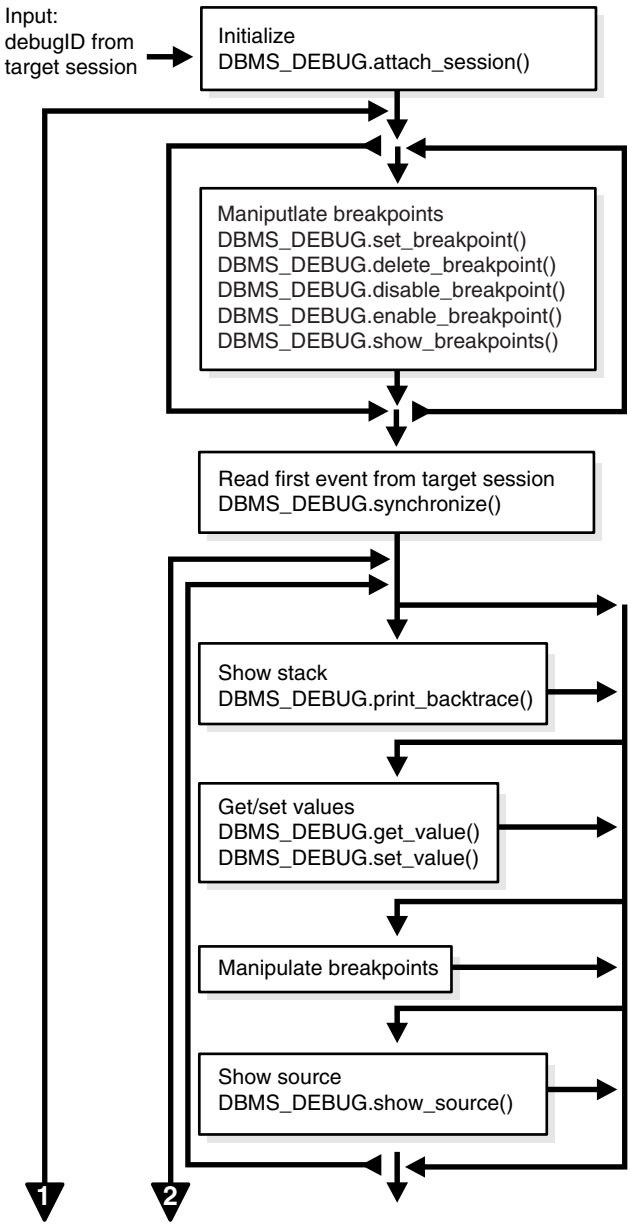
This illustration shows the first steps in the target session:

First, initialize the session for debugging, and generate or specify the unique debugID. DBMS_DEBUG.initialize()

Then, start debugging using DBMS_DEBUG.debug_on() or stop debugging using DBMS_DEBUG.debug_off(). Then, execute the PL/SQL program.

****

Figure 51–2 Debug Session



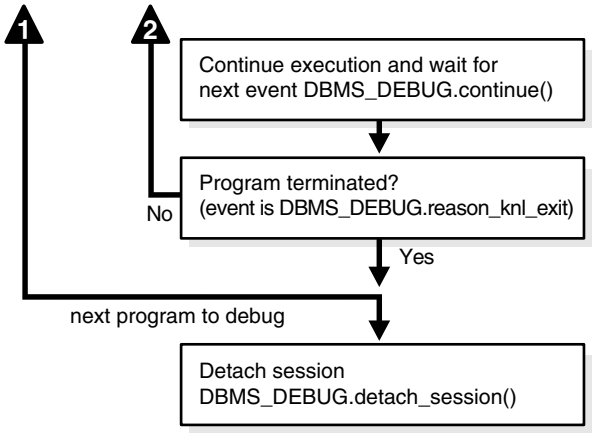
This illustration shows the continuation of steps in the target session:

- Initialize using DBMS_DEBUG.attach_session()
- Manipulate the breakpoints using:
  - DBMS_DEBUG.set_breakpoint()
  - DBMS_DEBUG.delete_breakpoint()
  - DBMS_DEBUG.disable_breakpoint()
  - DBMS_DEBUG.enable_breakpoint()
  - DBMS_DEBUG.show_breakpoint()
- Read first event from the target session using DBMS_DEBUG.synchronize()
- Show the stack using DBMS_DEBUG.print_backtrace()

- Get/set values using:
  - DBMS_DEBUG.get_value()
  -
  - DBMS_DEBUG.set_value()
- Manipulate the breakpoints
- Show the source by using DBMS_DEBUG.show_source().

****

Figure 51–3 Debug Session (Cont.)



This illustration shows the final steps in the target session:

- Continue execution and wait for the next event DBMS_DEBUG.continue()
- If the program terminated, detach the session using DBMS_DEBUG.detach_session()
- If it did not terminate, resume the process by showing the stack.

****

Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an *interesting* event occurs. The set of interesting events is specified by the flags passed to `DBMS_DEBUG.CONTINUE` in the `breakflags` parameter.

Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to `DBMS_DEBUG.SYNCHRONIZE` after the target session has ended causes the debug session to hang until it times out.

Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- `SET_BREAKPOINT` does not set the breakpoint number (it can be obtained later from `SHOW_BREAKPOINTS` if necessary).
- `SET_BREAKPOINT` does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

Diagnostic Output

To debug Probe, there are *diagnostics* parameters to some of the calls in `DBMS_DEBUG`. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

Common and Debug Session Sections

- Common Section
- Target Session
- Debug Session Section

Common Section

The following subprograms may be called in either the target or the debug session:

- PROBE_VERSION Procedure
- SELF_CHECK Procedure
- SET_TIMEOUT Function

Target Session

The following subprograms may be called only in the target session:

- INITIALIZE Function
- DEBUG_ON Procedure
- SET_TIMEOUT_BEHAVIOUR Procedure
- GET_TIMEOUT_BEHAVIOUR Function

Debug Session Section

The following subprograms should be run in the debug session only:

- ATTACH_SESSION Procedure
- SYNCHRONIZE Function
- SHOW_FRAME_SOURCE Procedure
- SHOW_SOURCE Procedures
- GET_MORE_SOURCE Procedure
- PRINT_BACKTRACE Procedure
- CONTINUE Function
- SET_BREAKPOINT Function

- DELETE_BREAKPOINT Function
- SET_OER_BREAKPOINT Function
- DELETE_OER_BREAKPOINT Function
- ENABLE_BREAKPOINT Function
- DISABLE_BREAKPOINT Function
- SHOW_BREAKPOINTS Procedures
- SET_VALUE Functionn
- GET_VALUE Function
- TARGET_PROGRAM_RUNNING Procedure
- DETACH_SESSION Procedure
- GET_RUNTIME_INFO Function
- PRINT_INSTANTIATIONS Procedure
- PING Procedure
- GET_LINE_MAP Function
- GET_RUNTIME_INFO Function
- GET_INDEXES Function
- EXECUTE Procedure

OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are exception_init'd to the same OER, they are indistinguishable.

Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
   - Package specifications.
   - Procedures and functions that are not nested inside other packages, procedures, or functions.
   - Object types.
3. `Namespace_pkg_body` contains package bodies and type bodies.
4. `Namespace_trigger` contains triggers.

Libunit Types

These values are used to disambiguate among objects in a given namespace. These constants are used in PROGRAM_INFO when Probe is giving a stack backtrace.

- LibunitType_cursor
- LibunitType_procedure
- LibunitType_function
- LibunitType_package
- LibunitType_package_body
- LibunitType_trigger
- LibunitType_Unknown

Breakflags

These are values to use for the breakflags parameter to CONTINUE, in order to tell Probe what events are of interest to the client. These flags may be combined.

Value	Description
break_next_line	Break at next source line (step over calls)
break_any_call	Break at next source line (step into calls)
break_any_return	Break after returning from current entrypoint (skip over any entrypoints called from the current routine)
break_return	Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running Proc1, which calls Proc2, then break_return stops at the end of Proc2.)
break_exception	Break when an exception is raised
break_handler	Break when an exception handler is executed
abort_execution	Stop execution and force an 'exit' event as soon as DBMS_DEBUG.CONTINUE is called.

Information Flags

These are flags which may be passed as the info_requested parameter to SYNCHRONIZE, CONTINUE, and GET_RUNTIME_INFO.

Flag	Description
info_getStackDepth	Get the current depth of the stack
info_getBreakpoint	Get the breakpoint number
info_getLineinfo	Get program unit information

Reasons for Suspension

After CONTINUE is run, the program either runs to completion or breaks on some line.

Reason	Description
reason_none	-

Reason	Description
reason_ interpreter_ starting	Interpreter is starting
reason_breakpoint	Hit a breakpoint
reason_enter	Procedure entry
reason_return	Procedure is about to return
reason_finish	Procedure is finished
reason_line	Reached a new line
reason_interrupt	An interrupt occurred
reason_exception	An exception was raised
reason_exit	Interpreter is exiting (old form)
reason_knl_exit	Kernel is exiting
reason_handler	Start exception-handler
reason_timeout	A timeout occurred
reason_instantiate	Instantiation block
reason_abort	Interpreter is aborting

Data Structures

The DBMS_DEBUG package defines RECORD types and TABLE types.

RECORD Types

- BREAKPOINT_INFO Record Type
- PROGRAM_INFO Record Type
- RUNTIME_INFO Record Type

TABLE Types

- BACKTRACE_TABLE Table Type
- BREAKPOINT_TABLE Table Type
- INDEX_TABLE Table Type
- VC2_TABLE Table Type

BREAKPOINT_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

Syntax

```
TYPE breakpoint_info IS RECORD (
   name        VARCHAR2(30),
   owner       VARCHAR2(30),
   dblink      VARCHAR2(30),
   line#       BINARY_INTEGER,
   libunittype BINARY_INTEGER,
   status      BINARY_INTEGER);
```

Fields

Table 51–2 BREAKPOINT_INFO Fields

Field	Description
`name`	Name of the program unit
`owner`	Owner of the program unit
`dblink`	Database link, if remote
`line#`	Line number
`libunittype`	`NULL`, unless this is a nested procedure or function
`status`	See Constants on page 51-4 for values of `breakpoint_status_*`

PROGRAM_INFO Record Type

This type specifies a program location. It is a line number in a program unit. This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

Syntax

```
TYPE program_info IS RECORD(
    -- The following fields are used when setting a breakpoint
    namespace        BINARY_INTEGER,
    name             VARCHAR2(30),
    owner            VARCHAR2(30),
    dblink           VARCHAR2(30),
    line#            BINARY_INTEGER,
    -- Read-only fields (set by Probe when doing a stack backtrace)
    libunittype      BINARY_INTEGER,
    entrypointname   VARCHAR2(30));
```

Fields

Table 51–3 PROGRAM_INFO Fields

Field	Description
`namespace`	See Namespaces on page 51-12
`name`	Name of the program unit
`owner`	Owner of the program unit
`dblink`	Database link, if remote
`line#`	Line number
`libunittype`	`A read-only field, NULL`, unless this is a nested procedure or function
`entrypointname`	A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications). See the Libunit Types on page 51-13 for more information.

RUNTIME_INFO Record Type

This type gives context information about the running program.

Syntax

```
TYPE runtime_info IS RECORD(
    line#            BINARY_INTEGER,
    terminated       binary_integer,
    breakpoint       binary_integer,
    stackdepth       BINARY_INTEGER,
    interpreterdepth BINARY_INTEGER,
    reason           BINARY_INTEGER,
    program          program_info);
```

Fields

Table 51–4 RUNTIME_INFO Fields

Field	Description
`line#`	Duplicate of `program.line#`
`terminated`	Whether the program has terminated
`breakpoint`	Breakpoint number
`stackdepth`	Number of frames on the stack
`interpreterdepth`	[A reserved field]
`reason`	Reason for suspension
`program`	Source location

BACKTRACE_TABLE Table Type

This type is used by PRINT_BACKTRACE.

Syntax

```
TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;
```

BREAKPOINT_TABLE Table Type

This type is used by `SHOW_BREAKPOINTS`.

Syntax

```
TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;
```

INDEX_TABLE Table Type

This type is used by GET_INDEXES to return the available indexes for an indexed table.

Syntax

```
TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

VC2_TABLE Table Type

This type is used by SHOW_SOURCE.

Syntax

```
TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_DEBUG Subprograms

Table 51–5 DBMS_DEBUG Package Subprograms

Subprogram	Description
ATTACH_SESSION Procedure on page 51-25	Notifies the debug session about the target debugID
CONTINUE Function on page 51-26	Continues execution of the target program
DEBUG_OFF Procedure on page 27	Turns debug-mode off
DEBUG_ON Procedure on page 51-28	Turns debug-mode on
DELETE_BREAKPOINT Function on page 51-29	Deletes a breakpoint
DELETE_OER_ BREAKPOINT Function on page 51-30	Deletes an OER breakpoint
DETACH_SESSION Procedure on page 51-31	Stops debugging the target program
DISABLE_BREAKPOINT Function on page 51-32	Disables a breakpoint
ENABLE_BREAKPOINT Function on page 51-33	Activates an existing breakpoint
EXECUTE Procedure on page 51-34	Executes SQL or PL/SQL in the target session
GET_INDEXES Function on page 51-36	Returns the set of indexes for an indexed table
GET_MORE_SOURCE Procedure on page 51-37	Provides additional source in the event of buffer overflow when using SHOW_SOURCE
GET_LINE_MAP Function on page 51-38	Returns information about line numbers in a program unit
GET_RUNTIME_INFO Function on page 51-39	Returns information about the current program
GET_TIMEOUT_ BEHAVIOUR Function on page 51-40	Returns the current timeout behavior
GET_VALUE Function on page 51-41	Gets a value from the currently-running program
INITIALIZE Function on page 51-43	Sets debugID in target session
PING Procedure on page 51-45	Pings the target session to prevent it from timing out
PRINT_BACKTRACE Procedure on page 51-46	Prints a stack backtrace
PRINT_INSTANTIATIONS Procedure on page 51-47	Prints a stack backtrace
PROBE_VERSION Procedure on page 51-48	Returns the version number of `DBMS_DEBUG` on the server

Table 51–5 (Cont.) DBMS_DEBUG Package Subprograms

Subprogram	Description
SELF_CHECK Procedure on page 51-49	Performs an internal consistency check
SET_BREAKPOINT Function on page 51-50	Sets a breakpoint in a program unit
SET_OER_BREAKPOINT Function on page 51-51	Sets an OER breakpoint
SET_TIMEOUT Function on page 51-52	Sets the timeout value
SET_TIMEOUT_ BEHAVIOUR Procedure on page 51-53	Tells Probe what to do with the target session when a timeout occurs
SET_VALUE Function on page 51-54	Sets a value in the currently-running program
SHOW_BREAKPOINTS Procedures on page 51-56	Returns a listing of the current breakpoints
SHOW_FRAME_SOURCE Procedure on page 51-57	Fetches the frame source
SHOW_SOURCE Procedures on page 51-58	Fetches program source
SYNCHRONIZE Function on page 51-60	Waits for program to start running
TARGET_PROGRAM_ RUNNING Procedure on page 51-61	Returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not

ATTACH_SESSION Procedure

This procedure notifies the debug session about the target program.

Syntax

```
DBMS_DEBUG.ATTACH_SESSION (
   debug_session_id  IN VARCHAR2,
   diagnostics       IN BINARY_INTEGER := 0);
```

Parameters

Table 51–6 ATTACH_SESSION Procedure Parameters

Parameter	Description
`debug_session_id`	Debug ID from a call to `INITIALIZE` in target session
`diagnostics`	Generate diagnostic output if nonzero

CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If `info_requested` is not `NULL`, then calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.CONTINUE (
   run_info       IN OUT runtime_info,
   breakflags     IN     BINARY_INTEGER,
   info_requested IN     BINARY_INTEGER := NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–7 CONTINUE Function Parameters

Parameter	Description
`run_info`	Information about the state of the program
`breakflags`	Mask of events that are of interest (see "Breakflags" on page 51-13)
`info_requested`	Which information should be returned in `run_info` when the program stops (see "Information Flags" on page 51-13)

Return Values

Table 51–8 CONTINUE Function Return Values

Return	Description
`success`	
`error_timeout`	Timed out before the program started running
`error_communication`	Other communication error

DEBUG_OFF Procedure

Caution: There must be a debug session waiting if immediate is `TRUE`**.**

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

DEBUG_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

Syntax

```
DBMS_DEBUG.DEBUG_ON (
   no_client_side_plsql_engine BOOLEAN := TRUE,
   immediate                   BOOLEAN := FALSE);
```

Parameters

Table 51–9 DEBUG_ON Procedure Parameters

Parameter	Description
`no_client_side_ plsql_engine`	Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine
`immediate`	If this is `TRUE`, then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.

DELETE_BREAKPOINT Function

This function deletes a breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–10 DELETE_BREAKPOINT Function Parameters

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

Return Values

Table 51–11 DELETE_BREAKPOINT Function Return Values

Return	Description
success	
error_no_such_ breakpt	No such breakpoint exists
error_idle_breakpt	Cannot delete an unused breakpoint
error_stale_breakpt	The program unit was redefined since the breakpoint was set

DELETE_OER_BREAKPOINT Function

This function deletes an OER breakpoint.

Syntax

```
DBMS_DEBUG.DELETE_OER_BREAKPOINT (
   oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 51–12 DELETE_OER_BREAKPOINT Function Parameters

Parameter	Description
`oer`	The OER (positive 4-byte number) to delete

DETACH_SESSION Procedure

This procedure stops debugging the target program. This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```

DISABLE_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–13 DISABLE_BREAKPOINT Function Parameters

Parameter	Description
`breakpoint`	Breakpoint number from a previous call to `SET_BREAKPOINT`

Return Values

Table 51–14 DISABLE_BREAKPOINT Function Return Values

Returns	Description
`success`	
`error_no_such_ breakpt`	No such breakpoint exists
`error_idle_breakpt`	Cannot disable an unused breakpoint

ENABLE_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (
   breakpoint IN BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–15 ENABLE_BREAKPOINT Function Parameters

Parameter	Description
breakpoint	Breakpoint number from a previous call to SET_BREAKPOINT

Return Values

Table 51–16 ENABLE_BREAKPOINT Function Return Values

Return	Description
success	Success
error_no_such_ breakpt	No such breakpoint exists
error_idle_breakpt	Cannot enable an unused breakpoint

EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to DBMS_DEBUG.EXECUTE occurs in the debug session, which then asks the target session to execute the code.

Syntax

```
DBMS_DEBUG.EXECUTE (
   what         IN VARCHAR2,
   frame#       IN BINARY_INTEGER,
   bind_results IN BINARY_INTEGER,
   results      IN OUT NOCOPY dbms_debug_vc2coll,
   errm         IN OUT NOCOPY VARCHAR2);
```

Parameters

Table 51–17 EXECUTE Procedure Parameters

Parameter	Description
what	SQL or PL/SQL source to execute
frame#	The context in which to execute the code. Only -1 (global context) is supported at this time.
bind_results	Whether the source wants to bind to results in order to return values from the target session: 0 = No 1 = Yes
results	Collection in which to place results, if bind_results is not 0
errm	Error message, if an error occurred; otherwise, NULL

Examples

Example 1

This example executes a SQL statement. It returns no results.

```
DECLARE
   coll sys.dbms_debug_vc2coll; -- results (unused)
   errm VARCHAR2(100);
BEGIN
   dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
                      'values(''LJE'', 1, 1)',
                      -1, 0, coll, errm);
END;
```

Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```
DECLARE
   coll sys.dbms_debug_vc2coll;
   errm VARCHAR2(100);
BEGIN
```

```
   dbms_debug.execute(
       'DECLARE PRAGMA autonomous_transaction; ' ||
       'BEGIN ' ||
       '   insert into emp(ename, empno, deptno) ' ||
       '   values(''LJE'', 1, 1); ' ||
       ' COMMIT; ' ||
       'END;',
       -1, 0, coll, errm);
END;
```

Example 3

This example executes a PL/SQL block, and it returns some results.

```
DECLARE
   coll sys.dbms_debug_vc2coll;
   errm VARCHAR2(100);
BEGIN
   dbms_debug.execute(
      'DECLARE ' ||
      '   pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
      '   x  PLS_INTEGER; ' ||
      '   i  PLS_INTEGER := 1; ' ||
      'BEGIN ' ||
      '   SELECT COUNT(*) INTO x FROM emp; ' ||
      '   pp.EXTEND(x * 6); ' ||
      '   FOR c IN (SELECT * FROM emp) LOOP ' ||
      '      pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
      '      pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
      '      pp(i) := ''Job:   '' || c.job;   i := i+1; ' ||
      '      pp(i) := ''Mgr:   '' || c.mgr;   i := i+1; ' ||
      '      pp(i) := ''Sal:   '' || c.sal;   i := i+1; ' ||
      '      pp(i) := null;                   i := i+1; ' ||
      '   END LOOP; ' ||
      '   :1 := pp;' ||
      'END;',
       -1, 1, coll, errm);
   each := coll.FIRST;
   WHILE (each IS NOT NULL) LOOP
      dosomething(coll(each));
      each := coll.NEXT(each);
   END LOOP;
END;
```

GET_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

Syntax

```
DBMS_DEBUG.GET_INDEXES (
   varname   IN  VARCHAR2,
   frame#    IN  BINARY_INTEGER,
   handle    IN  program_info,
   entries   OUT index_table)
RETURN BINARY_INTEGER;
```

Parameters

Table 51–18 GET_INDEXES Function Parameters

Parameter	Description
`varname`	Name of the variable to get index information about
`frame#`	Number of frame in which the variable or parameter resides; `NULL` for a package variable
`handle`	Package description, if object is a package variable
`entries`	1-based table of the indexes: if non-`NULL`, then `entries`(1) contains the first index of the table, `entries`(2) contains the second index, and so on.

Return Values

Table 51–19 GET_INDEXES Function Return Values

Return	Description
`error_no_such_object`	One of the following: - The package does not exist - The package is not instantiated - The user does not have privileges to debug the package - The object does not exist in the package

GET_MORE_SOURCE Procedure

When source does not fit in the buffer provided by that version of the SHOW_SOURCE Procedures which produce a formatted buffer, this procedure provides additional source.

Syntax

```
DBMS_DEBUG.GET_MORE_SOURCE (
   buffer          IN OUT VARCHAR2,
   buflen          IN BINARY_INTEGER,
   piece#          IN BINARY_INTEGER);
```

Parameters

Table 51–20 GET_MORE_SOURCE Procedure Parameters

Parameter	Description
buffer	The buffer
buflen	The length of the buffer
piece#	A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the SHOW_SOURCE Procedures

Usage Notes

This procedure should be called only after the version of SHOW_SOURCE that returns a formatted buffer.

GET_LINE_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

Syntax

```
DBMS_DEBUG.GET_LINE_MAP (
   program                IN   program_info,
   maxline                OUT  BINARY_INTEGER,
   number_of_entry_points OUT  BINARY_INTEGER,
   linemap                OUT  RAW)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–21 GET_LINE_MAP Function Parameters

Parameter	Description
`program`	A top-level program unit (procedure / package / function / package body, and so on). Its `Namespace`, `Name`, and `Owner` fields must be initialized, the remaining fields are ignored.
`maxline`	The largest source code line number in 'program'
`number_of_entry_points`	The number of subprograms in 'program'
`linemap`	A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either `maxline` divided by 8 (plus one if `maxline` MOD 8 is not zero) or 32767 in the unlikely case of `maxline` being larger than 32767 * 8.

Return Values

Table 51–22 GET_LINE_MAP Function Return Values

Return	Description
`success`	A successful completion
`error_no_debug_info`	The program unit exists, but has no debug info
`error_bad_handle`	No such program unit exists

GET_RUNTIME_INFO Function

This function returns information about the current program. It is only needed if the `info_requested` parameter to `SYNCHRONIZE` or `CONTINUE` was set to `0`.

> **Note:** This is currently only used by client-side PL/SQL.

Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (
   info_requested  IN  BINARY_INTEGER,
   run_info        OUT runtime_info)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–23 GET_RUNTIME_INFO Function Parameters

Parameter	Description
`info_requested`	Which information should be returned in `run_info` when the program stops (see "Information Flags" on page 51-13)
`run_info`	Information about the state of the program

GET_TIMEOUT_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

Syntax

```
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
 RETURN BINARY_INTEGER;
```

Parameters

Table 51–24 GET_TIMEOUT_BEHAVIOUR Function Parameters

Parameter	Description
`oer`	The OER (a 4-byte positive number)

Return Values

Table 51–25 GET_TIMEOUT_BEHAVIOUR Function Return Values

Return	Description
`success`	A successful completion

Information Flags

```
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`.

GET_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET_VALUE functions.

Syntax

```
DBMS_DEBUG.GET_VALUE (
   variable_name  IN  VARCHAR2,
   frame#         IN  BINARY_INTEGER,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 51–26 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter
frame#	Frame in which it lives; 0 means the current procedure
scalar_value	Value
format	Optional date format to use, if meaningful

Return Values

Table 51–27 GET_VALUE Function Return Values

Return	Description
success	A successful completion
error_bogus_frame	Frame does not exist
error_no_debug_info	Entrypoint has no debug information
error_no_such_object	variable_name does not exist in frame#
error_unknown_type	The type information in the debug information is illegible
error_nullvalue	Value is NULL
error_indexed_table	The object is a table, but no index was provided

This form of GET_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

Syntax

```
DBMS_DEBUG.GET_VALUE (
   variable_name  IN  VARCHAR2,
   handle         IN  program_info,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 51–28 GET_VALUE Function Parameters

Parameter	Description
variable_name	Name of the variable or parameter
handle	Description of the package containing the variable
scalar_value	Value
format	Optional date format to use, if meaningful

Return Values

Table 51–29 GET_VALUE Function Return Values

Return	Description
error_no_such_object	One of the following: - Package does not exist - Package is not instantiated - User does not have privileges to debug the package - Object does not exist in the package
error_indexed_table	The object is a table, but no index was provided

Examples

This example illustrates how to get the value with a given package PACK in schema SCOTT, containing variable VAR:

```
DECLARE
   handle     dbms_debug.program_info;
   resultbuf  VARCHAR2(500);
   retval     BINARY_INTEGER;
BEGIN
   handle.Owner     := 'SCOTT';
   handle.Name      := 'PACK';
   handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
   retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
```

INITIALIZE Function

This function initializes the target session for debugging.

Syntax

```
DBMS_DEBUG.INITIALIZE (
   debug_session_id  IN VARCHAR2       := NULL,
   diagnostics       IN BINARY_INTEGER := 0)
  RETURN VARCHAR2;
```

Parameters

Table 51–30 INITIALIZE Function Parameters

Parameter	Description
debug_session_id	Name of session ID. If NULL, then a unique ID is generated.
diagnostics	Indicates whether to dump diagnostic output to the tracefile: 0 = (default) no diagnostics 1 = print diagnostics

Return Values

The newly-registered debug session ID (debugID)

Usage Notes

You cannot use DBMS_DEBUG and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to DBMS_DEBUG will succeed only if either the caller or the specified debug role carries the DEBUG CONNECT SESSION privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The CREATE ANY PROCEDURE privilege does not affect the visibility of routines through the debugger. A privilege DEBUG for each object has been introduced with a corresponding DEBUG ANY PROCEDURE variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for DEBUG CONNECT SESSION privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or PUBLIC will be used to check for DEBUG CONNECT SESSION. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the DEBUG privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made

(even if those roles were not available within a definer's rights environment of the call), and the debug role.

PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the `timeout_behaviour` is set to `retry_on_timeout` then this procedure is not necessary.

Syntax

```
DBMS_DEBUG.PING;
```

Exceptions

Oracle will display the `no_target_program` exception if there is no target program or if the target session is not currently waiting for input from the debug session.

Usage Notes

Timeout options for the target session are registered with the target session by calling `set_timeout_behaviour:`

- `retry_on_timeout` - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- `continue_on_timeout` - Continue execution, using same event flags.
- `nodebug_on_timeout` - Turn debug-mode OFF (in other words, call debug_off) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling debug_on.
- `abort_on_timeout` - Continue execution, using the abort_execution flag, which should cause the program to terminate immediately. The session remains in debug-mode.

```
retry_on_timeout CONSTANT BINARY_INTEGER:= 0;

continue_on_timeout CONSTANT BINARY_INTEGER:= 1;

nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;

abort_on_timeout CONSTANT BINARY_INTEGER:= 3;
```

PRINT_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded PRINT_BACKTRACE procedures.

Syntax

```
DBMS_DEBUG.PRINT_BACKTRACE (
  listing IN OUT VARCHAR2);

DBMS_DEBUG.PRINT_BACKTRACE (
  backtrace OUT backtrace_table);
```

Parameters

Table 51–31 PRINT_BACKTRACE Procedure Parameters

Parameter	Description
listing	A formatted character buffer with embedded newlines
backtrace	1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.

PRINT_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

Syntax

```
DBMS_DEBUG.PRINT_INSTANTIATIONS (
   pkgs   IN OUT NOCOPY backtrace_table,
   flags  IN BINARY_INTEGER);
```

Parameters

Table 51–32 PRINT_INSTANTIATIONS Procedure Parameters

Parameter	Description
pkgs	The instantiated packages
flags	Bitmask of options: ■ 1 - show specs ■ 2 - show bodies ■ 4 - show local instantiations ■ 8 - show remote instantiations (NYI) ■ 16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.

Exceptions

`no_target_program` - target session is not currently executing

Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: `Namespace, Name, Owner,` and `LibunitType.`

In addition, Line# contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped

PROBE_VERSION Procedure

This procedure returns the version number of DBMS_DEBUG on the server.

Syntax

```
DBMS_DEBUG.PROBE_VERSION (
   major out BINARY_INTEGER,
   minor out BINARY_INTEGER);
```

Parameters

Table 51–33 PROBE_VERSION Procedure Parameters

Parameter	Description
major	Major version number
minor	Minor version number: increments as functionality is added

SELF_CHECK Procedure

This procedure performs an internal consistency check. SELF_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF_CHECK does not return successfully, then an incorrect version of DBMS_DEBUG was probably installed on this server. The solution is to install the correct version (pbload.sql loads DBMS_DEBUG and the other relevant packages).

Syntax

```
DBMS_DEBUG.SELF_CHECK (
   timeout IN binary_integer := 60);
```

Parameters

Table 51–34 SELF_CHECK Procedure Parameters

Parameter	Description
timeout	The timeout to use for the communication test. Default is 60 seconds.

Exceptions

Table 51–35 SELF_CHECK Procedure Exceptions

Exception	Description
OER-6516	Probe version is inconsistent
pipe_creation_ failure	Could not create a pipe
pipe_send_failure	Could not write data to the pipe
pipe_receive_failure	Could not read data from the pipe
pipe_datatype_ mismatch	Datatype in the pipe was wrong
pipe_data_error	Data got garbled in the pipe

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

SET_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session. Execution pauses if the target program reaches the breakpoint.

Syntax

```
DBMS_DEBUG.SET_BREAKPOINT (
   program     IN  program_info,
   line#       IN  BINARY_INTEGER,
   breakpoint# OUT BINARY_INTEGER,
   fuzzy       IN  BINARY_INTEGER := 0,
   iterations  IN  BINARY_INTEGER := 0)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–36 SET_BREAKPOINT Function Parameters

Parameter	Description
`program`	Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to `NULL`, in which case the breakpoint is placed in the currently-running program unit.)
`line#`	Line at which the breakpoint is to be set
`breakpoint#`	On successful completion, contains the unique breakpoint number by which to refer to the breakpoint
`fuzzy`	Only applicable if there is no executable code at the specified line: 0 means return `error_illegal_line` 1 means search forward for an adjacent line at which to place the breakpoint -1 means search backward for an adjacent line at which to place the breakpoint
`iterations`	Number of times to wait before signalling this breakpoint

Return Values

Note: The `fuzzy` and `iterations` parameters are not yet implemented

Table 51–37 SET_BREAKPOINT Function Return Values

Return	Description
`success`	A successful completion
`error_illegal_line`	Cannot set a breakpoint at that line
`error_bad_handle`	No such program unit exists

SET_OER_BREAKPOINT Function

This function sets an OER breakpoint.

Syntax

```
DBMS_DEBUG.SET_OER_BREAKPOINT (
   oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 51–38 SET_OER_BREAKPOINT Function Parameters

Parameter	Description
oer	The OER (positive 4-byte number) to set

Return Values

Table 51–39 SET_OER_BREAKPOINT Function Return Values

Return	Description
success	A successful completion
error_no_such_ breakpt	No such OER breakpoint exists

SET_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT (
   timeout BINARY_INTEGER)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–40 SET_TIMEOUT Function Parameters

Parameter	Description
`timeout`	The timeout to use for communication between the target and debug sessions

SET_TIMEOUT_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

Syntax

```
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (
   behaviour IN PLS_INTEGER);
```

Parameters

Table 51–41 SET_TIMEOUT_BEHAVIOUR Procedure Parameters

Parameter	Description
`behaviour - One of the following:`	
`retry_on_timeout`	Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
`continue_on_timeout`	Continue execution, using same event flags
`nodebug_on_timeout`	Turn debug-mode OFF (in other words, call `debug_off`) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling `debug_on`.
`abort_on_timeout`	Continue execution, using the `abort_execution` flag, which should cause the program to terminate immediately. The session remains in debug-mode.

Exceptions

unimplemented - the requested behavior is not recognized

Usage Notes

The default behavior (if this procedure is not called) is `continue_on_timeout`, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.

SET_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET_VALUE functions.

Syntax

```
DBMS_DEBUG.SET_VALUE (
   frame#              IN binary_integer,
   assignment_statement IN varchar2)
  RETURN BINARY_INTEGER;

DBMS_DEBUG.SET_VALUE (
   handle              IN program_info,
   assignment_statement IN VARCHAR2)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–42 SET_VALUE Function Parameters

Parameter	Description
frame#	Frame in which the value is to be set; 0 means the currently executing frame.
handle	Description of the package containing the variable
assignment_statement	An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3;'.
	Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.

Return Values

Table 51–43 SET_VALUE Function Return Values

Return	Description
success	-
error_illegal_value	Not possible to set it to that value
error_illegal_null	Cannot set to NULL because object type specifies it as 'not NULL'
error_value_ malformed	Value is not a scalar
error_name_ incomplete	The assignment statement does not resolve to a scalar. For example, 'x := 3;', if x is a record.
error_no_such_object	One of the following:
	- Package does not exist
	- Package is not instantiated
	- User does not have privileges to debug the package
	- Object does not exist in the package

Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that modification to a package variable using SET_VALUE might not take effect for a line or two.

Examples

To set the value of SCOTT.PACK.var to 6:

```
DECLARE
   handle  dbms_debug.program_info;
   retval  BINARY_INTEGER;
BEGIN
   handle.Owner     := 'SCOTT';
   handle.Name      := 'PACK';
   handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
   retval           := dbms_debug.set_value(handle, 'var := 6;');
END;
```

SHOW_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW_BREAKPOINTS procedures.

Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS (
   listing    IN OUT VARCHAR2);

DBMS_DEBUG.SHOW_BREAKPOINTS (
   listing    OUT breakpoint_table);

DBMS_DEBUG.SHOW_BREAKPOINTS (
   code_breakpoints  OUT breakpoint_table,
   oer_breakpoints   OUT oer_table);
```

Parameters

Table 51–44 SHOW_BREAKPOINTS Procedure Parameters

Parameter	Description
listing	A formatted buffer (including newlines) of the breakpoints.
	Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.
code_breakpoints	The indexed table of breakpoint entries, indexed by breakpoint number
oer_breakpoints	The indexed table of OER breakpoints, indexed by OER

SHOW_FRAME_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```
DBMS_DEBUG.SHOW_FRAME_SOURCE (
   first_line  IN            BINARY_INTEGER,
   last_line   IN            BINARY_INTEGER,
   source      IN OUT NOCOPY vc2_table,
   frame_num   IN            BINARY_INTEGER);
```

Parameters

Table 51–45 SHOW_FRAME_SOURCE Procedure Parameters

Parameter	Description
first_line	Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)
last_line	Line number of last line to fetch. No lines are fetched past the end of the program.
source	The resulting table, which may be indexed by line#
frame_num	1-based frame number

Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source in order to set a breakpoint.
- If frame number is top of the stack and it's an anonymous block then SHOW_SOURCE can also be used.
- If it's a stored PLSQL package/function/procedure then use SQL as described in the Usage Notes to SHOW_SOURCE Procedures.

SHOW_SOURCE Procedures

The procedure gets the source code. There are two overloaded `SHOW_SOURCE` procedures.

Syntax

```
DBMS_DEBUG.SHOW_SOURCE (
   first_line  IN   BINARY_INTEGER,
   last_line   IN   BINARY_INTEGER,
   source      OUT  vc2_table);

DBMS_DEBUG.SHOW_SOURCE (
   first_line   IN     BINARY_INTEGER,
   last_line    IN     BINARY_INTEGER,
   window       IN     BINARY_INTEGER,
   print_arrow  IN     BINARY_INTEGER,
   buffer       IN OUT VARCHAR2,
   buflen       IN     BINARY_INTEGER,
   pieces       OUT    BINARY_INTEGER);
```

Parameters

Table 51–46 SHOW_SOURCE Procedure Parameters

Parameter	Description
`first_line`	Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)
`last_line`	Line number of last line to fetch. No lines are fetched past the end of the program.
`source`	The resulting table, which may be indexed by line#
`window`	'Window' of lines (the number of lines around the current source line)
`print_arrow`	Nonzero means to print an arrow before the current line
`buffer`	Buffer in which to place the source listing
`buflen`	Length of buffer
`pieces`	Set to nonzero if not all the source could be placed into the given buffer

Return Values

An indexed table of source-lines. The source lines are stored starting at `first_line`. If any error occurs, then the table is empty.

Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```
DECLARE
    info DBMS_DEBUG.runtime_info;
BEGIN
   -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
   -- or GET_RUNTIME_INFO to fill in 'info'
   SELECT text INTO <buffer> FROM all_source
```

```
   WHERE owner = info.Program.Owner
     AND name  = info.Program.Name
     AND line  = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in bufferlength (`buflen`), then additional pieces can be retrieved using the `GET_MORE_SOURCE` procedure (`pieces` returns the number of additional pieces that need to be retrieved).

SYNCHRONIZE Function

This function waits until the target program signals an event. If `info_requested` is not `NULL`, then it calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.SYNCHRONIZE (
   run_info       OUT  runtime_info,
   info_requested IN   BINARY_INTEGER := NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 51–47 SYNCHRONIZE Function Parameters

Parameter	Description
`run_info`	Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.
`info_requested`	Optional bit-field in which to request information other than the default (which is `info_getStackDepth` + `info_getLineInfo`). 0 means that no information is requested at all (see "Information Flags" on page 51-13).

Return Values

Table 51–48 SYNCHRONIZE Function Return Values

Return	Description
`success`	A successful completion
`error_timeout`	Timed out before the program started execution
`error_communication`	Other communication error

TARGET_PROGRAM_RUNNING Procedure

This procedure returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not.

Syntax

```
DBMS_DEBUG.TARGET_PROGRAM_RUNNING
  RETURN BOOLEAN;
```

52

DBMS_DEFER

DBMS_DEFER is the user interface to a replicated transactional deferred remote procedure call facility. Replicated applications use the calls in this interface to queue procedure calls for later transactional execution at remote nodes.

These procedures are typically called from either after row triggers or application specified update procedures.

- Documentation of DBMS_DEFER

Documentation of DBMS_DEFER

For a complete description of this package within the context of Replication, see DBMS_DEFER in the *Oracle Database Advanced Replication Management API Reference.*

53

DBMS_DEFER_QUERY

DBMS_DEFER_QUERY enables you to query the deferred transactions queue data that is not exposed through views.

- Documentation of DBMS_DEFER_QUERY

Documentation of DBMS_DEFER_QUERY

For a complete description of this package within the context of Replication, see DBMS_DEFER_QUERY in the *Oracle Database Advanced Replication Management API Reference.*

54

DBMS_DEFER_SYS

DBMS_DEFER_SYS subprograms manage default replication node lists. This package is the system administrator interface to a replicated transactional deferred remote procedure call facility. Administrators and replication daemons can execute transactions queued for remote nodes using this facility, and administrators can control the nodes to which remote calls are destined.

- Documentation of DBMS_DEFER_SYS

Documentation of DBMS_DEFER_SYS

For a complete description of this package within the context of Replication, see `DBMS_DEFER_SYS` in the *Oracle Database Advanced Replication Management API Reference*.

55

DBMS_DESCRIBE

You can use the DBMS_DESCRIBE package to get information about a PL/SQL object. When you specify an object name, DBMS_DESCRIBE returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

- Using DBMS_DESCRIBE
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Examples
- Summary of DBMS_DESCRIBE Subprograms

Using DBMS_DESCRIBE

- Overview
- Security Model
- Types
- Exceptions
- Examples

Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

See Also: *Oracle Call Interface Programmer's Guide*

Security Model

This package is available to `PUBLIC` and performs its own security checking based on the schema object being described.

Types

The DBMS_DESCRIBE package declares two PL/SQL table types, which are used to hold data returned by DESCRIBE_PROCEDURE in its OUT parameters. The types are:

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
    INDEX BY BINARY_INTEGER;

TYPE NUMBER_TABLE IS TABLE OF NUMBER
    INDEX BY BINARY_INTEGER;
```

Exceptions

DBMS_DESCRIBE can raise application errors in the range -20000 to -20004.

Table 55–1 DBMS_DESCRIBE Errors

Error	Description
ORA-20000	ORU 10035: cannot describe a package ('X') only a procedure within a package.
ORA-20001	ORU-10032: procedure 'X' within package 'Y' does not exist.
ORA-20002	ORU-10033: object 'X' is remote, cannot describe; expanded name 'Y'.
ORA-20003	ORU-10036: object 'X' is invalid and cannot be described.
ORA-20004	Syntax error attempting to parse 'X'.

Examples

One use of the DESCRIBE_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT_NAME of SCOTT.ACCOUNT_UPDATE, where ACCOUNT_UPDATE is an overloaded function with specification:

```
TABLE account (account_no NUMBER, person_id NUMBER,
               balance NUMBER(7,2))
TABLE person  (person_id number(4), person_nm varchar2(10))

FUNCTION ACCOUNT_UPDATE (account_no   NUMBER,
                         person       person%rowtype,
                         amounts      DBMS_DESCRIBE.NUMBER_TABLE,
                         trans_date   DATE)
                         return       account.balance%type;

FUNCTION ACCOUNT_UPDATE (account_no   NUMBER,
                         person       person%rowtype,
                         amounts      DBMS_DESCRIBE.NUMBER_TABLE,
                         trans_no     NUMBER)
                         return       account.balance%type;
```

This procedure might look similar to the following output:

```
overload position  argument level  datatype length prec scale rad
-------- --------- -------- ------ -------- ------ ---- ----- ---
       1         0             0        2     22    7     2  10
       1         1   ACCOUNT   0        2      0    0     0   0
       1         2   PERSON    0      250      0    0     0   0
       1         1   PERSON_ID 1        2     22    4     0  10
       1         2   PERSON_NM 1        1     10    0     0   0
       1         3   AMOUNTS   0      251      0    0     0   0
       1         1             1        2     22    0     0   0
       1         4   TRANS_DATE 0      12      0    0     0   0
       2         0             0        2     22    7     2  10
       2         1   ACCOUNT_NO 0       2     22    0     0   0
       2         2   PERSON    0        2     22    4     0  10
       2         3   AMOUNTS   0      251     22    4     0  10
       2         1             1        2      0    0     0   0
       2         4   TRANS_NO  0        2      0    0     0   0
```

The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```
CREATE OR REPLACE PROCEDURE p1 (
        pvc2    IN     VARCHAR2,
        pvc     OUT    VARCHAR,
        pstr    IN OUT STRING,
        plong   IN     LONG,
        prowid  IN     ROWID,
        pchara  IN     CHARACTER,
        pchar   IN     CHAR,
        praw    IN     RAW,
        plraw   IN     LONG RAW,
        pbinint IN     BINARY_INTEGER,
        pplsint IN     PLS_INTEGER,
        pbool   IN     BOOLEAN,
        pnat    IN     NATURAL,
        ppos    IN     POSITIVE,
        pposn   IN     POSITIVEN,
```

```
        pnatn   IN     NATURALN,
        pnum    IN     NUMBER,
        pintgr  IN     INTEGER,
        pint    IN     INT,
        psmall  IN     SMALLINT,
        pdec    IN     DECIMAL,
        preal   IN     REAL,
        pfloat  IN     FLOAT,
        pnumer  IN     NUMERIC,
        pdp     IN     DOUBLE PRECISION,
        pdate   IN     DATE,
        pmls    IN     MLSLABEL) AS

BEGIN
    NULL;
END;
```

If you describe this procedure using the following:

```
CREATE OR REPLACE PACKAGE describe_it AS

    PROCEDURE desc_proc (name VARCHAR2);

END describe_it;

CREATE OR REPLACE PACKAGE BODY describe_it AS

  PROCEDURE prt_value(val VARCHAR2, isize INTEGER) IS
    n INTEGER;
  BEGIN
    n := isize - LENGTHB(val);
    IF n < 0 THEN
      n := 0;
    END IF;
    DBMS_OUTPUT.PUT(val);
    FOR i in 1..n LOOP
      DBMS_OUTPUT.PUT(' ');
    END LOOP;
  END prt_value;

  PROCEDURE desc_proc (name VARCHAR2) IS

      overload     DBMS_DESCRIBE.NUMBER_TABLE;
      position     DBMS_DESCRIBE.NUMBER_TABLE;
      c_level      DBMS_DESCRIBE.NUMBER_TABLE;
      arg_name     DBMS_DESCRIBE.VARCHAR2_TABLE;
      dty          DBMS_DESCRIBE.NUMBER_TABLE;
      def_val      DBMS_DESCRIBE.NUMBER_TABLE;
      p_mode       DBMS_DESCRIBE.NUMBER_TABLE;
      length       DBMS_DESCRIBE.NUMBER_TABLE;
      precision    DBMS_DESCRIBE.NUMBER_TABLE;
      scale        DBMS_DESCRIBE.NUMBER_TABLE;
      radix        DBMS_DESCRIBE.NUMBER_TABLE;
      spare        DBMS_DESCRIBE.NUMBER_TABLE;
      idx          INTEGER := 0;

  BEGIN
      DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
              name,
              null,
              null,
```

```
                overload,
                position,
                c_level,
                arg_name,
                dty,
                def_val,
                p_mode,
                length,
                precision,
                scale,
                radix,
                spare);

        DBMS_OUTPUT.PUT_LINE('Position    Name        DTY  Mode');
        LOOP
            idx := idx + 1;
            prt_value(TO_CHAR(position(idx)), 12);
            prt_value(arg_name(idx), 12);
            prt_value(TO_CHAR(dty(idx)), 5);
            prt_value(TO_CHAR(p_mode(idx)), 5);
            DBMS_OUTPUT.NEW_LINE;
        END LOOP;
    EXCEPTION
       WHEN NO_DATA_FOUND THEN
          DBMS_OUTPUT.NEW_LINE;
          DBMS_OUTPUT.NEW_LINE;

    END desc_proc;
END describe_it;
```

Then the results list all the numeric codes for the PL/SQL datatypes:

```
Position  Name    Datatype_Code  Mode
1         PVC2      1              0
2         PVC       1              1
3         PSTR      1              2
4         PLONG     8              0
5         PROWID    11             0
6         PCHARA    96             0
7         PCHAR     96             0
8         PRAW      23             0
9         PLRAW     24             0
10        PBININT   3              0
11        PPLSINT   3              0
12        PBOOL     252            0
13        PNAT      3              0
14        PPOS      3              0
15        PPOSN     3              0
16        PNATN     3              0
17        PNUM      2              0
18        PINTGR    2              0
19        PINT      2              0
20        PSMALL    2              0
21        PDEC      2              0
22        PREAL     2              0

```

Summary of DBMS_DESCRIBE Subprograms

Table 55–2 DBMS_DESCRIBE Package Subprograms

Subprogram	Description
DESCRIBE_PROCEDURE Procedure on page 55-11	Provides a brief description of a PL/SQL stored procedure

DESCRIBE_PROCEDURE Procedure

The procedure DESCRIBE_PROCEDURE provides a brief description of a PL/SQL stored procedure. It takes the name of a stored procedure and returns information about each parameter of that procedure.

Syntax

```
DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
   object_name                  IN  VARCHAR2,
   reserved1                    IN  VARCHAR2,
   reserved2                    IN  VARCHAR2,
   overload                     OUT NUMBER_TABLE,
   position                     OUT NUMBER_TABLE,
   level                        OUT NUMBER_TABLE,
   argument_name                OUT VARCHAR2_TABLE,
   datatype                     OUT NUMBER_TABLE,
   default_value                OUT NUMBER_TABLE,
   in_out                       OUT NUMBER_TABLE,
   length                       OUT NUMBER_TABLE,
   precision                    OUT NUMBER_TABLE,
   scale                        OUT NUMBER_TABLE,
   radix                        OUT NUMBER_TABLE,
   spare                        OUT NUMBER_TABLE
   include_string_constraints   OUT BOOLEAN DEFAULT FALSE);
```

Parameters

Table 55–3 DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
object_name	Name of the procedure being described. The syntax for this parameter follows the rules used for identifiers in SQL. The name can be a synonym. This parameter is required and may not be null. The total length of the name cannot exceed 197 bytes. An incorrectly specified OBJECT_NAME can result in one of the following exceptions: ORA-20000 - A package was specified. You can only specify a stored procedure, stored function, packaged procedure, or packaged function. ORA-20001 - The procedure or function that you specified does not exist within the given package. ORA-20002 - The object that you specified is a remote object. This procedure cannot currently describe remote objects. ORA-20003 - The object that you specified is invalid and cannot be described. ORA-20004 - The object was specified with a syntax error.
reserved1 reserved2	Reserved for future use -- must be set to NULL or the empty string.
overload	A unique number assigned to the procedure's signature. If a procedure is overloaded, then this field holds a different value for each version of the procedure.
position	Position of the argument in the parameter list. Position 0 returns the values for the return type of a function.

Table 55–3 (Cont.) DBMS_DESCRIBE.DESCRIBE_PROCEDURE Parameters

Parameter	Description
`level`	If the argument is a composite type, such as record, then this parameter returns the level of the datatype. See the *Oracle Call Interface Programmer's Guide* for a description of the `ODESSP` call for an example.
`argument_name`	Name of the argument associated with the procedure that you are describing.

`datatype`	Oracle datatype of the argument being described. The datatypes and their numeric type codes are:
	`0 placeholder for procedures with no arguments`
	`1 VARCHAR, VARCHAR, STRING`
	`2 NUMBER, INTEGER, SMALLINT, REAL, FLOAT, DECIMAL`
	`3 BINARY_INTEGER, PLS_INTEGER, POSITIVE, NATURAL`
	`8 LONG`
	`11 ROWID`
	`12 DATE`
	`23 RAW`
	`24 LONG RAW`
	`58 OPAQUE TYPE`
	`96 CHAR (ANSI FIXED CHAR), CHARACTER`
	`106 MLSLABEL`
	`121 OBJECT`
	`122 NESTED TABLE`
	`123 VARRAY`
	`178 TIME`
	`179 TIME WITH TIME ZONE`
	`180 TIMESTAMP`
	`181 TIMESTAMP WITH TIME ZONE`
	`231 TIMESTAMP WITH LOCAL TIME ZONE`
	`250 PL/SQL RECORD`
	`251 PL/SQL TABLE`
	`252 PL/SQL BOOLEAN`

`default_value`	1 if the argument being described has a default value; otherwise, the value is 0.

`in_out`	Describes the mode of the parameter:
	`0 IN`
	`1 OUT`
	`2 IN OUT`

`length`	For `%rowtype` formal arguments, the length constraint is returned, otherwise 0 is returned.If the `include_string_constraints` parameter is set to `TRUE, the` argument's formal length constraint is passed back if it is of the appropriate type. Those are the string types: 1;8;23;24;96
`precision`	If the argument being described is of datatype 2 (`NUMBER`), then this parameter is the precision of that number.
`scale`	If the argument being described is of datatype 2 (`NUMBER`), then this parameter is the scale of that number.
`radix`	If the argument being described is of datatype 2 (`NUMBER`), then this parameter is the radix of that number.
`spare`	Reserved for future functionality.
`include_ string_ constraints`	The default is `FALSE`. If the parameter is set to `TRUE`, the arguments' formal type constraints is passed back if it is of the appropriate type.Those are the string types: 1;8;23;24;96

Return Values

All values from `DESCRIBE_PROCEDURE` are returned in its `OUT` parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.

56

DBMS_DG

The DBMS_DG package allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover.

> **See Also:** *Oracle Data Guard Broker* for more information about performing a fast-start failover in a broker configuration

This chapter contains the following topics:

- Using DBMS_DG
- Summary of the DBMS_DG Subprogram

Using DBMS_DG

There are conditions detectable by applications running outside of the Oracle database that may warrant the Oracle Data Guard broker to perform a fast-start failover. Because the range of possible conditions is virtually unlimited, it is left to the applications to determine which conditions warrant a fast-start failover.

When such conditions occur, the application calls the `DBMS_DG.INITIATE_FS_FAILOVER` procedure to alert the primary database that the application wants a fast-start failover to occur immediately. The primary database then notifies the observer, which immediately initiates a fast-start failover as long as the standby database is in a valid fast-start failover state ("observed" and either "synchronized" or "within lag") to accept a failover.

If the configuration is not in a valid fast-start failover state, the `INITIATE_FS_FAILOVER` subprogram returns an ORA error message (it will not signal an exception) to inform the calling application that a fast-start failover could not be performed.

Summary of the DBMS_DG Subprogram

Table 56–1 DBMS_DG Package Subprogram

Subprogram	Description
INITIATE_FS_FAILOVER Procedure on page 56-4	Enables an application to notify the primary database that a fast-start failover is necessary when the application encounters conditions that warrant a failover.

INITIATE_FS_FAILOVER Procedure

Use this procedure to specify a condition string that, when encountered by an application, allows the application to request the primary database to immediately invoke a fast-start failover.

Syntax

```
DBMS_DG.INITIATE_FS_FAILOVER (
     condstr          IN VARCHAR2)
RETURN BINARY_INTEGER;
```

Parameters

Table 56–2 INITIATE_FS_FAILOVER Procedure Parameters

Parameter	Description
condstr	Specifies the condition string for which a fast-start failover should be requested. If no condition string argument is supplied, the default string of "Application Failover Requested" will be logged in the broker log file and in the database alert log of the primary database.

Usage Notes

- Requires `SYSDBA` privilege and must be defined as an invoker's rights package.
- This procedure returns a binary integer.
- Query the `V$FS_FAILOVER_STATS` view to see the time of the last fast-start failover and the reason it was performed.

Errors

Table 56–3 INITIATE_FS_FAILOVER Procedure Errors

Error	Description
`ORA-00000: normal, successful completion`	The request to initiate a fast-start failover has been posted to the observer.
`ORA-16646: fast-start failover is disabled`	Either a broker configuration does not exist or fast-start failover has not been enabled.
`ORA-16666: unable to initiate fast-start failover on a standby database`	`DBMS_DG.INITIATE_FS_FAILOVER` was invoked on a standby site.
`ORA-16817: unsynchronized fast-start failover configuration`	`DBMS_DG.INITIATE_FS_FAILOVER` was invoked in a maximum available fast-start failover configuration when the configuration was not synchronized.
`ORA-16819: fast-start failover observer not started`	`DBMS_DG.INITIATE_FS_FAILOVER` was invoked but an observer had not yet been started.
`ORA-16820: fast-start failover observer is no longer observing this database`	`DBMS_DG.INITIATE_FS_FAILOVER` was invoked but the configuration detects that the observer may not be running.

Table 56–3 (Cont.) INITIATE_FS_FAILOVER Procedure Errors

Error	Description
ORA-16829: lagging fast-start failover configuration	DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum performance fast-start failover configuration when the configuration was not in the user-specified redo lag limit.

Example

In this example, the program attempts to initiate a fast-start failover when fast-start failover is disabled. To use this example, connect as user SYS with SYDDBA privileges.

```
set serveroutput on

declare
status integer;

begin
status := dbms_dg.initiate_fs_failover(''Failover Requested'');

dbms_output.put_line(''Fast-Start Failover is disabled: Expected status =
ORA-16646'');
dbms_output.put_line(''                  Actual Status = ORA-'' || status);

end;
/
exit;
```

57

DBMS_DIMENSION

DBMS_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

> **See Also:** *Oracle Database Data Warehousing Guide* for detailed conceptual and usage information about the DBMS_DIMENSION package

This chapter contains the following topics:

- Using DBMS_DIMENSION
  - Security Model
- Summary of DBMS_DIMENSION Subprograms

Using DBMS_DIMENSION

This section contains topics which relate to using the `DBMS_DIMENSION` package.

- Security Model

Security Model

Security on this package can be controlled by granting `EXECUTE` to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: `CREATE ANY DIMENSION`, `ALTER ANY DIMENSION`, and `DROP ANY DIMENSION`.

Summary of DBMS_DIMENSION Subprograms

Table 57–1 DBMS_DIMENSION Package Subprograms

Subprogram	Description
DESCRIBE_DIMENSION Procedure on page 57-5	Prints out the definition of the input dimension, including dimension owner and name, levels, hierarchies, and attributes
VALIDATE_DIMENSION Procedure on page 57-6	Verifies that the relationships specified in a dimension are correct

DESCRIBE_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS_OUTPUT package.

Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (
   dimension  IN VARCHAR2);
```

Parameters

Table 57–2 DESCRIBE_DIMENSION Procedure Parameter

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.

VALIDATE_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table DIMENSION_EXCEPTIONS in the user's schema.

Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
   dimension               IN VARCHAR2,
   incremental             IN BOOLEAN := TRUE,
   check_nulls             IN BOOLEAN := FALSE,
   statement_id            IN VARCHAR2 := NULL );
```

Parameters

Table 57–3 VALIDATE_DIMENSION Procedure Parameters

Parameter	Description
dimension	The owner and name of the dimension in the format of owner.name.
incremental	If TRUE, check only the new rows for tables of this dimension. If FALSE, check all the rows.
check_nulls	If TRUE, then all level columns are verified to be non-null. If FALSE, this check is omitted. Specify FALSE when non-NULLness is guaranteed by other means, such as NOT NULL constraints.
statement_id	A client-supplied unique identifier to associate output rows with specific invocations of the procedure.

58

DBMS_DST

The DBMS_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone data type.

See Also:

- *Oracle Database Globalization Support Guide*
- *Oracle Database Reference*

This chapter contains the following topics:

- Using DBMS_DST
  - Overview
  - Security Model
  - Views
- Summary of DBMS_DST Subprograms

Using DBMS_DST

- Overview
- Security Model
- Views

Overview

The transition period during which Daylight Saving Time comes into effect, or stops being in effect, has the potential for problems, such as data loss, when handling timestamps with time zone data. The `DBMS_DST` package enables working with these transitions in the context of a set of rules.

Security Model

The DBMS_DST package is an invoker's rights package.

> **See Also:** *Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

The execute privilege on the package is granted to the EXECUTE_CATALOG_ROLE role. This role is normally granted to selected users to allow EXECUTE privileges for packages and procedures in the data dictionary.

The user that invokes the package must have the following privileges:

- CREATE ANY TABLE
- ALTER ANY TABLE
- DROP ANY TABLE
- SELECT ANY TABLE
- LOCK ANY TABLE
- ALTER ANY INDEX
- ALTER ANY TRIGGER
- UPDATE ANY TABLE
- EXECUTE ANY TYPE

Views

The DBMS_DST package uses the views shown in Table 58–1, " Views used by DBMS_DST", further described in the *Oracle Database Reference*:

Table 58–1 Views used by DBMS_DST

View	Description
DBA_TSTZ_TABLES	Displays information about all tables in the database, which have columns defined on TIMESTAMP WITH TIME ZONE data types or object types containing attributes of TIMESTAMP WITH TIME ZONE data types. Its columns are the same as those in ALL_TSTZ_TABLES
USER_TSTZ_TABLES	Displays information about the tables owned by the current user, which have columns defined on TIMESTAMP WITH TIME ZONE data types or object types containing attributes of TIMESTAMP WITH TIME ZONE data types. Its columns (except for OWNER) are the same as those in ALL_TSTZ_TABLES.
ALL_TSTZ_TABLES	Displays information about the tables accessible to the current user, which have columns defined on TIMESTAMP WITH TIME ZONE data types or object types containing attributes of TIMESTAMP WITH TIME ZONE data types

Summary of DBMS_DST Subprograms

Table 58–2 DBMS_DST Package Subprograms

Subprogram	Description
BEGIN_PREPARE Procedure on page 58-7	Starts a prepare window
BEGIN_UPGRADE Procedure on page 58-8	Starts an upgrade window
CREATE_AFFECTED_TABLE Procedure on page 58-9	Creates a table that has the schema shown in the comments for the FIND_AFFECTED_TABLES Procedure
CREATE_ERROR_TABLE Procedure on page 58-10	Creates a log error table
CREATE_TRIGGER_TABLE Procedure on page 58-11	Creates a table that is used to record active triggers disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process
END_PREPARE Procedure on page 58-12	Ends a prepare window
END_UPGRADE Procedure on page 58-13	Ends an upgrade window
FIND_AFFECTED_TABLES Procedure on page 58-14	Finds all the tables that have affected TSTZ data due to the new timezone version
UPGRADE_DATABASE Procedure on page 58-15	Upgrades all tables in the database that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type
UPGRADE_SCHEMA Procedure on page 58-17	Upgrades tables in a specified list of schemas that has one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type
UPGRADE_TABLE Procedure on page 58-19	Upgrades a specified list of tables that has one or more columns defined on the TSTZ type or an ADT containing the TSTZ type

BEGIN_PREPARE Procedure

This procedure starts a prepare window. Once a prepare window is started successfully, the database property 'DST_UPGRADE_STATE' is set to 'PREPARE', and the database property 'SECONDARY_TT_VERSION' is set to a new timezone version.

The prepare window lets a DBA investigate data affected by the upgrade, and so judge when it is optimal to perform the upgrade. The prepare window can overlap normal database operation.

Syntax

```
DBMS_DST.BEGIN_PREPARE (
   new_version               IN  BINARY_INTEGER);
```

Parameters

Table 58–3 BEGIN_PREPARE Procedure Parameters

Parameter	Description
new_version	New timezone version to which the database is to be prepared to upgrade

BEGIN_UPGRADE Procedure

This procedure starts an upgrade window. When an upgraded window is started successfully, the TSTZ data in the dictionary tables is upgraded to reflect the new timezone version, and the database property `'DST_UPGRADE_STATE'` is set to `'UPGRADE'`. Once `BEGIN_UPGRADE` has been performed successfully, the user must re-start the database. After a successful restart, the database property `'PRIMARY_TT_VERSION'` is the new timezone version, and `'SECONDARY_TT_VERSION'` is the old timezone version.

The procedure operates atomically, and upgrades all or none of the dictionary tables and the database properties. It must be called in the database in `OPEN MIGRATE` mode.

Syntax

```
DBMS_DST.BEGIN_UPGRADE (
   new_version                IN  BINARY_INTEGER,
   error_on_overlap_time      IN  BOOLEAN := FALSE,
   error_on_nonexisting_time  IN  BOOLEAN := FALSE);
```

Parameters

Table 58–4 BEGIN_UPGRADE Procedure Parameters

Parameter	Description
`new_version`	New timezone version to which the database is to be upgraded
`error_on_overlap_time`	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is `TRUE`. For more information about boundary cases, see *Oracle Database SQL Language Reference*.
`error_on_nonexisting_time`	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is `TRUE`.

CREATE_AFFECTED_TABLE Procedure

This procedure creates a table that has the schema shown in the comments for the FIND_AFFECTED_TABLES Procedure.

Syntax

```
DBMS_DST.CREATE_AFFECTED_TABLE (
   table_name      IN  VARCHAR2);
```

Parameters

Table 58–5 CREATE_AFFECTED_TABLE Procedure Parameters

Parameter	Description
table_name	Name of the table created

Usage Notes

This procedures takes a table_name without schema qualification, creating a table within the current user schema.

CREATE_ERROR_TABLE Procedure

This procedure creates a log error table which has the following schema:

```
CREATE TABLE dst$error_table(
   table_owner     VARCHAR2(30),
   table_name      VARCHAR2(30),
   column_name     VARCHAR2(4000),
   rid             ROWID,
   error_number    NUMBER)
```

Syntax

```
DBMS_DST.CREATE_ERROR_TABLE (
   table_name      IN  VARCHAR2);
```

Parameters

Table 58–6 CREATE_ERROR_TABLE Procedure Parameters

Parameter	Description
`table_name`	Name of the table created

Usage Notes

- This procedures takes a `table_name` without schema qualification, creating a table within the current user schema.
- The error number is found when upgrading time zone file and timestamp with time zone data. For more information about error handling when upgrading time zone file and timestamp with time zone data, see Oracle Database Globalization Support Guide

CREATE_TRIGGER_TABLE Procedure

This procedure creates a table that has the following schema.

```
CREATE TABLE dst_trigger_table (
trigger_owner  VARCHAR2(30),
trigger_name   VARCHAR2(30));
```

This table is used to record active triggers that are disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process.

Syntax

```
DBMS_DST.CREATE_TRIGGER_TABLE (
   table_name     IN    VARCHAR2);
```

Parameters

Table 58–7 CREATE_TRIGGER_TABLE Procedure Parameters

Parameter	Description
`table_name`	Name of table to be created

Usage Notes

This procedures takes a `table_name` without schema qualification, creating a table within the current user schema.

END_PREPARE Procedure

This procedure ends a prepare window.

Syntax

```
DBMS_DST.BEGIN_PREPARE;
```

END_UPGRADE Procedure

This procedure ends an upgrade window. An upgraded window is ended if all the affected user tables have been upgraded. Otherwise, the `OUT` parameter `num_of_failures` indicates how many tables have not been converted.

Syntax

```
DBMS_DST.END_UPGRADE (
  num_of_failures    OUT  BINARY_INTEGER);
```

Parameters

Table 58–8 END_UPGRADE Procedure Parameters

Parameter	Description
`num_of_failures`	Number of tables that fail to complete

FIND_AFFECTED_TABLES Procedure

This procedure finds all the tables which have affected TSTZ data due to the new timezone version. This procedure can only be invoked during a prepare window. The tables which have affected TSTZ data are recorded into a table indicated by parameter `affected_tables`. If semantic errors must be logged, they are recorded into a table indicated by parameter `log_errors_table`.

Syntax

```
DBMS_DST.FIND_AFFECTED_TABLES (
   affected_tables             IN  VARCHAR2 =: 'sys.dst$affected_tables',
   log_errors                  IN  BOOLEAN := FALSE,
   log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table');
```

Parameters

Table 58–9 FIND_AFFECTED_TABLES Procedure Parameters

Parameter	Description

`affected_tables`	Name of table with the following schema:
	`CREATE TABLE dst$affected_tables (`
	`table_owner VARCHAR2(30),`
	`table_name VARCHAR2(30),`
	`column_name VARCHAR2(4000),`
	`row_count NUMBER,`
	`error_count NUMBER)`
	The table can be created with the CREATE_AFFECTED_TABLE Procedure.

`log_errors`	Boolean flag indicating whether to log errors during upgrade. If `FALSE`, no error is logged into the `log_errors_table` after aborting conversion of the current table. If `TRUE`, the error is logged to the `log_errors_table`. The default is `FALSE`.

`log_errors_table`	Table name with the following schema:
	`CREATE TABLE dst$error_table (`
	`table_owner VARCHAR2(30),`
	`table_name VARCHAR2(30),`
	`column_name VARCHAR2(4000),`
	`rid ROWID,`
	`error_number NUMBER)`
	The table can be created with the CREATE_ERROR_TABLE Procedure. The `rid` column records the rowids of the offending rows, and the `error_number` column records the corresponding error number.

UPGRADE_DATABASE Procedure

This procedure upgrades all tables in the database, which have one or more columns defined on the TSTZ type or an ADT containing the TSTZ type. This procedure can only be invoked after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that, a base table and its materialized view log table are upgraded in an atomic transaction.

Syntax

```
DBMS_DST.UPGRADE_DATABASE  (
   num_of_failures             OUT BINARY_INTEGER,
   upgrade_data                IN  BOOLEAN := TRUE,
   parallel                    IN  BOOLEAN := FALSE,
   continue_after_errors       IN  BOOLEAN := TRUE,
   log_errors                  IN  BOOLEAN := FALSE,
   log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table' ,
   error_on_overlap_time       IN  BOOLEAN := FALSE,
   error_on_nonexisting_time   IN  BOOLEAN := FALSE,
   log_triggers_table          IN  VARCHAR2 := 'sys.dst$trigger_table');
```

Parameters

Table 58–10 UPGRADE_DATABASE Procedure Parameters

Parameter	Description
num_of_failures	Number of tables that fail to complete
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave it unconverted (FALSE). The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML. The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.
log_errors_table	Table name with the following schema: CREATE TABLE dst$error_table (table_owner VARCHAR2(30), table_name VARCHAR2(30), column_name VARCHAR2(4000), rid ROWID, error_number NUMBER) The table can be created with the CREATE_ERROR_TABLE Procedure. The rid column records the rowids of the offending rows, and the error_number column records the corresponding error number.

Table 58–10 (Cont.) UPGRADE_DATABASE Procedure Parameters

Parameter	Description
`error_on_overlap_time`	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is `TRUE`.
`error_on_nonexisting_time`	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is `TRUE`.
`log_triggers_table`	Table to log triggers which are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade

UPGRADE_SCHEMA Procedure

This procedure upgrades tables in a specified list of schemas that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type. This procedure can be invoked only after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that a base table and its materialized view log table are upgraded in an atomic transaction.

Syntax

```
DBMS_DST.UPGRADE_SCHEMA (
   num_of_failures             OUT BINARY_INTEGER,
   schema_list                 IN  VARCHAR2,
   upgrade_data                IN  BOOLEAN := TRUE,
   parallel                    IN  BOOLEAN := FALSE,
   continue_after_errors       IN  BOOLEAN := TRUE,
   log_errors                  IN  BOOLEAN := FALSE,
   log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table' ,
   error_on_overlap_time       IN  BOOLEAN := FALSE,
   error_on_nonexisting_time   IN  BOOLEAN := FALSE,
   log_triggers_table          IN  VARCHAR2 := 'sys.dst$trigger_table');
```

Parameters

Table 58–11 UPGRADE_SCHEMA Procedure Parameters

Parameter	Description
num_of_failures	Number of tables that fail to complete
schema_list	Schema name list (comma separated strings)
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE) or to leave unconverted (FALSE). The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML. The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.

Table 58–11 (Cont.) UPGRADE_SCHEMA Procedure Parameters

Parameter	Description

`log_errors_table`	Table name with the following schema:
	`CREATE TABLE dst$error_table (`
	`table_owner VARCHAR2(30),`
	`table_name VARCHAR2(30),`
	`column_name VARCHAR2(4000),`
	`rid ROWID,`
	`error_number NUMBER)`
	The table can be created with the CREATE_ERROR_TABLE Procedure. The `rid` column records the rowids of the offending rows, and the `error_number` column records the corresponding error number.

`error_on_overlap_time`	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is `TRUE`.
`error_on_nonexisting_time`	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is `TRUE`.
`log_triggers_table`	Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade

UPGRADE_TABLE Procedure

This procedure upgrades a specified list of tables that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type.

Syntax

```
DBMS_DST.UPGRADE_TABLE  (
   num_of_failures             OUT BINARY_INTEGER,
   table_list                  IN  VARCHAR2,
   upgrade_data                IN  BOOLEAN := TRUE,
   parallel                    IN  BOOLEAN := FALSE,
   continue_after_errors       IN  BOOLEAN := TRUE,
   log_errors                  IN  BOOLEAN := FALSE,
   log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table' ,
   error_on_overlap_time       IN  BOOLEAN := FALSE,
   error_on_nonexisting_time   IN  BOOLEAN := FALSE,
   log_triggers_table          IN  VARCHAR2 := 'sys.dst$trigger_table',
   atomic_upgrade              IN  BOOLEAN := FALSE);
```

Parameters

Table 58–12 UPGRADE_TABLE Procedure Parameters

Parameter	Description
num_of_failures	Number of tables that fail to complete
table_list	Table name list (comma separated strings)
upgrade_data	Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave unconverted (FALSE). The default is TRUE.
parallel	Boolean flag indicating whether to convert tables using PDML (Parallel DML), or Serial DML. The default is FALSE.
continue_after_errors	Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.
log_errors	Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.

log_errors_table	Table name with the following schema:
	`CREATE TABLE dst$error_table (`
	`table_owner VARCHAR2(30),`
	`table_name VARCHAR2(30),`
	`column_name VARCHAR2(4000),`
	`rid ROWID,`
	`error_number NUMBER)`
	The table can be created with the CREATE_ERROR_TABLE Procedure. The rid parameter records the rowids of the offending rows and the corresponding error number.

Table 58–12 (Cont.) UPGRADE_TABLE Procedure Parameters

Parameter	Description
`error_on_overlap_time`	Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is `TRUE`.
`error_on_nonexisting_time`	Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is `TRUE`.
`log_triggers_table`	Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade
`atomic_upgrade`	Boolean flag indicating whether to convert the listed tables atomically (in a single transaction). If `FALSE`, each table is converted in its own transaction. The default is `FALSE`.

Usage Notes

This procedure can only be invoked after an upgrade window has been started. The table list has to satisfy the following partial ordering:

1. If a base table has a materialized view log table, the log table must be the next item in the list.
2. If the container table for a materialized view appears in the list, the materialized view's 'non-upgraded' base tables and log tables must appear in the table list and before the container table.

A base table and its materialized view log table need to be upgraded in an atomic transaction by specifying `atomic_upgrade` to `TRUE`.

59

DBMS_DISTRIBUTED_TRUST_ADMIN

DBMS_DISTRIBUTED_TRUST_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

- Using DBMS_DISTRIBUTED_TRUST_ADMIN
  - Overview
  - Security Model
  - Examples
- Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

Using DBMS_DISTRIBUTED_TRUST_ADMIN

- Overview
- Security Model
- Examples

Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be "trusted" if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

Security Model

To execute DBMS_DISTRIBUTED_TRUST_ADMIN, the EXECUTE_CATALOG_ROLE role must be granted to the DBA. To select from the view TRUSTED_SERVERS, the SELECT_CATALOG_ROLE role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the ALLOW_SERVER procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the DENY_SERVER procedure does not have any effect if the database already does not trust any database or if that database is already untrusted.

The procedures DENY_ALL and ALLOW_ALL delete all entries (in other words, server names) that are explicitly allowed or denied using the ALLOW_SERVER procedure or DENY_SERVER procedure respectively.

Examples

If you have not yet used the package DBMS_DISTRIBUTED_TRUST_ADMIN to change the trust listing, by default you trust all databases in the same enterprise domain if that domain it listed as trusted in the directory service:

```
SELECT * FROM TRUSTED_SERVERS;
TRUST     NAME
--------- --------------------
Trusted   All
```

Because all servers are currently trusted, you can execute the DENY_SERVER Procedure and specify that a particular server is not trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER
                           ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
--------- ----------------------------------------------
Untrusted SALES.US.AMERICAS.ACME_AUTO.COM
```

By executing the DENY_ALL Procedure, you can choose to not trust any database server:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;

PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;

TRUST      NAME
--------- ----------------------------------------------
Untrusted All
```

The ALLOW_SERVER Procedure can be used to specify that one particular database is to be trusted:

```
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER
                             ('SALES.US.AMERICAS.ACME_AUTO.COM');
PL/SQL procedure successfully completed.

SELECT * FROM TRUSTED_SERVERS;
TRUST      NAME
--------- ----------------------------------------------
Trusted   SALES.US.AMERICAS.ACME_AUTO.COM
```

Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

Table 59–1 DBMS_DISTRIBUTED_TRUST_ADMIN Package Subprograms

Subprogram	Description
ALLOW_ALL Procedure on page 59-7	Empties the list and inserts a row indicating that all servers should be trusted
ALLOW_SERVER Procedure on page 59-8	Enables a specific server to be allowed access even though `deny` all is indicated in the list
DENY_ALL Procedure on page 59-9	Empties the list and inserts a row indicating that all servers should be untrusted
on page 59-10DENY_ SERVER Procedure	Enables a specific server to be denied access even though allow all is indicated in the list

ALLOW_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view TRUSTED_SERVERS will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;
```

Usage Notes

ALLOW_ALL only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

ALLOW_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "`deny all`").

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (
   server IN VARCHAR2);
```

Parameters

Table 59–2 ALLOW_SERVER Procedure Parameters

Parameter	Description
`server`	Unique, fully-qualified name of the server to be trusted.

Usage Notes

If the Trusted Servers List contains the entry "`deny all`", then this procedure adds a specification indicating that a specific database (for example, `DBx`) is to be trusted.

If the Trusted Servers List contains the entry "`allow all`", and if there is no "`deny DBx`" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "`allow all`", and if there is a "`deny DBx`" entry in the list, then that entry is deleted.

DENY_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view TRUSTED_SERVERS will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

DENY_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified `allow all`).

Syntax

```
DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER (
   server IN VARCHAR2);
```

Parameters

Table 59–3 DENY_SERVER Procedure Parameters

Parameter	Description
`server`	Unique, fully-qualified name of the server to be untrusted.

Usage Notes

If the Trusted Servers List contains the entry `allow all`, then this procedure adds an entry indicating that the specified database (for example, `DBx`) is not to be trusted.

If the Trusted Servers List contains the entry "`deny all`", and if there is no "`allow DBx`" entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry "`deny all`", and if there is an "`allow DBx`" entry, then this procedure causes that entry to be deleted.

60

DBMS_EPG

The DBMS_EPG package implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

- Using DBMS_EPG
  - Overview
  - Security Model
  - Exceptions
- Data Structures
  - VARCHAR2_TABLE Table Type
- Subprogram Groups
  - Configuration Subprograms
  - Authorization Subprograms
- Summary of DBMS_EPG Subprograms

Using DBMS_EPG

- Overview
- Security Model
- Exceptions

Overview

The DBMS_EPG package is a platform on which PL/SQL users develop and deploy PL/SQL Web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of mod_plsql in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser by way of HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

Security Model

The XDBADMIN role is required to invoke the configuration interface. It may invoked by the database user "XDB".

The authorization interface can be invoked by any user.

Exceptions

The following table lists the exceptions raised by the DBMS_EPG package.

Table 60–1 DBMS_EPG Exceptions

Exception	Error Code	Description
DAD_NOT_FOUND	20000	Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists.

Data Structures

The DBMS_EPG package defines a TABLE type.

VARCHAR2_TABLE Table Type

This type is used by the procedures GET_ALL_GLOBAL_ATTRIBUTES, GET_ALL_DAD_ATTRIBUTES, GET_ALL_DAD_MAPPINGS, and GET_DAD_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

```
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

Subprogram Groups

The DBMS_EPG consists of two interfaces:

- Configuration Subprograms
- Authorization Subprograms

Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

Table 60–2 Configuration Subprogram Group

Subprogram	Description
CREATE_DAD Procedure on page 60-12	Creates a new DAD
DELETE_DAD_ATTRIBUTE Procedure on page 60-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 60-15	Deletes a global attribute
DROP_DAD Procedure on page 60-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 60-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 60-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 60-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 60-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 60-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 60-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 60-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 60-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 60-26	Sets the value of a global attribute
UNMAP_DAD Procedure on page 60-27	Unmaps a DAD from the specified virtual path

Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

Table 60–3 Authorization Subprogram Group

Subprogram	Description
AUTHORIZE_DAD Procedure on page 60-11	Authorizes a DAD to invoke procedures and access document tables with a database user's privileges
DEAUTHORIZE_DAD Procedure on page 60-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges

Summary of DBMS_EPG Subprograms

Table 60–4 DBMS_EPG Package Subprograms

Subprogram	Description
AUTHORIZE_DAD Procedure on page 60-11	authorizes a DAD to invoke procedures and access document tables with a database user's privileges
CREATE_DAD Procedure on page 60-12	Creates a new DAD
DEAUTHORIZE_DAD Procedure on page 60-13	Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges
DELETE_DAD_ATTRIBUTE Procedure on page 60-14	Deletes a DAD attribute
DELETE_GLOBAL_ATTRIBUTE Procedure on page 60-15	Deletes a global attribute
DROP_DAD Procedure on page 60-16	Drops a DAD
GET_ALL_DAD_ATTRIBUTES Procedure on page 60-17	Retrieves all the attributes of a DAD.
GET_ALL_DAD_MAPPINGS Procedure on page 60-18	Retrieves all virtual paths to which the specified DAD is mapped.
GET_ALL_GLOBAL_ATTRIBUTES Procedure on page 60-19	Retrieves all global attributes and values
GET_DAD_ATTRIBUTE Function on page 60-20	Retrieves the value of a DAD attribute
GET_DAD_LIST Procedure on page 60-21	Retrieves a list of all DADs for an Embedded Gateway instance.
GET_GLOBAL_ATTRIBUTE Function on page 60-22	Retrieves the value of a global attribute
MAP_DAD Procedure on page 60-23	Maps a DAD to the specified virtual path.
SET_DAD_ATTRIBUTE Procedure on page 60-24	Sets the value for a DAD
SET_GLOBAL_ATTRIBUTE Procedure on page 60-26	Sets the value of a global attribute
UNMAP_DAD Procedure on page 60-27	Unmaps a DAD from the specified virtual path

AUTHORIZE_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

> **See Also:** Authorization Subprograms on page 60-9 for other subprograms in this group

Syntax

```
DBMS_EPG.AUTHORIZE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–5 AUTHORIZE_DAD Procedure Parameters

Parameter	Description
`dad_name`	The name of the DAD to create
`user`	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

- To authorize the use of another user's privileges, the invoker must have the `ALTER USER` system privilege.
- The DAD must exist but its "database-username" DAD attribute does not have to be set to user to authorize.
- Multiple users can authorize the same DAD and it is up to the DAD's "database-username" setting to decide which user's privileges to use.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.AUTHORIZE_DAD('HR');
```

CREATE_DAD Procedure

This procedure creates a new DAD.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.CREATE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–6 CREATE_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to create
path	The virtual path to which to map the DAD

DEAUTHORIZE_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges. The invoker can always deauthorize the use of his own privileges.

> **See Also:** Authorization Subprograms on page 60-9 for other subprograms in this group

Syntax

```
DBMS_EPG.DEAUTHORIZE_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–7 DEAUTHORIZE_DAD Procedure Parameters

Parameter	Description
`dad_name`	The name of the DAD for which to deauthorize use
`user`	The user whose privileges to deauthorize. If use, the invoker is assumed.

Usage Notes

To deauthorize the use of another user's privileges, the invoker must have the `ALTER USER` system privilege.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

```
DBMS_EPG.DEAUTHORIZE_DAD('HR');
```

DELETE_DAD_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

See Also: Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_DAD_ATTRIBUTE (
   dad_name      IN  VARCHAR2,
   attr_name     IN  VARCHAR2);
```

Parameters

Table 60–8 DELETE_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to delete a DAD attribute
attr_name	The name of the DAD attribute to delete

Exceptions

Raises an error if DAD does not exist

DELETE_GLOBAL_ATTRIBUTE Procedure

This procedure deletes a global attribute.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (
   attr_name     IN  VARCHAR2);
```

Parameters

Table 60–9 DELETE_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to delete

DROP_DAD Procedure

This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.DROP_DAD (
   dadname  IN  VARCHAR2);
```

Parameters

Table 60–10 DROP_DAD Procedure Parameters

Parameter	Description
dad_name	The DAD to drop

Exceptions

Raises an error if the DAD does not exist.

GET_ALL_DAD_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
   dad_name      IN          VARCHAR2,
   attr_names    OUT NOCOPY  VARCHAR2_TABLE,
   attr_values   OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 60–11 GET_ALL_DAD_ATTRIBUTES Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
attr_names	The attribute names
attr_values	The attribute values

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD has no attributes set, then attr_names and attr_values will be set to empty arrays.

GET_ALL_DAD_MAPPINGS Procedure

This procedure retrieves all virtual paths to which the specified DAD is mapped.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_DAD_MAPPINGS (
   dad_name      IN          VARCHAR2,
   paths         OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 60–12 GET_ALL_DAD_MAPPINGS Procedure Parameters

Parameter	Description
dad_names	The name of the DAD
paths	The virtual paths to which h the DAD is mapped

Exceptions

Raises an error if DAD does not exist.

Usage Notes

If the DAD is not mapped to any virtual path, paths will be set to empty arrays.

GET_ALL_GLOBAL_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (
   attr_names     OUT   NOCOPY  VARCHAR2_TABLE,
   attr_values    OUT   NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 60–13 GET_ALL_GLOBAL_ATTRIBUTES Procedure Parameters

Parameter	Description
attr_names	The global attribute names
attr_values	The values of the global attributes

Usage Notes

If the gateway instance has no global attributes set, then attr_names and attr_values will be set to empty arrays.

GET_DAD_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_ATTRIBUTE (
   dad_name     IN  VARCHAR2,
   attr_name    IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 60–14 GET_DAD_ATTRIBUTE Function Parameters

Parameter	Description
dad_name	The name of the DAD for which to delete an attribute
attr_name	The name of the attribute to delete

Return values

Returns the DAD attribute value. Returns NULL if attribute is unknown or has not been set.

Exceptions

Raises an error if DAD does not exist.

GET_DAD_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_DAD_LIST (
   dad_names     OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 60–15 GET_DAD_LIST Procedure Parameters

Parameter	Description
dad_names	The list of all DADs

Usage Notes

If no DADs exist then dad_names will be set to an empty array.

GET_GLOBAL_ATTRIBUTE Function

This function retrieves the value of a global attribute.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (
   attr_name  IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 60–16 GET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to retrieve

Return Values

Returns the global attribute value. Returns NULL if attribute has not been set or is not a valid attribute.

MAP_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.MAP_DAD (
   dad_name  IN  VARCHAR2,
   path      IN  VARCHAR2);
```

Parameters

Table 60–17 MAP_DAD Procedure Parameters

Parameter	Description
dad_name	The name of the DAD to map
path	The virtual path to map

Exceptions

Raises and error if the DAD does not exist.

SET_DAD_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

See Also: Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_DAD_ATTRIBUTE (
   dad_name    IN  VARCHAR2,
   attr_name   IN  VARCHAR2,
   attr_value  IN  VARCHAR2);
```

Parameters

Table 60–18 SET_DAD_ATTRIBUTE Procedure Parameters

Parameter	Description
dad_name	The name of the DAD for which to set the attribute
attr_name	The name of the attribute to set
attr_value	The attribute value to set

Table 60–19 Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlAfterProcedure	after-procedure	No	String
PlsqlAlwaysDescribeProcedure	always-describe-procedure	No	Enumeration of On, Off
PlsqlAuthenticationMode	authentication-mode	No	Enumeration of Basic, SingleSignOn, GlobalOwa, CustomOwa, PerPackageOwa
PlsqlBeforeProcedure	before-procedure	No	String
PlsqlBindBucketLengths	bind-bucket-lengths	Yes	Unsigned integer
PlsqlBindBucketWidths	bind-bucket-widths	Yes	Unsigned integer
PlsqlCGIEnvironmentList	cgi-environment-list	Yes	String
PlsqlCompatibilityMode	compatibility-mode	No	Unsigned integer
PlsqlDatabaseUsername	database-username	No	String
PlsqlDefaultPage	default-page	No	String
PlsqlDocumentPath	document-path	No	String
PlsqlDocumentProcedure	document-procedure	No	String
PlsqlDocumentTablename	document-table-name	No	String

Table 60–19 (Cont.) Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

mod_plsql DAD Attribute	Embedded PL/SQL Gateway DAD Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlErrorStyle	error-style	No	Enumeration of ApacheStyle, ModplsqlStyle, DebugStyle
PlsqlExclusionList	exclusion-list	Yes	String
PlsqlFetchBufferSize	fetch-buffer-size	No	Unsigned integer
PlsqlInfoLogging	info-logging	No	Enumeration of InfoDebug
PlsqlOWADebugEnable	owa-debug-enable	No	Enumeration of On, Off
PlsqlMaxRequestsPerSession	max-requests-per-session	No	Unsigned integer
PlsqlNLSLanguage	nls-language	No	String
PlsqlPathAlias	path-alias	No	String
PlsqlPathAliasProcedure	path-alias-procedure	No	String
PlsqlRequestValidationFunction	request-validation-function	No	String
PlsqlSessionCookieName	session-cookie-name	No	String
PlsqlSessionStateManagement	session-state-management	No	Enumeration of StatelessWithResetPackageState, StatelessWithFastRestPackageState, StatelessWithPreservePackageState
PlsqlTransferMode	transfer-mode	No	Enumeration of Char, Raw
PlsqlUploadAsLongRaw	upload-as-long-raw	No	String

Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

Usage Notes

- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. mod_plsql users should note the following
  - The `PlsqlDatabasePassword` attribute is not needed.
  - The `PlsqlDatabaseConnectString` attribute is not needed because the embedded gateway does not support logon to external databases.

Examples

```
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRApp.home');
```

SET_GLOBAL_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (
   attr_name    IN VARCHAR2,
   attr_value   IN VARCHAR2);
```

Parameters

Table 60–20 SET_GLOBAL_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_name	The global attribute to set
attr_value	The attribute value to set

Table 60–21 Mapping Between mod_plsql and Embedded PL/SQL Gateway Global Attributes

mod_plsql Global Attribute	Embedded PL/SQL Gateway Global Attribute	Allows Multiple Occurr-ences	Legal Values
PlsqlLogLevel	log-level	No	Unsigned integer
PlsqlMaxParameters	max-parameters	No	Unsigned integer

Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If attr_name attribute has been set before, then the old value will be overwritten with the new attr_value argument.

Exceptions

Raises an error if the attribute is unknown.

Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

UNMAP_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is `NULL`, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

> **See Also:** Configuration Subprograms on page 60-8 for other subprograms in this group

Syntax

```
DBMS_EPG.UNMAP_DAD (
   dad_name IN VARCHAR2,
   path     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 60–22 UNMAP_DAD Procedure Parameters

Parameter	Description
`dad_name`	The name of the DAD to unmap
`path`	The virtual path to unmap

Usage Notes

Raises and error if the DAD does not exist.

61

DBMS_ERRLOG

The DBMS_ERRLOG package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information regarding how to use DBMS_ERRLOG and *Oracle Database SQL Language Reference* for error_logging_clause syntax

This chapter contains the following topics:

- Using DBMS_ERRLOG
  - Security Model
- Summary of DBMS_ERRLOG Subprograms

Using DBMS_ERRLOG

This section contains topics which relate to using the `DBMS_ERRLOG` package.

- Security Model

Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

Summary of DBMS_ERRLOG Subprograms

Table 61–1 DBMS_ERRLOG Package Subprograms

Subprogram	Description
CREATE_ERROR_LOG Procedure on page 61-5	Creates the error logging table used in DML error logging

CREATE_ERROR_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

LONG, CLOB, BLOB, BFILE, and ADT datatypes are not supported in the columns.

Syntax

```
DBMS_ERRLOG.CREATE_ERROR_LOG (
   dml_table_name            IN VARCHAR2,
   err_log_table_name        IN VARCHAR2 := NULL,
   err_log_table_owner       IN VARCHAR2 := NULL,
   err_log_table_space       IN VARCHAR2 := NULL,
   skip_unsupported          IN BOOLEAN := FALSE);
```

Parameters

Table 61–2 CREATE_ERROR_LOG Procedure Parameters

Parameter	Description
dml_table_name	The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp, "EMP", "SCOTT"."EMP"). If a name component is enclosed in double quotes, it will not be upper cased.
err_log_table_name	The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR$_'. Examples are the following: dml_table_name: 'EMP',err_log_table_name: 'ERR$_EMP' dml_table_name: '"Emp2"',err_log_table_name: 'ERR$_Emp2'
err_log_table_owner	The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used.
err_log_table_space	The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used.
skip_unsupported	When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE.

Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```
SQL> DESC channels
Name                                      Null?    Type
----------------------------              -------  -----
CHANNEL_ID                                NOT NULL CHAR(1)
```

```
CHANNEL_DESC                            NOT NULL    VARCHAR2(20)
CHANNEL_CLASS                                       VARCHAR2(20)
```

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```
SQL> DESC ERR$_CHANNELS
Name                            Null?    Type
------------------              ----     ----
ORA_ERR_NUMBER$                          NUMBER
ORA_ERR_MESG$                            VARCHAR2(2000)
ORA_ERR_ROWID$                           ROWID
ORA_ERR_OPTYP$                           VARCHAR2(2)
ORA_ERR_TAG$                             VARCHAR2(2000)
CHANNEL_ID                               VARCHAR2(4000)
CHANNEL_DESC                             VARCHAR2(4000)
CHANNEL_CLASS                            VARCHAR2(4000)
```

See *Oracle Database Administrator's Guide* for more information regarding control columns.

62

DBMS_EXPFIL

The DBMS_EXPFIL package contains all the procedures used to manage attribute sets, expression sets, expression indexes, optimizer statistics, and privileges by Expression Filter.

> **See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- Summary of Expression Filter Subprograms

Summary of Expression Filter Subprograms

Table 62–1 describes the subprograms in the DBMS_EXPFIL package.

All the values and names passed to the procedures defined in the DBMS_EXPFIL package are not case sensitive, unless otherwise mentioned. To preserve the case, you use double quotation marks around the values.

Table 62–1 DBMS_EXPFIL Package Subprograms

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the attribute set
ADD_FUNCTIONS Procedure	Adds a function, type, or package to the approved list of functions with an attribute set
ASSIGN_ATTRIBUTE_SET Procedure	Assigns an attribute set to a column storing expressions
BUILD_EXCEPTIONS_TABLE Procedure	Creates an exception table to hold references to invalid expressions
CLEAR_EXPRSET_STATS Procedure	Clears the predicate statistics for an expression set
COPY_ATTRIBUTE_SET Procedure	Makes a copy of the attribute set
CREATE_ATTRIBUTE_SET Procedure	Creates an attribute set
DEFAULT_INDEX_PARAMETERS Procedure	Assigns default index parameters to an attribute set
DEFAULT_XPINDEX_PARAMETERS Procedure	Assigns default XPath index parameters to an attribute set
DEFRAG_INDEX Procedure	Rebuilds the bitmap indexes online to reduce fragmentation
DROP_ATTRIBUTE_SET Procedure	Drops an unused attribute set
GET_EXPRSET_STATS Procedure	Collects predicate statistics for an expression set
GRANT_PRIVILEGE Procedure	Grants an expression DML privilege to a user
INDEX_PARAMETERS Procedure	Assigns index parameters to an expression set
MODIFY_OPERATOR_LIST Procedure	Modifies the list of common operators used in predicates with a certain attribute
REVOKE_PRIVILEGE Procedure	Revokes an expression DML privilege from a user
SYNC_TEXT_INDEXES Procedure	Synchronizes the indexes defined to process the predicates involving the CONTAINS operator in stored expressions
UNASSIGN_ATTRIBUTE_SET Procedure	Breaks the association between a column storing expressions and the attribute set
VALIDATE_EXPRESSIONS Procedure	Validates expression metadata and the expressions stored in a column
XPINDEX_PARAMETERS Procedure	Assigns XPath index parameters to an expression set

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to the attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
   attr_set   IN   VARCHAR2,
   attr_name  IN   VARCHAR2,
   attr_type  IN   VARCHAR2,
   attr_defv1 IN   VARCHAR2 DEFAULT NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
   attr_set   IN   VARCHAR2,
   attr_name  IN   VARCHAR2,
   tab_alias  IN   exf$table_alias);
```

Allows addition of text attributes to the attribute set:

```
DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
   attr_set       IN   VARCHAR2,
   attr_name      IN   VARCHAR2,
   attr_type      IN   VARCHAR2,
   text_pref      IN   EXF$TEXT);
```

Parameters

Table 62–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
attr_defv1	Default value for the elementary attribute
tab_alias	Type that identifies the database table to which the attribute is aliased
text_pref	Text preferences such as LEXER and WORDLIST specification.

Usage Notes

- If the attribute set receiving the elementary attribute was originally created from an existing object type, then additional attributes cannot be added.
- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a ROWID from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more

information about table aliases, see *Oracle Database Rules Manager and Expression Filter Developer's Guide.*

- Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions.
- The default value specification for an attribute is similar to a default value specification for a table column. The resulting default values should agree with the datatype of the attribute. For example, valid default values for an attribute of `DATE` datatype are `SYSDATE` and `to_date('01-01-2004','DD-MM-YYYY')`.
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_ATTRIBUTES`.
- This procedure with a text preference bound to the `text_pref` argument creates a text attribute in the attribute set. The data type for such an attribute should be a `VARCHAR2` or a `CLOB`. The preferences specified with this procedure are validated only when an Expression Filter index is created using this attribute set.
- These preferences are used in the creation of the `CTXRULE` index that processes the predicates involving `CONTAINS` operator. The valid preferences are those that are valid in the `PARAMETERS` clause of `CTXRULE` index creation. See *Oracle Text Application Developer's Guide* for the syntax.

Examples

The following commands add two elementary attributes to an attribute set:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                              attr_set   => 'HRAttrSet',
                              attr_name  => 'HRREP',
                              attr_type  => 'VARCHAR2(30)'
                              attr_defv1 => 'Betty Smith');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                              attr_set  => 'HRAttrSet',
                              attr_name => 'DEPT',
                              tab_alias => exf$table_alias('DEPT'));
END;
/
```

The following commands define a CreationTime elementary attribute that takes the database time as the default value.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                         attr_set   => 'PurchaseOrder',
                         attr_name  => 'CreationTime',
                         attr_type  => 'DATE',
                         attr_defvl => 'SYSDATE');
END;
/
```

Alternately, the following commands initialize the `CreationTime` attribute to a specific value when it is not explicitly specified in the data item passed to the EVALUATE operator.

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
```

```
                        attr_set   => 'PurchaseOrder',
                        attr_name  => 'CreationTime',
                        attr_type  => 'DATE',
                        attr_defvl => 'to_date(''01-01-2004'',''DD-MM-YYYY'')');
END;
/
```

The following commands create an attribute set with a `Model` attribute of `VARCHAR2` data type and an InsReport attribute configured for text predicates.

```
BEGIN
   DBMS_EXPFIL.CREATE_EVENT_STRUT(event_struct => 'Car4Sale');
   // create scalar attributes
   DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                     attr_set  => 'Car4Sale',
                     attr_name => 'Model',
                     attr_type => 'VARCHAR2(30)');

   //create text attribute
   DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                     attr_set  => 'Car4Sale',
                     attr_name => 'InsReport',
                     attr_type => 'CLOB',
                     attr_type => exf$text(
                                  'LEXER insrpt_lexer
                                   WORDLIST insrpt_wordlist'));
END;
/
```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the attribute set.

Syntax

```
DBMS_EXPFIL.ADD_FUNCTIONS (
   attr_set   IN   VARCHAR2,
   funcs_name IN   VARCHAR2);
```

Parameters

Table 62–3 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle Database supplied SQL functions for use by the expression set. If the expression set refers to a user-defined function, the function must be explicitly added to the attribute set.
- The ADD_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list. The function added to the attribute set, and thus used in the stored expressions, should not perform any DML or DDL (database state changing) operations. Oracle Database catches violations to this rule only at run-time while evaluating the expressions. Violations are not checked during the ADD_FUNCTIONS procedure call.
- The function or the package name can be specified with a schema extension. If a function name is specified without a schema extension, only such references in the expression set are considered valid. The expressions in a set can be restricted to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding functions to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following commands add two functions to the attribute set:

```
BEGIN
  DBMS_EXPFIL.ADD_FUNCTIONS (
   attr_set   => 'Car4Sale',
   funcs_name => 'HorsePower');
  DBMS_EXPFIL.ADD_FUNCTIONS (
   attr_set   => 'Car4Sale',
```

```
   funcs_name => 'Scott.CrashTestRating');
END;
/
```

ASSIGN_ATTRIBUTE_SET Procedure

This procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column.

Syntax

```
DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (
   attr_set   IN   VARCHAR2,
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2,
   force      IN   VARCHAR2 DEFAULT 'FALSE');
```

Parameters

Table 62–4 ASSIGN_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
force	Argument used to trust the existing expressions in a table (and skip validation)

Usage Notes

- The ASSIGN_ATTRIBUTE_SET procedure assigns an attribute set to a VARCHAR2 column in a user table to create an Expression column. The attribute set contains the elementary attribute names and their datatypes and any functions used in the expressions. The Expression column, the column named by the expr_col parameter to store the expression, uses the attribute set to validate changes and additions to the expression set.
- An attribute set can be assigned only to a table column in the same schema as the attribute set. An attribute set can be assigned to one or more table columns. Assigning an attribute set to a column storing expressions implicitly creates methods for the associated object type. For this operation to succeed, the object type cannot have any dependent objects before the attribute set is assigned.
- By default, the column should not have any expressions at the time of association. However, if the values in the column are known to be valid expressions, you can use a value of 'TRUE' for the force argument to assign the attribute set to a column containing expressions.
- See the information about defining Expression columns in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS

Examples

The following command assigns the attribute set to a column storing expressions. The expression set should be empty at the time of association.

```
BEGIN
```

```
  DBMS_EXPFIL.ASSIGN_ATTRIBUTE_SET (attr_set => 'Car4Sale',
                                    expr_tab => 'consumer',
                                    expr_col => 'interest');
END;
/
```

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates the exception table, used in validation, in the current schema.

Syntax

```
DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (
   exception_tab IN VARCHAR2);
```

Parameters

Table 62–5 BUILD_EXCEPTIONS_TABLE Procedure Parameter

Parameter	Description
exception_tab	Name of the exception table

Usage Notes

- During expression validation, you can optionally provide the name of the exception table in which the references to the invalid expressions are stored. The BUILD_EXCEPTIONS_TABLE procedure creates the exception table in the current schema.
- See the section on evaluation semantics in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and VALIDATE_EXPRESSIONS Procedure for more information.
- Related view: USER_TABLES

Examples

The following command creates the exception table, InterestExceptions, in the current schema:

```
BEGIN
  DBMS_EXPFIL.BUILD_EXCEPTIONS_TABLE (exception_tab => 'InterestExceptions');
END;
/
```

CLEAR_EXPRSET_STATS Procedure

This procedure clears the predicate statistics for the expression set stored in a table column.

Syntax

```
DBMS_EXPFIL.CLEAR_EXPRSET_STATS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2);
```

Parameters

Table 62–6 CLEAR_EXPRSET_STATS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions

Usage Notes

- See also GET_EXPRSET_STATS Procedure for information about gathering the statistics.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_EXPRSET_STATS

Examples

The following command clears the predicate statistics for the expression set stored in interest column of the consumer table:

```
BEGIN
  DBMS_EXPFIL.CLEAR_EXPRSET_STATS (expr_tab => 'consumer',
                                   expr_col => 'interest');
END;
/
```

COPY_ATTRIBUTE_SET Procedure

This procedure copies an attribute set along with its user-defined function list and default index parameters to another set.

Syntax

```
DBMS_EXPFIL.COPY_ATTRIBUTE_SET (
   from_set   IN   VARCHAR2,
   to_set     IN   VARCHAR2);
```

Parameters

Table 62–7 COPY_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
from_set	Name of an existing attribute set to be copied
to_set	Name of the new attribute set

Usage Notes

- A schema-extended name can be used for the from_set argument to copy an attribute set across schemas. Before you issue this command, you must have the EXECUTE privilege for the object type associated with the original attribute set. Ensure that any references to schema objects (user-defined functions, tables, and embedded objects) are valid in the new schema.
- The default index parameters and the user-defined function list of the new set can be changed independent of the original set.
- Related views: ALL_EXPFIL_ATTRIBUTE_SETS and ALL_EXPFIL_ATTRIBUTES.

Examples

The following command makes a copy of the Car4Sale attribute set:

```
BEGIN
  DBMS_EXPFIL.COPY_ATTRIBUTE_SET (from_set => 'Car4Sale',
                                  to_set   => 'Vehicle');
END;
/
```

CREATE_ATTRIBUTE_SET Procedure

This procedure creates an empty attribute set or an attribute set with a complete set of elementary attributes derived from an object type with a matching name.

Syntax

```
DBMS_EXPFIL.CREATE_ATTRIBUTE_SET (
   attr_set   IN   VARCHAR2,
   from_type  IN   VARCHAR2 DEFAULT 'NO');
```

Parameters

Table 62–8 CREATE_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set to be created
from_type	YES, if the attributes for the attribute set should be derived from an existing object type

Usage Notes

- The object type used for an attribute set cannot contain any user methods, and it should not be an evolved type (with the use of ALTER TYPE command). This object type should not have any dependent objects at the time of the attribute set creation. If the attribute set is not derived from an existing object type, this procedure creates an object type with a matching name.
- An attribute set with one or more table alias attributes cannot be derived from an object type. For this purpose, create an empty attribute set and add one elementary attribute at a time using the DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE procedure. (See *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.)
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and ADD_ELEMENTARY_ATTRIBUTE Procedures for more information.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ATTRIBUTES.

Examples

The following commands create an attribute set with all the required elementary attributes derived from the Car4Sale type:

```
CREATE OR REPLACE TYPE Car4Sale AS OBJECT
                                    (Model   VARCHAR2(20),
                                     Year    NUMBER,
                                     Price   NUMBER,
                                     Mileage NUMBER);
/

BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set  => 'Car4Sale',
                                   from_type => 'YES');
END;
/
```

Assuming that the `Car4Sale` type does not exist, the attribute set can be created from scratch as shown in the following example:

```
BEGIN
  DBMS_EXPFIL.CREATE_ATTRIBUTE_SET(attr_set => 'Car4Sale');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Model',
                               attr_type => 'VARCHAR2(20)');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Year',
                               attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Price',
                               attr_type => 'NUMBER');
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE(
                               attr_set  => 'Car4Sale',
                               attr_name => 'Mileage',
                               attr_type => 'NUMBER');
END;
/
```

DEFAULT_INDEX_PARAMETERS Procedure

This procedure assigns default index parameters to an attribute set. It also adds or drops a partial list of stored and indexed attributes to or from the default list associated with the attribute list.

Syntax

```
DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS (
   attr_set   IN   VARCHAR2,
   attr_list  IN   EXF$ATTRIBUTE_LIST,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 62–9 DEFAULT_INDEX_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
attr_list	An instance of EXF$ATTRIBUTE_LIST with a partial list of (default) stored and indexed attributes for an Expression Filter index
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- Existing Expression Filter indexes are not modified when the default parameters for the corresponding attribute set are changed. The new index defaults are used when a new Expression Filter index is created and when an existing index is rebuilt. (See the section on alter index rebuild in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about rebuilding indexes.)
- See the section on creating an index from default parameters in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about assigning default index parameters to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following command adds the specified stored and indexed attributes to the attribute set's default index parameters list:

```
BEGIN
 DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERs(
    attr_set  => 'Car4Sale',
    attr_list => exf$attribute_list (
       exf$attribute (attr_name => 'Model',
                      attr_oper => exf$indexoper('='),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'Price',
                      attr_oper => exf$indexoper('all'),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'HorsePower(Model, Year)',
                      attr_oper => exf$indexoper('=','<','>','>=','<='),
                      attr_indexed => 'FALSE'),
       exf$attribute (attr_name => 'CrashTestRating(Model, Year)',
```

```
                    attr_oper => exf$indexoper('=','<','>','>=','<='),
                    attr_indexed => 'FALSE')),
    operation => 'ADD');
END;
/
```

The following command drops the `CrashTestRating(Model, Year)` attribute (stored or indexed) from the previous list.

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS(
      attr_set  => 'Car4Sale',
      attr_list => exf$attribute_list (
         exf$attribute (attr_name => 'CrashTestRating(Model, Year)')),
      operation => 'DROP');
END;
/
```

DEFAULT_XPINDEX_PARAMETERS Procedure

This procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set.

Syntax

```
DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS (
   attr_set   IN   VARCHAR2,
   xmlt_attr  IN   VARCHAR2,
   xptag_list IN   EXF$XPATH_TAGS,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 62–10 DEFAULT_XPINDEX_PARAMETERS Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
xmlt_attr	Name of the attribute with the XMLType datatype
xptag_list	An instance of EXF$XPATH_TAGS type with a partial list of XML elements and attributes to be configured for the Expression Filter index
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- The attribute set used for an expression set may have one or more XML type attributes (defined with XMLType datatype) and the corresponding expressions may contain XPath predicates on these attributes. The Expression Filter index created for the expression set can be tuned to process these XPath predicates efficiently by using some XPath-specific index parameters (in addition to some non-XPath index parameters).
- The DEFAULT_XPINDEX_PARAMETERS procedure adds (or drops) a partial list of XPath parameters to the default index parameters associated with the attribute set. The XPath parameters are assigned to a specific XMLType attribute in the attribute set and this information can be viewed using the USER_EXPFIL_DEF_INDEX_PARAMS view. The DEFAULT_INDEX_PARAMETERS procedure and the DEFAULT_XPINDEX_PARAMETERS procedure can be used independent of each other. They maintain a common list of default index parameters for the attribute set.
- See the section on index tuning for XPath predicates in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about XPath parameters to the default index parameters of an attribute set. See also DEFAULT_INDEX_PARAMETERS Procedure for more information about default index parameters.
- Related views: USER_EXPFIL_ATTRIBUTES and USER_EXPFIL_DEF_INDEX_PARAMS.

> **Note:** The values assigned to the tag_name argument of exf$xpath_tag type are case sensitive.

Examples

The following command adds the specified XML tags to the default index parameters list along with their preferences such as positional or value filter and indexed or stored predicate group:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
       attr_set   => 'Car4Sale',
       xmlt_attr  => 'Details',
       xptag_list =>                                    --- XPath tag list
         exf$xpath_tags(
           exf$xpath_tag(tag_name    => 'stereo@make',  --- XML attribute
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(15)'), --- value filter
           exf$xpath_tag(tag_name    => 'stereo',       --- XML element
                         tag_indexed => 'FALSE',
                         tag_type    => null),          --- positional filter
           exf$xpath_tag(tag_name    => 'memory',       --- XML element
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(10)'), --- value filter
           exf$xpath_tag(tag_name    => 'GPS',
                         tag_indexed => 'TRUE',
                         tag_type    => null)
          )
        );
END;
/
```

The following command drops the `stereo@make` tag from the default index parameters:

```
BEGIN
  DBMS_EXPFIL.DEFAULT_XPINDEX_PARAMETERS(
       attr_set   => 'Car4Sale',
       xmlt_attr  => 'Details',
       xptag_list =>                                    --- XPath tag list
         exf$xpath_tags(
           exf$xpath_tag(tag_name    => 'stereo@make')
         ),
       operation => 'DROP'
       );
END;
/
```

DEFRAG_INDEX Procedure

This procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.

Syntax

```
DBMS_EXPFIL.DEFRAG_INDEX (
   idx_name   IN  VARCHAR2);
```

Parameters

Table 62–11 DEFRAG_INDEX Procedure Parameter

Parameter	Description
idx_name	Name of the Expression Filter index

Usage Notes

- The bitmap indexes defined for the indexed attributes of an Expression Filter index become fragmented as additions and updates are made to the expression set. This can affect performance. The DEFRAG_INDEX procedure rebuilds the bitmap indexes online and thus reduces the fragmentation.
- Indexes can be defragmented when the expression set is being modified. However, you should schedule defragmentation when the workload is relatively light, such as 2 a.m.
- See the section on index storage and maintenance in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about rebuilding indexes.
- Related views: USER_EXPFIL_INDEXES and USER_INDEXES.

Examples

The following command is issued to defragment the bitmap indexes associated with the Expression Filter index:

```
BEGIN
  DBMS_EXPFIL.DEFRAG_INDEX (idx_name => 'InterestIndex');
END;
/
```

DROP_ATTRIBUTE_SET Procedure

This procedure drops an attribute set not being used for any expression set.

Syntax

```
DBMS_EXPFIL.DROP_ATTRIBUTE_SET (
   attr_set   IN   VARCHAR2);
```

Parameters

Table 62–12 DROP_ATTRIBUTE_SET Procedure Parameter

Parameter	Description
attr_set	Name of the attribute set to be dropped

Usage Notes

- The DROP_ATTRIBUTE_SET procedure drops an attribute set not being used for any expression set. If the attribute set was initially created from an existing object type, the object type remains after dropping the attribute set. Otherwise, the object type is dropped with the attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_EXPRESSION_SETS.

Examples

Assuming that the attribute set is not used by an Expression column, the following command drops the attribute set:

```
BEGIN
  DBMS_EXPFIL.DROP_ATTRIBUTE_SET(attr_set => 'Car4Sale');
END;
/
```

GET_EXPRSET_STATS Procedure

This procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.

Syntax

```
DBMS_EXPFIL.GET_EXPRSET_STATS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2);
```

Parameters

Table 62–13 GET_EXPRSET_STATS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions

Usage Notes

- When a representative set of expressions are stored in a table column, you can use predicate statistics for those expressions to configure the corresponding Expression Filter index (using the TOP parameters clause). The GET_EXPRSET_STATS procedure computes the predicate statistics for an expression set and stores them in the expression filter dictionary.
- See the section on creating an index from statistics in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about using predicate statistics.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_EXPRSET_STATS.

Examples

The following command computes the predicate statistics for the expressions stored in the interest column of the consumer table:

```
BEGIN
  DBMS_EXPFIL.GET_EXPRSET_STATS (expr_tab => 'consumer',
                                 expr_col => 'interest');
END;
/
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on one or more Expression columns to other users.

Syntax

```
DBMS_EXPFIL.GRANT_PRIVILEGE (
   expr_tab   IN  VARCHAR2,
   expr_col   IN  VARCHAR2,
   priv_type  IN  VARCHAR2,
   to_user    IN  VARCHAR2);
```

Parameters

Table 62–14 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
priv_type	Type of the privilege to be granted. Valid values: INSERT EXPRESSION, UPDATE EXPRESSION, ALL.
to_user	User to whom the privilege is to be granted

Usage Notes

- The SQL EVALUATE operator evaluates expressions with the privileges of the owner of the table that stores the expressions. The privileges of the user issuing the query are not considered. The owner of the table can insert, update, and delete expressions. Other users must have INSERT and UPDATE privileges for the table and INSERT EXPRESSION and UPDATE EXPRESSION privilege for a specific Expression column in the table.
- Using the GRANT_PRIVILEGE procedure, the owner of the table can grant INSERT EXPRESSION or UPDATE EXPRESSION privileges on one or more Expression columns to other users. Both the privileges can be granted to a user by specifying ALL for the privilege type.
- See REVOKE_PRIVILEGE Procedure and the section on granting and revoking privileges in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about granting and revoking privileges.
- Related views: USER_EXPFIL_EXPRESSION_SETS and USER_EXPFIL_PRIVILEGES.

Examples

The owner of consumer table can grant INSERT EXPRESSION privileges to user SCOTT with the following command. User SCOTT should also have INSERT privileges on the table so that he can add new expressions to the set.

```
BEGIN
  DBMS_EXPFIL.GRANT_PRIVILEGE (expr_tab  => 'consumer',
                               expr_col  => 'interest',
                               priv_type => 'INSERT EXPRESSION',
                               to_user   => 'SCOTT');
END;
```

INDEX_PARAMETERS Procedure

This procedure fine-tunes the index parameters for each expression set before index creation.

Syntax

```
DBMS_EXPFIL.INDEX_PARAMETERS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2,
   attr_list  IN   EXF$ATTRIBUTE_LIST,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 62–15 INDEX_PARAMETERS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions.
attr_list	An instance of EXF$ATTRIBUTE_LIST with a partial list of stored and indexed attributes
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- An attribute set can be used by multiple expression sets stored in different columns of user tables. By default, the index parameters associated with the attribute set are used to define an Expression Filter index on an expression set. If you need to fine-tune the index for each expression set, you can specify a small list of the index parameters in the PARAMETERS clause of the CREATE INDEX statement. However, when an Expression Filter index uses a large number of index parameters or if the index is configured for XPath predicates, fine-tuning the parameters with the CREATE INDEX statement is not possible.
- The INDEX_PARAMETERS procedure fine-tunes the index parameters for each expression set before index creation. This procedure can be used to copy the defaults from the corresponding attribute set and selectively add (or drop) additional index parameters for the expression set. (You use the XPINDEX_PARAMETERS procedure to add and drop XPath index parameters.) The Expression Filter index defined for an expression set with a non-empty list of index parameters always uses these parameters. The INDEX_PARAMETERS procedure cannot be used when the Expression Filter index is already defined for the column storing expressions.
- The operations allowed with this procedure include:
  - Deriving the current list of default index parameters (including any XPath-specific parameters) from the corresponding attribute set and assigning them to the specified expression set (a value of DEFAULT for the operation argument).
  - Adding (or dropping) one or more attributes to (or from) the current list of parameters assigned to the expression set (values of ADD or DROP for the operation argument).

– Clearing the index parameters assigned to the expression set. This enables the user to start using default parameters or tune the parameters from scratch (a value of CLEAR for the operation argument).

> **Note:** This procedure is useful only when an attribute set is shared across multiple expression sets. In all other cases, the defaults assigned to the attribute set can be tuned for the expression set using it.

- See the section on creating an index from exact parameters in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and XPINDEX_PARAMETERS Procedure for more information.
- Related views: USER_EXPFIL_EXPRESSION_SETS, USER_EXPFIL_DEF_INDEX_PARAMS and USER_EXPFIL_INDEX_PARAMS.

Examples

The following command synchronizes the expression set's index parameters with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'consumer',
                               expr_col  => 'interest',
                               attr_list => null,
                               operation => 'DEFAULT');
END;
/
```

The following command adds a stored attribute to the expression set's index parameters.

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'consumer',
                               expr_col  => 'interest',
                               attr_list =>
                                exf$attribute_list (
                                 exf$attribute (
                                   attr_name => 'CrashTestRating(Model, Year)',
                                   attr_oper => exf$indexoper('all'),
                                   attr_indexed => 'FALSE')),
                               operation => 'ADD');
END;
/
```

The following command clears the index parameters associated with the expression set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'consumer',
                               expr_col  => 'interest',
                               attr_list => null,
                               operation => 'CLEAR');
END;
/
```

A subsequent index creation will use the default index parameters assigned to the corresponding attribute set.

MODIFY_OPERATOR_LIST Procedure

This procedure modifies the list of common operators associated with a certain attribute in the attribute set.

Syntax

```
DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
   attr_set   IN   VARCHAR2,
   attr_name  IN   VARCHAR2,
   attr_oper  IN   EXF$INDEXOPER);
```

Parameters

Table 62–16 MODIFY_OPERATOR_LIST Procedure Parameters

Parameter	Description
attr_set	Name of the attribute set
attr_name	Name of the stored or indexed attribute being modified
attr_oper	New list of operators that are frequently used in the predicates with the attribute

Usage Notes

- The MODIFY_OPERATOR_LIST procedure modifies the operator list for the stored and indexed attributes defined in the default index parameters of the attribute set. Existing Expression Filter indexes are not affected when an attribute's operator list is modified. The updated index defaults are used when a new Expression Filter index is created or when an existing index is rebuilt.
- Related views: USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following command modifies the operator list associated with the HorsePower(Model,Year) attribute defined in the Car4Sale attribute set.

```
BEGIN
  DBMS_EXPFIL.MODIFY_OPERATOR_LIST (
    attr_set => 'Car4Sale',
    attr_name => 'HorsePower(Model, Year)',
    attr_oper => exf$indexoper('=','<','>', 'between'));
END;
/
```

REVOKE_PRIVILEGE Procedure

This procedure revokes an expression privilege previously granted by the owner.

Syntax

```
DBMS_EXPFIL.REVOKE_PRIVILEGE (
   expr_tab   IN  VARCHAR2,
   expr_col   IN  VARCHAR2,
   priv_type  IN  VARCHAR2,
   from_user  IN  VARCHAR2);
```

Parameters

Table 62–17 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
`expr_tab`	Name of table storing the expression set
`expr_col`	Name of column in the table that stores the expressions
`priv_type`	Type of privilege to be revoked
`from_user`	User from whom the privilege is to be revoked

Usage Notes

- See GRANT_PRIVILEGE Procedure and the section on granting and revoking privileges in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about granting and revoking privileges.
- Related views: `USER_EXPFIL_EXPRESSION_SETS` and `USER_EXPFIL_PRIVILEGES`.

Examples

The following command revokes the `INSERT EXPRESSION` privilege on the `interest` column of the `consumer` table from user `SCOTT`:

```
BEGIN
  DBMS_EXPFIL.REVOKE_PRIVILEGE (expr_tab  => 'consumer',
                                 expr_col  => 'interest',
                                 priv_type => 'INSERT EXPRESSION',
                                  from_user => 'SCOTT');
END;
/
```

SYNC_TEXT_INDEXES Procedure

This procedure synchronizes the indexes defined to process the predicates involving the CONTAINS operator in stored expressions.

Syntax

```
DBMS_EXPFIL.SYNC_TEXT_INDEXES (
     expr_tab   IN   VARCHAR2);
```

Parameters

Table 62–18 SYNC_TEXT_INDEXES Procedure Parameters

Parameter	Description
expr_tab	Name of table with expression columns containing text predicates

Usage Notes

- When an expression filter index is defined on a column storing expressions, any text predicates in the expressions are indexed using a CTXRULE index. Unlike the other types of indexes (bitmap for scalar and XML predicates or spatial for spatial predicates) used to process the predicates in the expression set, the CTXRULE index defined to process the text predicates is not transactional in nature. That is, when the text predicates are updated with DML operations on the table storing expressions, the new predicates are not automatically reflected in the corresponding CTXRULE index. This could result in inconsistent results until the CTXRULE index is synchronized. This procedure can be used to synchronize all the CTXRULE indexes associated with a table with one or more expression columns. This procedure identifies all the CTXRULE indexes and invokes the CTX_DDL.SYNC_INDEX procedure on each of these indexes.

  You must have the EXECUTE privilege on the CTX_DDL package for successful synchronization of the text indexes.

Examples

The following command synchronizes the text indexes associated with the expression columns in the consumer table:

```
BEGIN
  DBMS_EXPFIL.SYNC_TEXT_INDEXES (expr_tab => 'consumer');
END;
/
```

UNASSIGN_ATTRIBUTE_SET Procedure

This procedure unassigns an attribute set from a column storing expressions.

Syntax

```
DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2);
```

Parameters

Table 62–19 UNASSIGN_ATTRIBUTE_SET Procedure Parameters

Parameter	Description
`expr_tab`	Name of table storing the expression set
`expr_col`	Name of column in the table that stores the expressions

Usage Notes

- A column of an expression datatype can be converted back to a `VARCHAR2` type by unassigning the attribute set. You can unassign an attribute set from a column storing expressions if an Expression Filter index is not defined on the column.
- See ASSIGN_ATTRIBUTE_SET Procedure for information about assigning attribute sets.
- Related views: `USER_EXPFIL_EXPRESSION_SETS` and `USER_EXPFIL_INDEXES`.

Examples

The following command unassigns the attribute set previously assigned to the `interest` column of the `consumer` table. (See the section on bulk loading of expression data in *Oracle Database Rules Manager and Expression Filter Developer's Guide*.)

```
BEGIN
  DBMS_EXPFIL.UNASSIGN_ATTRIBUTE_SET (expr_tab => 'consumer',
                                      expr_col => 'interest');
END;
/
```

VALIDATE_EXPRESSIONS Procedure

This procedure validates all the expressions in a set.

Syntax

```
DBMS_EXPFIL.VALIDATE_EXPRESSIONS (
   expr_tab      IN  VARCHAR2,
   expr_col      IN  VARCHAR2,
   exception_tab IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 62–20 VALIDATE_EXPRESSIONS Procedure Parameters

Parameter	Description
expr_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
exception_tab	Name of the exception table. This table is created using the BUILD_EXCEPTIONS_TABLE procedure.

Usage Notes

- The expressions stored in a table may have references to schema objects like user-defined functions and tables. When these schema objects are dropped or modified, the expressions could become invalid and the subsequent evaluation (query with EVALUATE operator) could fail.
- By default, the expression validation procedure fails on the first expression that is invalid. Optionally, the caller can pass an exception table to store references to all the invalid expressions. In addition to validating expressions in the set, this procedure validates the parameters (stored and indexed attributes) of the associated index and the approved list of user-defined functions. Any errors in the index parameters or the user-defined function list are immediately reported to the caller.
- See the section on evaluation semantics in *Oracle Database Rules Manager and Expression Filter Developer's Guide* and BUILD_EXCEPTIONS_TABLE Procedure for more information.
- Related views: USER_EXPFIL_EXPRESSION_SETS, USER_EXPFIL_ASET_FUNCTIONS, and USER_EXPFIL_PREDTAB_ATTRIBUTES.

Examples

The following command validates the expressions stored in the interest column of the consumer table.

```
BEGIN
  DBMS_EXPFIL.VALIDATE_EXPRESSIONS (expr_tab => 'consumer',
                                    expr_col => 'interest');
END;
/
```

XPINDEX_PARAMETERS Procedure

This procedure is used in conjunction with the INDEX_PARAMETERS procedure to fine-tune the XPath-specific index parameters for each expression set.

Syntax

```
DBMS_EXPFIL.XPINDEX_PARAMETERS (
   expr_tab   IN   VARCHAR2,
   expr_col   IN   VARCHAR2,
   xmlt_attr  IN   VARCHAR2,
   xptag_list IN   EXF$XPATH_TAGS,
   operation  IN   VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 62–21 XPINDEX_PARAMETERS Procedure Parameters

Parameter	Description
exp_tab	Name of table storing the expression set
expr_col	Name of column in the table that stores the expressions
xmlt_attr	Name of the attribute with the XMLType datatype
xptag_list	An instance of EXF$XPATH_TAGS type with a partial list of XML elements and attributes
operation	Operation to be performed on the list of index parameters. Default value: ADD. Valid values: ADD and DROP.

Usage Notes

- When an attribute set is shared by multiple expression sets, the INDEX_PARAMETERS procedure can be used to tune the simple (non-XPath) index parameters for each expression set. The XPINDEX_PARAMETERS procedure is used in conjunction with the INDEX_PARAMETERS procedure to fine-tune the XPath-specific index parameters for each expression set.
- See also INDEX_PARAMETERS Procedure and the section on index tuning for XPath predicates in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.
- Related views: USER_EXPFIL_ATTRIBUTES, USER_EXPFIL_DEF_INDEX_PARAMS, and USER_EXPFIL_INDEX_PARAMS.

> **Note:** The values assigned to the tag_name argument of exf$xpath_tag type are case-sensitive.

Examples

The following command synchronizes the index parameters of the expression set (XPath and non-XPath) with the defaults associated with the corresponding attribute set:

```
BEGIN
  DBMS_EXPFIL.INDEX_PARAMETERS(expr_tab  => 'consumer',
                               expr_col  => 'interest',
                               attr_list => null,
```

```
                                operation => 'DEFAULT');
END;
/
```

The following command adds an XPath-specific index parameter to the expression set:

```
BEGIN
  DBMS_EXPFIL.XPINDEX_PARAMETERS(expr_tab   => 'consumer',
                                 expr_col   => 'interest',
                                 xmlt_attr  => 'details',
                                 xptag_list =>
                                  exf$xpath_tags(
                                   exf$xpath_tag(tag_name    => 'GPS',
                                                 tag_indexed => 'TRUE',
                                                 tag_type    => NULL)),
                                 operation  => 'ADD');
END;
/
```

63

DBMS_FGA

The `DBMS_FGA` package provides fine-grained security functions.

This chapter contains the following topics:

- Using DBMS_FGA
  - Security Model
  - Operational Notes
- Summary of DBMS_FGA Subprograms

Using DBMS_FGA

- Security Model
- Operational Notes

Security Model

Execute privilege on `DBMS_FGA` is needed for administering audit policies. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module will be executed with the module owner's privilege.

Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering. For both the rule-based optimizer and the cost-based optimizer, you can refer to `DBA_FGA_AUDIT_TRAIL` to analyze the SQL text and corresponding bind variables that are issued.

Summary of DBMS_FGA Subprograms

Table 63–1 DBMS_FGA Package Subprograms

Subprogram	Description
ADD_POLICY Procedure on page 63-6	Creates an audit policy using the supplied predicate as the audit condition
DISABLE_POLICY Procedure on page 63-11	Disables an audit policy
DROP_POLICY Procedure on page 63-12	Drops an audit policy
ENABLE_POLICY Procedure on page 63-13	Enables an audit policy

ADD_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition. The maximum number of FGA policies on any table or view object is 256.

Syntax

```
DBMS_FGA.ADD_POLICY(
   object_schema      VARCHAR2,
   object_name        VARCHAR2,
   policy_name        VARCHAR2,
   audit_condition    VARCHAR2,
   audit_column       VARCHAR2,
   handler_schema     VARCHAR2,
   handler_module     VARCHAR2,
   enable             BOOLEAN,
   statement_types    VARCHAR2,
   audit_trail        BINARY_INTEGER IN DEFAULT,
   audit_column_opts  BINARY_INTEGER IN DEFAULT);
```

Parameters

Table 63–2 ADD_POLICY Procedure Parameters

Parameter	Description	Default Value
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)	NULL
object_name	The name of the object to be audited.	-
policy_name	The unique name of the policy.	-
audit_condition	A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.	NULL
audit_column	The columns to be checked for access. These can include OLS hidden columns or object type columns. The default, NULL, causes audit if any column is accessed or affected.	NULL
handler_schema	The schema that contains the event handler. The default, NULL, causes the current schema to be used.	NULL
handler_module	The function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well.	NULL
enable	Enables the policy if TRUE, which is the default.	TRUE
statement_types	The SQL statement types to which this policy is applicable: INSERT, UPDATE, DELETE, or SELECT only.	SELECT
audit_trail	Destination (DB or XML) of fine grained audit records. Also specifies whether to populate LSQLTEXT and LSQLBIND in fga_log$.	DB+EXTENDED
audit_column_opts	Establishes whether a statement is audited when the query references *any* column specified in the audit_column parameter or only when *all* such columns are referenced.	ANY_COLUMNS

Usage Notes

- If object_schema is not specified, the current log-on user schema is assumed.

- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's `audit_condition`. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement `INSERT-WITH-APPEND-hint`.)
- The `audit_condition` must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. This condition can be NULL (or omitted), which is interpreted as `TRUE`, but it cannot contain the following elements:
  - Subqueries or sequences
  - Any direct use of `SYSDATE, UID, USER or USERENV` functions. However, a user-defined function and other SQL functions can use these functions to return the desired information.
  - Any use of the pseudo columns `LEVEL, PRIOR, or ROWNUM`.

  Specifying an audit condition of "1=1" to force auditing of all specified statements ("`statement_types`") affecting the specified column ("`audit_column`") is no longer needed to achieve this purpose. `NULL` will cause audit even if no rows were processed, so that all actions on a table with this policy are audited.
- The `audit_condition` is evaluated using the privileges of the user who creates the policy.
- The audit function (`handler_module`) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

  ```
  PROCEDURE <fname> ( object_schema VARCHAR2, object_name VARCHAR2, policy_name
  VARCHAR2 )  AS ...
  ```

  where `fname` is the name of the procedure, `object_schema` is the name of the schema of the table audited, `object_name` is the name of the table to be audited, and `policy_name` is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.
- The `audit_trail` parameter specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named `LSQLTEXT` and `LSQLBIND`):
  - If audit_trail includes XML, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an `AUDIT_FILE_DEST` statement in SQL. (The default `AUDIT_FILE_DEST` is `$ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump` on Unix-based systems, and `$ORACLE_BASE\admin\$DB_UNIQUE_NAME\adump` on Windows systems.)
  - If audit_trail includes DB instead, then the audit records are written to the `SYS.FGA_LOG$` table in the database.
  - If audit_trail includes `EXTENDED`, then the query's SQL Text and SQL Bind variable information are included in the audit trail.

  - For example:
    * Setting audit_trail to DBMS_FGA.DB sends the audit trail to the SYS.FGA_LOG$ table in the database and omits SQL Text and SQL Bind.
    * Setting audit_trail to DBMS_FGA.DB + DBMS_FGA.EXTENDED sends the audit trail to the SYS.FGA_LOG$ table in the database and includes SQL Text and SQL Bind.
    * Setting audit_trail to DBMS_FGA.XML writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.
    * Setting audit_trail to DBMS_FGA.XML + DBMS_FGA.EXTENDED writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.

  The audit_trail parameter appears in the ALL_AUDIT_POLICIES view.

- You can change the operating system destination using the following command:

  ```
  ALTER SYSTEM SET AUDIT_FILE_DEST = '<New Directory>' DEFERRED
  ```

- On many platforms, XML audit files are named <process_name>_<processId>.xml, for example, ora_2111.xml, or s002_11.xml. On Windows, the XML audit files are named <process_name>_<ThreadId>.xml (or <process_name>_ProcessId>.xml if the process is not running as a thread).
- The audit_column_opts parameter establishes whether a statement is audited
  - when the query references *any* column specified in the audit_column parameter (audit_column_opts = DBMS_FGA.ANY_COLUMNS), or
  - only when *all* such columns are referenced (audit_column_opts = DBMS_FGA.ALL_COLUMNS).

  The default is DBMS_FGA.ANY_COLUMNS.

  The ALL_AUDIT_POLICIES view also shows audit_column_opts.
- When audit_column_opts is set to DBMS_FGA.ALL_COLUMNS, a SQL statement is audited only when all the columns mentioned in audit_column have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

  Also, all these columns must refer to a single table/view or alias.

  Thus, if a SQL statement selects the columns from different table aliases, the statement will not be audited.

V$XML_AUDIT_TRAIL View

The new values for the audit_trail parameter (XML and XML+EXTENDED) cause fine-grained auditing records to be written to operating system files in XML format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

A new dynamic view, V$XML_AUDIT_TRAIL, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability. Querying this view causes all XML files (all files with an .xml extension) in the AUDIT_FILE_DEST directory to be parsed and presented in relational table format.

The DBA_COMMON_AUDIT_TRAIL view includes the contents of the V$XML_AUDIT_TRAIL dynamic view for standard and fine-grained audit records.

Since the audit XML files are stored in files with extension .xml on all platforms, the dynamic view presents audit information similarly on all platforms, using the following schema:

Table 63–3 Elements in the V$XML_AUDIT_TRAIL Dynamic View

Element	Type
AUDIT_TYPE	VARCHAR2(18)
SESSION_ID	NUMBER
PROXY_SESSIONID	NUMBER
STATEMENTID	NUMBER
ENTRYID	NUMBER
EXTENDED_TIMESTAMP	TIMESTAMP(6) WITH TIME ZONE
GLOBAL_UID	VARCHAR2(32)
DB_USER	VARCHAR2(30)
CLIENT_ID	VARCHAR2(64)
EXT_NAME	VARCHAR2(4000)
OS_USER	VARCHAR2(255)
USERHOST	VARCHAR2(128)
OS_PROCESS	VARCHAR2(16)
TERMINAL	VARCHAR2(255)
INSTANCE_NUMBER	NUMBER
OBJECT_SCHEMA	VARCHAR2(30)
OBJECT_NAME	VARCHAR2(128)
POLICY_NAME	VARCHAR2(30)
STATEMENT_TYPE	VARCHAR2(28)
TRANSACTIONID	RAW(8)
SCN	NUMBER
COMMENT_TEXT	VARCHAR2(4000)
SQL_BIND	VARCHAR2(4000)
SQL_TEXT	VARCHAR2(4000)

Usage Notes

- Every XML audit record contains the elements AUDIT_TYPE and EXTENDED_TIMESTAMP, with the latter printed in UTC zone (with no timezone information). Values retrieved using V$XML_AUDIT_TRAIL view are converted to session timezone and printed.
- For SQL_TEXT and SQL_BIND element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such SQL_TEXT and SQL_BIND values.

- For large numbers of XML audit files, querying V$XML_AUDIT_TRAIL is faster when they are loaded into a database table using SQL*Loader or a similar tool. XML audit files are larger than the equivalent written to OS files when AUDIT_TRAIL=OS.
- Error handling is the same as when AUDIT_TRAIL=OS. If any error occurs in writing an audit record to disk, including the directory identified by AUDIT_FILE_DEST being full, the auditing operation fails. An alert message is logged.
- The policy event handler module will be executed with the module owner's privilege.

Examples

```
DBMS_FGA.ADD_POLICY (
   object_schema      =>  'scott',
   object_name        =>  'emp',
   policy_name        =>  'mypolicy1',
   audit_condition    =>  'sal < 100',
   audit_column       =>  'comm,sal',
   handler_schema     =>   NULL,
   handler_module     =>   NULL,
   enable             =>   TRUE,
   statement_types    =>  'INSERT, UPDATE',
   audit_trail        =>   DBMS_FGA.XML + DBMS_FGA.EXTENDED,
   audit_column_opts  =>   DBMS_FGA.ANY_COLUMNS);
```

DISABLE_POLICY Procedure

This procedure disables an audit policy.

Syntax

```
DBMS_FGA.DISABLE_POLICY(
   object_schema  VARCHAR2,
   object_name    VARCHAR2,
   policy_name    VARCHAR2 );
```

Parameters

Table 63–4 DISABLE_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema of the object to be audited. (If NULL, the current log-on user schema is assumed.)
object_name	The name of the object to be audited.
policy_name	The unique name of the policy.

The default value for object_schema is NULL. (If NULL, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DISABLE_POLICY (
object_schema   =>  'scott',
object_name     =>  'emp',
policy_name     =>  'mypolicy1');
```

DROP_POLICY Procedure

This procedure drops an audit policy.

Syntax

```
DBMS_FGA.DROP_POLICY(
   object_schema  VARCHAR2,
   object_name    VARCHAR2,
   policy_name    VARCHAR2 );
```

Parameters

Table 63–5 DROP_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema of the object to be audited. (If `NULL`, the current log-on user schema is assumed.)
`object_name`	The name of the object to be audited.
`policy_name`	The unique name of the policy.

Usage Notes

The `DBMS_FGA` procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the `DBMS_FGA` procedures are part of the DDL transaction. The default value for object_schema is `NULL`. (If `NULL`, the current log-on user schema is assumed.)

Examples

```
DBMS_FGA.DROP_POLICY (
object_schema   =>  'scott',
object_name     =>  'emp',
policy_name     =>  'mypolicy1');
```

ENABLE_POLICY Procedure

This procedure enables an audit policy.

Syntax

```
DBMS_FGA.ENABLE_POLICY(
   object_schema  VARCHAR2,
   object_name    VARCHAR2,
   policy_name    VARCHAR2,
   enable         BOOLEAN);
```

Parameters

Table 63–6 ENABLE_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema of the object to be audited. (If `NULL`, the current log-on user schema is assumed.)
`object_name`	The name of the object to be audited.
`policy_name`	The unique name of the policy.
`enable`	Defaults to `TRUE` to enable the policy.

Examples

```
DBMS_FGA.ENABLE_POLICY (
object_schema    =>  'scott',
object_name      =>  'emp',
policy_name      =>  'mypolicy1',
enable           =>   TRUE);
```

64

DBMS_FILE_GROUP

The DBMS_FILE_GROUP package, one of a set of Oracle Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. This package can be used to create and manage file group repositories.

See Also: *Oracle Streams Concepts and Administration*

This chapter contains the following topics:

- Using DBMS_FILE_GROUP
  - Overview
  - Constants
- Summary of DBMS_FILE_GROUP Subprograms

Using DBMS_FILE_GROUP

This section contains topics which relate to using the `DBMS_FILE_GROUP` package.

- Overview
- Constants

Overview

The following terms pertain to the DBMS_FILE_GROUP package:

File

A **file** is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is expdat.dmp.
- The directory object that contains the file is db_files.
- The file type is DBMS_FILE_GROUP.EXPORT_DUMP_FILE.

Version

A **version** is a collection of related files. For example, a version might consist of a set of datafiles and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

File Group

A **file group** is a collection of versions. A file group can be used to logically group a set of versions. For example, a file group named financial_quarters can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as Q1FY04, Q2FY04, and so on.

Constants

The DBMS_FILE_GROUP package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_FILE_GROUP.EXPORT_DUMP_FILE.

Table 64–1 lists the parameters and enumerated constants.

Table 64–1 DBMS_FILE_GROUP Parameters with Enumerated Constants

Parameter	Option	Type	Description
file_type new_file_type	■ DATAFILE ■ EXPORT_DUMP_FILE ■ DATAPUMP_LOG_FILE	VARCHAR2(30)	DATAFILE is a datafile for a database. This constant can be specified as 'DATAFILE'. EXPORT_DUMP_FILE is a Data Pump export dump file. This constant can be specified as 'DUMPSET'. DATAPUMP_LOG_FILE is a Data Pump export log file. This constant can be specified as 'DATAPUMPLOG'.
max_versions retention_days	■ INFINITE	NUMBER	INFINITE specifies no limit. The max_versions or retention_days can increase without reaching a limit.
privilege	System privilege specified in the GRANT_SYSTEM_PRIVILEGE procedure: ■ READ_ANY_FILE_GROUP ■ MANAGE_ANY_FILE_GROUP ■ MANAGE_FILE_GROUP Object privilege specified in the GRANT_OBJECT_PRIVILEGE procedure: ■ READ_ON_FILE_GROUP ■ MANAGE_ON_FILE_GROUP	BINARY_INTEGER	READ_ANY_FILE_GROUP grants the privilege to view information about any file group in any schema in the data dictionary. MANAGE_ANY_FILE_GROUP grants the privilege to create, manage, and drop any file group in any schema. MANAGE_FILE_GROUP grants the privilege to create, manage, and drop file groups in the user's schema. READ_ON_FILE_GROUP grants the privilege to view information about a specific file group in the data dictionary. MANAGE_ON_FILE_GROUP grants the privilege to manage a specific file group in a schema other than the user's schema.

Summary of DBMS_FILE_GROUP Subprograms

Table 64–2 DBMS_FILE_GROUP Package Subprograms

Subprogram	Description
ADD_FILE Procedure on page 64-6	Adds a file to a version of a file group
ALTER_FILE Procedure on page 64-8	Alters a file in a version of a file group
ALTER_FILE_GROUP Procedure on page 64-10	Alters a file group
ALTER_VERSION Procedure on page 64-12	Alters a version of a file group
CREATE_FILE_GROUP Procedure on page 64-14	Creates a file group
CREATE_VERSION Procedure on page 64-16	Creates a version of a file group
DROP_FILE_GROUP Procedure on page 64-17	Drops a file group
DROP_VERSION Procedure on page 64-18	Drops a version of a file group
GRANT_OBJECT_PRIVILEGE Procedure on page 64-19	Grants object privileges on a file group to a user
GRANT_SYSTEM_PRIVILEGE Procedure on page 64-20	Grants system privileges for file group operations to a user
PURGE_FILE_GROUP Procedure on page 64-21	Purges a file group using the file group's retention policy
REMOVE_FILE Procedure on page 64-22	Removes a file from a version of a file group
REVOKE_OBJECT_PRIVILEGE Procedure on page 64-23	Revokes object privileges on a file group from a user
REVOKE_SYSTEM_PRIVILEGE Procedure on page 64-24	Revokes system privileges for file group operations from a user

Note: All subprograms commit unless specified otherwise.

ADD_FILE Procedure

This procedure adds a file to a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ADD_FILE(
  file_group_name  IN  VARCHAR2,
  file_name        IN  VARCHAR2,
  file_type        IN  VARCHAR2  DEFAULT NULL,
  file_directory   IN  VARCHAR2  DEFAULT NULL,
  version_name     IN  VARCHAR2  DEFAULT NULL,
  comments         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 64–3 ADD_FILE Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group that contains the version, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`file_name`	The name of the file being added to the version. Each file name in a version must be unique.

`file_type`	The file type. The following are reserved file types:
	■ If the file is a datafile, then enter the following:
	`'DATAFILE'`
	■ If the file is a Data Pump export dump file, then enter the following:
	`'DUMPSET'`
	Data Pump metadata is populated when a Data Pump export dump file is imported.
	■ If the file is a Data Pump export log file, then enter the following:
	`'DATAPUMPLOG'`
	If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify `NULL` to omit a file type description.
	See "Constants" on page 64-4 for more information about the reserved file types.

`file_directory`	The name of the directory object that corresponds to the directory containing the file. If `NULL`, then the procedure uses the default directory object for the version. If `NULL` and no default directory object exists for the version, then the procedure uses the default directory object for the file group. If `NULL` and no default directory object exists for the version or file group, then the procedure raises an error.

Table 64–3 (Cont.) ADD_FILE Procedure Parameters

Parameter	Description
version_name	The name of the version to which the file is added. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is added to version 1 of the file group. If NULL, then the procedure uses the version with the latest creation time for the file group.
comments	Comments about the file being added

Usage Notes

To run this procedure with either DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET' specified for the file_type parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

> **See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE Procedure

This procedure alters a file in a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE(
  file_group_name     IN  VARCHAR2,
  file_name           IN  VARCHAR2,
  version_name        IN  VARCHAR2  DEFAULT NULL,
  new_file_name       IN  VARCHAR2  DEFAULT NULL,
  new_file_directory  IN  VARCHAR2  DEFAULT NULL,
  new_file_type       IN  VARCHAR2  DEFAULT NULL,
  remove_file_type    IN  VARCHAR2  DEFAULT 'N',
  new_comments        IN  VARCHAR2  DEFAULT NULL,
  remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 64–4 ALTER_FILE Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
file_name	The name of the file being altered in the version
version_name	The name of the version that contains the file being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_file_name	The new name of the file if the file name is being changed. Each file name in a version must be unique. If NULL, then the procedure does not change the file name. **Note:** When a non-NULL new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk.
new_file_directory	The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed. If NULL, then the procedure does not change the directory object name. **Note:** When a non-NULL new file directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk.

Table 64–4 (Cont.) ALTER_FILE Procedure Parameters

Parameter	Description
new_file_type	The file type. The following are reserved file types: ■ If the file is a datafile, then enter the following: 'DATAFILE' ■ If the file is a Data Pump export dump file, then enter the following: 'DUMPSET' ■ If the file is a Data Pump export log file, then enter the following: 'DATAPUMPLOG' If the file type is not one of the reserved file types, then enter a text description of the file type. If NULL, then the procedure does not change the file type. **See Also:** "Constants" on page 64-4 for more information about the reserved file types.
remove_file_type	If Y, then the procedure removes the file type. If Y and the new_file_type parameter is non-NULL, then the procedure raises an error. If N, then the procedure does not remove the file type.
new_comments	New comments about the file being altered. If non-NULL, then the procedure replaces the existing comments with the specified comments. If NULL, then the procedure does not change the existing comments.
remove_comments	If Y, then the procedure removes the comments for the file. If Y and the new_comments parameter is non-NULL, then the procedure raises an error. If N, then the procedure does not change the existing comments.

Usage Notes

If the file type is changed to DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET' specified for the new_file_type parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have READ privilege on the directory object that contains the Data Pump export dump file

> **See Also:** *Oracle Database Utilities* for more information about Data Pump privileges

ALTER_FILE_GROUP Procedure

This procedure alters a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP(
  file_group_name           IN  VARCHAR2,
  keep_files                IN  VARCHAR2  DEFAULT NULL,
  min_versions              IN  NUMBER    DEFAULT NULL,
  max_versions              IN  NUMBER    DEFAULT NULL,
  retention_days            IN  NUMBER    DEFAULT NULL,
  new_default_directory     IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
  new_comments              IN  VARCHAR2  DEFAULT NULL,
  remove_comments           IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 64–5 ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group being altered, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. If NULL, then this parameter is not changed. **Note:** If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1. If NULL, then the procedure does not change the min_versions setting for the file group.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions. If NULL, then the procedure does not change the max_versions setting for the file group.

Table 64–5 (Cont.) ALTER_FILE_GROUP Procedure Parameters

Parameter	Description
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can be used to specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist. If NULL, then the procedure does not change the retention_days setting for the file group.
new_default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory for the file group. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory for the file group.
new_comments	Comments about the file group. If non-NULL, then the new comments replace the existing comments for the file group. If NULL, then the procedure does not change the existing comments.
remove_comments	If Y, then the comments for the file group are removed. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not change the comments for the file group.

Usage Notes

If min_versions is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set min_versions to at least 2 if a version of the file group must be available at all times.

ALTER_VERSION Procedure

This procedure alters a version of a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_VERSION(
  file_group_name           IN  VARCHAR2,
  version_name              IN  VARCHAR2  DEFAULT NULL,
  new_version_name          IN  VARCHAR2  DEFAULT NULL,
  remove_version_name       IN  VARCHAR2  DEFAULT 'N',
  new_default_directory     IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
  new_comments              IN  VARCHAR2  DEFAULT NULL,
  remove_comments           IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 64–6 ALTER_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered. If '*' is specified, then the procedure alters all versions, and the new_version_name parameter must be NULL. If NULL, then the procedure uses the version with the latest creation time for the file group.
new_version_name	The new name of the version. Do not specify a schema. The specified version name cannot be a positive integer or an asterisk ('*'). If NULL, then the procedure does not change the version name.
remove_version_name	If Y, then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If Y and the new_version_name parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the version name.
new_default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added. If NULL, then the procedure does not change the default directory.
remove_default_directory	If Y, then the procedure removes the default directory. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory.

Table 64–6 (Cont.) ALTER_VERSION Procedure Parameters

Parameter	Description
new_comments	Comments about the version. If non-NULL, then the new comments replace the existing comments for the version. If NULL, then the procedure does not change the comments.
remove_comments	If Y, then the procedure removes the comments for the version. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the comments for the version.

CREATE_FILE_GROUP Procedure

This procedure creates a file group.

Syntax

```
DBMS_FILE_GROUP.CREATE_FILE_GROUP(
  file_group_name    IN  VARCHAR2,
  keep_files         IN  VARCHAR2  DEFAULT 'Y',
  min_versions       IN  NUMBER    DEFAULT 2,
  max_versions       IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
  retention_days     IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
  default_directory  IN  VARCHAR2  DEFAULT NULL,
  comments           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 64–7 CREATE_FILE_GROUP Procedure Parameters

Parameter	Description
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
keep_files	If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. **Note:** If the file group is dropped as a result of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.
min_versions	The minimum number of versions to retain. The specified value must be greater than or equal to 1.
max_versions	The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions.
retention_days	The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can be used to specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist.
default_directory	The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.
comments	Comments about the file group being created.

Usage Notes

If `min_versions` is set to `1`, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set `min_versions` to at least `2` if a version of the file group must be available at all times.

CREATE_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the PURGE_FILE_GROUP procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the OUT parameter version_out, and the other does not.

See Also: "PURGE_FILE_GROUP Procedure" on page 64-21

Syntax

```
DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name    IN  VARCHAR2,
  version_name       IN  VARCHAR2 DEFAULT NULL,
  default_directory  IN  VARCHAR2 DEFAULT NULL,
  comments           IN  VARCHAR2 DEFAULT NULL);

DBMS_FILE_GROUP.CREATE_VERSION(
  file_group_name    IN   VARCHAR2,
  version_name       IN   VARCHAR2 DEFAULT NULL,
  default_directory  IN   VARCHAR2 DEFAULT NULL,
  comments           IN   VARCHAR2 DEFAULT NULL,
  version_out        OUT  VARCHAR2);
```

Parameters

Table 64–8 CREATE_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group to which the new version is added, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk ('*').
default_directory	The default directory object used when files are added to a version if no directory is specified when the files are added.
comments	Comments about the version being created
version_out	If the version_name parameter is set to a non-NULL value, then this parameter contains the specified version name. If the version_name parameter is set to NULL, then this parameter contains the generated version number.

DROP_FILE_GROUP Procedure

This procedure drops a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_FILE_GROUP(
  file_group_name  IN  VARCHAR2,
  keep_files       IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 64–9 DROP_FILE_GROUP Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group being dropped, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`keep_files`	If `Y`, then the procedure retains the files in the file group on hard disk. If `N`, then the procedure deletes the files in the file group from hard disk. If `NULL`, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

DROP_VERSION Procedure

This procedure drops a version of a file group.

Syntax

```
DBMS_FILE_GROUP.DROP_VERSION(
  file_group_name  IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  keep_files       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 64–10 DROP_VERSION Procedure Parameters

Parameter	Description
file_group_name	The name of the file group that contains the version, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
version_name	The name of the version being dropped. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is dropped. If NULL, then the procedure uses the version with the oldest creation time for the file group. If '*', then the procedure drops all versions.
keep_files	If Y, then the procedure retains the files in the version on hard disk. If N, then the procedure deletes the files in the version from hard disk. If NULL, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

Syntax

```
DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
  object_name   IN  VARCHAR2,
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 64–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`object_name`	The name of the file group on which the privilege is granted, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`privilege`	The constant that specifies the privilege. See "Constants" on page 64-4 for valid privileges.
`grantee`	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
`grant_option`	If `TRUE`, then the specified user granted the specified privilege can grant this privilege to others. If `FALSE`, then the specified user granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

> **Note:** When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.
>
> If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object will allow access to any schema, including SYS. Set the O7_DICTIONARY_ACCESSIBILITY initialization parameter with caution.

Syntax

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 64–12 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
privilege	The constant that specifies the privilege. See "Constants" on page 64-4 for valid privileges.
grantee	The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified.
grant_option	If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.

PURGE_FILE_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the `max_versions`, `min_versions`, and `retention_days` parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the `max_versions` setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the `retention_days` setting for the file group except when purging a version will cause the number of versions to drop below the `min_versions` setting for the file group.

A job named `SYS.FGR$AUTOPURGE_JOB` automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the `DBMS_SCHEDULER` package. Alternatively, you can create a job that runs the `PURGE_FILE_GROUP` procedure periodically.

Syntax

```
DBMS_FILE_GROUP.PURGE_FILE_GROUP(
  file_group_name  IN  VARCHAR2);
```

Parameter

Table 64–13 PURGE_FILE_GROUP Procedure Parameter

Parameter	Description
`file_group_name`	The name of the file group, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default. If `NULL` and this procedure is run by `SYS` user, then the procedure purges all file groups.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files. Files are deleted when a version is purged and the `keep_files` parameter is set to `N` for the version's file group.

REMOVE_FILE Procedure

This procedure removes a file from a version of a file group.

Syntax

```
DBMS_FILE_GROUP.REMOVE_FILE(
  file_group_name  IN  VARCHAR2,
  file_name        IN  VARCHAR2,
  version_name     IN  VARCHAR2 DEFAULT NULL,
  keep_file        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 64–14 REMOVE_FILE Procedure Parameters

Parameter	Description
`file_group_name`	The name of the file group that contains the version, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`file_name`	The name of the file being removed from the version
`version_name`	The name of the version from which the file is removed. If a positive integer is specified as a `VARCHAR2` value, then the integer is interpreted as a version number. For example, if `'1'` is specified, then the file is removed from version 1 of the file group. If `NULL`, then the procedure uses the version with the latest creation time for the file group. If `'*'`, then the procedure removes the file from all versions.
`keep_file`	If `Y`, then the procedure retains the file on hard disk. If `N`, then the procedure deletes the file from hard disk. If `NULL`, then the procedure uses the default keep files property of the file group.

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have `WRITE` privilege on the directory object that contains the files.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE(
  object_name  IN  VARCHAR2,
  privilege    IN  BINARY_INTEGER,
  revokee      IN  VARCHAR2);
```

Parameters

Table 64–15 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`object_name`	The name of the file group on which the privilege is revoked, specified as *`[schema_name.]file_group_name`*. For example, if the schema is `hq_dba` and the file group name is `sales_tbs`, then specify `hq_dba.sales_tbs`. If the schema is not specified, then the current user is the default.
`privilege`	The constant that specifies the privilege. See "Constants" on page 64-4 for valid privileges.
`revokee`	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

Syntax

```
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE(
  privilege  IN  BINARY_INTEGER,
  revokee    IN  VARCHAR2);
```

Parameters

Table 64–16 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The constant that specifies the privilege. See "Constants" on page 64-4 for valid privileges.
`revokee`	The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified.

65

DBMS_FILE_TRANSFER

The DBMS_FILE_TRANSFER package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

See Also:

- *Oracle Database Administrator's Guide* for instructions about using file transfer
- *Oracle Streams Concepts and Administration* for applications of file transfer.

This chapter contains the following topic:

- Using DBMS_FILE_TRANSFER
  - Operating Notes
- Summary of DBMS_FILE_TRANSFER Subprograms

Using DBMS_FILE_TRANSFER

- Operating Notes

Operating Notes

Caution: DBMS_FILE_TRANSFER supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

If you want to use DBMS_FILE_TRANSFER for performing backups, note that you are implementing self-managed backups, and should therefore put the files in hot backup mode.

Summary of DBMS_FILE_TRANSFER Subprograms

Table 65–1 DBMS_FILE_TRANSFER Package Subprograms

Subprogram	Description
COPY_FILE Procedure on page 65-5	Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.
GET_FILE Procedure on page 65-7	Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM
PUT_FILE Procedure on page 65-9	Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system

COPY_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.COPY_FILE(
   source_directory_object       IN  VARCHAR2,
   source_file_name              IN  VARCHAR2,
   destination_directory_object  IN  VARCHAR2,
   destination_file_name         IN  VARCHAR2);
```

Parameters

Table 65–2 COPY_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the CREATE DIRECTORY command).
source_file_name	The name of the file to copy. This file must exist in the source directory.
destination_directory_object	The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, +diskgroup1) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: +diskgroup1/dbs/control).
destination_file_name	The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM: ■ The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type) ■ The file type tag assigned to the file is COPY_FILE ■ The value of the destination_file_name argument becomes the file's alias name in the designated destination directory The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template.

Usage Notes

To run this procedure successfully, the current user must have the following privileges:

- `READ` privilege on the directory object specified in the `source_directory_object` parameter
- `WRITE` privilege on directory object specified in the `destination_directory_object` parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file copy, query the `V$SESSION_LONGOPS` dynamic performance view.

> **See Also:** *Oracle Database Storage Administrator's Guide* for instructions about using file transfer

Examples

```
SQL> create directory DGROUP as '+diskgroup1/dbs/backup';

Directory created.

SQL>  BEGIN
   2    DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR','t_xdbtmp.f', 'DGROUP',
                                     't_xdbtmp.f');
   3  END;
   4  /

PL/SQL procedure successfully completed.

SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525
```

GET_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.GET_FILE
   source_directory_object      IN  VARCHAR2,
   source_file_name             IN  VARCHAR2,
   source_database              IN  VARCHAR2,
   destination_directory_object IN  VARCHAR2,
   destination_file_name        IN  VARCHAR2);
```

Parameters

Table 65–3 GET_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.
source_database	The name of a database link to the remote database where the file is located.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.
destination_file_name	The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the source_directory_object parameter.
- The current user at the local database must have write privilege on the directory object specified in the destination_directory_object parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS ''^t_work^'';
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- asumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.

BEGIN
-- asm file to an os file
-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'df' , 'a1' , 'dbs1', 'dsk_files' , 'oa5.dat' );

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
  DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files' , 'a2.dat' , 'dbs1', 'dsk_files' ,
'a2back.dat' );

END ;
/
```

PUT_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

```
DBMS_FILE_TRANSFER.PUT_FILE(
   source_directory_object       IN  VARCHAR2,
   source_file_name              IN  VARCHAR2,
   destination_directory_object  IN  VARCHAR2,
   destination_file_name         IN  VARCHAR2,
   destination_database          IN  VARCHAR2);
```

Parameters

Table 65–4 PUT_FILE Procedure Parameters

Parameter	Description
source_directory_object	The directory object from which the file is copied at the local source site. This directory object must exist at the source site.
source_file_name	The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object.
destination_directory_object	The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system.
destination_file_name	The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system.
destination_database	The name of a database link to the remote database to which the file is copied.

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The current user at the local database must have read privilege on the directory object specified in the source_directory_object parameter.
- The connected user at the destination database must have write privilege to the directory object specified in the destination_directory_object parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. The copied file is treated as a binary file, and no character set conversion is performed. To monitor the progress of a long file transfer, query the V$SESSION_LONGOPS dynamic performance view.

Examples

```
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user;
Enter password: password

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
 DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' ,
                               'dbs2' ) ;
END ;
```

66

DBMS_FLASHBACK

Using DBMS_FLASHBACK, you can flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN).

> **See Also:** For detailed information about DBMS_FLASHBACK:
>
> - *Oracle Database Advanced Application Developer's Guide*
> - *Oracle Database SQL Language Reference*.

This chapter contains the following topics:

- Using DBMS_FLASHBACK
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Operational Notes
  - Examples
- Summary of DBMS_FLASHBACK Subprograms

Using DBMS_FLASHBACK

- Overview
- Security Model
- Types
- Exceptions
- Operational Notes
- Examples

Overview

DBMS_FLASHBACK provides an interface for the user to view the database at a particular time in the past, with the additional capacity provided by transaction backout features that allow for selective removal of the effects of individual transactions. This should not be confused this with a flashback database which actually moves the database back in time.

When `DBMS_FLASHBACK` is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use `DBMS_FLASHBACK` for the following reasons:

- Self-service repair: If you accidentally delete rows from a table, you can recover the deleted rows.
- Packaged applications such as e-mail and voicemail: You can use Flashback to restore deleted e-mail by re-inserting the deleted message into the current message box.
- Decision support system (DSS) and online analytical processing (OLAP) applications: You can perform data analysis or data modeling to track seasonal demand.

Security Model

To use this package, a database administrator must grant `EXECUTE` privileges for `DBMS_FLASHBACK`.

Types

The following types are used by DBMS_FLASHBACK subprograms:

Table 66–1 DBMS_FLASHBACK

Type	Description
TXNAME_ARRAY	Creates a VARRAY for holding Transaction Names or Identifiers (XIDs

Exceptions

Table 66–2 DBMS_FLASHBACK Error Messages

Error	Description
ORA-08180	Time specified is too old.
ORA-08181	Invalid system change number specified.
ORA-08182	User cannot begin read-only or serializable transactions in Flashback mode.
ORA-08183	User cannot enable Flashback within an uncommitted transaction.
ORA-08184	User cannot enable Flashback within another Flashback session.
ORA-08185	SYS cannot enable Flashback mode.

Operational Notes

DBMS_FLASHBACK is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode. You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need.

If you need to perform a Flashback over a 24-hour period, the DBA should set the undo_retention parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the RETENTION GUARANTEE clause for the undo tablespace to ensure that unexpired undo is not discarded.UNDO_RETENTION is not in itself a complete guarantee because, if the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, RETENTION GUARANTEE prevents this. For more information, see the *Oracle Database Administrator's Guide*

In a Flashback-enabled session, SYSDATE is not affected; it continues to provide the current time.

DBMS_FLASHBACK can be used within logon triggers to enable Flashback without changing the application code.

Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```
DROP TABLE employee;
DROP TABLE keep_scn;

REM -- Keep_scn is a temporary table to store scns that we are interested in

CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee (
   employee_no   number(5) PRIMARY KEY,
   employee_name varchar2(20),
   employee_mgr  number(5)
      CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
   salary        number,
   hiredate      date
);

REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;

REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Sleep for a short time (approximately 10 to 20  seconds) to avoid
REM -- querying close to table creation

EXECUTE DBMS_LOCK.SLEEP(10);

REM -- Store this snapshot for later access through Flashback
DECLARE
I NUMBER;
BEGIN
I := DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER;
INSERT INTO keep_scn VALUES (I);
COMMIT;
END;
/

REM -- Scott decides to retire but the transaction is done incorrectly
DELETE FROM EMPLOYEE WHERE employee_name = 'Scott Tiger';
COMMIT;
```

```
REM -- notice that all of scott's employees are gone
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM EMPLOYEE
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Flashback to see Scott's organization
DECLARE
   restore_scn number;
BEGIN
   SELECT  scn INTO restore_scn FROM keep_scn;
   DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (restore_scn);
END;
/

REM -- Show Scott's org.
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no =
   (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger')
ORDER BY LEVEL;

REM -- Restore scott's organization.
DECLARE
   scotts_emp NUMBER;
   scotts_mgr NUMBER;
   CURSOR c1 IS
      SELECT employee_no, employee_name, employee_mgr, salary, hiredate
      FROM employee
      CONNECT BY PRIOR employee_no = employee_mgr
      START WITH employee_no =
         (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger');
   c1_rec c1 % ROWTYPE;
BEGIN
   SELECT employee_no, employee_mgr INTO scotts_emp, scotts_mgr FROM employee
   WHERE employee_name = 'Scott Tiger';
   /* Open c1 in flashback mode */
   OPEN c1;
   /* Disable Flashback */
   DBMS_FLASHBACK.DISABLE;
 LOOP
   FETCH c1 INTO c1_rec;
   EXIT WHEN c1%NOTFOUND;
   /*
     Note that all the DML operations inside the loop are performed
     with Flashback disabled
   */
   IF (c1_rec.employee_mgr = scotts_emp) then
      INSERT INTO employee VALUES (c1_rec.employee_no,
         c1_rec.employee_name,
         scotts_mgr,
         c1_rec.salary,
         c1_rec.hiredate);
   ELSE
   IF (c1_rec.employee_no != scotts_emp) THEN
   INSERT INTO employee VALUES (c1_rec.employee_no,
         c1_rec.employee_name,
```

```
         c1_rec.employee_mgr,
         c1_rec.salary,
         c1_rec.hiredate);
      END IF;
    END IF;
 END LOOP;
END;
/

REM -- Show the restored organization.
select lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;
```

Summary of DBMS_FLASHBACK Subprograms

Table 66–3 DBMS_FLASHBACK Package Subprograms

Subprogram	Description
DISABLE Procedure on page 66-12	Disables the Flashback mode for the entire session
ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure on page 66-13	Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN
ENABLE_AT_TIME Procedure on page 66-14	Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in `query_time`
GET_SYSTEM_CHANGE_NUMBER Function on page 66-15	Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots
TRANSACTION_BACKOUT Procedures on page 66-16	Provides the mechanism to backout a transaction

DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

Syntax

```
DBMS_FLASHBACK.DISABLE;
```

Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:

```
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');
SELECT salary FROM emp where name = 'Joe'
EXECUTE dbms_flashback.disable;
```

ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number. In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (
   query_scn IN NUMBER);
```

Parameters

Table 66–4 ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure Parameters

Parameter	Description
query_scn	The system change number (SCN), a version number for the database that is incremented on every transaction commit.

ENABLE_AT_TIME Procedure

This procedure enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in query_time.It enables Flashback for the entire session.

Syntax

```
DBMS_FLASHBACK.ENABLE_AT_TIME (
   query_time   IN TIMESTAMP);
```

Parameters

Table 66–5 ENABLE_AT_TIME Procedure Parameters

Parameter	Description
query_time	This is an input parameter of type TIMESTAMP. A time stamp can be specified in the following ways: ■ Using the TIMESTAMP constructor EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TIMESTAMP '2001-01-09 12:31:00'). Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings. ■ Using the TO_TIMESTAMP function: EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TO_TIMESTAMP('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS')) You provide the format you want to use. This example shows the TO_TIMESTAMP function for February 12, 2001, 2:35 PM. ■ If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M. ■ Note that if the query time contains a time zone, the time zone information is truncated.

GET_SYSTEM_CHANGE_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

Syntax

```
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER
 RETURN NUMBER;
```

TRANSACTION_BACKOUT Procedures

This procedure provides a mechanism to backout a set of transactions. The user can call these procedures with either transaction names or transaction identifiers (XIDS).

The procedure analyzes the transactional dependencies, perform DML's and generates an extensive report on the operation performed by the subprogram. This procedure does not commit the DML's performed as part of transaction backout. However it holds all the required locks on rows and tables in the right form, so that no other dependencies can enter the system. To make the changes permanent the user needs to explicitly commit the transaction.

A report is generated in the system tables DBA_FLASHBACK_TRANSACTION_STATE and DBA_FLASHBACK_TRANSACTION_REPORT.

Syntax

```
DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numtxns            NUMBER,
   xids               XID_ARRAY,
   options            NUMBER default NOCASCADE,
   timeHint           TIMESTAMP default MINTIME);

DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numtxns            NUMBER,
   xids               XID_ARRAY,
   options            NUMBER default NOCASCADE,
   scnHint            TIMESTAMP default 0   );

DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numtxns           NUMBER,
   txnnames          TXNAME_ARRAY,
   options           NUMBER default NOCASCADE,
   timehint          TIMESTAMP MINTIME );

DBMS_FLASHBACK.TRANSACTION_BACKOUT
   numtxns           NUMBER,
   txnNames         TXNAME_ARRAY,
   options          NUMBER default NOCASCADE,
   scnHint          NUMBER 0);
```

Parameters

Table 66–6 TRANSACTION_BACKOUT Procedure Parameters

Parameter	Description
numtxns	Number of transactions passed as input
xids	List of transaction IDs in the form of an array
txnnames	List of transaction names in the form of an array

Table 66–6 (Cont.) TRANSACTION_BACKOUT Procedure Parameters

Parameter	Description
options	Backout dependent transactions: ■ NOCASCADE - The user expects no dependency. If a dependency is found, this raises an error, with the first dependent transaction provided in the report. ■ NOCASCADE_FORCE - The user forcibly backs out the given transactions without considering the dependent transactions. The RDBMS executes the UNDO SQL for the given transactions in reverse order of their commit times. If no constraints break, and the result is satisfactory, the user can either COMMIT the changes or else ROLL BACK. ■ NONCONFLICT_ONLY - This option lets the user backout the changes to the non-conflicting rows of the given transactions. Note that a transaction dependency happens due to a row conflict, whether either through WAW or primary/unique key constraints. If the user chooses to back out only the non-conflicting rows, this should not cause any problem with database consistency, although transaction atomicity is lost. As this is a recovery operation, the user can correct the data. ■ CASCADE - This completely removes the given transactions including their dependents in a post order fashion (reverse order of commit times).
timehint	Time hint on the start of the transaction
scnhint	SCN hint on the start of the transaction

Usage Notes

Note: For information about restrictions in using TRANSACTION_BACKOUT, see "Using Flashback Transaction" in the *Oracle Database Advanced Application Developer's Guide*.

- If transaction name is used, a time hint must be provided. The time hint should be a time before the start of all the given transactions to back out.
- If the SCN hint is provided, it must be before the start of the earliest transaction in the specified input set, or this raises an error and terminate. If it is not provided and the transaction has committed within undo retention, the database system is able to determine the start time.

67

DBMS_FLASHBACK_ARCHIVE

The `DBMS_FLASHBACK_ARCHIVE` package contains two simple procedures for disassociation and reassociation of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively.

> **See Also:** Oracle Database Advanced Application Developer's Guide

This chapter contains the following topics:

- Using DBMS_FLASHBACK_ARCHIVE
  - Overview
  - Security Model
  - Examples
- Summary of DBMS_FLASHBACK_ARCHIVE Subprograms

Using DBMS_FLASHBACK_ARCHIVE

- Overview
- Security Model
- Examples

Overview

The Flashback Data Archive feature, which is available through the Total Recall option, provides strict protection on the internal history tables that it creates and maintains for users.

The read-only semantics provided prohibits users, including a DBA, from doing updates, deletes, and inserts on the Flashback Data Archive internal history tables. The feature also prohibits users from issuing any DDL statements on these tables. This strict security enforcement by Flashback Data Archive meets the requirements of regulatory-compliance type of applications. The feature supports a lot of common DDL statements, including some DDL statements that alter table definition or incur data movement, on user tables that are enabled for Flashback Data Archive. However, there are some DDL statements that are not supported on tables enabled for the feature. Since most applications schemas evolve as they release new versions of their software, the ability to perform DDL operations on the base table is a key customer requirement.

In order to support user applications' schema evolution during application upgrade and other table maintenance tasks beyond DDL statements supported by Flashback Data Archive, the `DBMS_FLASHBACK_ARCHIVE` package provides a set of simple-to-use PL/SQL procedures:

- To disassociate a Flashback Data Archive enabled base table from the underlying FDA.
- To reassociate a temporarily disassociated base table with its underlying FDA.

After a user has disassociated the base table from its FDA, it's possible to issue any DDL statements on the base table or the history tables in the FDA. Having finished with the schema changes, the user can then reassociate the base table with its FDA so that Flashback Data Archive protection is in operation and automatic tracking and archiving is resumed.

Security Model

Users with `the FLASHBACK ARCHIVE ADMINISTER` system privilege can execute the disassociation and reassociation PL/SQL procedures. Once a table is disassociated, normal users can perform DDL and DML statements as long as they have the necessary privileges on the tables.

Examples

Normally, users cannot perform any modification to the history table:

```
SQL> DELETE FROM scott.SYS_FBA_HIST_61527;

ERROR at line 1:
ORA-55622: DML, ALTER and CREATE UNIQUE INDEX operations are not allowed on table
"SCOTT"."SYS_FBA_HIST_61527"
```

Users also cannot issue DDL statements on history tables:

```
SQL> ALTER TABLE scott.SYS_FBA_HIST_61527 DROP COLUMN comm;

ERROR at line 1:
ORA-55622: DML, ALTER and CREATE UNIQUE INDEX operations are not allowed on table
"SCOTT"."SYS_FBA_HIST_61527"
```

Use the DISASSOCIATE_FBA Procedure to disassociate the `scott.emp_test` table:

```
SQL> EXEC DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA('scott','emp_test');

PL/SQL procedure successfully completed.
```

Now a user can perform table structural modifications (through DDL statements) to the user base table:

```
SQL> ALTER TABLE scott.emp_test RENAME COLUMN sal TO salary;

Table altered.
```

Users can also modify the contents in the history table that they couldn't modify previously.

```
SQL> DELETE FROM scott.SYS_FBA_HIST_61527 WHERE empno=3968;

2 rows deleted.
```

If a user tries to reassociate the history table with the base table, this will fail as the user has not performed corresponding structural modifications (through DDL statements) to the history table:

```
SQL> EXEC DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA('scott','emp_test');
BEGIN DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA('scott','emp_test');
END;

ERROR at line 1:
ORA-55636: Flashback Data Archive enabled table "SCOTT"."EMP_TEST" has different
definition from its history table
ORA-06512: at "SYS.DBMS_FLASHBACK_ARCHIVE", line 17
ORA-06512: at line 1
```

Disassociate the table and fix the table definition problem:

```
SQL> EXEC DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA('scott','emp_test');

PL/SQL procedure successfully completed.
```

Perform the same rename column DDL on the history table to make its definition conform to its base table `scott.emp_test`:

```
SQL> ALTER TABLE scott.SYS_FBA_HIST_61527 RENAME COLUMN sal TO salary;
```

```
Table altered.
```

Finally, reassociate the base table with its history table successfully:

```
SQL> EXEC DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA('scott','emp_test')

PL/SQL procedure successfully completed.
```

Summary of DBMS_FLASHBACK_ARCHIVE Subprograms

Table 67–1 DBMS_FLASHBACK_ARCHIVE Package Subprograms

Subprogram	Description
DISASSOCIATE_FBA Procedure on page 67-8	Disassociates the given table from the flashback data archive
REASSOCIATE_FBA Procedure on page 67-9	Reassociates the given table with the flashback data archive

DISASSOCIATE_FBA Procedure

This procedure disassociates the given table from the flashback data archive.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA (
   owner_name      VARCHAR2,
   table_name      VARCHAR2);
```

Parameters

Table 67–2 DISASSOCIATE_FBA Procedure Parameters

Parameter	Description
owner_name	Schema of the Flashback Data Archive enabled base table
table_name	Name of the Flashback Data Archive enabled base table

Exceptions

Table 67–3 DISASSOCIATE_FBA Procedure Exceptions

Parameter	Description
ORA-55602	User table is not enabled for Flashback Data Archive
ORA-55634	Cannot acquire the lock on the table for disassociation

REASSOCIATE_FBA Procedure

This procedure reassociates the given table with the flashback data archive.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA (
   owner_name      VARCHAR2,
   table_name      VARCHAR2);
```

Parameters

Table 67–4 REASSOCIATE_FBA Procedure Parameters

Parameter	Description
owner_name	Schema of the Flashback Data Archive enabled base table
table_name	Name of the Flashback Data Archive enabled base table

Exceptions

Table 67–5 REASSOCIATE_FBA Procedure Exceptions

Parameter	Description
ORA-55602	User table is not enabled for Flashback Data Archive
ORA-55636	table definition validation failed

Usage Notes

- The procedure will signal an error if the base table and the history table do not have identical data definitions. For example when columns are added or table is split, the resulting base table and history table need to have the same schema.
- The FDA internal history table schema has some row versions metadata columns. The procedure will signal an error if any of the metadata columns is dropped by users.

68

DBMS_FREQUENT_ITEMSET

The DBMS_FREQUENT_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

- Summary of DBMS_FREQUENT_ITEMSET Subprograms

Summary of DBMS_FREQUENT_ITEMSET Subprograms

Table 68–1 DBMS_FREQUENT_ITEMSET Package Subprograms

Subprogram	Description
FI_HORIZONTAL Function on page 68-3	Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded
FI_TRANSACTIONAL Function on page 68-5	Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded

FI_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
   tranx_cursor         IN    SYSREFCURSOR,
   support_threshold    IN    NUMBER,
   itemset_length_min   IN    NUMBER,
   itemset_length_max   IN    NUMBER,
   including_items      IN    SYS_REFCURSOR DEFAULT NULL,
   excluding_items      IN    SYS_REFCURSOR DEFAULT NULL)
  RETURN TABLE OF ROW (
     itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
     support        NUMBER,
     length         NUMBER,
     total_tranx    NUMBER);
```

Parameters

Table 68–2 FI_HORIZONTAL Function Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. There is no limits on the number of returning columns.Each column of cursor represents an item. All columns of the cursor must be of the same data type. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned.The default is NULL.

Return Values

Table 68–3 FI_HORIZONTAL Return Values

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER.

Example

Suppose you have a table horiz_table_in.

```
horiz_table_in(iid1 VARCHAR2(30), iid2 VARCHAR2(30), iid3 VARCHAR2(30), iid4
VARCHAR2(30), iid5 VARCHAR2(30));
```

and the data in horiz_table_in looks as follows:

```
('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)
```

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple','banana','orange'), but excluding any of ('milk') in any itemset. You use the following query:

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
                CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
                         FROM horiz_table_in),
                0.3,
                2,
                5,
                CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                                    ('apple','banana','orange'))),
                CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk')))));
```

FI_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In 'TRANSACTIONAL' row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

Syntax

```
DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
   tranx_cursor         IN    SYSREFCURSOR,
   support_threshold    IN    NUMBER,
   itemset_length_min   IN    NUMBER,
   itemset_length_max   IN    NUMBER,
   including_items      IN    SYS_REFCURSOR DEFAULT NULL,
   excluding_items      IN    SYS_REFCURSOR DEFAULT NULL)
  RETURN TABLE OF ROW (
     itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
     support        NUMBER,
     length         NUMBER,
     total_tranx    NUMBER);
```

Parameters

Table 68–4 FI_TRANSACTIONAL Function Parameters

Parameter	Description
tranx_cursor	The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, VARCHAR2(n)).
support_threshold	A fraction number of total transaction count. An itemset is termed "frequent" if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.
itemset_length_min	The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.
itemset_length_max	The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.
including_items	A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is NULL.
excluding_items	A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is NULL.

Return Values

Table 68–5 FI_TRANSACTIONAL Return Values

Parameter	Description
support	The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.
itemset	A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.
length	Number of items in a frequent itemset. This will be returned as a NUMBER.
total_tranx	The total transaction count. This will be returned as a NUMBER, and will be the same for all returned rows, similar to a reporting aggregate.

Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

Examples

Suppose that the input table tranx_table_in looks as follows:

```
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')
```

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

```
itemset=('apple','banana'), support=2, length=2, total_tranx=3
```

You need to create a nested table of item type before you submit a query to perform the frequent itemset counting. In this example, since item is of VARCHAR2(30), you must create a nested table of VARCHAR2(30):

```
CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
                cursor(SELECT tid, iid FROM tranx_table_in),
                0.6,
                2,
                5,
                NULL,
                NULL));
```

Here is another example to illustrate how to include certain items and exclude certain items in the counting.

```
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
   FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
                CURSOR(SELECT tid, iid FROM tranx_table_in),
```

```
              0.6,
              2,
              5,
             CURSOR(SELECT * FROM table(FI_VARCHAR_NT
                                        ('apple','banana','orange'))),
             CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));
```

Using the including/excluding items parameter, you are able to further optimize the execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

```
SELECT
  bt.setid, nt.*
FROM
(SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
 FROM table(
   DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
     CURSOR(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
     NULL, NULL))) bt,
table(bt.itemset) nt;
```

If you want to use an insert statement to load frequent itemsets into a nested table, it is better to use the `NESTED_TABLE_FAST_INSERT` hint for performance:

```
CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
  coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */  INTO fq_nt
 SELECT cast(itemset as FI_VARCHAR_NT)
 FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL));
```

Note that if you want to use the package inside a PL/SQL cursor, you must cast the return type of the table function:

```
CREATE TYPE fi_res AS OBJECT (
  itemset      FI_VARCHAR_NT,
  support      NUMBER,
  length       NUMBER,
  total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
  cursor freqC is
    SELECT Itemset
    FROM table(
      CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
        cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
        NULL, NULL) AS fi_coll));
  coll_nt  FI_VARCHAR_NT;
  num_rows int;
  num_itms int;
BEGIN
  num_rows := 0;
  num_itms := 0;
  OPEN freqC;
  LOOP
```

```
      FETCH freqC INTO coll_nt;
      EXIT WHEN freqC%NOTFOUND;
      num_rows := num_rows + 1;
      num_itms := num_itms + coll_nt.count;
    END LOOP;
  CLOSE freqC;
  DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || '
items were produced.');
END;
/
```

69

DBMS_HM

This package contains constants and procedure declarations for health check management. Health Monitor provides facilities to run a check store and retrieve the reports through `DBMS_HM` package

> **See Also:** *Oracle Database Administrator's Guide* for more information about "Health Monitor"

This chapter contains the following topics:

- Using DBMS_HM
  - Security Model
- Summary of DBMS_HM Subprograms

Using DBMS_HM

- Security Model

Security Model

Users must have `EXECUTE` privilege to run the procedures of `DBMS_HM` package.

Summary of DBMS_HM Subprograms

Table 69–1 DBMS_HM Package Subprograms

Subprogram	Description
GET_RUN_REPORT Function on page 69-5	Returns the report for the specified checker run
RUN_CHECK Procedure on page 69-6	Runs the specified checker with the given arguments

GET_RUN_REPORT Function

This function returns the report for the specified checker run.

Syntax

```
DBMS_HM.GET_RUN_REPORT (
    run_name      IN  VARCHAR2,
    type           IN  VARCHAR2 := 'TEXT',
    level          IN  VARCHAR2 := 'BASIC',)
  RETURN CLOB;
```

Parameters

Table 69–2 GET_RUN_REPORT Function Parameters

Parameter	Description
`run_name`	Name of the check's run
`type`	Report format type. Possible values are `'HTML'`, `'XML'` and `'TEXT'`. Default report type is `'TEXT'`.
`level`	Details of report, possible value are `'BASIC'` and `'DETAIL'`. Caution: Currently only `'BASIC'` level is supported.

RUN_CHECK Procedure

This procedure runs the specified checker with the given arguments. It lets user to specify a name for the run, inputs needed and maximum timeout for the run. The run's report will be maintained persistently in database.

Syntax

```
DBMS_HM.RUN_CHECK (
   check_name     IN  VARCHAR2,
   run_name       IN  VARCHAR2 := NULL,
   timeout        IN  NUMBER := NULL,
   input_params   IN  VARCHAR2 := NULL);
```

Parameters

Table 69–3 RUN_CHECK Procedure Parameters

Parameter	Description
check_name	Name of the check to be invoked. Check names and their parameters can be accessed from the V$HM_CHECK and V$HM_CHECK_PARAM views. Users can run all checks which are not internal in nature: SELECT name FROM V$HM_CHECK WHERE INTERNAL_CHECK = 'N' retrieves the list of checks that can be run manually by users.
run_name	Name with which external users can uniquely identify this check's run. If NULL value is passed, then HM creates a unique name and associates with this check's run.
timeout	Maximum amount of time (in units of seconds), this checker run is allowed to run. HM will interrupt the run, if it the specified time elapses for the run. If NULL value is passed, HM doesn't impose any timeout limits on the run.
input_params	Input string: which consists of name, value pairs de-limited by a special character ';'. Example ('Data Block Integrity Check' invocation may take following type of input parameters. 'BLC_DF_NUM=1;BLC_BL_NUM=23456' Input parameters BLC_DF_NUM and BLC_BL_NUM have values '1' and '23456' respectively. Every check will have well defined set of inputs associated with it. These Input parameters, their types, default values and descriptions can be obtained using V$HM_CHECK_PARAM view. Example: The following query gets the list of parameters, their default values and descriptions for a 'Data Block Integrity Check' SELECT a.* FROM v$hm_check_param a, v$hm_check b WHERE a.check_id = b.id AND b.name = 'Data Block Integrity Check';

70

DBMS_HPROF

The `DBMS_HPROF` package provides an interface for profiling the execution of PL/SQL applications. It provides services for collecting the hierarchical profiler data, analyzing the raw profiler output and profiling information generation.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for more information about the "PL/SQL Hierarchical Profiler"

This chapter contains the following topic:

- Summary of DBMS_HPROF Subprograms

Summary of DBMS_HPROF Subprograms

This table list the package subprograms in alphabetical order.

Table 70–1 DBMS_HPROF Package Subprograms

Subprogram	Description
ANALYZE Function on page 70-3	Analyzes the raw profiler output and produces hierarchical profiler information in database tables
START_PROFILING Procedure on page 70-5	Starts hierarchical profiler data collection in the user's session
STOP_PROFILING Procedure on page 70-6	Stops profiler data collection in the user's session.s

ANALYZE Function

This function analyzes the raw profiler output and produces hierarchical profiler information in database tables.

Syntax

```
DBMS_HPROF.ANALYZE (
   location         VARCHAR2,
   filename         VARCHAR2,
   summary_mode     BOOLEAN     DEFAULT FALSE,
   trace            VARCHAR2    DEFAULT NULL,
   skip             PLS_INTEGER DEFAULT 0,
   collect          PLS_INTEGER DEFAULT NULL,
   run_comment      VARCHAR2    DEFAULT NULL)
  RETURN NUMBER;
```

Parameters

Table 70–2 ANALYZE Function Parameters

Parameter	Description
`location`	Name of a directory object. The raw profiler data file is read from the file system directory mapped to this directory object. Output files are also written to this directory.
`filename`	Name of the raw profiler data file to be analyzed. The file must exist in the directory specified by the `location` parameter.
`summary_mode`	By default (that is, when `summary_mode` is `FALSE`), the detailed analysis is done. When `summary_mode` is `TRUE`, only top-level summary information is generated into the database table.
`trace`	Analyze only the subtrees rooted at the specified trace entry. By default (when trace is `NULL`), the analysis/reporting is generated for the entire run. The trace entry must be specified in a special quoted qualified format (including the schema name, module name & function name) as in for example, '"`SCOTT`"."`PKG`"."`FOO`"' or '""."."__`plsql_vm`"'. If multiple overloads exist for the specified name, all of them will be analyzed.
`skip`	Used only when `trace` is specified. Analyze only the subtrees rooted at the specified trace, but ignore the first `skip` invocations to trace. The default value for skip is 0.
`collect`	Used only when `trace` is specified. Analyze `collect` number of invocations of traces (starting from `skip`+1'th invocation). By default only 1 invocation is collected.
`run_comment`	User-provided comment for this run

Return Values

A unique run identifier for this run of the analyzer. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

Usage Notes

- Use the `dbmshptab.sql` script located in the `rdbms/admin` directory to create the hierarchical profiler database tables and other data structures required for persistently storing the results of analyzing the raw profiler data.
- Running `dbmshptab.sql` drops the any previously created hierarchical profiler tables.

Examples

The following snippet installs the hierarchical profiler tables in HR schema.

```
connect HR/HR;
@?/rdbms/admin/dbmshptab.sql
```

START_PROFILING Procedure

This procedure starts hierarchical profiler data collection in the user's session.

Syntax

```
DBMS_HPROF.START_PROFILING (
   location    VARCHAR2 DEFAULT NULL,
   filename    VARCHAR2 DEFAULT NULL,
   max_depth   PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 70–3 START_PROFILING Procedure Parameters

Parameter	Description
`location`	Name of a directory object. The file system directory mapped to this directory object is where the raw profiler output is generated.
`filename`	Output filename for the raw profiler data. The file is created in the directory specified by the `location` parameter.
`max_depth`	By default (that is, when `max_depth` value is `NULL`) profile information is gathered for all functions irrespective of their call depth. When a non-`NULL` value is specified for `max_depth`, the profiler collects data only for functions up to a call depth level of `max_depth`.

Usage Notes

Even though the profiler does not individually track functions at depth greater than max_depth, the time spent in such functions is charged to the ancestor function at depth max_depth.

STOP_PROFILING Procedure

This procedure stops profiler data collection in the user's session. This subprogram also has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_HPROF.STOP_PROFILING;
```

71

DBMS_HS_PARALLEL

The DBMS_HS_PARALLEL PL/SQL package enables parallel processing for heterogeneous targets access. This package is designed to improve performance when retrieving data from a large foreign table.

This chapter discusses the following topics:

- Using DBMS_HS_PARALLEL
- Summary of DBMS_HS_PARALLEL Subprograms

Using DBMS_HS_PARALLEL

DBMS_HS_PARALLEL is compiled with the authorization ID of CURRENT_USER, which uses invoker's rights. In other words, all procedures in this package are executed with the privileges of the calling user.

Summary of DBMS_HS_PARALLEL Subprograms

Table 71–1 DBMS_HS_PARALLEL Package Subprograms

Subprogram	Description
CREATE_OR_REPLACE_VIEW on page 71-4	Creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.
CREATE_TABLE_TEMPLATE on page 71-6	Writes out a `CREATE TABLE` template based on information gathered from the remote table. You can use the information to add any optimal Oracle `CREATE TABLE` clauses.
DROP_VIEW on page 71-7	Drops the view and internal objects created by the `CREATE_OR_REPLACE_VIEW` procedure. If the view has not already been created by the `CREATE_OR_REPLACE_VIEW` procedure, an error message is returned.
LOAD_TABLE on page 71-8	Loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically.

CREATE_OR_REPLACE_VIEW

This procedure creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.

Syntax

```
CREATE_OR_REPLACE_VIEW (remote_table, database_link, oracle_view, parallel_degree)
```

Parameters

Table 71–2 CREATE_OR_REPLACE_VIEW Parameter

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_view	IN VARCHAR2	The name of the Oracle view. It is specified as [schema_name.]oracle_view_name. The default schema name is the current user. If the oracle_view parameter is not specified, the remote table name will be used as the view name.
parallel_degree	IN NUMBER	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.

Usage Notes

- The specified Oracle view is created and future reference of this view utilizes internal database objects for parallel retrieval of remote non-Oracle table data. If the Oracle view already exists, the following Oracle error message is raised:

  ```
  ORA-00955: name is already used by an existing object
  ```

- This view is created as a read-only view. If you attempt to insert and update the view, the following Oracle error message is raised:

  ```
  ORA-01733: virtual column not allowed here
  ```

- If the remote table or the database link does not exist, one of the following Oracle error messages is raised:

  ```
  ORA-00942: table or view does not exist
  or
  ORA-02019: connection description for remote database not found
  ```

- You need the CREATE VIEW, CREATE TABLE, CREATE TYPE, CREATE PACKAGE, and CREATE FUNCTION privileges to execute the CREATE_OR_REPLACE_VIEW procedure.

- If you encounter either of the following Oracle error messages, increase the PROCESSES and SESSIONS parameter in the Oracle initialization parameter file:

```
ORA-12801: error signaled in parallel query server P003
or
ORA-00018: maximum number of session exceeded
```

- Because the CREATE_OR_REPLACE_VIEW procedure creates some internal objects, use the DROP_VIEW procedure to drop the view and the internal objects. The SQL DROP VIEW statement only drops the view and not the internal objects.

CREATE_TABLE_TEMPLATE

This procedure writes out a CREATE TABLE template based on information gathered from the remote table. You can use the information to add any optimal Oracle CREATE TABLE clauses.

Syntax

```
CREATE_TABLE_TEMPLATE (remote_table, database_link, oracle_table, create_table_
template_string)
```

Parameters

Table 71–3 CREATE_TABLE_TEMPLATE Parameter

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_ schema_name.]remote_table_ name.
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_table	IN VARCHAR2	The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_ table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.
create_table_ template_string	OUT VARCHAR2	Contains the Oracle CREATE TABLE SQL template when the procedure is returned.

DROP_VIEW

This procedure drops the view and internal objects created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not already been created by the CREATE_OR_REPLACE_VIEW procedure, an error message is returned.

Syntax

```
DROP_VIEW (oracle_view)
```

Parameters

Table 71–4 DROP_VIEW Parameter

Parameter	Value	Description
oracle_view	IN VARCHAR2 NOT NULL	The name of the Oracle view created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not been created by the CREATE_OR_REPLACE_VIEW procedure, an error is returned.

LOAD_TABLE

This procedure loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically.

Syntax

```
LOAD_TABLE (remote_table, database_link, oracle_table, truncate, parallel_degree,
row_count)
```

Parameters

Table 71–5 LOAD_TABLE Parameters

Parameter	Value	Description
remote_table	IN VARCHAR2 NOT NULL	The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name
database_link	IN VARCHAR2 NOT NULL	The remote database link name. The call can only be applied to a heterogeneous services database link.
oracle_table	IN VARCHAR2	The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.
truncate	IN BOOLEAN	Determines whether the Oracle table is truncated before the data is loaded. The value is either TRUE or FALSE. The default value is TRUE which means the Oracle table is truncated first. When set to FALSE, the Oracle table will not be truncated before the data is loaded.
parallel_degree	IN NUMBER	The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.
row_count	OUT NUMBER	Contains the number of rows just added with the load table operation.

Usage Notes

- This procedure only loads the remote table data into Oracle local table. It does not create a key, index, constraints or any other dependencies such as triggers. It is recommended that you create these dependencies after the table data is loaded as performance will improve greatly. You will need to decide whether to create the dependencies before or after the data is loaded based on your knowledge of the remote table data and dependencies.

- If the local table does not exist, the LOAD_TABLE procedure creates a simple (non-partitioned) local table based on the exact column matching of the remote table after which the data is inserted into the local table.
- If the remote table or the database link does not exist, an error message is returned.
- If the local table is incompatible with the remote table, an error message is returned.
- You need the CREATE TABLE, CREATE TYPE, CREATE PACKAGE, and CREATE FUNCTION privileges to execute the LOAD_TABLE procedure.
- If you encounter either of the following Oracle error messages, increase the PROCESSES and SESSIONS parameter in Oracle initialization parameter file:

```
ORA-12801: error signaled in parallel query server P003
or
ORA-00018: maximum number of session exceeded
```

- One of the following is required for parallel processing:
  - The remote table is range partitioned.
  - Histogram information for a numeric column is available.
  - There is a numeric index or primary key.
- To drop the local table, use the DROP TABLE SQL statement.

72

DBMS_HS_PASSTHROUGH

The DBMS_HS_PASSTHROUGH PL/SQL package allows you to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows operations in statements for which there is no equivalent in Oracle.

This chapter discusses the following topics:

- Using DBMS_HS_PASSTHROUGH
  - Overview
  - Operational Notes
- Summary of DBMS_HS_PASSTHROUGH Subprograms

> **See Also:** *Oracle Database Heterogeneous Connectivity User's Guide* for more information about this package

Using DBMS_HS_PASSTHROUGH

This section contains topics which relate to using the `DBMS_HS_PASSTHROUGH` package.

Overview

You can execute passthrough SQL statements directly at the non-Oracle system using the PL/SQL package `DBMS_HS_PASSTHROUGH`. Any statement executed with this package is executed in the same transaction as standard SQL statements.

> **See Also:** *Oracle Database Heterogeneous Connectivity User's Guide* for information about this package

Operational Notes

The DBMS_HS_PASSTHROUGH package is a virtual package. It conceptually resides at the non-Oracle system. In reality, however, calls to this package are intercepted by Heterogeneous Services and mapped to one or more Heterogeneous Services calls. The driver, in turn, maps these Heterogeneous Services calls to the API of the non-Oracle system. The client application should invoke the procedures in the package through a database link in exactly the same way as it would invoke a non-Oracle system stored procedure. The special processing done by Heterogeneous Services is transparent to the user.

Summary of DBMS_HS_PASSTHROUGH Subprograms

Table 72–1 DBMS_HS_PASSTHROUGH Package Subprograms

Subprogram	Description
BIND_INOUT_VARIABLE Procedure on page 72-6	Binds IN OUT bind variables
BIND_INOUT_VARIABLE_ RAW Procedure on page 72-7	Binds IN OUT bind variables of data type RAW
BIND_OUT_VARIABLE Procedure on page 72-8	Binds an OUT variable with a PL/SQL program variable
BIND_OUT_VARIABLE_RAW Procedure on page 72-9	Binds an OUT variable of data type RAW with a PL/SQL program variable
BIND_VARIABLE Procedure on page 72-10	Binds an IN variable positionally with a PL/SQL program variable
BIND_VARIABLE_RAW Procedure on page 72-11	Binds IN variables of type RAW
CLOSE_CURSOR Procedure on page 72-12	Closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system
EXECUTE_IMMEDIATE Procedure on page 72-13	Runs a (non-SELECT) SQL statement immediately, without bind variables
EXECUTE_NON_QUERY Function on page 72-14	Runs a (non-SELECT) SQL statement
FETCH_ROW Function on page 72-15	Fetches rows from a query
GET_VALUE Procedure on page 72-16	Retrieves column value from SELECT statement, or retrieves OUT bind parameters
GET_VALUE_RAW Procedure on page 72-17	Similar to GET_VALUE, but for data type RAW
OPEN_CURSOR Function on page 72-18	Opens a cursor for running a passthrough SQL statement at the non-Oracle system
PARSE Procedure on page 72-19	Parses SQL statement at non-Oracle system

BIND_INOUT_VARIABLE Procedure

This procedure binds IN OUT bind variables.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE (
   c     IN     BINARY_INTEGER NOT NULL,
   p     IN     BINARY_INTEGER NOT NULL,
   v     IN OUT <dty>,
   n     IN     VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** For binding IN OUT variables of data type RAW see BIND_INOUT_VARIABLE_RAW Procedure on page 72-7.

Parameters

Table 72–2 BIND_INOUT_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 72–3 BIND_INOUT_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_INOUT_VARIABLE_RAW Procedure

This procedure binds IN OUT bind variables of data type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE_RAW (
   c      IN     BINARY_INTEGER NOT NULL,
   p      IN     BINARY_INTEGER NOT NULL,
   v      IN OUT RAW,
   n      IN     VARCHAR2);
```

Parameters

Table 72–4 BIND_INOUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.
n	(Optional) Name the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 72–5 BIND_INOUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_OUT_VARIABLE Procedure

This procedure binds an OUT variable with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (
   c      IN  BINARY_INTEGER NOT NULL,
   p      IN  BINARY_INTEGER NULL,
   v      OUT <dty>,
   n      IN  VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** For binding OUT variables of data type RAW, see BIND_OUT_VARIABLE_RAW Procedure on page 72-9.

Parameters

Table 72–6 BIND_OUT_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 72–7 BIND_OUT_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_OUT_VARIABLE_RAW Procedure

This procedure binds an OUT variable of data type RAW with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (
   c     IN  BINARY_INTEGER NOT NULL,
   p     IN  BINARY_INTEGER NOT NULL,
   v     OUT RAW,
   n     IN  VARCHAR2);
```

Parameters

Table 72–8 BIND_OUT_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable stores its value. The package remembers only the "size" of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE_RAW.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 72–9 BIND_OUT_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

BIND_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (
   c      IN BINARY_INTEGER NOT NULL,
   p      IN BINARY_INTEGER NOT NULL,
   v      IN <dty>,
   n      IN VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** To bind RAW variables use BIND_VARIABLE_RAW Procedure on page 72-11.

Parameters

Table 72–10 BIND_VARIABLE Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable name.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 72–11 BIND_VARIABLE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined: WNDS, RNDS
```

BIND_VARIABLE_RAW Procedure

This procedure binds IN variables of type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE_RAW (
   c    IN BINARY_INTEGER NOT NULL,
   p    IN BINARY_INTEGER NOT NULL,
   v    IN RAW,
   n    IN VARCHAR2);
```

Parameters

Table 72–12 BIND_VARIABLE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable in the SQL statement: Starts at 1.
v	Value that must be passed to the bind variable.
n	(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required.

Exceptions

Table 72–13 BIND_VARIABLE_RAW Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

CLOSE_CURSOR Procedure

This function closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system. If the cursor was not open, then the operation is a "no operation".

Syntax

```
DBMS_HS_PASSTHROUGH.CLOSE_CURSOR (
   c IN BINARY_INTEGER NOT NULL);
```

Parameters

Table 72–14 CLOSE_CURSOR Procedure Parameters

Parameter	Description
c	Cursor to be released.

Exceptions

Table 72–15 CLOSE_CURSOR Procedure Exceptions

Exception	Description
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

EXECUTE_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except SELECT can be run immediately. The statement must not contain any bind variables. The statement is passed in as a VARCHAR2 in the argument. Internally the SQL statement is run using the PASSTHROUGH SQL protocol sequence of OPEN_CURSOR, PARSE, EXECUTE_NON_QUERY, CLOSE_CURSOR.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE (
   s IN VARCHAR2 NOT NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 72–16 EXECUTE_IMMEDIATE Procedure Parameters

Parameter	Description
s	VARCHAR2 variable with the statement to be executed immediately.

Return Values

The number of rows affected by the execution of the SQL statement.

Exceptions

Table 72–17 EXECUTE_IMMEDIATE Procedure Exceptions

Exception	Description
ORA-28551	SQL statement is invalid.
ORA-28554	Max open cursors.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

EXECUTE_NON_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a SELECT statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (
   c IN BINARY_INTEGER NOT NULL)
  RETURN BINARY_INTEGER;
```

Parameters

Table 72–18 EXECUTE_NON_QUERY Function Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.

Return Values

The number of rows affected by the SQL statement in the non-Oracle system

Exceptions

Table 72–19 EXECUTE_NON_QUERY Function Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	BIND_VARIABLE procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A NULL value was passed for a NOT NULL parameter.

FETCH_ROW Function

This function fetches rows from a result set. The result set is defined with a SQL SELECT statement. When there are no more rows to be fetched, the exception NO_DATA_FOUND is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

Syntax

```
DBMS_HS_PASSTHROUGH.FETCH_ROW (
   c   IN BINARY_INTEGER NOT NULL,
   f   IN BOOLEAN)
  RETURN BINARY_INTEGER;
```

Parameters

Table 72–20 FETCH_ROW Function Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
first	(Optional) Reexecutes SELECT statement. Possible values: – TRUE: reexecute SELECT statement. – FALSE: fetch the next row, or if run for the first time, then execute and fetch rows (default).

Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

Exceptions

Table 72–21 FETCH_ROW Function Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS
```

GET_VALUE Procedure

This procedure has two purposes:

- It retrieves the select list items of SELECT statements, after a row has been fetched.
- It retrieves the OUT bind values, after the SQL statement has been run.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE (
   c      IN  BINARY_INTEGER NOT NULL,
   p    IN  BINARY_INTEGER NOT NULL,
   v    OUT <dty>);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

> **See Also:** For retrieving values of data type RAW, see GET_VALUE_RAW Procedure on page 72-17.

Parameters

Table 72–22 GET_VALUE Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable or select list item stores its value.

Exceptions

Table 72–23 GET_VALUE Procedure Exceptions

Exception	Description
ORA-1403	Returns NO_DATA_FOUND exception when running the GET_VALUE after the last row was fetched (that is, FETCH_ROW returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS
```

GET_VALUE_RAW Procedure

This procedure is similar to GET_VALUE, but for data type RAW.

Syntax

```
DBMS_HS_PASSTHROUGH.GET_VALUE_RAW (
   c    IN  BINARY_INTEGER NOT NULL,
   p    IN  BINARY_INTEGER NOT NULL,
   v    OUT RAW);
```

Parameters

Table 72–24 GET_VALUE_RAW Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.
p	Position of the bind variable or select list item in the SQL statement: Starts at 1.
v	Variable in which the OUT bind variable or select list item stores its value.

Exceptions

Table 72–25 GET_VALUE_RAW Procedure Exceptions

Exception	Description
ORA-1403	Returns NO_DATA_FOUND exception when running the GET_VALUE after the last row was fetched (that is, FETCH_ROW returned "0").
ORA-28550	The cursor passed is invalid.
ORA-28552	Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)
ORA-28553	The position of the bind variable is out of range.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS
```

OPEN_CURSOR Function

This function opens a cursor for running a passthrough SQL statement at the non-Oracle system. This function must be called for any type of SQL statement.

The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure CLOSE_CURSOR.

Syntax

```
DBMS_HS_PASSTHROUGH.OPEN_CURSOR
  RETURN BINARY_INTEGER;
```

Return Values

The cursor to be used on subsequent procedure and function calls.

Exceptions

Table 72–26 OPEN_CURSOR Function Exceptions

Exception	Description
ORA-28554	Maximum number of open cursor has been exceeded. Increase Heterogeneous Services' OPEN_CURSORS initialization parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

PARSE Procedure

This procedure parses SQL statement at non-Oracle system.

Syntax

```
DBMS_HS_PASSTHROUGH.PARSE (
   c       IN  BINARY_INTEGER NOT NULL,
   stmt    IN  VARCHAR2 NOT NULL);
```

Parameters

Table 72–27 PARSE Procedure Parameters

Parameter	Description
c	Cursor associated with the passthrough SQL statement. Cursor must be opened using function OPEN_CURSOR.
stmt	Statement to be parsed.

Exceptions

Table 72–28 PARSE Procedure Exceptions

Exception	Description
ORA-28550	The cursor passed is invalid.
ORA-28551	SQL statement is illegal.
ORA-28555	A NULL value was passed for a NOT NULL parameter.

Pragmas

```
Purity level defined : WNDS, RNDS
```

73

DBMS_JAVA

The DBMS_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

- Documentation of DBMS_JAVA

Documentation of DBMS_JAVA

For a complete description of this package within the context of DBMS_JAVA, see DBMS_JAVA in the *Oracle Database Java Developer's Guide.*

74

DBMS_IOT

The DBMS_IOT package creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command. DBMS_IOT can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the enable_constraint operation.

DBMS_IOT is not loaded during database installation. To install DBMS_IOT, run dbmsiotc.sql, available in the ADMIN directory.

This chapter contains the following topics:

- Summary of DBMS_IOT Subprograms

> **Note:** With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.

Summary of DBMS_IOT Subprograms

Table 74–1 DBMS_IOT Package Subprograms

Subprogram	Description
BUILD_CHAIN_ROWS_TABLE Procedure on page 74-3	Creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command
BUILD_EXCEPTIONS_TABLE Procedure on page 74-4	Creates an exception table into which rows of an index-organized table that violate a constraint can be placed

BUILD_CHAIN_ROWS_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the ANALYZE command.

Syntax

```
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE (
   owner               IN VARCHAR2,
   iot_name            IN VARCHAR2,
   chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```

Parameters

Table 74–2 BUILD_CHAIN_ROWS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
chainrow_table_name	Intended name for the chained-rows table.

Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

Examples

```
CREATE TABLE l(a char(16),b char(16), c char(16), d char(240),
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS','L','LC');
```

A chained-row table is created with the following columns:

```
Column Name                    Null?    Type
------------------------------ -------- ----
OWNER_NAME                              VARCHAR2(30)
TABLE_NAME                              VARCHAR2(30)
CLUSTER_NAME                            VARCHAR2(30)
PARTITION_NAME                          VARCHAR2(30)
SUBPARTITION_NAME                       VARCHAR2(30)
HEAD_ROWID                              ROWID
TIMESTAMP                               DATE
A                                       CHAR(16)
B                                       CHAR(16)
C                                       CHAR(16)
```

BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates an exception table into which rows of an index-organized table that violate a constraint can be placed during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

Syntax

```
DBMS_IOT.BUILD_EXCEPTIONS_TABLE (
   owner                 IN VARCHAR2,
   iot_name              IN VARCHAR2,
   exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
```

Parameters

Table 74–3 BUILD_EXCEPTIONS_TABLE Procedure Parameters

Parameter	Description
owner	Owner of the index-organized table.
iot_name	Index-organized table name.
exceptions_table_name	Intended name for exception-table.

Usage Notes

You should create a separate exception table for each index-organized table to accommodate its primary key.

Examples

```
EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE('SYS','L','LE');
```

An exception table for the preceding index-organized table with the following columns:

```
Column Name                    Null?    Type
------------------------------ -------- ----
ROW_ID                                  VARCHAR2(30)
OWNER                                   VARCHAR2(30)
TABLE_NAME                              VARCHAR2(30)
CONSTRAINT                              VARCHAR2(30)
A                                       CHAR(16)
B                                       CHAR(16)
C                                       CHAR(16)
```

75

DBMS_JOB

The DBMS_JOB package schedules and manages jobs in the job queue.

> **Note:** The DBMS_JOB package has been superseded by the DBMS_SCHEDULER package. In particular, if you are administering jobs to manage system load, you should consider disabling DBMS_JOB by revoking the package execution privilege for users.
>
> For more information, see Chapter 125, "DBMS_SCHEDULER" and "Moving from DBMS_JOB to DBMS_SCHEDULER" in *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- Using DBMS_JOB
  - Security Model
  - Operational Notes
- Summary of DBMS_JOB Subprograms

Using DBMS_JOB

- Security Model
- Operational Notes

Security Model

No specific system privileges are required to use DBMS_JOB. No system privileges are available to manage DBMS_JOB. Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user or for which the user is explicitly granted EXECUTE. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

Operational Notes

- Working with Oracle Real Application Clusters
- Stopping a Job

Working with Oracle Real Application Clusters

DBMS_JOB supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in Oracle Database 10g Release 1 (10.1) instance binding is not recommended. Service affinity is preferred. This concept is implemented in the DBMS_SCHEDULER package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

DBMS_JOB.SUBMIT

To submit a job to the job queue, use the following syntax:

```
DBMS_JOB.SUBMIT(
   job       OUT    BINARY_INTEGER,
   what      IN     VARCHAR2, NEXT_DATE IN DATE DEFAULTSYSDATE,
   interval  IN     VARCHAR2 DEFAULT 'NULL',
   no_parse  IN     BOOLEAN DEFAULT FALSE,
   instance  IN     BINARY_INTEGER DEFAULT ANY_INSTANCE,
   force     IN     BOOLEAN DEFAULT FALSE);
```

Use the parameters instance and force to control job and instance affinity. The default value of instance is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the instance value. Oracle displays error ORA-23319 if the instance value is a negative number or NULL.

The force parameter defaults to false. If force is TRUE, any positive integer is acceptable as the job instance. If force is FALSE, the specified instance must be running, or Oracle displays error number ORA-23428.

DBMS_JOB.INSTANCE

To assign a particular instance to execute a job, use the following syntax:

```
DBMS_JOB.INSTANCE(  JOB IN BINARY_INTEGER,
  instance                IN BINARY_INTEGER,
  force                   IN BOOLEAN DEFAULT FALSE);
```

The FORCE parameter in this example defaults to FALSE. If the instance value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of force. If the INSTANCE value is positive and the FORCE parameter is FALSE, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the force parameter is TRUE, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the instance value is negative or NULL.

DBMS_JOB.CHANGE

To alter user-definable parameters associated with a job, use the following syntax:

```
DBMS_JOB.CHANGE(  JOB IN BINARY_INTEGER,
```

```
   what                 IN VARCHAR2 DEFAULT NULL,
next_date             IN DATE DEFAULT NULL,
interval              IN VARCHAR2 DEFAULT NULL,
instance              IN BINARY_INTEGER DEFAULT NULL,
force                 IN BOOLEAN DEFAULT FALSE );
```

Two parameters, `instance` and `force`, appear in this example. The default value of `instance` is `null` indicating that job affinity will not change.

The default value of `force` is `FALSE`. Oracle displays error `ORA-23428` if the specified instance is not running and error `ORA-23319` if the `instance` number is negative.

DBMS_JOB.RUN

The `force` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If `force` is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If force is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if force is `FALSE` and the connected instance is the incorrect instance.

```
DBMS_JOB.RUN(
   job    IN BINARY_INTEGER,
   force  IN BOOLEAN DEFAULT FALSE);
```

Stopping a Job

Note that, once a job is started and running, there is no easy way to stop the job.

Summary of DBMS_JOB Subprograms

Table 75–1 DBMS_JOB Package Subprograms

Subprogram	Description
BROKEN Procedure on page 75-7	Disables job execution
CHANGE Procedure on page 75-8	Alters any of the user-definable parameters associated with a job
INSTANCE Procedure on page 75-9	Assigns a job to be run by a instance
INTERVAL Procedure on page 75-10	Alters the interval between executions for a specified job
NEXT_DATE Procedure on page 75-11	Alters the next execution time for a specified job
REMOVE Procedure on page 75-12	Removes specified job from the job queue
RUN Procedure on page 75-13	Forces a specified job to run
SUBMIT Procedure on page 75-14	Submits a new job to the job queue
USER_EXPORT Procedures on page 75-16	Re-creates a given job for export, or re-creates a given job for export with instance affinity
WHAT Procedure on page 75-17	Alters the job description for a specified job

BROKEN Procedure

This procedure sets the broken flag. Broken jobs are never run.

Syntax

```
DBMS_JOB.BROKEN (
   job       IN  BINARY_INTEGER,
   broken    IN  BOOLEAN,
   next_date IN  DATE DEFAULT SYSDATE);
```

Parameters

Table 75–2 BROKEN Procedure Parameters

Parameter	Description
job	Number of the job being run.
broken	Job broken: IN value is FALSE.
next_date	Date of the next refresh.

> **Note:** If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

Syntax

```
DBMS_JOB.CHANGE (
   job       IN  BINARY_INTEGER,
   what      IN  VARCHAR2,
   next_date IN  DATE,
   interval  IN  VARCHAR2,
   instance  IN  BINARY_INTEGER DEFAULT NULL,
   force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 75–3 CHANGE Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`what`	PL/SQL procedure to run.
`next_date`	Date of the next refresh.
`interval`	Date function; evaluated immediately before the job starts running.
`instance`	When a job is submitted, specifies which instance can run the job. This defaults to `NULL`, which indicates that instance affinity is not changed.
`force`	If this is `FALSE`, then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception. If this is `TRUE`, then any positive integer is acceptable as the job instance.

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.
- If the parameters `what`, `next_date`, or `interval` are `NULL`, then leave that value as it is.

Example

```
BEGIN
   DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
   COMMIT;
END;
```

INSTANCE Procedure

This procedure changes job instance affinity.

Syntax

```
DBMS_JOB.INSTANCE (
   job        IN BINARY_INTEGER,
   instance   IN BINARY_INTEGER,
   force      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 75–4 INSTANCE Procedure Parameters

Parameter	Description
job	Number of the job being run.
instance	When a job is submitted, a user can specify which instance can run the job.
force	If this is TRUE, then any positive integer is acceptable as the job instance. If this is FALSE (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

INTERVAL Procedure

This procedure changes how often a job runs.

Syntax

```
DBMS_JOB.INTERVAL (
   job       IN  BINARY_INTEGER,
   interval  IN  VARCHAR2);
```

Parameters

Table 75–5 INTERVAL Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`interval`	Date function, evaluated immediately before the job starts running.

Usage Notes

- If the job completes successfully, then this new date is placed in `next_date`. `interval` is evaluated by plugging it into the statement select `interval` into `next_date` from dual;
- The `interval` parameter must evaluate to a time in the future. Legal intervals include:

Interval	Description
`'sysdate + 7'`	Run once a week.
`'next_day(sysdate,''TUESDAY'')'`	Run once every Tuesday.
`'null'`	Run only once.

- If `interval` evaluates to `NULL` and if a job completes successfully, then the job is automatically deleted from the queue.
- You must issue a `COMMIT` statement immediately after the statement.

NEXT_DATE Procedure

This procedure changes when an existing job next runs.

Syntax

```
DBMS_JOB.NEXT_DATE (
   job       IN  BINARY_INTEGER,
   next_date IN  DATE);
```

Parameters

Table 75–6 NEXT_DATE Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`next_date`	Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it.

Usage Notes

You must issue a `COMMIT` statement immediately after the statement.

REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

Syntax

```
DBMS_JOB.REMOVE (
   job       IN  BINARY_INTEGER );
```

Parameters

Table 75–7 REMOVE Procedure Parameters

Parameter	Description
job	Number of the job being run.

Usage Notes

You must issue a COMMIT statement immediately after the statement.

Example

```
BEGIN
   DBMS_JOB.REMOVE(14144);
   COMMIT;
END;
```

RUN Procedure

This procedure runs job JOB now. It runs it even if it is broken.

Running the job recomputes next_date. See view user_jobs.

Syntax

```
DBMS_JOB.RUN (
   job       IN  BINARY_INTEGER,
   force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 75–8 RUN Procedure Parameters

Parameter	Description
job	Number of the job being run.
force	If this is TRUE, then instance affinity is irrelevant for running jobs in the foreground process. If this is FALSE, then the job can be run in the foreground only in the specified instance.

Example

```
EXECUTE DBMS_JOB.RUN(14144);
```

Caution: This re-initializes the current session's packages.

Exceptions

An exception is raised if force is FALSE, and if the connected instance is the wrong one.

SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence `sys.jobseq`.

Syntax

```
DBMS_JOB.SUBMIT (
   job       OUT BINARY_INTEGER,
   what      IN  VARCHAR2,
   next_date IN  DATE DEFAULT sysdate,
   interval  IN  VARCHAR2 DEFAULT 'null',
   no_parse  IN  BOOLEAN DEFAULT FALSE,
   instance  IN  BINARY_INTEGER DEFAULT any_instance,
   force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 75–9 SUBMIT Procedure Parameters

Parameter	Description
`job`	Number of the job being run.
`what`	PL/SQL procedure to run.
`next_date`	Next date when the job will be run.
`interval`	Date function that calculates the next time to run the job. The default is `NULL`. This must evaluate to a either a future point in time or `NULL`.
`no_parse`	A flag. The default is `FALSE`. If this is set to `FALSE`, then Oracle parses the procedure associated with the job. If this is set to `TRUE`, then Oracle parses the procedure associated with the job the first time that the job is run. For example, if you want to submit a job before you have created the tables associated with the job, then set this to `TRUE`.
`instance`	When a job is submitted, specifies which instance can run the job.
`force`	If this is `TRUE`, then any positive integer is acceptable as the job instance. If this is `FALSE` (the default), then the specified instance must be running; otherwise the routine raises an exception.

Usage Notes

- You must issue a `COMMIT` statement immediately after the statement.
- The parameters `instance` and `force` are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

Example

This submits a new job to the job queue. The job calls the procedure `DBMS_DDL.ANALYZE_OBJECT` to generate optimizer statistics for the table `DQUON.ACCOUNTS`. The statistics are based on a sample of half the rows of the `ACCOUNTS` table. The job is run every 24 hours:

```
VARIABLE jobno number;
BEGIN
```

```
   DBMS_JOB.SUBMIT(:jobno,
      'dbms_ddl.analyze_object(''TABLE'',
      ''DQUON'', ''ACCOUNTS'',
      ''ESTIMATE'', NULL, 50);'
      SYSDATE, 'SYSDATE + 1');
   COMMIT;
END;
/
Statement processed.
print jobno
JOBNO
----------
14144
```

USER_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (8*i* and after) and preserves the compatibility.

Syntax

```
DBMS_JOB.USER_EXPORT (
   job    IN     BINARY_INTEGER,
   mycall IN OUT VARCHAR2);

DBMS_JOB.USER_EXPORT (
   job      IN     BINARY_INTEGER,
   mycall   IN OUT VARCHAR2,
   myinst   IN OUT VARCHAR2);
```

Parameters

Table 75–10 USER_EXPORT Procedure Parameter

Parameter	Description
`job`	Number of the job being run.
`mycall`	Text of a call to re-create the given job.
`myinst`	Text of a call to alter instance affinity.

WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

Syntax

```
DBMS_JOB.WHAT (
   job       IN  BINARY_INTEGER,
   what      IN  VARCHAR2);
```

Parameters

Table 75–11 WHAT Procedure Parameters

Parameter	Description
job	Number of the job being run.
what	PL/SQL procedure to run.

Usage Notes

- You must issue a COMMIT statement immediately after the statement.
- Some legal values of what (assuming the routines exist) are:
  - 'myproc(''10-JAN-82'', next_date, broken);'
  - 'scott.emppackage.give_raise(''JENKINS'', 30000.00);'
  - 'dbms_job.remove(job);'

76

DBMS_LDAP

The DBMS_LDAP package lets you access data from LDAP servers.

- Documentation of DBMS_LDAP

Documentation of DBMS_LDAP

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP` in the *Oracle Fusion Middleware Application Developer's Guide for Oracle Identity Management*.

77

DBMS_LDAP_UTL

The DBMS_LDAP_UTL package contains the Oracle Extension utility functions.

- Documentation of DBMS_LDAP_UTL

Documentation of DBMS_LDAP_UTL

For a complete description of this package within the context of Oracle Internet Directory, see `DBMS_LDAP_UTL` in the *Oracle Internet Directory Application Developer's Guide.*

78

DBMS_LIBCACHE

The DBMS_LIBCACHE package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

- Using DBMS_LIBCACHE
  - Overview
  - Security Model
- Summary of DBMS_LIBCACHE Subprograms

Using DBMS_LIBCACHE

- Overview
- Security Model

Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package `DBMS_LIBCACHE` for `SELECT` statements. The open and parse functions are executed in advance for PL/SQL and DML. For PL/SQL, executing the parse phase has the effect of loading all library cache heaps other than the `MCODE`.

Security Model

To execute DBMS_LIBCACHE you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, DBMS_LIBCACHE should be called for each.

Alternatively, DBMS_LIBCACHE may be called with the generic user PARSER. However, this user cannot parse the SQL that uses objects with access granted though roles. This is a standard PL/SQL security limitation.

Summary of DBMS_LIBCACHE Subprograms

Table 78–1 DBMS_LIBCACHE Package Subprograms

Subprogram	Description
COMPILE_FROM_REMOTE Procedure on page 78-6	Extracts SQL in batch from the source instance and compiles the SQL at the target instance

COMPILE_FROM_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

Syntax

```
DBMS_LIBCACHE.COMPILE_FROM_REMOTE (
   p_db_link                IN     dbms_libcache$def.db_link%type,
   p_username               IN     VARCHAR2 default null,
   p_threshold_executions   IN     NATURAL  default 3,
   p_threshold_sharable_mem IN     NATURAL  default 1000,
   p_parallel_degree        IN     NATURAL  default 1);
```

Parameters

Table 78–2 COMPILE_FROM_REMOTE Procedure Parameters

Parameter	Description
p_db_link	Database link to the source name (mandatory). The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role SELECT_ON_CATALOG at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with dbms_libcache$def.ACCESS_METHOD = DB_LINK_METHOD
p_instance_name	(Reserved for future use). The name of the instance that will be used for extracting the SQL statements. The instance name must be unique for all instances excluding the local instance. The name is not case sensitive.
p_username	Source username (default is all users). The name of the username that will be used for extracting the SQL statements. The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single user_id, for example APPS, APPS is the parsing user_id that is recorded in the shared pool. To select only SQL statements parsed by APPS, enter the string 'APPS' in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example GL. If the username is supplied, it must be valid. The name is not case sensitive.
p_threshold_executions	The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted.

Table 78–2 (Cont.) COMPILE_FROM_REMOTE Procedure Parameters

Parameter	Description
p_threshold_sharable_mem	The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes.
p_parallel_degree	The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented.

79

DBMS_LOB

The DBMS_LOB package provides subprograms to operate on BLOBs, CLOBs, NCLOBs, BFILEs, and temporary LOBs. You can use DBMS_LOB to access and manipulation specific parts of a LOB or complete LOBs.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

This chapter contains the following topics:

- Using DBMS_LOB
  - Overview
  - Security Model
  - Constants
  - Datatypes
  - Rules and Limits
  - Operational Notes
  - Exceptions
- Summary of DBMS_LOB Subprograms

Using DBMS_LOB

- Overview
- Security Model
- Constants
- Datatypes
- Rules and Limits
- Operational Notes
- Exceptions

Overview

DBMS_LOB can read and modify BLOBs, CLOBs, and NCLOBs; it provides read-only operations for BFILEs. The bulk of the LOB operations are provided by this package.

Security Model

This package must be created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS.

Any DBMS_LOB subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_LOB subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the AUTHID to indicate whether they want definer's rights or invoker's rights. For example:

```
CREATE PROCEDURE proc1 AUTHID DEFINER ...
```

or

```
CREATE PROCEDURE proc1 AUTHID CURRENT_USER ...
```

> **See Also:** For more information on AUTHID and privileges, see *Oracle Database PL/SQL Language Reference*

You can provide secure access to BFILEs using the DIRECTORY feature discussed in BFILENAME function in the *Oracle Database SecureFiles and Large Objects Developer's Guide* and the *Oracle Database SQL Language Reference*.

For information about the security model pertaining to temporary LOBs, see Operational Notes.

Constants

The DBMS_LOB package uses the constants shown in following tables:

- Table 79–1, " DBMS_LOB Constants - Basic"
- Table 79–2, " DBMS_LOB Constants - Option Types"
- Table 79–3, " DBMS_LOB Constants - Option Values"
- Table 79–4, " DBMS_LOB Constants - DBFS State Value Types"
- Table 79–5, " DBMS_LOB Constants - DBFS Cache Flags"
- Table 79–6, " DBMS_LOB Constants - Maximum 1-Byte ASCII Characters for Contenttype"

Table 79–1 DBMS_LOB Constants - Basic

Constant	Type	Value	Description
CALL	PLS_INTEGER	12	Create the TEMP LOB with call duration
FILE_READONLY	BINARY_INTEGER	0	Open the specified BFILE read-only
LOB_READONLY	BINARY_INTEGER	0	Open the specified LOB read-only
LOB_READWRITE	BINARY_INTEGER	1	Open the specified LOB read-write
LOBMAXSIZE	INTEGER	18446744073709551615	Maximum size of a LOB in bytes
SESSION	PLS_INTEGER	10	Create the TEMP LOB with session duration

Table 79–2 DBMS_LOB Constants - Option Types

Constant	Definition	Value	Description
OPT_COMPRESS	BINARY_INTEGER	1	Set/Get the SECUREFILE compress option value
OPT_DEDUPLICATE	BINARY_INTEGER	4	Set/Get the SECUREFILE Deduplicate option value
OPT_ENCRYPT	BINARY_INTEGER	2	Get the SECUREFILE encrypt option value

Table 79–3 DBMS_LOB Constants - Option Values

Constant	Definition	Value	Description
COMPRESS_OFF	BINARY_INTEGER	0	For SETOPTIONS Procedures, set compress off; for GETOPTIONS Functions, compress is off
COMPRESS_ON	BINARY_INTEGER	1	For SETOPTIONS Procedures, set compress on; for GETOPTIONS Functions, compress is on
DEDUPLICATE_OFF	BINARY_INTEGER	0	For SETOPTIONS Procedures, set deduplicate is off; for GETOPTIONS Functions, deduplicate is off

Table 79–3 (Cont.) DBMS_LOB Constants - Option Values

Constant	Definition	Value	Description
DEDUPLICATE_ON	BINARY_INTEGER	4	For SETOPTIONS Procedures, set deduplicate is on; for GETOPTIONS Functions, deduplicate is on
ENCRYPT_OFF	BINARY_INTEGER	0	For GETOPTIONS Functions, encrypt is off
ENCRYPT_ON	BINARY_INTEGER	2	For GETOPTIONS Functions, encrypt is on

Table 79–4 DBMS_LOB Constants - DBFS State Value Types

Constant	Definition	Value	Description
DBFS_LINK_NEVER	PLS_INTEGER	0	LOB has never been archived
DBFS_LINK_NO	PLS_INTEGER	2	LOB was archived, but as been read back in to the RDBMS
DBFS_LINK_YES	PLS_INTEGER	1	LOB is currently archived

Table 79–5 DBMS_LOB Constants - DBFS Cache Flags

Constant	Definition	Value	Description
DBFS_LINK_CACHE	PLS_INTEGER	1	Put the LOB data to the archive, but keep the data in the RDBMS as a cached version
DBFS_LINK_ NOCACHE	PLS_INTEGER	0	Put the LOB data to the archive, and remove the data from the RDBMS.

Table 79–6 DBMS_LOB Constants - Maximum 1-Byte ASCII Characters for Contenttype

Constant	Definition	Value	Description
CONTENTTYPE_ MAX_SIZE	PLS_INTEGER	128	Maximum number of bytes allowed in the content type string

Datatypes

The DBMS_LOB package uses the datatypes shown in Table 79–7.

Table 79–7 Datatypes Used by DBMS_LOB

Type	Description
BLOB	Source or destination binary LOB.
RAW	Source or destination RAW buffer (used with BLOB).
CLOB	Source or destination character LOB (including NCLOB).
VARCHAR2	Source or destination character buffer (used with CLOB and NCLOB).
INTEGER	Specifies the size of a buffer or LOB, the offset into a LOB, or the amount to access.
BFILE	Large, binary object stored outside the database.

The DBMS_LOB package defines no special types.

An NCLOB is a CLOB for holding fixed-width and varying-width, multibyte national character sets.

The clause ANY_CS in the specification of DBMS_LOB subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.

Rules and Limits

- General Rules and Limits
- Rules and Limits Specific to External Files (BFILEs)
- Maximum LOB Size
- Maximum Buffer Size

General Rules and Limits

- The following rules apply in the specification of subprograms in this package:
  - `length`, `offset`, and `amount` parameters for subprograms operating on `BLOB`s and `BFILE`s must be specified in terms of *bytes*.
  - `length`, `offset`, and `amount` parameters for subprograms operating on `CLOB`s must be specified in terms of *characters*.
- A subprogram raises an `INVALID_ARGVAL` exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
  1. Only positive, absolute offsets from the beginning of `LOB` data are permitted: Negative offsets from the tail of the `LOB` are not permitted.
  2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as `amount`, `offset`, `newlen`, `nth`, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
  3. The value of `offset`, `amount`, `newlen`, `nth` must not exceed the value `lobmaxsize` 18446744073709551615 (2^{64}) in any `DBMS_LOB` subprogram.
  4. For `CLOB`s consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed (`lobmaxsize/character_width_in_bytes`) characters .

     For example, if the `CLOB` consists of 2-byte characters, such as:

     ```
     JA16SJISFIXED
     ```

     Then, the maximum `amount` value should not exceed:

     ```
     18446744073709551615/2 = 9223372036854775807
     ```
- PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for `RAW` and `VARCHAR2` parameters used in `DBMS_LOB` subprograms. For example, if you declare a variable to be:

  ```
  charbuf VARCHAR2(3000)
  ```

  Then, `charbuf` can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for `DBMS_LOB` subprograms for `CLOB`s and `NCLOB`s.
- The `%CHARSET` clause indicates that the form of the parameter with `%CHARSET` must match the form of the `ANY_CS` parameter to which it refers.

  For example, in `DBMS_LOB` subprograms that take a `VARCHAR2` buffer parameter, the form of the `VARCHAR2` buffer must match the form of the `CLOB` parameter. If the input `LOB` parameter is of type `NCLOB`, then the buffer must contain `NCHAR`

data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For DBMS_LOB subprograms that take two CLOB parameters, both CLOB parameters must have the same form; that is, they must both be NCLOBs, or they must both be CLOBs.

- If the value of amount plus the offset exceeds the maximum LOB size allowed by the database, then access exceptions are raised.

  Under these input conditions, read subprograms, such as READ, COMPARE, INSTR, and SUBSTR, read until End of Lob/File is reached. For example, for a READ operation on a BLOB or BFILE, if the user specifies offset value of 3 GB and an amount value of 2 GB on a LOB that is 4GB in size, then READ returns only 1GB (4GB-3GB) bytes.

- Functions with NULL or invalid input values for parameters return a NULL. Procedures with NULL values for destination LOB parameters raise exceptions.
- Operations involving patterns as parameters, such as COMPARE, INSTR, and SUBSTR do not support regular expressions or special matching characters (such as % in the LIKE operator in SQL) in the pattern parameter or substrings.
- The End Of LOB condition is indicated by the READ procedure using a NO_DATA_FOUND exception. This exception is raised only upon an attempt by the user to read beyond the end of the LOB. The READ buffer for the last read contains 0 bytes.
- For consistent LOB updates, you must lock the row containing the destination LOB before making a call to any of the procedures (mutators) that modify LOB data.
- Unless otherwise stated, the default value for an offset parameter is 1, which indicates the first byte in the BLOB or BFILE data, and the first character in the CLOB or NCLOB value. No default values are specified for the amount parameter — you must input the values explicitly.
- You must lock the row containing the destination internal LOB before calling any subprograms that modify the LOB, such as APPEND, COPY, ERASE, TRIM, or WRITE. These subprograms do not implicitly lock the row containing the LOB.

Rules and Limits Specific to External Files (BFILEs)

- The subprograms COMPARE, INSTR, READ, SUBSTR, FILECLOSE, FILECLOSEALL and LOADFROMFILE operate only on an *opened* BFILE locator; that is, a successful FILEOPEN call must precede a call to any of these subprograms.
- For the functions FILEEXISTS, FILEGETNAME and GETLENGTH, a file's open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the DIRECTORY object and the file.
- DBMS_LOB does not support any concurrency control mechanism for BFILE operations.
- In the event of several open files in the session whose closure has not been handled properly, you can use the FILECLOSEALL subprogram to close all files opened in the session and resume file operations from the beginning.
- If you are the creator of a DIRECTORY, or if you have system privileges, then use the CREATE OR REPLACE, DROP, and REVOKE statements in SQL with extreme caution.

  If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to

invoke a program or anonymous block that calls FILECLOSEALL, reopen your files, and restart your file operations.

- All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after *both* normal and abnormal termination of operations on the BFILE.

  In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than SESSION_MAX_OPEN_FILES.

  In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the BFILE variable in its most current state.

  After the exception transfers program control outside the PL/SQL program block, all references to the open BFILEs are lost. The result is a larger open file count which may or may not exceed the SESSION_MAX_OPEN_FILES value.

  For example, consider a READ operation past the end of the BFILE value, which generates a NO_DATA_FOUND exception:

```
-- This assumes a directory 'DDD' whose path is already known
DECLARE
       fil BFILE:= bfilename('DDD', 'filename.foo');
       pos INTEGER;
       amt BINARY_INTEGER;
       buf RAW(40);
BEGIN
       SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
       dbms_lob.open(fil, dbms_lob.lob_readonly);
       amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
       dbms_lob.read(fil, amt, pos, buf);
       dbms_output.put_line('Read F1 past EOF: '||
           utl_raw.cast_to_varchar2(buf));
       dbms_lob.close(fil);
END;

ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10
```

  After the exception has occurred, the BFILE locator variable file goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

```
DECLARE
     fil BFILE;
     pos INTEGER;
     amt BINARY_INTEGER;
     buf RAW(40);
BEGIN
     SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
     dbms_lob.open(fil, dbms_lob.lob_readonly);
     amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
     dbms_lob.read(fil, amt, pos, buf);
     dbms_output.put_line('Read F1 past EOF: '||
          utl_raw.cast_to_varchar2(buf));
     dbms_lob.close(fil);
     exception
```

```
      WHEN no_data_found
      THEN
        BEGIN
          dbms_output.put_line('End of File reached. Closing file');
          dbms_lob.fileclose(fil);
          -- or dbms_lob.filecloseall if appropriate
        END;
END;
     /

Statement processed.
End of File reached. Closing file
```

In general, you should ensure that files opened in a PL/SQL block using `DBMS_LOB` are closed before normal or abnormal termination of the block.

Maximum LOB Size

The maximum size for LOBs supported by the database is equal to the value of the blocksize of the tablespace the LOB column resides in times the value 2^{32}-1 (4294967295). This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

Maximum Buffer Size

The maximum buffer size, 32767 bytes, is represented by `maxbufsize`.

Operational Notes

All DBMS_LOB subprograms work based on LOB locators. For the successful completion of DBMS_LOB subprograms, you must provide an input locator that represents a LOB that already exists in the database tablespaces or external file system. See also Chapter 1 of *Oracle Database SecureFiles and Large Objects Developer's Guide.*

To use LOBs in your database, you must first use SQL data definition language (DDL) to define the tables that contain LOB columns.

- Internal LOBs
- External LOBs
- Temporary LOBs

Internal LOBs

To populate your table with internal LOBs after LOB columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the LOB columns.

External LOBs

For an external LOB (BFILE) to be represented by a LOB locator, you must:

- Ensure that a DIRECTORY object representing a valid, existing physical directory has been defined, and that physical files (the LOBs you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the DIRECTORY object and the filename of the external LOB you are adding to the BFILENAME function to create a LOB locator for your external LOB.

Once you have completed these tasks, you can insert or update a row containing a LOB column using the specified LOB locator.

After the LOBs are defined and created, you can then SELECT from a LOB locator into a local PL/SQL LOB variable and use this variable as an input parameter to DBMS_LOB for access to the LOB value.

For details on the different ways to do this, you must refer to the section of the *Oracle Database SecureFiles and Large Objects Developer's Guide* that describes "Accessing External LOBs (BFILEs)."

Temporary LOBs

The database supports the definition, creation, deletion, access, and update of temporary LOBs. Your temporary tablespace stores the temporary LOB data. Temporary LOBs are not permanently stored in the database. Their purpose is mainly to perform transformations on LOB data.

For temporary LOBs, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary LOBs can be either BLOBs, CLOBs, or NCLOBs.

A temporary LOB is empty when it is created. By default, all temporary LOBs are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary LOBs are deleted, and the space for temporary LOBs is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as CACHE/ NOCACHE. There is a default store for every session into which temporary LOBs are placed if you don't specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and rollbacks are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-REF semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB data. The PL/SQL DBMS_LOB package, PRO*C/C++, OCI, and other programmatic interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.

Temporary LOBs do not support the EMPTY_BLOB or EMPTY_CLOB functions that are supported for permanent LOBs. The EMPTY_BLOB function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the DBMS_LOB package by using the appropriate FREETEMPORARY or OCIDurationEnd statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and DBMS_LOB statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or DBMS_LOB COPY command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user's session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user's own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else's data.

The database keeps track of temporary LOBs for each session in a v$ view called V$TEMPORARY_LOBS, which contains information about how many temporary LOBs exist for each session. V$ views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using V$TEMPORARY_LOBS in conjunction with DBA_SEGMENTS, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in DBMS_LOB return NULL if any of the input parameters are NULL. All procedures in DBMS_LOB raise an exception if the LOB locator is input as NULL.
2. Operations based on CLOBs do not verify if the character set IDs of the parameters (CLOB parameters, VARCHAR2 buffers and patterns, and so on) match. It is the user's responsibility to ensure this.
3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.

> **See Also:** *Oracle Database PL/SQL Language Reference* for more information on NOCOPY syntax

Exceptions

Table 79–8 DBMS_LOB Exceptions

Exception	Code	Description
ACCESS_ERROR	22925	You are trying to write too much data to the LOB: LOB size is limited to 4 gigabytes.
BUFFERING_ENABLED	22279	Cannot perform operation with LOB buffering enabled
CONTENTTYPE_TOOLONG	43859	The length of the contenttype string exceeds the defined maximum. Modify the length of the contenttype string and retry the operation.
CONTENTTYPEBUF_WRONG	43862	The length of the contenttype buffer is less than defined constant. Modify the length of the contenttype buffer and retry the operation.
INVALID_ARGVAL	21560	The argument is expecting a non-NULL, valid value but the argument value passed in is NULL, invalid, or out of range.
INVALID_DIRECTORY	22287	The directory used for the current operation is not valid if being accessed for the first time, or if it has been modified by the DBA since the last access.
NO_DATA_FOUND	1403	ENDOFLOB indicator for looping read operations. This is not a hard error.
NOEXIST_DIRECTORY	22285	The directory leading to the file does not exist.
NOPRIV_DIRECTORY	22286	The user does not have the necessary access privileges on the directory or the file for the operation.
OPEN_TOOMANY	22290	The number of open files has reached the maximum limit.
OPERATION_FAILED	22288	The operation attempted on the file failed.
QUERY_WRITE	14553	Cannot perform a LOB write inside a query or PDML slave
SECUREFILE_BADLOB	43856	A non-SECUREFILE LOB type was used in a SECUREFILE only call
SECUREFILE_BADPARAM	43857	An invalid argument was passed to a SECUREFILE subprogram
SECUREFILE_MARKERASED	43861	The mark provided to a FRAGMENT_* operation has been deleted
SECUREFILE_OUTOFBOUNDS	43883	Attempted to perform a FRAGMENT_* operation past the LOB end
UNOPENED_FILE	22289	The file is not open for the required operation to be performed.
VALUE_ERROR	6502	PL/SQL error for invalid values to subprogram's parameters.

Summary of DBMS_LOB Subprograms

Table 79–9 DBMS_LOB Package Subprograms

Subprogram	Description
APPEND Procedures on page 79-19	Appends the contents of the source LOB to the destination LOB
COPY_DBFS_LINK Procedures on page 79-32	Copies the DBFS link in the source LOB to the destination LOB
COPY_FROM_DBFS_LINK on page 79-31	Retrieves the data for the LOB from the DBFS store
CLOSE Procedure on page 79-20	Closes a previously opened internal or external LOB
COMPARE Functions on page 79-21	Compares two entire LOBs or parts of two LOBs
CONVERTTOBLOB Procedure on page 79-23	Reads character data from a source CLOB or NCLOB instance, converts the character data to the specified character, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets
CONVERTTOCLOB Procedure on page 79-26	Takes a source BLOB instance, converts the binary data in the source instance to character data using the specified character, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets
COPY Procedures on page 79-29	Copies all, or part, of the source LOB to the destination LOB
CREATETEMPORARY Procedures on page 79-33	Creates a temporary BLOB or CLOB and its corresponding index in the user's default temporary tablespace
ERASE Procedures on page 79-34	Erases all or part of a LOB
FILECLOSE Procedure on page 79-36	Closes the file
FILECLOSEALL Procedure on page 79-37	Closes all previously opened files
FILEEXISTS Function on page 79-38	Checks if the file exists on the server
FILEGETNAME Procedure on page 79-39	Gets the directory object name and file name
FILEISOPEN Function on page 79-40	Checks if the file was opened using the input BFILE locators
FILEOPEN Procedure on page 79-41	Opens a file
FRAGMENT_DELETE Procedure on page 79-42	Deletes the data at the specified offset for the specified length from the LOB
FRAGMENT_INSERT Procedures on page 79-43	Inserts the specified data (limited to 32K) into the LOB at the specified offset
FRAGMENT_MOVE Procedure on page 79-44	Moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the specified offset to the new offset specified

Table 79–9 (Cont.) DBMS_LOB Package Subprograms

Subprogram	Description
FRAGMENT_REPLACE Procedures on page 79-45	Replaces the data at the specified offset with the specified data (not to exceed 32k)
FREETEMPORARY Procedures on page 79-47	Frees the temporary `BLOB` or `CLOB` in the default temporary tablespace
GET_DBFS_LINK Functions on page 79-48	Returns the DBFS Link path associated with the specified SecureFile
GET_DBFS_LINK_STATE Procedures on page 79-49	Retrieves the current DBFS Link state of the specified SecureFile
GETCHUNKSIZE Functions on page 79-52	Returns the amount of space used in the `LOB` chunk to store the `LOB` value
GETCONTENTTYPE Functions on page 79-50	Returns the content ID string previously set by means of the SETCONTENTTYPE Procedure
GETLENGTH Functions on page 79-53	Gets the length of the LOB value
GETOPTIONS Functions on page 79-54	Obtains settings corresponding to the `option_type` field for a particular `LOB`
GET_STORAGE_LIMIT Function on page 79-51	Returns the storage limit for LOBs in your database configuration
INSTR Functions on page 79-55	Returns the matching position of the *nth* occurrence of the pattern in the `LOB`
ISOPEN Functions on page 79-57	Checks to see if the `LOB` was already opened using the input locator
ISTEMPORARY Functions on page 79-58	Checks if the locator is pointing to a temporary `LOB`
LOADBLOBFROMFILE Procedure on page 79-59	Loads `BFILE` data into an internal `BLOB`
LOADCLOBFROMFILE Procedure on page 79-61	Loads `BFILE` data into an internal `CLOB`
LOADFROMFILE Procedure on page 79-65	Loads `BFILE` data into an internal `LOB`
MOVE_TO_DBFS_LINK Procedures on page 79-67	Writes the specified SecureFile data to the DBFS store
OPEN Procedures on page 79-68	Opens a `LOB` (internal, external, or temporary) in the indicated mode
READ Procedures on page 79-70	Reads data from the `LOB` starting at the specified offset
SET_DBFS_LINK Procedures on page 79-72	Links the specified SecureFile to the specified path name. It does not copy the data to the path
SETCONTENTTYPE Procedure on page 79-73	Sets the content type string for the data in the LOB
SETOPTIONS Procedures on page 79-74	Enables CSCE features on a per-LOB basis, overriding the default LOB column settings
SUBSTR Functions on page 79-75	Returns part of the `LOB` value starting at the specified offset
TRIM Procedures on page 79-77	Trims the `LOB` value to the specified shorter length

Table 79–9 (Cont.) DBMS_LOB Package Subprograms

Subprogram	Description
WRITE Procedures on page 79-79	Writes data to the `LOB` from a specified offset
WRITEAPPEND Procedures on page 79-81	Writes a buffer to the end of a `LOB`

APPEND Procedures

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

Syntax

```
DBMS_LOB.APPEND (
   dest_lob IN OUT  NOCOPY BLOB,
   src_lob  IN             BLOB);

DBMS_LOB.APPEND (
   dest_lob IN OUT  NOCOPY CLOB  CHARACTER SET ANY_CS,
   src_lob  IN             CLOB  CHARACTER SET dest_lob%CHARSET);
```

Parameters

Table 79–10 APPEND Procedure Parameters

Parameter	Description
dest_lob	Locator for the internal LOB to which the data is to be appended.
src_lob	Locator for the internal LOB from which the data is to be read.

Exceptions

Table 79–11 APPEND Procedure Exceptions

Exception	Description
VALUE_ERROR	Either the source or the destination LOB is NULL.
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

  If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- If APPEND is called on a LOB that has been archived, it implicitly gets the LOB before the first byte is written

  See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

Syntax

```
DBMS_LOB.CLOSE (
   lob_loc    IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE (
   lob_loc    IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE (
   file_loc   IN OUT NOCOPY BFILE);
```

Parameters

Table 79–12 CLOSE Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Exceptions

No error is returned if the BFILE exists but is not opened. An error is returned if the LOB is not open.

Usage Notes

CLOSE requires a round-trip to the server for both internal and external LOBs. For internal LOBs, CLOSE triggers other code that relies on the close call, and for external LOBs (BFILEs), CLOSE actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

COMPARE Functions

This function compares two entire LOBs or parts of two LOBs.

Syntax

```
DBMS_LOB.COMPARE (
   lob_1            IN BLOB,
   lob_2            IN BLOB,
   amount           IN INTEGER := DBMS_LOB.LOBMAXSIZE,
   offset_1         IN INTEGER := 1,
   offset_2         IN INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.COMPARE (
   lob_1            IN CLOB  CHARACTER SET ANY_CS,
   lob_2            IN CLOB  CHARACTER SET lob_1%CHARSET,
   amount           IN INTEGER := DBMS_LOB.LOBMAXSIZE,
   offset_1         IN INTEGER := 1,
   offset_2         IN INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.COMPARE (
   lob_1            IN BFILE,
   lob_2            IN BFILE,
   amount           IN INTEGER,
   offset_1         IN INTEGER := 1,
   offset_2         IN INTEGER := 1)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 79–13 COMPARE Function Parameters

Parameter	Description
lob_1	LOB locator of first target for comparison.
lob_2	LOB locator of second target for comparison.
amount	Number of bytes (for BLOBs) or characters (for CLOBs/NCLOBSs) to compare.
offset_1	Offset in bytes or characters on the first LOB (origin: 1) for the comparison.
offset_2	Offset in bytes or characters on the second LOB (origin: 1) for the comparison.

Return Values

- INTEGER: Zero if the comparison succeeds, nonzero if not.
- NULL, if
  - amount < 1
  - amount > LOBMAXSIZE

- offset_1 or offset_2 < 1
  - offset_1 or offset_2 > LOBMAXSIZE

Usage Notes

- You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.
- COMPARE returns zero if the data exactly matches over the range specified by the offset and amount parameters. Otherwise, a nonzero INTEGER is returned.
- For fixed-width *n*-byte CLOBs, if the input amount for COMPARE is specified to be greater than (DBMS_LOB.LOBMAXSIZE/*n*), then COMPARE matches characters in a range of size (DBMS_LOB.LOBMAXSIZE/*n*), or Max(length(clob1), length(clob2)), whichever is lesser.
- If COMPARE is called on any LOB that has been archived, it implicitly gets the LOB before the compare begins.

Exceptions

Table 79–14 COMPARE Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

CONVERTTOBLOB Procedure

This procedure reads character data from a source CLOB or NCLOB instance, converts the character data to the character set you specify, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOBLOB(
  dest_lob       IN OUT     NOCOPY  BLOB,
  src_clob       IN         CLOB CHARACTER SET ANY_CS,
  amount         IN         INTEGER,
  dest_offset    IN OUT     INTEGER,
  src_offset     IN OUT     INTEGER,
  blob_csid      IN         NUMBER,
  lang_context   IN OUT     INTEGER,
  warning        OUT        INTEGER);
```

Parameters

Table 79–15 CONVERTTOBLOB Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of characters to convert from the source LOB. If you want to copy the entire LOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the LOB.
dest_offset	(IN) Offset in bytes in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in bytes after the end of the write.
src_offset	(IN) Offset in characters in the source LOB for the start of the read. (OUT) Offset in characters in the source LOB right after the end of the read.
blob_csid	Desired character set ID of the converted data.
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 79–15 (Cont.) CONVERTTOBLOB Procedure Parameters

Parameter	Description
warning	(OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertible_char in the DBMS_LOB package.

Usage Notes

Preconditions

Before calling the CONVERTTOBLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

Constants and Defaults

All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 79–16 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the dbmslob.sql package specification file.

Table 79–16 DBMS_LOB.CONVERTTOBLOB Typical Values

Parameter	Value	Description
amount	LOBMAXSIZE (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
blob_csid	DEFAULT_CSID (IN)	default CSID, use same CSID as source LOB
lang_context	DEFAULT_LANG_CTX (IN)	default language context
warning	NO_WARNING (OUT)	no warning message, success
	WARN_INCONVERTIBLE_CHAR (OUT)	character in source cannot be properly converted

General Notes

- You must specify the desired character set for the destination LOB in the blob_csid parameter. You can pass a zero value for blob_csid. When you do so, the database assumes that the desired character set is the same as the source LOB character set.

- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The amount and src_offset values are in characters and the dest_offset is in bytes. To convert the entire LOB, you can specify LOBMAXSIZE for the amount parameter.
- CONVERTTOBLOB gets the source and/or destination LOBs as necessary prior to conversion and write of the data.

Exceptions

Table 79–17 gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

Table 79–17 CONVERTTOBLOB Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	One or more of the following: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

CONVERTTOCLOB Procedure

This procedure takes a source BLOB instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets. You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```
DBMS_LOB.CONVERTTOCLOB(
   dest_lob       IN OUT NOCOPY  CLOB CHARACTER SET ANY_CS,
   src_blob       IN             BLOB,
   amount         IN             INTEGER,
   dest_offset    IN OUT         INTEGER,
   src_offset     IN OUT         INTEGER,
   blob_csid      IN             NUMBER,
   lang_context   IN OUT         INTEGER,
   warning        OUT            INTEGER);
```

Parameters

Table 79–18 CONVERTTOCLOB Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the destination LOB instance.
src_blob	LOB locator of the source LOB instance.
amount	Number of bytes to convert from the source LOB. If you want to copy the entire BLOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the BLOB.
dest_offset	(IN) Offset in characters in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in characters after the end of the write. This offset always points to the beginning of the first complete character after the end of the write.
src_offset	(IN) Offset in bytes in the source LOB for the start of the read. (OUT) Offset in bytes in the source LOB right after the end of the read.
blob_csid	The character set ID of the source data
lang_context	(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.

Table 79–18 (Cont.) CONVERTTOCLOB Procedure Parameters

Parameter	Description
warning	Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertible_char in the DBMS_LOB package.

Usage Notes

Preconditions

Before calling the CONVERTTOCLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the CONVERTTOCLOB procedure. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

Constants and Defaults

All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 79–19 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the dbmslob.sql package specification file.

Table 79–19 DBMS_LOB.CONVERTTOCLOB Typical Values

Parameter	Value	Description
amount	LOBMAXSIZE (IN)	convert the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	DEFAULT_CSID (IN)	default CSID, use destination CSID
lang_context	DEFAULT_LANG_CTX (IN)	default language context
warning	NO_WARNING (OUT)	no warning message, success
	WARN_INCONVERTIBLE_CHAR (OUT)	character in source cannot be properly converted

General Notes

- You must specify the desired character set for the destination LOB in the blob_csid parameter. You can pass a zero value for blob_csid. When you do so, the database assumes that the desired character set is the same as the source LOB character set.

- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source `LOB`. The `amount` and `src_offset` values are in characters and the `dest_offset` is in bytes. To convert the entire `LOB`, you can specify `LOBMAXSIZE` for the `amount` parameter.
- `CONVERTTOCLOB` gets the source and/or destination `LOB`s as necessary prior to conversion and write of the data.

Exceptions

Table 79–20 CONVERTTOCLOB Procedure Exceptions

Exception	Description
`VALUE_ERROR`	Any of the input parameters are `NULL` or `INVALID`.
`INVALID_ARGVAL`	One or more of the following: - `src_offset` or `dest_offset` < 1. - `src_offset` or `dest_offset` > `LOBMAXSIZE`. - `amount` < 1. - `amount` > `LOBMAXSIZE`.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

COPY Procedures

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

Syntax

```
DBMS_LOB.COPY (
  dest_lob    IN OUT NOCOPY BLOB,
  src_lob     IN            BLOB,
  amount      IN            INTEGER,
  dest_offset IN            INTEGER := 1,
  src_offset  IN            INTEGER := 1);

DBMS_LOB.COPY (
  dest_lob    IN OUT NOCOPY CLOB  CHARACTER SET ANY_CS,
  src_lob     IN            CLOB  CHARACTER SET dest_lob%CHARSET,
  amount      IN            INTEGER,
  dest_offset IN            INTEGER := 1,
  src_offset  IN            INTEGER := 1);
```

Parameters

Table 79–21 COPY Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the copy target.
src_lob	LOB locator of source for the copy.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to copy.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy.
src_offset	Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy.

Exceptions

Table 79–22 COPY Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or invalid.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1 - src_offset or dest_offset > LOBMAXSIZE - amount < 1 - amount > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB

Usage Notes

- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the src_offset to the end of the source LOB.
- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- Prior to copy, the source and destination LOBs are gotten, if they are currently archived. For a complete over-write, the destination LOB is not be retrieved.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

COPY_FROM_DBFS_LINK

This procedure reads the archived data from the DBFS store and writes it back into the LOB.

Syntax

```
DBMS_LOB.COPY_FROM_DBFS_LINK (
  lob_loc       IN OUT BLOB);

DBMS_LOB.COPY_FROM_DBFS_LINK (
  lob_loc       IN OUT CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 79–23 COPY_FROM_DBFS_LINK Procedure Parameters

Parameter	Description
lob_loc	LOB to be retrieved from the archive

Exceptions

Table 79–24 COPY_FROM_DBFS_LINK Procedure Exceptions

Exception	Description
SECUREFILE_ BADLOB	lob_loc is not a SECUREFILE
ORA-01555	If the LOB has already been retrieved and has been modified since retrieval, if the LOB has been migrated in and out (modified or not) since the locator was retrieved

COPY_DBFS_LINK Procedures

This procedure copies the DBFS link in the source LOB to the destination LOB.

Syntax

```
DBMS_LOB.COPY_DBFS_LINK (
  lob_loc_dst    IN OUT BLOB,
  lob_loc_src    IN     BLOB,
  flags          IN     PLS_INTEGER DEFAULT COPY_ARCHIVE_REF);

DBMS_LOB.COPY_DBFS_LINK (
  lob_loc_dst    IN OUT CLOB CHARACTER SET ANY_CS,
  lob_loc_src    IN     CLOB CHARACTER SET ANY_CS,
  flags          IN     PLS_INTEGER DEFAULT COPY_ARCHIVE_REF);
```

Parameters

Table 79–25 COPY_DBFS_LINK Procedure Parameters

Parameter	Description
lob_loc_dst	LOB to be made to reference the same storage data as lob_loc_src
lob_loc_src	LOB to copy the reference from
flags	Options to COPY_DBFS_LINK: ■ ARCHIVE_COPY_REF specifies to only copy the archival reference ■ ARCHIVE_COPY_CACHE specifies to copy the archival reference and read the archival data into the RDBMS LOB specified by lob_loc_dst so that the data is cached

Exceptions

Table 79–26 COPY_DBFS_LINK Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	Either lob_loc_src or lob_loc_dst is not a SECUREFILE
INVALID_ARGVAL	lob_loc_src LOB has not been archived
ORA-01555	If the source LOB has been retrieved, never archived, or if the LOB has been migrated in and out (modified or not) since the locator was gotten.

CREATETEMPORARY Procedures

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

Syntax

```
DBMS_LOB.CREATETEMPORARY (
   lob_loc IN OUT NOCOPY BLOB,
   cache   IN            BOOLEAN,
   dur     IN            PLS_INTEGER := DBMS_LOB.SESSION);

DBMS_LOB.CREATETEMPORARY (
   lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   cache   IN            BOOLEAN,
   dur     IN            PLS_INTEGER := 10);
```

Parameters

Table 79–27 CREATETEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
cache	Specifies if LOB should be read into buffer cache or not.
dur	1 of 3 predefined duration values (SESSION, TRANSACTION, or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session, transaction or call. If dur is omitted, then the session duration is used.

See Also:

- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure
- *Oracle Database PL/SQL Language Reference* for more information about NOCOPY and passing temporary lobs as parameters

ERASE Procedures

This procedure erases an entire internal LOB or part of an internal LOB.

Syntax

```
DBMS_LOB.ERASE (
   lob_loc           IN OUT   NOCOPY   BLOB,
   amount            IN OUT   NOCOPY   INTEGER,
   offset            IN                INTEGER := 1);

DBMS_LOB.ERASE (
   lob_loc           IN OUT   NOCOPY   CLOB CHARACTER SET ANY_CS,
   amount            IN OUT   NOCOPY   INTEGER,
   offset            IN                INTEGER := 1);
```

Parameters

Table 79–28 ERASE Procedure Parameters

Parameter	Description
lob_loc	Locator for the LOB to be erased.For more information, see Operational Notes.
amount	Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased.
offset	Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs).

Usage Notes

- When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.
- The actual number of bytes or characters erased can differ from the number you specified in the amount parameter if the end of the LOB value is reached before erasing the specified number. The actual number of characters or bytes erased is returned in the amount parameter.
- ERASE gets the LOB if it is archived, unless the erase covers the entire LOB.

> **Note:** The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the "TRIM Procedures" on page 79-77.

Exceptions

Table 79–29 ERASE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any input parameter is NULL.
INVALID_ARGVAL	Either: - amount < 1 or amount > LOBMAXSIZE - offset < 1 or offset > LOBMAXSIZE

Table 79–29 (Cont.) ERASE Procedure Exceptions

Exception	Description
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- "TRIM Procedures" on page 79-77
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILECLOSE Procedure

This procedure closes a BFILE that has already been opened through the input locator.

Note: The database has only read-only access to BFILEs. This means that BFILEs cannot be written through the database.

Syntax

```
DBMS_LOB.FILECLOSE (
    file_loc IN OUT NOCOPY BFILE);
```

Parameters

Table 79–30 FILECLOSE Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE to be closed.

Exceptions

Table 79–31 FILECLOSE Procedure Exceptions

Exception	Description
VALUE_ERROR	NULL input value for file_loc.
UNOPENED_FILE	File was not opened with the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- "FILEOPEN Procedure" on page 79-41
- "FILECLOSEALL Procedure" on page 79-37
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILECLOSEALL Procedure

This procedure closes all `BFILEs` opened in the session.

Syntax

```
DBMS_LOB.FILECLOSEALL;
```

Exceptions

Table 79–32 FILECLOSEALL Procedure Exception

Exception	Description
`UNOPENED_FILE`	No file has been opened in the session.

See Also:

- "FILEOPEN Procedure" on page 79-41
- "FILECLOSE Procedure" on page 79-36
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEEXISTS Function

This function finds out if a specified BFILE locator points to a file that actually exists on the server's file system.

Syntax

```
DBMS_LOB.FILEEXISTS (
   file_loc     IN    BFILE)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 79–33 FILEEXISTS Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

Table 79–34 FILEEXISTS Function Return Values

Return	Description
0	Physical file does not exist.
1	Physical file exists.

Exceptions

Table 79–35 FILEEXISTS Function Exceptions

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- "FILEISOPEN Function" on page 79-40.
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEGETNAME Procedure

This procedure determines the directory object and filename, given a BFILE locator. This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the dir_alias buffer is 30, and for the entire path name, it is 2000.

Syntax

```
DBMS_LOB.FILEGETNAME (
   file_loc   IN    BFILE,
   dir_alias  OUT   VARCHAR2,
   filename   OUT   VARCHAR2);
```

Parameters

Table 79–36 FILEGETNAME Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE
dir_alias	Directory object name
filename	Name of the BFILE

Exceptions

Table 79–37 FILEGETNAME Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	dir_alias or filename are NULL.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEISOPEN Function

This function finds out whether a BFILE was opened with the specified FILE locator.

Syntax

```
DBMS_LOB.FILEISOPEN (
   file_loc   IN    BFILE)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(fileisopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 79–38 FILEISOPEN Function Parameter

Parameter	Description
file_loc	Locator for the BFILE.

Return Values

INTEGER: 0 = file is not open, 1 = file is open

Usage Notes

If the input FILE locator was never passed to the FILEOPEN procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

Exceptions

Table 79–39 FILEISOPEN Function Exceptions

Exception	Description
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.

See Also:

- "FILEEXISTS Function" on page 79-38
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FILEOPEN Procedure

This procedure opens a BFILE for read-only access. BFILE data may not be written through the database.

Syntax

```
DBMS_LOB.FILEOPEN (
   file_loc   IN OUT NOCOPY  BFILE,
   open_mode  IN             BINARY_INTEGER := file_readonly);
```

Parameters

Table 79–40 FILEOPEN Procedure Parameters

Parameter	Description
file_loc	Locator for the BFILE.
open_mode	File access is read-only.

Exceptions

Table 79–41 FILEOPEN Procedure Exceptions

Exception	Description
VALUE_ERROR	file_loc or open_mode is NULL.
INVALID_ARGVAL	open_mode is not equal to FILE_READONLY.
OPEN_TOOMANY	Number of open files in the session exceeds session_max_open_files.
NOEXIST_DIRECTORY	Directory associated with file_loc does not exist.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.

See Also:

- "FILECLOSE Procedure" on page 79-36
- "FILECLOSEALL Procedure" on page 79-37
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

FRAGMENT_DELETE Procedure

This procedure deletes the data at the specified offset for the specified length from the LOB without having to rewrite all the data in the LOB following the specified offset.

Syntax

```
DBMS_LOB.FRAGMENT_DELETE (
   lob_loc     IN OUT NOCOPY BLOB,
   amount      IN            INTEGER,
   offset      IN            INTEGER);

DBMS_LOB.FRAGMENT_DELETE (
   lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   amount      IN            INTEGER,
   offset      IN            INTEGER);
```

Parameters

Table 79–42 FRAGMENT_DELETE Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be removed from the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the deletion

Exceptions

Table 79–43 FRAGMENT_DELETE Procedure Exceptions

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

FRAGMENT_INSERT Procedures

This procedure inserts the specified data (limited to 32K) into the LOB at the specified offset.

Syntax

```
DBMS_LOB.FRAGMENT_INSERT (
   lob_loc     IN OUT NOCOPY BLOB,
   amount      IN            INTEGER,
   offset      IN            INTEGER,
   buffer      IN            RAW);

DBMS_LOB.FRAGMENT_INSERT (
   lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   amount      IN            INTEGER,
   offset      IN            INTEGER,
   buffer      IN            VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 79–44 FRAGMENT_INSERT Procedure Parameters

Parameter	Description
lob_loc	LOB locator.For more information, see Operational Notes.
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be inserted into the LOB
offset	Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the insertion
buffer	Data to insert into the LOB

Exceptions

Table 79–45 FRAGMENT_INSERT Procedure Exceptions

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

Usage Notes

FRAGMENT_INSERT gets the LOB, if necessary, before performing operations on the LOB.

FRAGMENT_MOVE Procedure

This procedure moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the specified offset to the new offset specified.

Syntax

```
DBMS_LOB.FRAGMENT_MOVE (
   lob_loc       IN OUT NOCOPY BLOB,
   amount        IN            INTEGER,
   src_offset    IN            INTEGER,
   dest_offset   IN            INTEGER);

DBMS_LOB.FRAGMENT_MOVE (
   lob_loc       IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   amount        IN            INTEGER,
   src_offset    IN            INTEGER,
   dest_offset   IN            INTEGER);
```

Parameters

Table 79–46 FRAGMENT_MOVE Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be moved in the LOB
src_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
dest_offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to remove the data

Exceptions

Table 79–47 FRAGMENT_MOVE Procedure Exceptions

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

Usage Notes

- All offsets are pre-move offsets.
- Offsets of more than 1 past the end of the LOB are not permitted.
- FRAGMENT_MOVE gets the LOB, if necessary, before performing operations on the LOB.

FRAGMENT_REPLACE Procedures

This procedure replaces the data at the specified offset with the specified data (not to exceed 32k).

Syntax

```
DBMS_LOB.FRAGMENT_REPLACE (
   lob_loc     IN OUT NOCOPY BLOB,
   old_amount  IN            INTEGER,
   new_amount  IN            INTEGER,
   offset      IN            INTEGER,
   buffer      IN            RAW);

DBMS_LOB.FRAGMENT_REPLACE (
   lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   old_amount  IN           INTEGER,
   new_amount  IN           INTEGER,
   offset      IN           INTEGER,
   buffer      IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 79–48 FRAGMENT_REPLACE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
old_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to be replaced in the LOB
new_amount	Number of bytes (BLOB) or characters (CLOB/NCLOB) to written to the LOB
offset	Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data
buffer	Data to insert into the LOB

Exceptions

Table 79–49 FRAGMENT_REPLACE Procedure Exceptions

Exception	Description
INVALID_ARGVAL	A parameter value was invalid
QUERY_WRITE	Cannot perform operation during a query
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled
SECUREFILE_BADLOB	A non-SECUREFILE LOB was used in a SECUREFILE LOB only call
SECUREFILE_OUTOFBOUNDS	Attempted to perform a FRAGMENT_* operation past LOB end

Usage Notes

- Invoking this procedure is equivalent to deleting the old amount of bytes/characters at offset and then inserting the new amount of bytes/characters at offset.

- FRAGMENT_REPLACE gets the LOB, if necessary, before performing operations on the LOB.

FREETEMPORARY Procedures

This procedure frees the temporary BLOB or CLOB in the default temporary tablespace.

Syntax

```
DBMS_LOB.FREETEMPORARY (
   lob_loc  IN OUT  NOCOPY BLOB);

DBMS_LOB.FREETEMPORARY (
   lob_loc  IN OUT  NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 79–50 FREETEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator.For more information, see Operational Notes.

Usage Notes

- When a new temporary LOB is created, and there is currently no temporary LOB in use with the same duration (session, transaction, call), a new temporary LOB segment is created. When the temporary LOB is freed, the space it consumed is released to the temporary segment. If there are no other temporary LOBs for the same duration, the temporary segment is also freed.
- After the call to FREETEMPORARY, the LOB locator that was freed is marked as invalid.
- If an invalid LOB locator is assigned to another LOB locator using OCILobLocatorAssign in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

GET_DBFS_LINK Functions

This function returns the DBFS Link path associated with the specified SecureFile.

Syntax

```
DBMS_LOB.GET_DBFS_LINK (
  lob_loc        IN  BLOB)
 RETURN   RAW(1024);

DBMS_LOB.GET_DBFS_LINK (
  lob_loc        IN CLOB CHARACTER SET ANY_CS)
 RETURN RAW(1024);
```

Parameters

Table 79–51 GET_DBFS_LINK Function Parameters

Parameter	Description
lob_loc	LOB for which to get the reference value

Return Values

The Archive ID

Exceptions

Table 79–52 GET_DBFS_LINK Function Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE
ORA-01555	If the LOB has already been retrieved and has been modified since retrieval, if the LOB has been migrated in and out (modified or not) since the locator was retrieved

GET_DBFS_LINK_STATE Procedures

This procedure retrieves the current DBFS Link state of the specified SecureFile.

Syntax

```
DBMS_LOB.GET_DBFS_LINK_STATE (
  lob_loc       IN BLOB,
  content_id    OUT RAW(1024),
  state         OUT NUMBER,
  cached        OUT BOOLEAN);

DBMS_LOB.GET_DBFS_LINK_STATE (
  lob_loc       IN CLOB CHARACTER SET ANY_CS,
  content_id    OUT RAW(1024),
  state         OUT NUMBER,
  cached        OUT BOOLEAN);
```

Parameters

Table 79–53 GET_DBFS_LINK_STATE Procedure Parameters

Parameter	Description
lob_loc	LOB to be retrieved from the archive
content_id	Unique identifier specific to the RDBMS
state	One of DBFS_LINK_NEVER, DBFS_LINK_NO or DBFS_LINK_YES
cached	If the LOB is archived and the data was specified to be cashed on put

Exceptions

Table 79–54 GET_DBFS_LINK_STATE Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

Usage Notes

- If the LOB has never been archived, state is set to DBMS_LOB.DBFS_LINK_NEVER. If the LOB has been archived, state is set to DBMS_LOB.DBFS_LINK_YES. If the LOB has been previously retrieved from the archive, state is set to DBFS_LINK_NO.
