`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 141–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 141–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 245, "Logical Change Record TYPEs"

Table 141–4 (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

See Also:

- "Operational Notes" on page 141-8 and "Propagation Rules for LCRs" on page 141-10 for more information about the rules created by this procedure
- "Propagation User" on page 141-5

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_GLOBAL_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database. See "Capture Process Rules for Changes in the Redo Log" on page 141-9 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying all logical change records (LCRs) in a queue. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 141-11 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing all persistent LCRs from a queue. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 141-12 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2  DEFAULT NULL,
   queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml         IN   BOOLEAN   DEFAULT TRUE,
   include_ddl         IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
   source_database     IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name       OUT  VARCHAR2,
   ddl_rule_name       OUT  VARCHAR2,
   inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
   and_condition       IN   VARCHAR2  DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
   streams_type        IN   VARCHAR2,
```

```
  streams_name        IN   VARCHAR2  DEFAULT NULL,
  queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
  include_dml         IN   BOOLEAN   DEFAULT TRUE,
  include_ddl         IN   BOOLEAN   DEFAULT FALSE,
  include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
  source_database     IN   VARCHAR2  DEFAULT NULL,
  inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
  and_condition       IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 141–5 ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name.
queue_name	The name of the local queue, specified as [*schema_name.*]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.

Table 141–5 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.

Table 141–5 (Cont.) ADD_GLOBAL_RULES Procedure Parameters

Parameter	Description
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 245, "Logical Change Record TYPEs"

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

Examples

The following is an example of a global rule condition created for DML changes:

```
(:dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_MESSAGE_PROPAGATION_RULE Procedure

This procedure adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
   message_type            IN   VARCHAR2,
   rule_condition          IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   rule_name               OUT  VARCHAR2,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
   message_type            IN   VARCHAR2,
   rule_condition          IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 141–6 ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
`message_type`	The type of the message. The type can be an Oracle built-in type, such as `VARCHAR2` or `NUMBER`, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as `[`*`schema_name`*`.]`*`type_name`*. If the schema is not specified, then the current user is the default. For example, to specify `VARCHAR2`, enter `VARCHAR2(`*`n`*`)`, where *`n`* is the size specification. To specify a type named `usr_msg` in the `strmadmin` schema, enter `strmadmin.usr_msg` for this parameter. The following data types require a size specification: `VARCHAR2`, `NVARCHAR2`, and `RAW`. **See Also:** *Oracle Database SQL Language Reference* for more information about data types
`rule_condition`	The rule condition for this message type. The rule variable name specified in the rule condition must be the following: `:msg` **See Also:** "Examples" on page 141-38

Table 141–6 (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name*.]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name*.]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
rule_name	Contains the rule name

Table 141–6 (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ▪ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ▪ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ▪ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

- "Operational Notes" on page 141-8 and "Propagation Rules for User Messages" on page 141-11 for more information about the rules created by this procedure
- "Propagation User" on page 141-5

Examples

Suppose the message type is VARCHAR2(128). Given this type, the following rule condition can be specified:

```
':msg = ''HQ'''
```

This rule condition evaluates to TRUE if a user message of type VARCHAR2(128) has HQ for its value.

Suppose the message type is usr_msg, and that this type has the following attributes: source_dbname, owner, name, and message. Given this type, the following rule condition can be specified:

```
':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND  ' ||
':msg.name = ''EMPLOYEES'''
```

This rule condition evaluates to `TRUE` if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

Note: The quotation marks in the preceding examples are all single quotation marks.

ADD_MESSAGE_RULE Procedure

This procedure adds a message rule to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `apply`, this procedure adds an apply process rule for dequeuing user messages of a specific message type from a queue. See "Apply Process Rules for User Messages" on page 141-12 for more information about such rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds a messaging client rule for dequeuing user messages of a specific message type from a queue. See "Messaging Client Rules for User Messages" on page 141-13 for more information about such rules.

This procedure also creates the specified Oracle Streams client if it does not exist.

This procedure is overloaded. One version of this procedure contains the `OUT` parameter `rule_name`, and the other does not.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
   message_type    IN   VARCHAR2,
   rule_condition  IN   VARCHAR2,
   streams_type    IN   VARCHAR2,
   streams_name    IN   VARCHAR2  DEFAULT NULL,
   queue_name      IN   VARCHAR2  DEFAULT 'streams_queue',
   inclusion_rule  IN   BOOLEAN   DEFAULT TRUE,
   rule_name       OUT  VARCHAR2);

DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
   message_type    IN   VARCHAR2,
   rule_condition  IN   VARCHAR2,
   streams_type    IN   VARCHAR2,
   streams_name    IN   VARCHAR2  DEFAULT NULL,
   queue_name      IN   VARCHAR2  DEFAULT 'streams_queue',
   inclusion_rule  IN   BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 141–7 ADD_MESSAGE_RULE Procedure Parameters

Parameter	Description
message_type	The type of the message. The type can be an Oracle built-in type, such as VARCHAR2 or NUMBER, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as [*schema_name*.]*type_name*. If the schema is not specified, then the current user is the default. For example, to specify VARCHAR2, enter VARCHAR2(*n*), where *n* is the size specification. To specify a type named usr_msg in the strmadmin schema, enter strmadmin.usr_msg for this parameter. The following data types require a size specification: VARCHAR2, NVARCHAR2, and RAW. **See Also:** *Oracle Database SQL Language Reference* for more information about data types
rule_condition	The rule condition for this message type. The rule variable name specified in the rule condition must be the following: :msg **See Also:** "Examples" on page 141-42
streams_type	The type of message consumer, either apply for apply process or dequeue for messaging client
streams_name	The name of the Oracle Streams apply process or messaging client. If the specified streams_type is apply, then specify the name of the apply process. Do not specify an owner. If the specified apply process does not exist, then the procedure creates it automatically with a system-generated name. If the specified streams_type is dequeue, then specify the messaging client. For example, if the user strmadmin is the messaging client, then specify strmadmin. If NULL and a relevant apply process or messaging client for the queue exists, then the procedure uses the relevant apply process or messaging client. If NULL and multiple relevant apply processes or messaging clients for the queue exist, then the procedure raises an error. If NULL and no Oracle Streams client of the specified streams_type exists for the queue, then the procedure creates an apply process or messaging client automatically with a system-generated name. An apply process and a messaging client cannot have the same name.
queue_name	The name of the local queue from which messages will be dequeued, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the apply process or messaging client. If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the apply process or messaging client. In either case, the system creates the rule set if it does not exist.
rule_name	Contains the rule name

Usage Notes

If an apply process rule is added, then this procedure creates the apply process if it does not exist. An apply process created by this procedure can apply only user messages, and dequeued messages are sent to the message handler for the apply process. If a messaging client rule is added, then this procedure creates a messaging client if it does not exist.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

- "Operational Notes" on page 141-8
- "Security Model" on page 141-5
- ALTER_APPLY Procedure on page 20-9 for more information about setting a message handler for an apply process

Examples

Suppose the message type is `VARCHAR2(128)`. Given this type, the following rule condition can be specified:

```
':msg = ''HQ'''
```

This rule condition evaluates to `TRUE` if a user message of type `VARCHAR2(128)` has `HQ` for its value.

Suppose the message type is `usr_msg`, and that this type has the following attributes: `source_dbname`, `owner`, `name`, and `message`. Given this type, the following rule condition can be specified:

```
':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND  ' ||
':msg.name = ''EMPLOYEES'''
```

This rule condition evaluates to `TRUE` if a user message of type `usr_msg` has `DBS1.NET` for its `source_dbname` attribute, `HR` for its `owner` attribute, and `EMPLOYEES` for its `name` attribute.

Note: The quotation marks in the preceding examples are all single quotation marks.

ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
   schema_name             IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 141–8 ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema. For example, `hr`.
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 141–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 141–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 245, "Logical Change Record TYPEs"

Table 141–8 (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure Parameters

Parameter	Description
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

See Also:

- "Operational Notes" on page 141-8 and "Propagation Rules for LCRs" on page 141-10 for more information about the rules created by this procedure
- "Propagation User" on page 141-5

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SCHEMA_RULES Procedure

This procedures adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified schema. See "Capture Process Rules for Changes in the Redo Log" on page 141-9 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 141-11 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 141-12 for more information about these rules.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Caution: If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
   schema_name          IN   VARCHAR2,
   streams_type         IN   VARCHAR2,
   streams_name         IN   VARCHAR2  DEFAULT NULL,
   queue_name           IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml          IN   BOOLEAN   DEFAULT TRUE,
   include_ddl          IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr   IN   BOOLEAN   DEFAULT FALSE,
   source_database      IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name        OUT  VARCHAR2,
   ddl_rule_name        OUT  VARCHAR2,
   inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
   and_condition        IN   VARCHAR2  DEFAULT NULL);
```

```
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
   schema_name         IN   VARCHAR2,
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2  DEFAULT NULL,
   queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
   include_dml         IN   BOOLEAN   DEFAULT TRUE,
   include_ddl         IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
   source_database     IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
   and_condition       IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 141–9 ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
schema_name	The name of the schema. For example, hr. You can specify a schema that does not yet exist, because Oracle Streams does not validate the existence of the schema.
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name.

Table 141–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 141–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. In either case, the system creates the rule set if it does not exist.

Table 141–9 (Cont.) ADD_SCHEMA_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the schema rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 245, "Logical Change Record TYPEs"

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.

Examples

The following is an example of a schema rule condition created for DML changes:

```
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y'
and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_SUBSET_PROPAGATION_RULES Procedure

This procedures adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   insert_rule_name          OUT  VARCHAR2,
   update_rule_name          OUT  VARCHAR2,
   delete_rule_name          OUT  VARCHAR2,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
   table_name                IN   VARCHAR2,
   dml_condition             IN   VARCHAR2,
   streams_name              IN   VARCHAR2  DEFAULT NULL,
   source_queue_name         IN   VARCHAR2,
   destination_queue_name    IN   VARCHAR2,
   include_tagged_lcr        IN   BOOLEAN   DEFAULT FALSE,
   source_database           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue            IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 141–10 ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the propagation. Also, the specified table cannot have any LOB, `LONG`, `LONG RAW`, or `XMLType` columns currently or in the future.
`dml_condition`	The subset condition. Specify this condition similar to the way you specify conditions in a `WHERE` clause in SQL. For example, to specify rows in the `hr.employees` table where the `salary` is greater than `4000` and the `job_id` is `SA_MAN`, enter the following as the condition: `' salary > 4000 and job_id = ''SA_MAN'' '` **Note:** The quotation marks in the preceding example are all single quotation marks.

Table 141–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
streams_name	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_tagged_lcr	If TRUE, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. This setting is appropriate for a full (for example, standby) copy of a database. If FALSE, then an LCR is considered for propagation only when the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.

Table 141–10 (Cont.) ADD_SUBSET_PROPAGATION_RULES Procedure Parameters

Parameter	Description
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts, as well as updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes, as well as updates that must be converted into deletes
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

See Also:

- "Operational Notes" on page 141-8 and "Propagation Rules for LCRs" on page 141-10 for more information about the rules created by this procedure
- "Propagation User" on page 141-5

Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is region_id = 2, the table_name is hr.regions, and the source_database is dbs1.net:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

ADD_SUBSET_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table. See "Capture Process Rules for Changes in the Redo Log" on page 141-9 for more information about these rules.
- When the `streams_type` parameter is set to `sync_capture`, this procedure adds rules for capturing changes to a subset of rows in a specified table. See "Synchronous Capture Rules for DML Changes to Tables" on page 141-10 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 141-11 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 141-12 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
   table_name          IN   VARCHAR2,
   dml_condition       IN   VARCHAR2,
   streams_type        IN   VARCHAR2 DEFAULT 'apply',
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
   source_database     IN   VARCHAR2 DEFAULT NULL,
   insert_rule_name    OUT  VARCHAR2,
   update_rule_name    OUT  VARCHAR2,
   delete_rule_name    OUT  VARCHAR2);

DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
   table_name          IN   VARCHAR2,
   dml_condition       IN   VARCHAR2,
   streams_type        IN   VARCHAR2 DEFAULT 'apply',
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
```

```
   source_database     IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 141–11 ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified table must exist in the same database as the capture process, synchronous capture, apply process, or messaging client. Also, the specified table cannot have any LOB, LONG, LONG RAW, or XMLType columns currently or in the future.
dml_condition	The subset condition. Specify this condition similar to the way you specify conditions in a WHERE clause in SQL. For example, to specify rows in the hr.employees table where the salary is greater than 4000 and the job_id is SA_MAN, enter the following as the condition: ' salary > 4000 and job_id = ''SA_MAN'' ' **Note:** The quotation marks in the preceding example are all single quotation marks.
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify sync_capture for a synchronous capture. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name.

Table 141–11 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
include_tagged_lcr	If TRUE, then the Oracle Streams client performs its action regardless of the tag: ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. ■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag. ■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag. If FALSE, then an Oracle Streams client performs its action only when the tag is NULL: ■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. ■ A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag. ■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 141–11 (Cont.) ADD_SUBSET_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For synchronous capture rules, specify the name of the local database. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
insert_rule_name	Contains the system-generated INSERT rule name. This rule handles inserts, as well as updates that must be converted into inserts.
update_rule_name	Contains the system-generated UPDATE rule name. This rule handles updates that remain updates.
delete_rule_name	Contains the system-generated DELETE rule name. This rule handles deletes, as well as updates that must be converted into deletes

Usage Notes

Running this procedure generates three rules for the specified capture process, synchronous capture, apply process, or messaging client: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only DML changes that satisfy the condition specified for the dml_condition parameter are captured, applied, or dequeued. For UPDATE statements, the following variations are possible:

- If both the new and old values in a DML change satisfy the specified dml_condition, then the DML change is captured, applied, or dequeued without any changes.
- If neither the new or old values in a DML change satisfy the specified dml_condition, then the DML change is not captured, applied, or dequeued.
- If the old values for a DML change satisfy the specified dml_condition, but the new values do not, then the DML change is converted into a delete.
- If the new values for a DML change satisfy the specified dml_condition, but the old values do not, then the DML change is converted to an insert.

When an update is converted into an insert or a delete, it is called row migration.

A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering. If the Oracle Streams client does not have a positive rule set, then this procedure creates a positive rule set automatically, and adds the rules for the table to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing rule set for the process are not affected. Additional rules can be added using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package.

Rules for `INSERT`, `UPDATE`, and `DELETE` statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The `ADD_SUBSET_RULES` procedure is overloaded, and the system-generated rule names for `INSERT`, `UPDATE`, and `DELETE` statements are returned.

Attention: Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

See Also:

- "Operational Notes" on page 141-8
- "Security Model" on page 141-5

Examples

The following is an example of a rule condition created for filtering DML changes containing an update operation when the `dml_condition` is `region_id = 2`, the `table_name` is `hr.regions`, and the `source_database` is `dbs1.net`:

```
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

ADD_TABLE_PROPAGATION_RULES Procedure

This procedures adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_TABLE_PROPAGATION_RULES(
   table_name              IN   VARCHAR2,
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 141–12 ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
`table_name`	The name of the table specified as `[`*`schema_name`*`.]`*`table_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`streams_name`	The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If `NULL` and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If `NULL` and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.

Table 141–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
source_queue_name	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the destination queue, including a database link, specified as [*schema_name.*]*queue_name*[*@dblink_name*], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter strmadmin.streams_queue@dbs2.net for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.
include_dml	If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.

Table 141–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
source_database	The global name of the source database. The source database is where the change originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.

Table 141–12 (Cont.) ADD_TABLE_PROPAGATION_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 245, "Logical Change Record TYPEs"
queue_to_queue	If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: ■ If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error. ■ If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error. ■ If NULL, then the procedure does not change the queue to queue property of the propagation. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The

sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A propagation uses the rules for filtering.

See Also:

- "Operational Notes" on page 141-8 and "Propagation Rules for LCRs" on page 141-10 for more information about the rules created by this procedure
- "Security Model" on page 141-5

Examples

The following is an example of a table rule condition created for filtering DML statements:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

ADD_TABLE_RULES Procedure

This procedure adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a specified table. See "Capture Process Rules for Changes in the Redo Log" on page 141-9 for more information about these rules.
- When the `streams_type` parameter is set to `sync_capture`, this procedure adds rules for capturing changes to a specified table. See "Synchronous Capture Rules for DML Changes to Tables" on page 141-10 for more information about these rules.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See "Apply Process Rules for LCRs" on page 141-11 for more information about these rules.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified table. The rules can specify that the LCRs must be from a particular source database. See "Messaging Client Rules for LCRs" on page 141-12 for more information about these rules.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Note: Currently, messaging clients cannot dequeue buffered messages.

Syntax

```
DBMS_STREAMS_ADM.ADD_TABLE_RULES(
   table_name          IN   VARCHAR2,
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
   include_dml         IN   BOOLEAN  DEFAULT TRUE,
   include_ddl         IN   BOOLEAN  DEFAULT FALSE,
   include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
   source_database     IN   VARCHAR2 DEFAULT NULL,
   dml_rule_name       OUT  VARCHAR2,
   ddl_rule_name       OUT  VARCHAR2,
   inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
   and_condition       IN   VARCHAR2  DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_TABLE_RULES(
   table_name          IN   VARCHAR2,
   streams_type        IN   VARCHAR2,
   streams_name        IN   VARCHAR2 DEFAULT NULL,
   queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
```

```
  include_dml          IN   BOOLEAN  DEFAULT TRUE,
  include_ddl          IN   BOOLEAN  DEFAULT FALSE,
  include_tagged_lcr   IN   BOOLEAN  DEFAULT FALSE,
  source_database      IN   VARCHAR2 DEFAULT NULL,
  inclusion_rule       IN   BOOLEAN   DEFAULT TRUE,
  and_condition        IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 141–13 ADD_TABLE_RULES Procedure Parameters

Parameter	Description
table_name	The name of the table specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. You can specify a table that does not yet exist, because Oracle Streams does not validate the existence of the table.
streams_type	The type of Oracle Streams client: ■ Specify capture for a capture process. ■ Specify sync_capture for a synchronous capture. ■ Specify apply for an apply process. ■ Specify dequeue for a messaging client.
streams_name	The name of the capture process, synchronous capture, apply process, or messaging client. Do not specify an owner. If NULL, if streams_type is capture, sync_capture, or dequeue, and if one relevant capture process, synchronous capture, or messaging client for the queue exists, then the procedure uses the relevant Oracle Streams client. If no relevant Oracle Streams client exists for the queue, then the procedure creates an Oracle Streams client automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error. If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways: ■ If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process. ■ If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process. If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name. If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name.

Table 141–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
queue_name	The name of the local queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process or synchronous capture rules, this is the queue into which a capture process or synchronous capture enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.
include_dml	If TRUE, then the procedure creates a DML rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.
include_ddl	If TRUE, then the procedure creates a DDL rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted. The generated rule evaluates to TRUE for any DDL change that operates on the table or on an object that is part of the table, such as an index or trigger on the table. The rule evaluates to FALSE for any DDL change that either does not refer to the table or refers to the table in a subordinate way. For example, the rule evaluates to FALSE for changes that create synonyms or views based on the table. The rule also evaluates to FALSE for a change to a PL/SQL subprogram that refers to the table.

Table 141–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
include_tagged_lcr	If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry, session, or LCR has a non-NULL tag. If the rules are added to the positive rule set for the Oracle Streams client, then the Oracle Streams client performs its action regardless of the tag: ■ A redo entry is always considered for capture by a capture process, regardless of whether the redo entry has a non-NULL tag. ■ A change is always considered for capture by a synchronous capture, regardless of whether the session that makes the change has a non-NULL tag. ■ An LCR is always considered for apply by an apply process or dequeue by a messaging client, regardless of whether redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the Oracle Streams client, then whether a database change is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry, session, or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for an Oracle Streams client, then the Oracle Streams client performs its action only when the tag is NULL: ■ A redo entry is considered for capture by a capture process only when the redo entry contains a NULL tag. ■ A change is considered for capture by a synchronous capture only when the session that makes the change has a NULL tag. ■ An LCR is considered for apply by an apply process or dequeue by a messaging client only if the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the Oracle Streams client, then a database change can be discarded only if it has a NULL tag. A setting of FALSE is often specified in update-anywhere configurations to avoid sending a change back to its source database. In most cases, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Table 141–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For synchronous capture rules, specify the name of the local database. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
dml_rule_name	If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.
ddl_rule_name	If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.
inclusion_rule	If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. A synchronous capture cannot have a negative rule set. Specifying FALSE for a synchronous capture raises an error. In either case, the system creates the rule set if it does not exist.

Table 141–13 (Cont.) ADD_TABLE_RULES Procedure Parameters

Parameter	Description
and_condition	If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: (*system_condition*) AND (*and_condition*) The variable in the specified condition must be :lcr. For example, to specify that the table rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition: :lcr.get_tag() = HEXTORAW(''02'') The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule. Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter. **See Also:** Chapter 245, "Logical Change Record TYPEs"

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. A capture process, synchronous capture, apply process, or messaging client uses the rules for filtering.

See Also:

- "Operational Notes" on page 141-8
- "Security Model" on page 141-5

Examples

The following is an example of a table rule condition created for DML changes:

```
(((:dml.get_object_owner() = 'HR' and :dml.get_object_name() = 'LOCATIONS'))
and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET' )
```

CLEANUP_INSTANTIATION_SETUP Procedure

This procedure removes an Oracle Streams replication configuration that was set up by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures in this package. This procedure either remove the configuration directly, or it can generate a script that removes the configuration.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Attention: When the CLEANUP_INSTANTIATION_SETUP procedure is run, the parameter values must match the parameter values specified when the corresponding PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures were run, except for the values of the following parameters: perform_actions, script_name, and script_directory_object.

See Also:

- "PRE_INSTANTIATION_SETUP Procedure" on page 141-137
- "POST_INSTANTIATION_SETUP Procedure" on page 141-132
- "Procedures That Configure an Oracle Streams Environment" on page 141-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.CLEANUP_INSTANTIATION_SETUP(
   maintain_mode           IN VARCHAR2,
   tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_database         IN VARCHAR2,
   destination_database    IN VARCHAR2,
   perform_actions         IN BOOLEAN   DEFAULT TRUE,
   script_name             IN VARCHAR2  DEFAULT NULL,
   script_directory_object IN VARCHAR2  DEFAULT NULL,
   capture_name            IN VARCHAR2  DEFAULT NULL,
   capture_queue_table     IN VARCHAR2  DEFAULT NULL,
   capture_queue_name      IN VARCHAR2  DEFAULT NULL,
   capture_queue_user      IN VARCHAR2  DEFAULT NULL,
   propagation_name        IN VARCHAR2  DEFAULT NULL,
   apply_name              IN VARCHAR2  DEFAULT NULL,
   apply_queue_table       IN VARCHAR2  DEFAULT NULL,
   apply_queue_name        IN VARCHAR2  DEFAULT NULL,
   apply_queue_user        IN VARCHAR2  DEFAULT NULL,
   bi_directional          IN BOOLEAN   DEFAULT FALSE,
   change_global_name      IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 141–14 CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: ▪ GLOBAL to clean up the Oracle Streams configuration that maintained the entire database in both the source and destination databases ▪ TRANSPORTABLE TABLESPACES to cleanup the Oracle Streams configuration that maintained a set of tablespaces at both the source and destination database
tablespace_names	If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. **See Also:** TABLESPACE_SET Table Type on page 146-8
source_database	The global name of the source database. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. A database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
perform_actions	If TRUE, then this procedure performs the necessary actions to clean up the Oracle Streams configuration directly. If FALSE, then the procedure does not perform the necessary actions to clean up the Oracle Streams configuration directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ▪ script_name ▪ script_directory_object

Table 141–14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to clean up the Oracle Streams configuration. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the statements are appended to the existing file. If non-NULL and the perform_actions parameter is TRUE, then this procedure generates the specified script and performs the actions to clean up the Oracle Streams configuration directly. If NULL and the perform_actions parameter is TRUE, then this procedure directly performs the actions to clean up the Oracle Streams configuration without generating a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then this parameter is ignored, and this procedure does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
capture_name	The name of the capture processes configured to capture changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the capture processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
capture_queue_table	The name of the queue table for each queue used by a capture process, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure automatically identifies the capture queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
capture_queue_name	The name of each queue used by a capture process, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the procedure automatically identifies the capture queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
capture_queue_user	The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the source database. This user is a secure queue user of the queue.

Table 141–14 (Cont.) CLEANUP_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
propagation_name	The name of the propagations configured to propagate changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the propagations with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_name	The name of the apply processes configured to apply changes in the Oracle Streams configuration. Do not specify an owner. If NULL, then the procedure automatically identifies the apply processes with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_queue_table	The name of the queue table for each queue used by an apply process, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure automatically identifies the apply queue tables with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_queue_name	The name of each queue used by an apply process, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the procedure automatically identifies the apply queues with system-generated names created by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures.
apply_queue_user	The name of the user who has ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user is a secure queue user of the queue.
bi_directional	Specify TRUE if the Oracle Streams replication configuration is bi-directional between the database specified in source_database and the database specified in destination_database. Specify FALSE if the Oracle Streams replication configuration is one way replication from the current database to the database specified in destination_database.
change_global_name	If TRUE, then the procedure changes the global name of the database specified in destination_database to match the global name of the current database. If FALSE, then the procedure does not change the global name of the database specified in destination_database.

DELETE_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which deletes a column from a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

- The DELETE_COLUMN procedure supports the same data types supported by Oracle Streams capture processes.
- The DELETE_COLUMN procedure is useful when you want to delete a relatively small number of columns in a row LCR. If you want to delete most of the columns in a row LCR and keep a relatively small number of columns, consider using the KEEP_COLUMNS procedure in this package.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also:

- *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "KEEP_COLUMNS Procedure" on page 141-83

Syntax

```
DBMS_STREAMS_ADM.DELETE_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   value_type    IN  VARCHAR2   DEFAULT '*',
   step_number   IN  NUMBER     DEFAULT 0,
   operation     IN  VARCHAR2   DEFAULT 'ADD');
```

Parameters

Table 141–15 DELETE_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name*.]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.

Table 141–15 (Cont.) DELETE_COLUMN Procedure Parameters

Parameter	Description
table_name	The name of the table from which the column is deleted in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column deleted from each row LCR that satisfies the rule.
value_type	Specify 'NEW' to delete the column from the new values in the row LCR. Specify 'OLD' to delete the column from the old values in the row LCR. Specify '*' to delete the column from both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. See "Usage Notes" on page 141-77 for more information about this parameter.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the delete column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the DELETE_COLUMN procedure when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all delete column transformations for the specified rule.
NULL	NULL	non-NULL	Remove all delete column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all delete column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all delete column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all delete column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all delete column transformations with the specified table_name for the specified rule.

table_name	column_name	step_number	Result
non-NULL	non-NULL	non-NULL	Remove all delete column transformations with the specified table_name, column_name, and step_number for the specified rule.

GET_MESSAGE_TRACKING Function

Returns the tracking label for the current session.

See Also: SET_MESSAGE_TRACKING Procedure on page 141-162

Syntax

```
DBMS_STREAMS_ADM.GET_MESSAGE_TRACKING
RETURN VARCHAR2;
```

GET_SCN_MAPPING Procedure

This procedure gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment. This information can be used for the following purposes:

- To recover transactions after point-in-time recovery is performed on a source database in a multiple source Oracle Streams environment
- To run flashback queries for the corresponding SCN at a source database and destination database in an Oracle Streams single source replication environment

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about point-in-time recovery and flashback queries in an Oracle Streams replication environment

Syntax

```
DBMS_STREAMS_ADM.GET_SCN_MAPPING(
   apply_name             IN  VARCHAR2,
   src_pit_scn            IN  NUMBER,
   dest_instantiation_scn OUT NUMBER,
   dest_start_scn         OUT NUMBER,
   dest_skip_txn_ids      OUT DBMS_UTILITY.NAME_ARRAY);
```

Parameters

Table 141–16 GET_SCN_MAPPING Procedure Parameters

Parameter	Description
`apply_name`	Name of the apply process which applies logical change records (LCRs) from the source database. The procedure raises an error if the specified apply process does not exist.
`src_pit_scn`	The SCN at the source database. For point-in-time recovery, specify the point-in-time recovery SCN at the source database. If the specified SCN is greater than the source commit SCN of the last applied transaction, then `NULL` is returned for both `dest_start_scn` and `dest_instantiation_scn`. In this case, no values can be returned for these parameters because the corresponding transaction has not been applied at the destination database yet.
`dest_instantiation_scn`	The SCN at the destination database that corresponds to the specified `src_pit_scn` at the source database. For point-in-time recovery, use this value for the instantiation SCNs at the source database during recovery.
`dest_start_scn`	For point in time recovery, the SCN to use for the `start_scn` parameter for the recovery capture process.

Table 141–16 (Cont.) GET_SCN_MAPPING Procedure Parameters

Parameter	Description
dest_skip_txn_ids	Transaction IDs of transactions that were skipped at the dest_instantiation_scn because the apply process was applying nondependent transactions out of order. For point in time recovery, these transaction IDs should be ignored by the recovery apply process. This parameter is relevant only if the commit_serialization for the apply process that applied these transactions was set to DEPENDENT_TRANSACTIONS, and the transactions were applied out of order.

GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

See Also:

- "SET_TAG Procedure" on page 141-167
- *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS_ADM.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
   raw_tag RAW(2000);
BEGIN
   raw_tag := DBMS_STREAMS_ADM.GET_TAG();
   DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the `DUAL` view:

```
SELECT DBMS_STREAMS_ADM.GET_TAG FROM DUAL;
```

KEEP_COLUMNS Procedure

This procedure either adds or removes a declarative rule-based transformation which keeps a list of columns in a row logical change record (LCR) that satisfies the specified rule. The transformation deletes columns that are not in the list from the row LCR.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The `column_list` parameter is type `VARCHAR2` and the `column_table` parameter is type `DBMS_UTILITY.LNAME_ARRAY`. These parameters enable you to enter the list of columns in different ways and are mutually exclusive.

Note:

- The `KEEP_COLUMNS` procedure supports the same data types supported by Oracle Streams capture processes.
- The `KEEP_COLUMNS` procedure is useful when you want to keep a relatively small number of columns in a row LCR. If you want to keep most of the columns in a row LCR and delete a relatively small number of columns, consider using the `DELETE_COLUMN` procedure in this package.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also:

- *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes
- "DELETE_COLUMN Procedure" on page 141-76

Syntax

```
DBMS_STREAMS_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_list   IN  VARCHAR2,
   value_type    IN  VARCHAR2 DEFAULT '*',
   step_number   IN  NUMBER DEFAULT 0,
   operation     IN  VARCHAR2 DEFAULT 'ADD');

DBMS_STREAMS_ADM.KEEP_COLUMNS(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_table  IN  DBMS_UTILITY.LNAME_ARRAY,
   value_type    IN  VARCHAR2 DEFAULT '*',
   step_number   IN  NUMBER DEFAULT 0,
```

```
    operation     IN  VARCHAR2 DEFAULT 'ADD');
```

Parameters

Table 141–17 KEEP_COLUMNS Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table for which the columns are kept in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_list	The names of the columns kept for each row LCR that satisfies the rule. Specify a comma-delimited list of type VARCHAR2. The transformation removes columns that are not in the list from the row LCR. If this parameter is set to NULL, and the column_table parameter is also set to NULL, then the procedure raises an error.
column_table	The names of the columns kept for each row LCR that satisfies the rule. Specify a PL/SQL index-by table of type DBMS_UTILITY.LNAME_ARRAY, where each element is the name of a column. The first schema should be in position 1. The last position must be NULL. The transformation removes columns that are not in the table from the row LCR. If this parameter is set to NULL, and the column_list parameter is also set to NULL, then the procedure raises an error.
value_type	Specify 'NEW' to keep the columns in the new values in the row LCR. Specify 'OLD' to keep the columns in the old values in the row LCR. Specify '*' to keep the columns in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule. See "Usage Notes" on page 141-84 for more information about this parameter.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the keep columns declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_list, column_table, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the KEEP_COLUMNS procedure when one or more of these parameters is NULL:

table_name	column_list/column_table	step_number	Result
NULL	NULL	NULL	Remove all keep columns transformations for the specified rule.

table_name	column_list/column_table	step_number	Result
NULL	NULL	non-NULL	Remove all keep columns transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified column_list/column_table and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all keep columns transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all keep columns transformations with the specified column_list/column_table for the specified rule.
non-NULL	non-NULL	NULL	Remove all keep columns transformations with the specified table_name and column_ list/column_table for the specified rule.
non-NULL	NULL	NULL	Remove all keep columns transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all keep columns transformations with the specified table_name, column_ list/column_table, and step_number for the specified rule.

MAINTAIN_CHANGE_TABLE Procedure

This procedure configures an Oracle Streams environment that uses change handlers to record in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

A change handler is a special type of statement DML handler that tracks table changes and was created by either this `MAINTAIN_CHANGE_TABLE` procedure or the `DBMS_APPLY_ADM.SET_CHANGE_HANDLER` procedure. Information about change handlers is stored in the `ALL_APPLY_CHANGE_HANDLERS` and `DBA_APPLY_CHANGE_HANDLERS` views.

The change table can reside in the same database as the source table or in a different database.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note: The environment configured by this procedure does not record or replicate data definition language (DDL) changes made to the source table.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 141-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE(
   change_table_name        IN VARCHAR2,
   source_table_name        IN VARCHAR2,
   column_type_list         IN VARCHAR2,
   extra_column_list        IN VARCHAR2  DEFAULT 'command_type, value_type',
   capture_values           IN VARCHAR2,
   options_string           IN VARCHAR2  DEFAULT NULL,
   script_name              IN VARCHAR2  DEFAULT NULL,
   script_directory_object  IN VARCHAR2  DEFAULT NULL,
   perform_actions          IN BOOLEAN   DEFAULT TRUE,
   capture_name             IN VARCHAR2  DEFAULT NULL,
   propagation_name         IN VARCHAR2  DEFAULT NULL,
   apply_name               IN VARCHAR2  DEFAULT NULL,
   source_database          IN VARCHAR2  DEFAULT NULL,
   destination_database     IN VARCHAR2  DEFAULT NULL,
   keep_change_columns_only IN BOOLEAN   DEFAULT TRUE,
   execute_lcr              IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 141–18 MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
change_table_name	The table that records changes to the source table. This table is maintained by Oracle Streams after configuration. Specify the table as [*schema_name*.]*table_name*. For example, hr.jobs_change_table. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error. If the specified table exists at the database specified in the destination_database parameter, then the procedure raises an error.
source_table_name	The table at the source database for which changes are recorded. Specify the table as [*schema_name*.]*table_name*. For example, hr.jobs. If the schema is not specified, then the current user is the default. If NULL, then the procedure raises an error.
column_type_list	A list of the columns in the source table for which changes are recorded. Specify a comma-separated list of each column and its datatype. For example, specify the following for the hr.jobs table: job_id VARCHAR2(10), job_title VARCHAR2(35), min_salary NUMBER(6), max_salary NUMBER(6) The procedure automatically places columns with names that match the source database columns into an unconditional supplemental log group. If NULL, then the procedure raises an error.

Table 141–18 (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
extra_column_list	A comma-separated list metadata attributes to include in the change table. The column name for a metadata attribute is in the format of attribute name followed by a $ symbol. For example, the source_database_name attribute is stored in the source_database_name$ column in the change table. The following metadata attributes can be included: ▪ value_type ▪ source_database_name ▪ command_type ▪ object_owner ▪ object_name ▪ tag ▪ transaction_id ▪ scn ▪ commit_scn ▪ compatible ▪ instance_number ▪ message_number ▪ row_text ▪ row_id ▪ serial# ▪ session# ▪ source_time ▪ thread# ▪ tx_name ▪ username All of these metadata attributes, except for value_type and message_number, are row LCR attributes that can be stored in row LCRs. For information about LCR attributes, see *Oracle Streams Concepts and Administration*. The value_type$ column in the change table contains either OLD or NEW, depending on whether the column value is the original column value or the new column value, respectively. The message_number$ column in the change table contains the identification number of each row LCR within a transaction. The message number increases incrementally for each row LCR within a transaction and shows the order of the row LCRs within a transaction. The procedure automatically configures the source database to place information about extra attributes, such as serial#, into the redo log so that the information can be captured and recorded.

Table 141–18 (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
capture_values	Specify which values to capture when update operations are performed on the source table: ■ old - To capture the original values for an updated column in the source table ■ new - To capture the new values for an updated column in the source table ■ * - To capture both the original and the new values for an updated column in the source table If NULL, then the procedure raises an error. **Note:** For insert operations, only new column values can be captured. For delete operations, only old column values can be captured.
options_string	String of options passed to the CREATE TABLE statement that creates the change table. The string is appended to the generated CREATE TABLE statement after the closing parenthesis that defines the columns of the table. The string must be syntactically correct.
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the replication environment directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the replication environment directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
perform_actions	If TRUE, then the procedure performs the necessary actions to configure the environment directly. If FALSE, then the procedure does not perform the necessary actions to configure the environment directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ■ script_name ■ script_directory_object

Table 141–18 (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
capture_name	The name of each capture process configured to capture changes. Do not specify an owner. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If NULL, then the system generates a name for each capture process it creates. **Note:** The capture process name cannot be altered after the capture process is created.
propagation_name	The name of the propagation configured to propagate changes from the source database to the destination database. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set. If NULL, then the system generates a name for the propagation. If non-NULL and the source_database and destination_database are set to the same value, then this procedure raises an error. When the capture process and apply process are in the same database, they can use the same queue, and a propagation is not needed. **Note:** The propagation name cannot be altered after the propagation is created.
apply_name	The name of each apply process configured to apply changes. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for the apply process. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter. **Note:** The apply process name cannot be altered after the apply process is created.
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.

Table 141–18 (Cont.) MAINTAIN_CHANGE_TABLE Procedure Parameters

Parameter	Description
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
keep_change_columns_only	If TRUE, then this procedure adds a declarative rule-based transformation which keeps the list of columns specified in the column_type_list parameter. The columns that are not specified in the column_type_list parameter are removed from each row LCR captured by the capture process. If FALSE, then this procedure does not create a declarative rule-based transformation, and all of the columns in the row LCRs are kept. Specify FALSE when information about columns that are not included in the column_type_list parameter is needed at the destination database. For example, if the execute_lcr parameter is set to TRUE and the configuration will replicate all of the columns in a source table, but the column_type_list parameter includes a subset of these columns, then the keep_change_columns_only parameter should be set to FALSE. **Note:** When this parameter is set to TRUE, a declarative rule-based transformation is always created, even if the column_type_list includes all of the columns in the source table.
execute_lcr	If TRUE, then this procedure creates a change handler that executes each row LCR at the destination database. If FALSE, then the row LCRs are not executed at the destination database.

Usage Notes

The following are usage notes for this procedure:

Types of Oracle Streams Environments Configured by the Procedure

This procedure can configure the following types of Oracle Streams environments:

- **Local capture and apply on one database:** Specify the same global name for the source_database and the destination_database parameter.
- **Local capture and remote apply:** Specify the global name of the local database for the source_database parameter and a remote database for the destination_database parameter.
- **Downstream capture and local apply:** Specify a remote database for the source_database parameter and the local database for the destination_database parameter.
- **Downstream capture and remote apply:** Specify a remote database for the source_database parameter and a remote database for the destination_database parameter.

Optional One-Way Replication With This Procedure

To configure one-way replication of the table, in addition to recording changes to the table, set the `execute_lcr` parameter to `TRUE`. The apply process executes each row LCR and applies the change in the row LCR to the replica table at the destination database. In this case, ensure that the source table is instantiated at the destination database before running the procedure. Specifically, the source table must be prepared for instantiation, the instantiation SCN must be set for the replica table at the destination database, and, in most cases, the source table replica table should be consistent.

See Also: *Oracle Streams Replication Administrator's Guide*

Statement DML Handlers, the Change Table, and Row LCR Execution

This procedure configures one or more statement DML handlers that perform the following actions:

- Record changes in the change table using the information in row LCRs.
- Execute row LCRs if the `execute_lcr` parameter is set to `TRUE`.

The procedure ensures that the row LCRs contain the required attributes to record the changes specified in the `capture_type_list`, `extra_column_list`, and `capture_values` parameters. The procedure adds the statement DML handlers to the apply process specified in the `apply_name` parameter.

See Also: Chapter 144, "DBMS_STREAMS_HANDLER_ADM"

MAINTAIN_GLOBAL Procedure

This procedure configures an Oracle Streams environment that replicates changes at the database level between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the destination database while the `MAINTAIN_GLOBAL` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.
- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 141-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_GLOBAL(
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   dump_file_name               IN VARCHAR2  DEFAULT NULL,
   capture_name                 IN VARCHAR2  DEFAULT NULL,
   capture_queue_table          IN VARCHAR2  DEFAULT NULL,
   capture_queue_name           IN VARCHAR2  DEFAULT NULL,
   capture_queue_user           IN VARCHAR2  DEFAULT NULL,
   propagation_name             IN VARCHAR2  DEFAULT NULL,
   apply_name                   IN VARCHAR2  DEFAULT NULL,
   apply_queue_table            IN VARCHAR2  DEFAULT NULL,
   apply_queue_name             IN VARCHAR2  DEFAULT NULL,
   apply_queue_user             IN VARCHAR2  DEFAULT NULL,
   log_file                     IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE,
   include_ddl                  IN BOOLEAN   DEFAULT FALSE,
```

```
   instantiation               IN INTEGER   DEFAULT
                                            DBMS_STREAMS_ADM.INSTANTIATION_FULL);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 141-16 for descriptions of the procedure parameters

Table 141–19 MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred. If the source database and destination database are running on the same computer system, then the source and destination directories must be different. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In these cases, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.

Table 141–19 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL, then the log file name is the same name as the export dump file name with an extension of .clg.

Table 141–19 (Cont.) MAINTAIN_GLOBAL Procedure Parameters

Parameter	Description
instantiation	Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: DBMS_STREAMS_ADM.INSTANTIATION_FULL performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If you use the RMAN DUPLICATE or CONVERT DATABASE command for database instantiation, then the destination database cannot be the capture database. If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_FULL or DBMS_STREAMS_ADM.INSTANTIATION_FULL_NETWORK, then the database objects being instantiated must exist at the source database. If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.

MAINTAIN_SCHEMAS Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `schema_names` parameter is type `VARCHAR2` and the other `schema_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of schemas in different ways and are mutually exclusive.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the schemas from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_SCHEMAS` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 141-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SCHEMAS(
   schema_names                 IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,

   apply_queue_name             IN VARCHAR2  DEFAULT NULL,
   apply_queue_user             IN VARCHAR2  DEFAULT NULL,
   log_file                     IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE,
   include_ddl                  IN BOOLEAN   DEFAULT FALSE,
   instantiation                IN INTEGER   DEFAULT
                                             DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 141-16 for descriptions of the procedure parameters that are not in Table 141–20

Table 141–20 MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
schema_names	The schemas to be configured for replication and maintained by Oracle Streams after configuration. The schemas can be specified in the following ways: ▪ Comma-delimited list of type VARCHAR2 ▪ A PL/SQL index-by table of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a schema. The first schema should be in position 1. The last position must be NULL. If a specified schema does not exist at the source database, then the procedure raises an error. If this parameter is set to NULL, then the procedure raises an error.

Table 141–20 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remains in this directory after the procedure completes. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred. If the source database and destination database are running on the same computer system, then the source and destination directories must be different. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.

Table 141–20 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.
capture_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA, then the log file name is the same name as the export dump file name with an extension of .clg.

Table 141–20 (Cont.) MAINTAIN_SCHEMAS Procedure Parameters

Parameter	Description
instantiation	Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. The instantiation SCN is set for the shared database objects during import. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA or DBMS_STREAMS_ADM.INSTANTIATION_SCHEMA_NETWORK, then the database objects being instantiated must exist at the source database. If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported.

MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

See Also:

- "Deprecated Subprograms" on page 141-4
- MAINTAIN_SIMPLE_TTS Procedure on page 141-107

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TABLESPACE(
   tablespace_name              IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   destination_database         IN VARCHAR2,
   setup_streams                IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 141–21 MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
`tablespace_name`	The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams. The tablespace must exist at the source database, but it must not exist at the destination database. A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have `READ` privilege on this directory object. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If `NULL`, then the procedure raises an error.
`source_directory_object`	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes. If `NULL`, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.

Table 141–21 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred. If the source database and destination database are running on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_database	The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist. If NULL, then the procedure raises an error.
setup_streams	If TRUE, then the procedure performs the necessary actions to maintain the tablespace directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespace directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ▪ script_name ▪ script_directory_object
script_name	If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.

Table 141–21 (Cont.) MAINTAIN_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
bi_directional	Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Documentation for this Procedure

The following documentation applies to the MAINTAIN_SIMPLE_TABLESPACE procedure:

- Automatic Platform Conversion on page 141-14
- *Oracle Streams Replication Administrator's Guide*

Requirements for Running this Procedure

Meet the following requirements when run the MAINTAIN_SIMPLE_TABLESPACE procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the destination_database parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted DBA role. This user must have the necessary privileges to complete the following actions:
  - Create ANYDATA queues, capture processes, propagations, and apply processes.

  - Specify supplemental logging
  - Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
  - Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
  - The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 146-17 for the list of required privileges.
  - The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 146-10 for the list of required privileges.

  To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be should be created in the Oracle Streams administrator's schema.

- If the bi_directional parameter is set to TRUE, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- Each specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes this procedure must have READ and WRITE privilege on each one.
- The databases configured by this procedure must be Oracle Database 10*g* Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The setup_streams parameter is set to TRUE to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10*g* Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The setup_streams parameter is set to FALSE in this procedure, and the replication environment is configured with a generated script.

  If the script configures an Oracle Database 10*g* Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10*g* Release 2 or later, such as queue-to-queue propagation.
- If the procedure is run at an Oracle Database 10*g* Release 1 database, then the databases configured by the procedure must be Oracle Database 10*g* Release 1 or later databases.

See Also: *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TABLESPACE Procedure

This procedure uses the default values for the parameters in the `MAINTAIN_TABLESPACES` procedure that do not exist in the `MAINTAIN_SIMPLE_TABLESPACE` procedure. For example, this procedure creates a capture process at the source database named `capture`, because that is the default value for the `capture_name` parameter in the `MAINTAIN_TABLESPACES` procedure.

See Also: MAINTAIN_TABLESPACES Procedure on page 141-115

Configuration Progress and Recoverability

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

See Also: "RECOVER_OPERATION Procedure" on page 141-143

MAINTAIN_SIMPLE_TTS Procedure

This procedure clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespace from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated `MAINTAIN_SIMPLE_TABLESPACE` procedure.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 141-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_SIMPLE_TTS(
   tablespace_name              IN VARCHAR2,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 141-16 for descriptions of the procedure parameters that are not in Table 141–22

Table 141–22 MAINTAIN_SIMPLE_TTS Procedure Parameters

Parameter	Description
tablespace_name	The local simple tablespace to be cloned at the destination database and maintained by Oracle Streams. The tablespace must exist at the source database, but it must not exist at the destination database. A directory object must exist for the directory that contains the datafile for the tablespace. The user who invokes this procedure must have READ privilege on this directory object. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If NULL, then the procedure raises an error.
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafile for the cloned tablespace are transferred. If the source database and destination database are running on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.

Table 141–22 (Cont.) MAINTAIN_SIMPLE_TTS Procedure Parameters

Parameter	Description
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.

Usage Notes

The specified tablespace must be a simple tablespace. A simple tablespace is a single, self-contained tablespace that uses only one datafile. A self-contained tablespace has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. This procedure cannot be used for a non simple tablespace or a set of tablespaces.

DDL Changes Not Maintained

This procedure does not configure the Oracle Streams environment to maintain DDL changes to the tablespace nor to the database objects in the tablespace. For example, the Oracle Streams environment is not configured to replicate ALTER TABLESPACE statements on the tablespace, nor is it configured to replicate ALTER TABLE statements on tables in the tablespace. You can configure the Oracle Streams environment to maintain DDL changes manually or modify generated scripts to achieve this.

Additional Privileges Required by the MAINTAIN_SIMPLE_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 141-15, the user who runs the MAINTAIN_SIMPLE_TTS procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the DBMS_STREAMS_TABLESPACES_ADM package
- The necessary privileges to run the CLONE_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the source database. See CLONE_SIMPLE_TABLESPACE Procedure on page 146-17 for the list of required privileges.
- The necessary privileges to run the ATTACH_SIMPLE_TABLESPACE procedure in the DBMS_STREAMS_TABLESPACES_ADM package at the destination database. See ATTACH_SIMPLE_TABLESPACE Procedure on page 146-10 for the list of required privileges.

Default Values for Parameters Excluded From the MAINTAIN_SIMPLE_TTS Procedure

This procedure uses the default values for the parameters in the MAINTAIN_TTS procedure that do not exist in the MAINTAIN_SIMPLE_TTS procedure. For example, this procedure automatically generates the capture process name, because NULL is the default value for the capture_name parameter in the MAINTAIN_TTS procedure, and the procedure generates the capture process name when NULL is specified for capture_name.

See Also: MAINTAIN_TTS Procedure on page 141-122

MAINTAIN_TABLES Procedure

This procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases. This procedure can either configure the environment directly, or it can generate a script that configures the environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

This procedure is overloaded. One `table_names` parameter is type `VARCHAR2` and the other `table_names` parameter is type `DBMS_UTILITY.UNCL_ARRAY`. These parameters enable you to enter the list of tables in different ways and are mutually exclusive.

Note: If the `bi_directional` parameter is set to `TRUE`, then do not allow data manipulation language (DML) or data definition language (DDL) changes to the shared database objects at the destination database while the `MAINTAIN_TABLES` procedure, or the script generated by the procedure, is running. This restriction does not apply to the source database.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 141-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TABLES(
   table_names                    IN VARCHAR2,
   source_directory_object        IN VARCHAR2,
   destination_directory_object   IN VARCHAR2,
   source_database                IN VARCHAR2,
   destination_database           IN VARCHAR2,
   perform_actions                IN BOOLEAN   DEFAULT TRUE,
   script_name                    IN VARCHAR2  DEFAULT NULL,

capture_queue_table          IN VARCHAR2  DEFAULT NULL,
capture_queue_name           IN VARCHAR2  DEFAULT NULL,
capture_queue_user           IN VARCHAR2  DEFAULT NULL,
propagation_name             IN VARCHAR2  DEFAULT NULL,
apply_name                   IN VARCHAR2  DEFAULT NULL,
apply_queue_table            IN VARCHAR2  DEFAULT NULL,
apply_queue_name             IN VARCHAR2  DEFAULT NULL,
apply_queue_user             IN VARCHAR2  DEFAULT NULL,
log_file                     IN VARCHAR2  DEFAULT NULL,
bi_directional               IN BOOLEAN   DEFAULT FALSE,
include_ddl                  IN BOOLEAN   DEFAULT FALSE,
instantiation                IN INTEGER   DEFAULT
                                          DBMS_STREAMS_ADM.INSTANTIATION_TABLE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 141-16 for descriptions of the procedure parameters that are not in Table 141–23

Table 141–23 MAINTAIN_TABLES Procedure Parameters

Parameter	Description
table_names	The tables to be configured for replication and maintained by Oracle Streams after configuration. The tables can be specified in the following ways: ▪ Comma-delimited list of type VARCHAR2 ▪ A PL/SQL index-by table of type DBMS_UTILITY.UNCL_ARRAY, where each element is the name of a table. The first table should be in position 1. The last position must be NULL. Each table should be specified as [*schema_name*.]*table_name*. For example, hr.employees. If the schema is not specified, then the current user is the default. If a specified table does not exist at the source database, then the procedure raises an error. If this parameter is set to NULL, then the procedure raises an error.

Table 141–23 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file is placed. This file remain in this directory after the procedure completes. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the source_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file is transferred. If the source database and destination database are running on the same computer system, then the source and destination directories must be different. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. In this case, specify NULL for the destination_directory_object parameter. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.

Table 141–23 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.
capture_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. This parameter is ignored if instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK or DBMS_STREAMS_ADM.INSTANTIATION_NONE. If NULL and instantiation is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE, then the log file name is the same name as the export dump file name with an extension of .clg.

Table 141–23 (Cont.) MAINTAIN_TABLES Procedure Parameters

Parameter	Description
instantiation	Specify whether to perform instantiation and, if instantiation is performed, the type of instantiation: DBMS_STREAMS_ADM.INSTANTIATION_TABLE performs a full Data Pump export at the source database and a Data Pump import of the export dump file at the destination database. If the instantiation parameter is set to this value, then the user who runs this procedure must have EXECUTE privilege on the DBMS_FILE_TRANSFER package. DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK performs a full network Data Pump import. A network import means that Data Pump performs the import without using an export dump file. If the instantiation parameter is set to this value, then a database link from the destination database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. DBMS_STREAMS_ADM.INSTANTIATION_NONE does not perform an instantiation. This setting is valid only if the perform_actions parameter is set to FALSE, and the procedure generates a configuration script. In this case, the configuration script does not perform an instantiation and does not set the instantiation SCN for each shared database object. Instead, you must perform the instantiation and ensure that instantiation SCN values are set properly. If this parameter is set to DBMS_STREAMS_ADM.INSTANTIATION_TABLE or DBMS_STREAMS_ADM.INSTANTIATION_TABLE_NETWORK, then the tables being instantiated must exist at the source database. If an instantiated database object does not exist at the destination database, then it is imported at the destination database, including its supplemental logging specifications from the source database and its supporting database objects, such as indexes and triggers. However, if the database object already exists at the destination database before instantiation, then it is not imported at the destination database. Therefore, the supplemental logging specifications from the source database are not specified for the database object at the destination database, and the supporting database objects are not imported. Also, if an instantiated table does not exist at the destination database, then this procedure sets the instantiation SCN for the table. However, if an instantiated table already exist at the destination database before instantiation, then this procedure does not set the instantiation SCN for the table. In this case, you must set the instantiation SCN for the table manually after the procedure completes.

MAINTAIN_TABLESPACES Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions. Run this procedure at the source database.

Note: This procedure is deprecated. It is replaced by the `MAINTAIN_TTS` procedure.

See Also:

- "Deprecated Subprograms" on page 141-4
- MAINTAIN_TTS Procedure on page 141-122

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TABLESPACES(
   tablespace_names             IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   destination_database         IN VARCHAR2,
   setup_streams                IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   dump_file_name               IN VARCHAR2  DEFAULT NULL,
   source_queue_table           IN VARCHAR2  DEFAULT 'streams_queue_table',
   source_queue_name            IN VARCHAR2  DEFAULT 'streams_queue',
   source_queue_user            IN VARCHAR2  DEFAULT NULL,
   destination_queue_table      IN VARCHAR2  DEFAULT 'streams_queue_table',
   destination_queue_name       IN VARCHAR2  DEFAULT 'streams_queue',
   destination_queue_user       IN VARCHAR2  DEFAULT NULL,
   capture_name                 IN VARCHAR2  DEFAULT 'capture',
   propagation_name             IN VARCHAR2  DEFAULT NULL,
   apply_name                   IN VARCHAR2  DEFAULT NULL,
   log_file                     IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE,
   include_ddl                  IN BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 141–24 MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_names	The local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If NULL, then the procedure raises an error. **See Also:** TABLESPACE_SET Table Type on page 146-8
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred. If the source database and destination database are running on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_database	The global name of the destination database. A database link from the source database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.

Table 141–24 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
setup_streams	If TRUE, then the procedure performs the necessary actions to maintain the tablespaces directly. If FALSE, then the procedure does not perform the necessary actions to maintain the tablespaces directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ▪ script_name ▪ script_directory_object
script_name	If non-NULL and the setup_streams parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to maintain the specified tablespace set. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the setup_streams parameter is TRUE, then this procedure generates the specified script and performs the actions to maintain the specified tablespace directly. If NULL and the setup_streams parameter is TRUE, then this procedure does not generate a script and performs the actions to maintain the specified tablespace set directly. If NULL and the setup_streams parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
dump_file_name	The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.

Table 141–24 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
source_queue_table	The name of the queue table for the queue at the source database, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.
source_queue_name	The name of the queue at the source database that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.
source_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
destination_queue_table	The name of the queue table for the queue at the destination database, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default.
destination_queue_name	The name of the queue at the destination database that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue.
destination_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
capture_name	The name of each capture process configured to capture changes to the database objects in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database objects in the tablespace set to the positive capture process rule set. **Note:** The capture process name cannot be altered after the capture process is created.

Table 141–24 (Cont.) MAINTAIN_TABLESPACES Procedure Parameters

Parameter	Description
propagation_name	The name of each propagation configured to propagate changes to the database objects in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the database objects in the tablespace set to the positive propagation rule set. If NULL, then the system generates a name for each propagation it creates. **Note:** The propagation name cannot be altered after the propagation is created.
apply_name	The name of each apply process configured to apply changes to the database objects in the tablespace set. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the database objects in the tablespace set to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for each apply process it creates. **Note:** The apply process name cannot be altered after the apply process is created.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. If NULL, then the log file name is the same name as the export dump file name with an extension of .clg.
bi_directional	Specify TRUE to configure bi-directional replication between the current database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured at both databases, and propagations are configured between the databases to propagate messages. Specify FALSE to configure one way replication from the current database to the database specified in destination_database. A capture process is configured at the current database, a propagation is configured to propagate messages from the current database to the destination database, and an apply process is configured at the destination database.
include_ddl	Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes. Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, will not be replicated.

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Additional Documentation for this Procedure

The following documentation applies to the `MAINTAIN_TABLESPACES` procedure:

- Automatic Platform Conversion on page 141-14
- *Oracle Streams Replication Administrator's Guide*

Requirements for Running this Procedure

Meet the following requirements when run the `MAINTAIN_TABLESPACES` procedure:

- Run the procedure at the source database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs this procedure should be granted `DBA` role. This user must have the necessary privileges to complete the following actions:
  - Create `ANYDATA` queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the `DBMS_STREAMS_ADM` and `DBMS_AQADM` packages.
  - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.
  - Run subprograms in the `DBMS_STREAMS_TABLESPACES_ADM` package
  - The necessary privileges to run the `CLONE_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the source database. See CLONE_TABLESPACES Procedure on page 146-19 for the list of required privileges.
  - The necessary privileges to run the `ATTACH_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the destination database. See ATTACH_TABLESPACES Procedure on page 146-12 for the list of required privileges.

  To ensure that the user who runs this procedure has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be should be created in the Oracle Streams administrator's schema.
- If the `bi_directional` parameter is set to `TRUE`, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes this procedure must have `READ` and `WRITE` privilege on each one.
- The databases configured by this procedure must be Oracle Database 10*g* Release 2 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The `setup_streams` parameter is set to `TRUE` to configure the Oracle Streams replication environment directly.
- The databases configured by this procedure must be Oracle Database 10*g* Release 1 or later databases when this procedure is run under the following conditions:
  - The procedure is run at an Oracle Database 10*g* Release 2 or later database.
  - The `setup_streams` parameter is set to `FALSE` in this procedure, and the replication environment is configured with a generated script.

  If the script configures an Oracle Database 10*g* Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10*g* Release 2 or later, such as queue-to-queue propagation.
- If the procedure is run at an Oracle Database 10*g* Release 1 database, then the databases configured by the procedure must be Oracle Database 10*g* Release 1 or later databases.

See Also: *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Configuration Progress and Recoverability

When this procedure is run with the `setup_streams` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When this procedure is run with the `setup_streams` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by this procedure is run.

See Also: "RECOVER_OPERATION Procedure" on page 141-143

MAINTAIN_TTS Procedure

This procedure clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure can either perform these actions directly, or it can generate a script that performs these actions.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

Note:

- This procedure automatically excludes database objects that are not supported by Oracle Streams in the tablespaces from the replication environment by adding rules to the negative rule set of each capture and apply process. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.
- This procedure replaces the deprecated `MAINTAIN_TABLESPACES` procedure.

See Also: "Procedures That Configure an Oracle Streams Environment" on page 141-13 for more information about this procedure

Syntax

```
DBMS_STREAMS_ADM.MAINTAIN_TTS(
   tablespace_names             IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_directory_object      IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   source_database              IN VARCHAR2,
   destination_database         IN VARCHAR2,
   perform_actions              IN BOOLEAN   DEFAULT TRUE,
   script_name                  IN VARCHAR2  DEFAULT NULL,
   script_directory_object      IN VARCHAR2  DEFAULT NULL,
   dump_file_name               IN VARCHAR2  DEFAULT NULL,
   capture_name                 IN VARCHAR2  DEFAULT NULL,
   capture_queue_table          IN VARCHAR2  DEFAULT NULL,
   capture_queue_name           IN VARCHAR2  DEFAULT NULL,
   capture_queue_user           IN VARCHAR2  DEFAULT NULL,
   propagation_name             IN VARCHAR2  DEFAULT NULL,
   apply_name                   IN VARCHAR2  DEFAULT NULL,
   apply_queue_table            IN VARCHAR2  DEFAULT NULL,
   apply_queue_name             IN VARCHAR2  DEFAULT NULL,
   apply_queue_user             IN VARCHAR2  DEFAULT NULL,
   log_file                     IN VARCHAR2  DEFAULT NULL,
   bi_directional               IN BOOLEAN   DEFAULT FALSE,
   include_ddl                  IN BOOLEAN   DEFAULT FALSE);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 141-16 for descriptions of the procedure parameters that are not in Table 141–25

Table 141–25 MAINTAIN_TTS Procedure Parameters

Parameter	Description
tablespace_names	The local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. A directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. The directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group. If NULL, then the procedure raises an error. **See Also:** TABLESPACE_SET Table Type on page 146-8
source_directory_object	The directory object for the directory on the computer system running the source database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are placed. These files remain in this directory after the procedure completes. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.
destination_directory_object	The directory object for the directory on the computer system running the destination database into which the generated Data Pump export dump file and the datafiles that comprise the cloned tablespace set are transferred. If the source database and destination database are running on the same computer system, then the source and destination directories must be different. If NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle ASM disk group.

Table 141–25 (Cont.) MAINTAIN_TTS Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
dump_file_name	The name of the Data Pump export dump file that contains the specified tablespace set. If a file with the specified file name exists in the specified directory for the source_directory_object or destination_directory_object parameter, then the procedure raises an error. If NULL, then the export dump file name is generated by the system. In this case, the export dump file name is expat*nn*.dmp, where *nn* is a sequence number. The sequence number is increased to produce an export dump file with a unique name in the source directory.
log_file	The name of the Data Pump export log file. This log file is placed in the same directory as the Data Pump export dump file. If NULL, then the log file name is the same name as the export dump file name with an extension of .clg.

Usage Notes

The specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Additional Privileges Required by the MAINTAIN_TTS Procedure

In addition to the required privileges described in "Requirements for Running These Procedures" on page 141-15, the user who runs the `MAINTAIN_TTS` procedure must have the necessary privileges to complete the following actions:

- Run subprograms in the `DBMS_STREAMS_TABLESPACES_ADM` package
- The necessary privileges to run the `CLONE_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the source database. See CLONE_TABLESPACES Procedure on page 146-19 for the list of required privileges.
- The necessary privileges to run the `ATTACH_TABLESPACES` procedure in the `DBMS_STREAMS_TABLESPACES_ADM` package at the destination database. See ATTACH_TABLESPACES Procedure on page 146-12 for the list of required privileges.

MERGE_STREAMS Procedure

This procedure merges a stream that is flowing from one capture process with a stream that is flowing from another capture process.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

This procedure is called by the MERGE_STREAMS_JOB procedure. The MERGE_STREAMS_JOB procedure determines whether the streams are within a user-specified merge threshold so that the streams can be merged safely. If the streams are not within the merge threshold, then the MERGE_STREAMS_JOB procedure does nothing. Typically, it is best to run the MERGE_STREAMS_JOB procedure instead of running the MERGE_STREAMS procedure directly.

However, you can choose to run the MERGE_STREAMS procedure directly when the following conditions are met:

- The problem at the destination of the split stream has been corrected, and the destination queue can accept changes.
- The cloned capture process used by the split stream is started and is capturing changes.
- The apply process at the destination database is applying the changes captured by the cloned capture process.
- The CAPTURE_MESSAGE_CREATE_TIME in the GV$STREAMS_CAPTURE view of the cloned capture process has caught up to, or nearly caught up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The cloned capture process might never completely catch up to the original capture process. Therefore, you can merge the split stream when the cloned capture process has nearly caught up to the original capture process.

The MERGE_STREAMS procedure performs the following actions:

1. Stops the cloned capture process.
2. Stops the original capture process.
3. Copies the cloned propagation back to the original propagation. The propagation has the same name as the original propagation after it is copied back.
4. Starts the original capture process from the lower SCN value of these two SCN values:
   - The acknowledged SCN of the cloned propagation.
   - The lowest acknowledged SCN of the other propagations that propagate changes captured by the original capture process.

   When the original capture process is started, it might recapture changes that it already captured, or it might capture changes that were already captured by the cloned capture process. In either case, the relevant apply processes will discard any duplicate changes they receive.

5. Drops the cloned propagation.
6. Drops the cloned capture process.
7. Drops the cloned queue.

See Also:

- MERGE_STREAMS_JOB Procedure on page 141-129
- SPLIT_STREAMS Procedure on page 141-171

Syntax

```
DBMS_STREAMS_ADM.MERGE_STREAMS(
   cloned_propagation_name  IN  VARCHAR2,
   propagation_name         IN  VARCHAR2  DEFAULT NULL,
   queue_name               IN  VARCHAR2  DEFAULT NULL,
   perform_actions          IN  BOOLEAN   DEFAULT TRUE,
   script_name              IN  VARCHAR2  DEFAULT NULL,
   script_directory_object  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 141–26 MERGE_STREAMS Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you want to use a name that is different than the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See "Usage Notes" on page 141-128 for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions: ■ The queue specified in the queue_name parameter does not exist. ■ The queue specified in the queue_name parameter exists but is not used by a capture process.

Table 141–26 (Cont.) MERGE_STREAMS Procedure Parameters

Parameter	Description
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See "Usage Notes" on page 141-128 for more information.
perform_actions	If TRUE, then the procedure performs the necessary actions to merge the streams directly. If FALSE, then the procedure does not perform the necessary actions to merge the streams directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ▪ script_name ▪ script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to merge the streams. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to merge the streams directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Usage Notes

You can use the MERGE_STREAMS procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

MERGE_STREAMS_JOB Procedure

This procedure determines whether the original capture process and the cloned capture process are within the specified merge threshold. If they are within the merge threshold, then this procedure runs the MERGE_STREAMS procedure to merge the two streams.

Typically, this procedure is used to merge two streams that were split using the SPLIT_STREAMS procedure in this package. The SPLIT_STREAMS procedure clones components of the original stream when it splits the streams. Therefore, the information in this section uses the following terminology:

- The stream before it was split off has the original queue, original capture process, and original propagation.
- The stream that was split off by the SPLIT_STREAMS procedure has a cloned queue, cloned capture process, and cloned propagation.

If the auto_merge_threshold parameter was set to a positive number in the SPLIT_STREAMS procedure that split the streams, then a merge job runs the MERGE_STREAMS_JOB procedure automatically according to its schedule. The schedule name is specified for the schedule_name parameter, and the merge job name is specified for the merge_job_name parameter when the MERGE_STREAMS_JOB procedure is run automatically. The merge job and its schedule were created by the SPLIT_STREAMS procedure.

If the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams, then you can run the MERGE_STREAMS_JOB procedure manually. In this case, it is not run automatically.

See Also:

- MERGE_STREAMS Procedure on page 141-126
- SPLIT_STREAMS Procedure on page 141-171
- *Oracle Streams Replication Administrator's Guide* for instructions on using the MERGE_STREAMS_JOB procedure

Syntax

```
DBMS_STREAMS_ADM.MERGE_STREAMS_JOB(
   cloned_propagation_name        IN VARCHAR2,
   propagation_name               IN VARCHAR2 DEFAULT NULL,
   queue_name                     IN VARCHAR2 DEFAULT NULL,
   merge_threshold                IN NUMBER,
   schedule_name                  IN VARCHAR2 DEFAULT NULL,
   merge_job_name                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 141–27 MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
cloned_propagation_name	The name of the cloned propagation used by the stream that was split off from the original stream using the SPLIT_STREAMS procedure. The name of the cloned propagation also identifies the cloned queue and capture process used by the cloned propagation. You must specify an existing propagation name. Do not specify an owner.
propagation_name	The name of the propagation that is merged back to the original stream. If NULL, then the name of the original propagation in the original stream is used. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you want to use a name that is different than the original propagation name or if you are merging two streams that were not split by the SPLIT_STREAMS procedure. See "Usage Notes" on page 141-131 for more information. If a non-NULL value is specified, then an error is raised under either of the following conditions: ▪ The queue specified in the queue_name parameter does not exist. ▪ The queue specified in the queue_name parameter exists but is not used by a capture process.
queue_name	The name of the queue that is the source queue for the propagation that is merged back. If NULL, then the existing, original queue is the source queue for the propagation that is merged back. Specify NULL only if the streams were split using the SPLIT_STREAMS procedure. Specify a non-NULL value if you are merging two streams that were not split by the SPLIT_STREAMS procedure. Specify the name of the existing queue used by the capture process that will capture changes in the merged stream. See "Usage Notes" on page 141-131 for more information.
merge_threshold	The merge threshold in seconds. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines whether or not the streams are merged. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then this procedure runs the MERGE_STREAMS procedure to merge the streams. If the difference is greater than the value specified by this parameter, then this procedure does nothing.
schedule_name	The name of the schedule for the merge job. If NULL, then no schedule name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.

Table 141–27 (Cont.) MERGE_STREAMS_JOB Procedure Parameters

Parameter	Description
merge_job_name	The name of the job that merges the streams. If NULL, then no merge job name is specified. Typically, you set this parameter to NULL when the auto_merge_threshold parameter was set to NULL or 0 (zero) in the SPLIT_STREAMS procedure that split the streams. Specify NULL if you run this procedure manually.

Usage Notes

You can use the MERGE_STREAMS_JOB procedure to merge two streams that were not split using the SPLIT_STREAMS procedure. Merging streams in this way can save resources and improve performance when a single database is running two or more capture processes.

After the MERGE_STREAMS_JOB procedure completes, you can query the DBA_CAPTURE and DBA_PROPAGATION views to determine whether the streams were merged. If the streams were merged, then the cloned capture process and cloned propagation do not appear in these views.

If the streams were merged and the schedule_name and merge_job_name parameters were non-NULL, then the specified schedule and merge job are deleted automatically.

The DBA_STREAMS_SPLIT_MERGE view contains information about split and merge operations.

POST_INSTANTIATION_SETUP Procedure

This procedure performs the actions required after instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the source database.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

Attention: When the `POST_INSTANTIATION_SETUP` procedure is run, the parameter values must match the parameter values specified when the corresponding `PRE_INSTANTIATION_SETUP` procedure was run, except for the values of the following parameters: `perform_actions`, `script_name`, `script_directory_object`, and `start_processes`.

Note: A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.

Syntax

```
DBMS_STREAMS_ADM.POST_INSTANTIATION_SETUP(
   maintain_mode           IN VARCHAR2,
```

```
  tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
  source_database         IN VARCHAR2,
  destination_database    IN VARCHAR2,
  perform_actions         IN BOOLEAN          DEFAULT TRUE,
  script_name             IN VARCHAR2         DEFAULT NULL,
  script_directory_object IN VARCHAR2         DEFAULT NULL,
  capture_name            IN VARCHAR2         DEFAULT NULL,
  capture_queue_table     IN VARCHAR2         DEFAULT NULL,
  capture_queue_name      IN VARCHAR2         DEFAULT NULL,
  capture_queue_user      IN VARCHAR2         DEFAULT NULL,
  propagation_name        IN VARCHAR2         DEFAULT NULL,
  apply_name              IN VARCHAR2         DEFAULT NULL,
  apply_queue_table       IN VARCHAR2         DEFAULT NULL,
  apply_queue_name        IN VARCHAR2         DEFAULT NULL,
  apply_queue_user        IN VARCHAR2         DEFAULT NULL,
  bi_directional          IN BOOLEAN          DEFAULT FALSE,
  include_ddl             IN BOOLEAN          DEFAULT FALSE,
  start_processes         IN BOOLEAN          DEFAULT FALSE,
  instantiation_scn       IN NUMBER           DEFAULT NULL,
  exclude_schemas         IN VARCHAR2         DEFAULT NULL,
  exclude_flags           IN BINARY_INTEGER   DEFAULT NULL);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 141-16 for descriptions of the procedure parameters that are not in Table 141–28

Table 141–28 POST_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: ▪ GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter ▪ TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter
tablespace_names	If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. **See Also:** TABLESPACE_SET Table Type on page 146-8

Table 141–28 (Cont.) POST_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
start_processes	If TRUE, then the procedure starts each capture process and apply process. Any disabled capture or apply process created by the PRE_INSTANTITAION_SETUP procedure also is started. If FALSE, then the procedure does not start any capture processes or apply processes.
instantiation_scn	Specify the instantiation SCN for the database objects at the destination database if the instantiation SCN was not set during instantiation. The instantiation SCN is not set automatically during RMAN instantiations, but the correct instantiation SCN value should be determined during an RMAN instantiation. See the *Oracle Streams Replication Administrator's Guide* for more information. Specify NULL if the instantiation SCN was set for the database objects at the destination database during instantiation. The instantiation SCN can be set during export/import instantiations.
exclude_schemas	A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database. If NULL, then the procedure does not exclude any schemas in the database. This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.

Table 141–28 (Cont.) POST_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
exclude_flags	Specify what is excluded from the replication configuration in the schemas specified by the exclude_schemas parameter. This parameter works the same way in the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures. See "Usage Notes" on page 141-139 for the PRE_INSTANTIATION_SETUP procedure for more information.

Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

Destination Database Renamed During RMAN Database Instantiation

If the maintain_mode parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. If the RMAN DUPLICATE or RMAN CONVERT DATABASE command is used for database instantiation, then the global name of the destination database can be renamed to the global name of the source database during instantiation. In this case, before you run the POST_INSTANTIATION_SETUP procedure, complete the following steps:

1. Rename the global name of the destination database back to the name specified in the destination_database parameter.
2. At the destination database, drop and recreate any loopback database links that existed on the source and were cloned on the destination database. For example, suppose the source database dbs1.net has a database link that refers to itself. Suppose the destination database is dbs2.net. At the destination database, drop and recreate this database link as a loopback database link that refers to itself (dbs2.net).
3. At the destination database, drop any database links that were cloned from the source database and are from the source database to the destination database. For example, if the source database is dbs1.net and the destination database is dbs2.net, then drop any database links on the destination database that are from dbs1.net to dbs2.net.
4. Create a database link from the destination database to the source database with the same name as the global name of the source database. The database link must be accessible to the Oracle Streams administrator at the destination database.

   This database link is required because the POST_INSTANTIATION_SETUP procedure runs the SET_GLOBAL_INSTANTIATION_SCN procedure in the DBMS_APPLY_ADM package at the destination database, and the SET_GLOBAL_INSTANTIATION_SCN procedure requires the database link. The instantiation

SCN is set to the value specified in the instantiation_scn parameter of the POST_INSTANTIATION_SETUP procedure.

Note: When the RMAN DUPLICATE or CONVERT DATABASE command is used for database instantiation, the destination database cannot be the capture database.

Oracle Streams Components Removed From the Destination Database

If the maintain_mode parameter is set to GLOBAL, then database instantiation is required before running the POST_INSTANTIATION_SETUP procedure. During database instantiation, Oracle Streams components created by the PRE_INSTANTIATION_SETUP procedure, such as Oracle Streams clients and queues, can be copied from the source database to the destination database. The POST_INSTANTIATION_SETUP procedure removes the Stream components created by the PRE_INSTANTIATION_SETUP procedure from the destination database.

In some cases, rule sets and rules created by the PRE_INSTANTIATION_SETUP procedure might not be removed from the destination database. The POST_INSTANTIATION_SETUP procedure does not associate these rule sets and rules with any Stream clients in the destination database. Optionally, you can remove these rule sets and rules from the destination database after the POST_INSTANTIATION_SETUP procedure, or the script generated by the procedure, completes.

Note: The POST_INSTANTIATION_SETUP procedure only removes Oracle Streams components that were created by the PRE_INSTANTIATION_SETUP procedure. It does not remove Oracle Streams components that were created in a different way.

PRE_INSTANTIATION_SETUP Procedure

This procedure performs the actions required before instantiation to configure an Oracle Streams replication environment.

Run this procedure at the capture database. The capture database is the database that captures changes made to the source database.

To complete the Oracle Streams replication configuration, follow these steps:

1. Run the `PRE_INSTANTIATION_SETUP` procedure at the database that will be the source database in the Stream replication environment.
2. Perform any necessary instantiation actions.
3. Run the `POST_INSTANTIATION_SETUP` procedure at the source database.

Typically, the Oracle Streams replication environment configured using these steps serves one of the following purposes:

- Replicates changes to shared database objects to keep the database objects synchronized at different databases.
- Replicates changes to database objects during a database maintenance operation, such migrating a database to a different platform. In this case, use the `CLEANUP_INSTANTIATION_SETUP` procedure to remove the replication environment after the maintenance operation is complete.

Note:

- A capture process never captures changes in the `SYS`, `SYSTEM`, or `CTXSYS` schemas. This procedure does not configure replication for these schemas.
- When the RMAN `DUPLICATE` or `CONVERT DATABASE` command is used for database instantiation, the destination database cannot be the capture database.

Syntax

```
DBMS_STREAMS_ADM.PRE_INSTANTIATION_SETUP(
   maintain_mode           IN VARCHAR2,
   tablespace_names        IN DBMS_STREAMS_TABLESPACE_ADM.TABLESPACE_SET,
   source_database         IN VARCHAR2,
   destination_database    IN VARCHAR2,
```

```
  perform_actions         IN BOOLEAN         DEFAULT TRUE,
  script_name             IN VARCHAR2        DEFAULT NULL,
  script_directory_object IN VARCHAR2        DEFAULT NULL,
  capture_name            IN VARCHAR2        DEFAULT NULL,
  capture_queue_table     IN VARCHAR2        DEFAULT NULL,
  capture_queue_name      IN VARCHAR2        DEFAULT NULL,
  capture_queue_user      IN VARCHAR2        DEFAULT NULL,
  propagation_name        IN VARCHAR2        DEFAULT NULL,
  apply_name              IN VARCHAR2        DEFAULT NULL,
  apply_queue_table       IN VARCHAR2        DEFAULT NULL,
  apply_queue_name        IN VARCHAR2        DEFAULT NULL,
  apply_queue_user        IN VARCHAR2        DEFAULT NULL,
  bi_directional          IN BOOLEAN         DEFAULT FALSE,
  include_ddl             IN BOOLEAN         DEFAULT FALSE,
  start_processes         IN BOOLEAN         DEFAULT FALSE,
  exclude_schemas         IN VARCHAR2        DEFAULT NULL,
  exclude_flags           IN BINARY_INTEGER  DEFAULT NULL);
```

Parameters

See Also: "Common Parameters for the Configuration Procedures" on page 141-16 for descriptions of the procedure parameters that are not in Table 141–29

Table 141–29 PRE_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
maintain_mode	Specify one of the following: ▪ GLOBAL to maintain the entire database by configuring replication between the local database and the database specified in the destination_database parameter ▪ TRANSPORTABLE TABLESPACES to maintain a set of tablespaces by configuring replication between the local database and the database specified in the destination_database parameter
tablespace_names	If maintain_mode is set to TRANSPORTABLE TABLESPACES, then specify the local tablespace set to be cloned at the destination database and maintained by Oracle Streams. The tablespaces in the tablespace set must exist at the source database, but these tablespaces must not exist at the destination database. Also, a directory object must exist for each directory that contains the datafiles for the tablespace set. The user who invokes this procedure must have READ privilege on these directory objects. If maintain_mode is set to GLOBAL, then specify an empty tablespace set. Regardless of the maintain_mode setting, an error is raised if the tablespace_names parameter is not set or is set to NULL. **See Also:** TABLESPACE_SET Table Type on page 146-8

Table 141–29 (Cont.) PRE_INSTANTIATION_SETUP Procedure Parameters

Parameter	Description
source_database	The global name of the source database. If the specified global name is the same as the global name of the local database, then the procedure configures a local capture process for the source database. If the specified global name is different than the global name of the local database, then the procedure configures a downstream capture process at the local database. In this case, a database link from the local database to the source database with the same name as the global name of the source database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure uses the global name of the local database.
destination_database	The global name of the destination database. If the local database is not the destination database, then a database link from the local database to the destination database with the same name as the global name of the destination database must exist and must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
capture_queue_table	The name of the queue table for each queue used by a capture process, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.
start_processes	If TRUE, then the procedure starts each capture process and apply process. If FALSE, then the procedure does not start any capture processes or apply processes.
exclude_schemas	A comma-delimited list of schemas to exclude from the Oracle Streams configuration. Schema rules are added to the negative rule sets of each capture process to exclude these schemas. Specify an asterisk (*) to exclude all of the schemas in the database. If NULL, then the procedure does not exclude any schemas in the database. This parameter is valid only if the MAINTAIN_MODE parameter is set to GLOBAL. If the MAINTAIN_MODE parameter is set to TRANSPORTABLE TABLESPACES, then the procedure ignores this parameter.
exclude_flags	Specify what to exclude from the replication configuration in the schemas specified by the exclude_schemas parameter. See "Usage Notes" on page 141-139 for more information.

Usage Notes

The following sections contain usage notes for this procedure.

Self-Contained Tablespace Sets

If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then the specified set of tablespaces must be self-contained. In this context "self-contained" means that there are no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespace sets

The exclude_flags Parameter

Specify one of the following values:

- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL to exclude changes to the schemas and all of the database objects in the schemas
- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED to exclude changes to the database objects that are not supported by Oracle Streams in the schemas

If both of these values are specified, then the procedure raises an error.

In addition to DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL or DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED, specify one or both of the following values:

- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML to exclude data manipulation language (DML) changes made to the excluded database objects
- DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL to exclude data definition language (DDL) changes made to the excluded database objects

Use the plus sign (+) to specify more than one of these values. For example, to maintain DML changes to the tables in a schemas specified by the exclude_schemas parameter but exclude DDL changes to these schemas and the database objects in these schemas, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_FULL +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

To exclude DML and DDL changes made to unsupported database objects in the schemas specified by the exclude_schemas parameter, specify the following for this parameter:

```
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_UNSUPPORTED +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DML +
DBMS_STREAMS_ADM.EXCLUDE_FLAGS_DDL
```

Rules for the excluded database objects are added to the negative rule set of each capture process. Therefore, changes to the excluded database objects will not be captured and replicated.

This parameter is valid only if the maintain_mode parameter is set to GLOBAL and the exclude_schemas parameter is set to a non-NULL value. If the maintain_mode parameter is set to GLOBAL and the exclude_schemas parameter is set to a NULL, then the procedure ignores this parameter. If the maintain_mode parameter is set to TRANSPORTABLE TABLESPACES, then this the procedure ignores this parameter and excludes any database objects in the specified tablespace set that are not supported by Oracle Streams from the Oracle Streams configuration automatically.

Also, if schemas are specified in the exclude_schemas parameter, but the exclude_flags parameter is set to NULL, then the procedure does not add any rules to the negative rule set of any capture process, and the procedure includes the

schemas specified in the `exclude_schemas` parameter in the replication environment.

PURGE_SOURCE_CATALOG Procedure

This procedure removes all Oracle Streams data dictionary information at the local database for the specified object. You can use this procedure to remove Oracle Streams metadata that is not needed currently and will not be needed in the future.

Syntax

```
DBMS_STREAMS_ADM.PURGE_SOURCE_CATALOG(
   source_database     IN  VARCHAR2,
   source_object_name  IN  VARCHAR2,
   source_object_type  IN  VARCHAR2);
```

Parameters

Table 141–30 PURGE_SOURCE_CATALOG Procedure Parameters

Parameter	Description
source_database	The global name of the source database containing the object. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.
source_object_name	The name of the object specified as [*schema_name*.]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
source_object_type	Type of the object. Currently, TABLE is the only possible object type.

Usage Notes

The global name of the source database containing the object must be specified for the source_database parameter. If the current database is not the source database for the object, then the procedure removes data dictionary information about the object from the current database, not the source database.

For example, suppose changes to the hr.employees table at the dbs1.net source database are being applied to the hr.employees table at the dbs2.net destination database. Also, suppose hr.employees at dbs2.net is not a source at all. In this case, specifying dbs2.net as the source_database for this table results in an error. However, specifying dbs1.net as the source_database for this table while running the PURGE_SOURCE_CATALOG procedure at the dbs2.net database removes data dictionary information about the table at dbs2.net.

Do not run this procedure at a database if either of the following conditions are true:

- Logical change records (LCRs) captured by the capture process for the object are or might be applied locally without reinstantiating the object.
- LCRs captured by the capture process for the object are or might be forwarded by the database without reinstantiating the object.

Note: These conditions do not apply to LCRs that were not created by the capture process. That is, these conditions do not apply to user-created LCRs.

RECOVER_OPERATION Procedure

This procedure provides options for operations that stopped because they encountered an errors. These operations include split and merge operations, Oracle Streams replication configuration operations, and Oracle Streams change table configuration operations. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.

This procedure only can perform these actions for the following operations:

- Split and merge operations using:
  - The `split_threshold` and `merge_threshold` capture process parameters set to non-`NULL` values to enable automatic split and merge
  - SPLIT_STREAMS Procedure
  - MERGE_STREAMS_JOB Procedure
- Change table configuration operations performed by the MAINTAIN_CHANGE_TABLE Procedure
- Replication configuration operations performed by the following procedures:
  - MAINTAIN_GLOBAL Procedure
  - MAINTAIN_SCHEMAS Procedure
  - MAINTAIN_SIMPLE_TABLESPACE Procedure
  - MAINTAIN_SIMPLE_TTS Procedure
  - MAINTAIN_TABLES Procedure
  - MAINTAIN_TABLESPACES Procedure
  - MAINTAIN_TTS Procedure
  - PRE_INSTANTIATION_SETUP Procedure
  - POST_INSTANTIATION_SETUP Procedure

Information about the operation is stored in the following data dictionary views when the operation is in process:

- `DBA_RECOVERABLE_SCRIPT`
- `DBA_RECOVERABLE_SCRIPT_PARAMS`
- `DBA_RECOVERABLE_SCRIPT_BLOCKS`
- `DBA_RECOVERABLE_SCRIPT_ERRORS`

For split and merge operations, the data dictionary views are populated at the database that contains the capture process. For the configuration operations, the data dictionary views are populated at the database where the replication configuration procedure was run.

When the operation completes successfully, metadata about the operation is moved from the `DBA_RECOVERABLE_SCRIPT` view to the `DBA_RECOVERABLE_SCRIPT_HIST` view. The other views, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`, retain information about the operation until it is purged automatically after 30 days.

When one of these operations encounters an error and stops, metadata about the operation remains in these views. In this case, you can either roll forward, roll back, or

purge the metadata about the operation using the RECOVER_OPERATION procedure. If you choose to roll forward the operation, then correct conditions that caused the errors reported in DBA_RECOVERABLE_SCRIPT_ERRORS before proceeding.

For split and merge operations, run the RECOVER_OPERATION procedure at the database that contains the capture process. For the configuration operations, run the RECOVER_OPERATION procedure at the database where the replication configuration procedure was run.

Note:

- Regarding the configuration operations, the procedure must configure the environment directly (perform_actions => TRUE), not by generating a script, for information about the operation to be stored in the recoverable views and for the operation to be managed by the RECOVER_OPERATION procedure.
- To run the RECOVER_OPERATION procedure, both databases must be Oracle Database 10*g* Release 2 or later databases.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
DBMS_STREAMS_ADM.RECOVER_OPERATION(
   script_id       IN  RAW,
   operation_mode  IN  VARCHAR2  DEFAULT 'FORWARD');
```

Parameters

Table 141–31 RECOVER_OPERATION Procedure Parameters

Parameter	Description
script_id	The operation id of the operation that is being rolled forward, rolled back, or purged. Query the SCRIPT_ID column of the DBA_RECOVERABLE_SCRIPT data dictionary view to determine the operation id.
operation_mode	If FORWARD, then the procedure rolls forward the operation. Specify FORWARD to try to complete the operation. If ROLLBACK, then the procedure rolls back all of the actions performed in the operation. If the rollback is successful, then this option also moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view. The other views retain information about the operation for 30 days. If PURGE, then the procedure moves the metadata about the operation from the DBA_RECOVERABLE_SCRIPT view to the DBA_RECOVERABLE_SCRIPT_HIST view without rolling the operation back. The other views retain information about the operation for 30 days.

REMOVE_QUEUE Procedure

This procedure removes the specified ANYDATA queue.

Specifically, this procedure performs the following actions:

1. Waits until all current enqueue and dequeue transactions commit.
2. Stops the queue, which means that no further enqueues into the queue or dequeues from the queue are allowed.
3. Drops the queue.
4. If the drop_unused_queue_table parameter is set to TRUE, then drops the queue table if it is empty and no other queues are using it.
5. If the cascade parameter is set to TRUE, then drops all of the Oracle Streams clients that are using the queue.

> **Note:** The specified queue must be a ANYDATA queue.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_QUEUE(
   queue_name                IN  VARCHAR2,
   cascade                   IN  BOOLEAN  DEFAULT FALSE,
   drop_unused_queue_table   IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 141–32 REMOVE_QUEUE Procedure Parameters

Parameter	Description
queue_name	The name of the queue to remove, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the current user is the default.
cascade	If TRUE, then the procedure drops any Oracle Streams clients that use the queue. If FALSE, then the procedure raises an error if there are any Oracle Streams clients that use the queue. Before you run this procedure with the cascade parameter set to FALSE, make sure no Oracle Streams clients are using the queue currently.
drop_unused_queue_table	If TRUE and the queue table for the queue is empty, then the procedure drops the queue table. The queue table is not dropped if it contains any messages or if it is used by another queue. If FALSE, then the procedure does not drop the queue table.

REMOVE_RULE Procedure

This procedure removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, apply process, propagation, or messaging client.

If this procedure results in an empty positive rule set for a messaging client, then the procedure drops the messaging client automatically.

> **Note:** If a rule was automatically created by the system, and you want to drop the rule, then you should use this procedure to remove the rule instead of the `DBMS_RULE_ADM.DROP_RULE` procedure. If you use the `DBMS_RULE_ADM.DROP_RULE` procedure, then some metadata about the rule might remain.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_RULE(
   rule_name         IN  VARCHAR2,
   streams_type      IN  VARCHAR2,
   streams_name      IN  VARCHAR2,
   drop_unused_rule  IN  BOOLEAN  DEFAULT TRUE,
   inclusion_rule    IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 141–33 REMOVE_RULE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule to remove, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure removes all rules from the specified capture process, synchronous capture, apply process, propagation, or messaging client rule set. For example, to specify a rule in the `hr` schema named `prop_rule1`, enter `hr.prop_rule1`. If the schema is not specified, then the current user is the default.
`streams_type`	The type of Oracle Streams client: ■ Specify `capture` for a capture process. ■ Specify `sync_capture` for a synchronous capture. ■ Specify `propagation` for a propagation. ■ Specify `apply` for an apply process. ■ Specify `dequeue` for a messaging client.
`streams_name`	The name of the Oracle Streams client, which can be a capture process, synchronous capture, propagation, apply process, or messaging client. Do not specify an owner. If the specified Oracle Streams client does not exist, but there is metadata in the data dictionary that associates the rule with this client, then the procedure removes the metadata. If the specified Oracle Streams client does not exist, and there is no metadata in the data dictionary that associates the rule with this client, then the procedure raises an error.

Table 141–33 (Cont.) REMOVE_RULE Procedure Parameters

Parameter	Description
drop_unused_rule	If TRUE and the rule is not in any rule set, then the procedure drops the rule from the database. If TRUE and the rule exists in any rule set, then the procedure does not drop the rule from the database. If FALSE, then the procedure does not drop the rule from the database.
inclusion_rule	If inclusion_rule is TRUE, then the procedure removes the rule from the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure removes the rule from the negative rule set for the Oracle Streams client.

REMOVE_STREAMS_CONFIGURATION Procedure

This procedure removes the Oracle Streams configuration at the local database.

Syntax

```
DBMS_STREAMS_ADM.REMOVE_STREAMS_CONFIGURATION;
```

Usage Notes

Specifically, this procedure performs the following actions at the local database:

- Drops all capture processes
- If any tables have been prepared for instantiation, then aborts preparation for instantiation for the table using the `ABORT_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If any schemas have been prepared for instantiation, then aborts preparation for instantiation for the schema using the `ABORT_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- If the database has been prepared for instantiation, then aborts preparation for instantiation for the database using the `ABORT_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package
- Drops propagations that were created using either the `DBMS_STREAMS_ADM` package or the `DBMS_PROPAGATION_ADM` package. Before a propagation is dropped, its propagation job is disabled. Does not drop propagations that were created using the `DBMS_AQADM` package.
- Disables all propagation jobs used by propagations
- Drops all apply processes. If there are apply errors in the error queue for an apply process, then this procedure deletes these apply errors before it drops the apply process.
- Removes specifications for DDL handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for message handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes specifications for precommit handlers used by apply processes, but does not delete the PL/SQL procedures used by these handlers
- Removes the instantiation SCN and ignore SCN for each apply object and schema and for the entire database
- Removes messaging clients
- Unsets message notification specifications that were set using the `SET_MESSAGE_NOTIFICATION` procedure in the `DBMS_STREAMS_ADM` package
- Removes specifications for procedure DML handlers and error handlers, but does not delete the PL/SQL procedures used by these handlers
- Removes update conflict handlers
- Removes specifications for substitute key columns for apply tables
- Drops rule sets and rules that were created using the `DBMS_STREAMS_ADM` package.

- Drops unused rule sets that were used by capture processes, propagations, apply processes, and messaging clients, and removes the rules in these rule sets. These rules and rule sets are removed regardless of whether they were created using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

This procedure stops capture processes and apply processes before it drops them.

This procedure does not drop rule sets or rules if they meet both of the following conditions:

- The rule sets or rules were created using the DBMS_RULE_ADM package.
- The rule sets or rules were not used by a capture process, propagation, apply process, or messaging client.

Attention: Running this procedure is dangerous. You should run this procedure only if you are sure you want to remove the entire Oracle Streams configuration at a database.

Note:

- Running this procedure repeatedly does not cause errors. If the procedure fails to complete, then you can run it again.
- This procedure commits multiple times.

- STOP_APPLY Procedure on page 20-68 in the DBMS_APPLY_ADM package
- REMOVE_RULE Procedure on page 141-146 in the DBMS_STREAMS_ADM package

RENAME_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a column in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note:

- The RENAME_COLUMN procedure supports the same data types supported by Oracle Streams capture processes.
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations and about the data types supported by Oracle Streams capture processes

Syntax

```
DBMS_STREAMS_ADM.RENAME_COLUMN(
   rule_name         IN  VARCHAR2,
   table_name        IN  VARCHAR2,
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
   value_type        IN  VARCHAR2  DEFAULT '*',
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 141–34 RENAME_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table in which the column is renamed in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
from_column_name	The name of the column to be renamed in each row LCR that satisfies the rule.
to_column_name	The new name of the column in each row LCR that satisfies the rule.

Table 141–34 (Cont.) RENAME_COLUMN Procedure Parameters

Parameter	Description
value_type	Specify 'NEW' to rename the column in the new values in the row LCR. Specify 'OLD' to rename the column in the old values in the row LCR. Specify '*' to rename the column in both the old and new values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_COLUMN procedure when one or more of these parameters is NULL:

table_name	from_column_name	to_column_name	step_number	Result
NULL	NULL	NULL	NULL	Remove all rename column transformations for the specified rule.
NULL	NULL	NULL	non-NULL	Remove all rename column transformations with the specified step_number for the specified rule.
NULL	NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified to_column_name and step_number for the specified rule.
NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name and step_number for the specified rule.
NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified column_name for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name and column_name for the specified rule.
NULL	non-NULL	NULL	NULL	Remove all rename column transformations with the specified table_name for the specified rule.

table_name	from_column_name	to_column_name	step_number	Result
NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.
non-NULL	non-NULL	non-NULL	non-NULL	Remove all rename column transformations with the specified table_name, column_name, and step_number for the specified rule.

RENAME_SCHEMA Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a schema in a row logical change record (LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

> **Note:** Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.RENAME_SCHEMA(
   rule_name         IN  VARCHAR2,
   from_schema_name  IN  VARCHAR2,
   to_schema_name    IN  VARCHAR2,
   step_number       IN  NUMBER    DEFAULT 0,
   operation         IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 141–35 RENAME_SCHEMA Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_schema_name`	The name of the schema to be renamed in each row LCR that satisfies the rule.
`to_schema_name`	The new name of the schema in each row LCR that satisfies the rule.
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
`operation`	Specify `'ADD'` to add the transformation to the rule. Specify `'REMOVE'` to remove the transformation from the rule.

Usage Notes

When `'REMOVE'` is specified for the `operation` parameter, all of the rename schema declarative rule-based transformations for the specified rule are removed that match the specified `from_schema_name`, `to_schema_name`, and `step_number` parameters. Nulls specified for these parameters act as wildcards. The following table

lists the behavior of the RENAME_SCHEMA procedure when one or more of these parameters is NULL:

from_schema_name	to_schema_name	step_number	Result
NULL	NULL	NULL	Remove all rename schema transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename schema transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified to_schema_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename schema transformations with the specified to_schema_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename schema transformations with the specified from_schema_name and to_schema_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename schema transformations with the specified from_schema_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename schema transformations with the specified from_schema_name, to_schema_name, and step_number for the specified rule.

RENAME_TABLE Procedure

This procedure either adds or removes a declarative rule-based transformation which renames a table in a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

Note: Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.RENAME_TABLE(
   rule_name        IN  VARCHAR2,
   from_table_name  IN  VARCHAR2,
   to_table_name    IN  VARCHAR2,
   step_number      IN  NUMBER    DEFAULT 0,
   operation        IN  VARCHAR2  DEFAULT 'ADD');
```

Parameters

Table 141–36 RENAME_TABLE Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule, specified as `[`*`schema_name`*`.]`*`rule_name`*. If `NULL`, then the procedure raises an error. For example, to specify a rule in the `hr` schema named `employees12`, enter `hr.employees12`. If the schema is not specified, then the current user is the default.
`from_table_name`	The name of the table to be renamed in each row LCR that satisfies the rule, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `hr.employees`. If the schema is not specified, then the current user is the default.
`to_table_name`	The new name of the table in each row LCR that satisfies the rule, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, `humres.staff`. The transformation can rename the table only, the schema only, or the table and the schema. If the schema is not specified, then the current user is the default.
`step_number`	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering

Table 141–36 (Cont.) RENAME_TABLE Procedure Parameters

Parameter	Description
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the rename table declarative rule-based transformations for the specified rule are removed that match the specified from_table_name, to_table_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the RENAME_TABLE procedure when one or more of these parameters is NULL:

from_table_name	to_table_name	step_number	Result
NULL	NULL	NULL	Remove all rename table transformations for the specified rule.
NULL	NULL	non-NULL	Remove all rename table transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified to_table_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all rename table transformations with the specified from_table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all rename table transformations with the specified to_table_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all rename table transformations with the specified from_table_name and to_table_name for the specified rule.
non-NULL	NULL	NULL	Remove all rename table transformations with the specified from_table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all rename table transformations with the specified from_table_name, to_table_name, and step_number for the specified rule.

SET_MESSAGE_NOTIFICATION Procedure

This procedure sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue. A notification is sent when a message is enqueued into the specified queue and the specified messaging client can dequeue the message because the message satisfies its rule sets.

Note:

- Currently, messaging clients cannot dequeue buffered messages.
- The DBMS_AQ package can also configure notifications. The DBMS_AQ package provides some notification features that are not available in DBMS_STREAMS_ADM package, such as buffered message notifications and notification grouping by time.

Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_NOTIFICATION(
   streams_name          IN  VARCHAR2,
   notification_action   IN  VARCHAR2,
   notification_type     IN  VARCHAR2     DEFAULT 'PROCEDURE',
   notification_context  IN  ANYDATA      DEFAULT NULL,
   include_notification  IN  BOOLEAN      DEFAULT TRUE,
   queue_name            IN  VARCHAR2     DEFAULT 'streams_queue');
```

Parameters

Table 141–37 SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
streams_name	The name of the Oracle Streams messaging client. Do not specify an owner. For example, if the user strmadmin is the messaging client, then specify strmadmin.

Table 141–37 (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
notification_action	The action to be performed on message notification. Specify one of the following: ■ For URL notifications, specify a URL without the prefix http://. For example, to specify the URL http://www.company.com:8080, enter the following: www.company.com:8080 ■ For email notifications, specify an email address. For example, to specify an the email address xyz@company.com, enter the following: xyz@company.com ■ For PL/SQL procedure notifications, specify an existing user-defined PL/SQL procedure in the form [*schema_name*.]*procedure_name*. If the *schema_name* is not specified, then the user who invokes the SET_MESSAGE_NOTIFICATION procedure is the default. The procedure must be a PLSQLCALLBACK data structure. For example, to specify a procedure named notify_orders in the oe schema, enter the following: oe.notify_orders **See Also:** Examples on page 141-160 for more information about message notification procedures
notification_type	The type of notification. Specify one of the following: ■ HTTP if you specified a URL for notification_action ■ MAIL if you specified an email address for notification_action ■ PROCEDURE if you specified a user-defined procedure for notification_action The type must match the specification for the notification_action parameter.
notification_context	The context of the notification. The context must be specified using RAW data type information. For example, to specify the hexidecimal equivalent of 'FF', enter the following: ANYDATA.ConvertRaw(HEXTORAW('FF')) The notification context is passed the PL/SQL procedure in procedure notifications and is not relevant for mail or HTTP notifications.
include_notification	If TRUE, then the procedure adds this notification for the specified streams_name and queue_name. That is, specifying TRUE turns on the notification for the streams_name and queue_name. If FALSE, then the procedure removes this notification for the specified streams_name and queue_name. That is, specifying FALSE turns off the notification for the streams_name and queue_name. If you specify FALSE, then this procedure ignores any specified values for the notification_action or notification_context parameters.

Table 141–37 (Cont.) SET_MESSAGE_NOTIFICATION Procedure Parameters

Parameter	Description
queue_name	The name of a local ANYDATA queue, specified as [*schema_name*.]*queue_name*. The current database must contain the queue. The specified queue must be a ANYDATA queue. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.

Usage Notes

You can specify one of the following types of notifications:

- An email address to which message notifications are sent. When a relevant message is enqueued into the queue, an email with the message properties is mailed to the specified email address.
- A PL/SQL procedure to be invoked on a notification. When a relevant message is enqueued into the queue, the specified PL/SQL procedure is invoked with the message properties. This PL/SQL procedure can dequeue the message.
- An HTTP URL to which the notification is posted. When a relevant message is enqueued into the queue, a notification with the message properties is posted to the specified URL specified.

A client does not need to be connected to the database to receive a notification.

If you register for email notifications, then you should use the DBMS_AQELM package to set the host name and port name for the SMTP server that will be used by the database to send email notifications. If required, then you should set the send-from email address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.

If you register for HTTP notifications, you might want to use the DBMS_AQELM package to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

Each notification is an AQXmlNotification, which includes of the following:

- notification_options, which includes the following:
  - destination - The destination queue from which the message was dequeued
  - consumer_name - The name of the messaging client that dequeued the message
- message_set - The set of message properties

See Also:

- The documentation for the DBMS_AQELM package for more information on email notifications and HTTP notifications
- *Oracle Database 2 Day + Data Replication and Integration Guide* for an example that configures message notification to automatically dequeue of messages of interest
- *Oracle Streams Advanced Queuing User's Guide* and *Oracle XML DB Developer's Guide* for more information about message notifications and XML
- *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

Examples

If you use a message notification procedure, then this PL/SQL procedure must have the following signature:

```
PROCEDURE procedure_name(
  context  IN  ANYDATA,
  reginfo  IN  SYS.AQ$_REG_INFO,
  descr    IN  SYS.AQ$_DESCRIPTOR);
```

Here, *procedure_name* stands for the name of the procedure. The procedure is a PLSQLCALLBACK data structure that specifies the user-defined PL/SQL procedure to be invoked on message notification.

The following is a simple example of a notification procedure that dequeues a message of type oe.user_msg using the message identifier and consumer name sent by the notification. To complete the example, first create the type:

```
CREATE TYPE oe.user_msg AS OBJECT(
  object_name    VARCHAR2(30),
  object_owner   VARCHAR2(30),
  message        VARCHAR2(50));
/
```

Next, create the procedure:

```
CREATE OR REPLACE PROCEDURE oe.notification_dequeue(
  context  ANYDATA,
  reginfo  SYS.AQ$_REG_INFO,
  descr    SYS.AQ$_DESCRIPTOR)
AS
  dequeue_options     DBMS_AQ.DEQUEUE_OPTIONS_T;
  message_properties  DBMS_AQ.MESSAGE_PROPERTIES_T;
  message_handle      RAW(16);
  message             ANYDATA;
  oe_message          oe.user_msg;
  rc                  PLS_INTEGER;
BEGIN
  -- Get the message identifier and consumer name from the descriptor
  dequeue_options.msgid := descr.msg_id;
  dequeue_options.consumer_name := descr.consumer_name;
  -- Dequeue the message
  DBMS_AQ.DEQUEUE(
    queue_name         => descr.queue_name,
    dequeue_options    => dequeue_options,
    message_properties => message_properties,
```

```
    payload            => message,
    msgid              => message_handle);
  rc := message.getobject(oe_message);
  COMMIT;
END;
/
```

See Also: *Oracle Database PL/SQL Packages and Types Reference* for more information about `PLSQLCALLBACK` data structures

SET_MESSAGE_TRACKING Procedure

Sets the tracking label for logical change records (LCRs) produced by the current session. This procedure affects only the current session. Any LCRs produced by the current session are tracked, including captured LCRs and persistent LCRs.

Note: The tracking label set by this procedure does not track non-LCR messages.

See Also: GET_MESSAGE_TRACKING Function on page 141-79

Syntax

```
DBMS_STREAMS_ADM.SET_MESSAGE_TRACKING(
   tracking_label IN VARCHAR2  DEFAULT 'Streams_tracking',
   actions        IN NUMBER    DEFAULT DBMS_STREAMS_ADM.ACTION_MEMORY);
```

Parameters

Table 141–38 SET_MESSAGE_TRACKING Procedure Parameters

Parameter	Description
`tracking_label`	The label used to track the LCRs produced by the session. Set this parameter to `NULL` to stop message tracking in the current session. The size limit for a label is 4,000 bytes.
`actions`	If `DBMS_STREAMS_ADM.ACTION_MEMORY` is specified, then the LCRs are tracked in memory, and the `V$STREAMS_MESSAGE_TRACKING` dynamic performance view is populated with information about the LCRs. If `DBMS_STREAMS_ADM.ACTION_TRACE` is specified, then the LCRs are tracked in the trace files of each database that processes the LCRs. The values specified for this parameter are enumerated constants. Enumerated constants must be prefixed with the package name.

SET_RULE_TRANSFORM_FUNCTION Procedure

This procedure sets or removes the transformation function name for a custom rule-based transformation.

Syntax

```
DBMS_STREAMS_ADM.SET_RULE_TRANSFORM_FUNCTION(
   rule_name           IN  VARCHAR2,
   transform_function  IN  VARCHAR2);
```

Parameters

Table 141–39 SET_RULE_TRANSFORM_FUNCTION Procedure Parameters

Parameter	Description
`rule_name`	The name of the rule whose rule-based transformation function you are setting or removing, specified as `[`*`schema_name`*`.]`*`rule_name`*. For example, to specify a rule in the `hr` schema named `prop_rule1`, enter `hr.prop_rule1`. If the schema is not specified, then the current user is the default.
`transform_function`	Either the name of the transformation function to be used in the rule-based transformation for the rule or `NULL`. If you specify a transformation function name, then specify an existing function in one of the following forms: ▪ `[`*`schema_name`*`.]`*`function_name`* ▪ `[`*`schema_name`*`.]`*`package_name.function_name`* If the function is in a package, then you must specify the *`package_name`*. For example, to specify a function in the `transform_pkg` package in the `hr` schema named `executive_to_management`, enter `hr.transform_pkg.executive_to_management`. An error is returned if the specified procedure does not exist. If the *`schema_name`* is not specified, then the user who invokes the rule-based transformation function is the default. If you specify `NULL`, then the `SET_RULE_TRANSFORM_FUNCTION` procedure removes the current custom rule-based transformation from the rule.

Usage Notes

The following sections contain usage notes for this procedure:

- Transformation Function Signature
- Rule Action Context
- User Who Calls the Transformation Function
- Function Verification

Transformation Function Signature

A custom rule-based transformation function always operates on one message, but it can return one message or many messages. A custom rule-based transformation function that returns one message is a one-to-one transformation function. A one-to-one transformation function must have the following signature:

```
FUNCTION user_function (
   parameter_name   IN  ANYDATA)
RETURN ANYDATA;
```

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an ANYDATA encapsulation of a message.

A custom rule-based transformation function that can return more than one message is a one-to-many transformation function. A one-to-many transformation function must have the following signature:

```
FUNCTION user_function (
   parameter_name  IN  ANYDATA)
RETURN STREAMS$_ANYDATA_ARRAY;
```

Here, *user_function* stands for the name of the function and *parameter_name* stands for the name of the parameter passed to the function. The parameter passed to the function is an ANYDATA encapsulation of a message, and the function must return an array that contains zero or more ANYDATA encapsulations of a message. If the array contains zero ANYDATA encapsulations of a message, then the original message is discarded.

The STREAMS$_ANYDATA_ARRAY type is an Oracle-supplied type that has the following definition:

```
CREATE OR REPLACE TYPE SYS.STREAMS$_ANYDATA_ARRAY
   AS VARRAY(2147483647) of ANYDATA
/
```

The following restrictions apply to custom rule-based transformations that use one-to-many functions:

- Rules that are associated with one-to-many functions are supported for Oracle Streams capture processes only. These rules must not be added to rule sets used by other Oracle Streams clients, including propagations, apply processes, and messaging clients.
- One-to-many functions only can operate on row logical change records (row LCRs). They cannot operate on DDL LCRs.
- Row LCRs returned by a one-to-many function cannot contain piecewise LOB, LONG, or LONG RAW operations.
- The one-to-many function must return row LCRs in the correct order. The order of row LCRs in the array (starting from index 1) is the order that the row LCRs will be executed in the transaction.

When an apply process dequeues row LCRs that are the result of a transformation by a one-to-many function, the apply process uses the instantiation SCN of the LCR passed to the one-to-many function for all of row LCRs.

Note:

- An error is raised if a one-to-one or one-to-many transformation function returns NULL.
- Only one custom rule-based transformation can be specified for a particular rule. You cannot specify both a one-to-one and a one-to-many transformation function for the same rule.
- For any LCR constructed and returned by a custom rule-based transformation, the source_database_name, transaction_id, and scn parameter values must match the values in the original LCR. Oracle automatically specifies the values in the original LCR for these parameters, even if an attempt is made to construct LCRs with different values.

Rule Action Context

This procedure modifies the specified rule's action context to specify the transformation. A rule's action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. The client of the rules engine can be a user-created application or an internal feature of Oracle, such as Oracle Streams. The Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A custom rule-based transformation in Oracle Streams always consists of the following name-value pair in an action context:

- If the function is a one-to-one transformation function, then the name is STREAMS$_TRANSFORM_FUNCTION. If the function is a one-to-many transformation function, then the name is STREAMS$_ARRAY_TRANS_FUNCTION.
- The value is a ANYDATA instance containing a PL/SQL function name specified as a VARCHAR2. This function performs the transformation.

User Who Calls the Transformation Function

The user that calls the transformation function must have EXECUTE privilege on the function. The following list describes which user calls the transformation function:

- If a transformation is specified for a rule used by a capture process, then the user who calls the transformation function is the capture user for the capture process.
- If a transformation is specified for a rule used by a synchronous capture, then the user who calls the transformation function is the capture user for the synchronous capture.
- If a transformation is specified for a rule used by a propagation, then the user who calls the transformation function is the owner of the source queue for the propagation.
- If a transformation is specified on a rule used by an apply process, then the user who calls the transformation function is the apply user for the apply process.
- If a transformation is specified on a rule used by a messaging client, then the user who calls the transformation function is the user who invokes the messaging client.

Function Verification

This procedure does not verify that the specified transformation function exists. If the function does not exist, then an error is raised when an Oracle Streams client tries to invoke the transformation function.

SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

See Also:

- "GET_TAG Function" on page 141-82
- *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS_ADM.SET_TAG(
   tag  IN RAW  DEFAULT NULL);
```

Parameters

Table 141–40 SET_TAG Procedure Parameters

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_STREAMS_ADM.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also: BUILD Procedure on page 30-15

SET_UP_QUEUE Procedure

This procedure creates a queue table and a ANYDATA queue.

Syntax

```
DBMS_STREAMS_ADM.SET_UP_QUEUE(
   queue_table     IN  VARCHAR2  DEFAULT 'streams_queue_table',
   storage_clause  IN  VARCHAR2  DEFAULT NULL,
   queue_name      IN  VARCHAR2  DEFAULT 'streams_queue',
   queue_user      IN  VARCHAR2  DEFAULT NULL,
   comment         IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 141–41 SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_table	The name of the queue table specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If the queue table owner is not specified, then the procedure specifies the user who runs this procedure automatically as the queue table owner. Queue table names can be a maximum of 24 bytes.
storage_clause	The storage clause for queue table The storage parameter is included in the CREATE TABLE statement when the queue table is created. You can specify any valid table storage clause. If a tablespace is not specified here, then the procedure creates the queue table and all its related objects in the default user tablespace of the user who runs this procedure. If a tablespace is specified here, then the procedure creates the queue table and all its related objects in the tablespace specified in the storage clause. If NULL, then the procedure uses the storage characteristics of the tablespace in which the queue table is created. **See Also:** *Oracle Database SQL Language Reference* for more information about storage clauses
queue_name	The name of the queue that will function as the ANYDATA queue, specified as [*schema_name.*]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the procedure uses the queue table owner. The owner of the queue table must also be the owner of the queue. The queue owner automatically has privileges to perform all queue operations on the queue. If the schema is not specified for this parameter, and the queue table owner is not specified in queue_table, then the current user is the default. Queue names can be a maximum of 24 bytes.

Table 141–41 (Cont.) SET_UP_QUEUE Procedure Parameters

Parameter	Description
queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
comment	The comment for the queue

Usage Notes

Set up includes the following actions:

- If the specified queue table does not exist, then this procedure runs the CREATE_QUEUE_TABLE procedure in the DBMS_AQADM package to create the queue table with the specified storage clause. If this procedure creates the queue table, then it creates a multiple consumer ANYDATA queue that is both a secure queue and a transactional queue.

  Also, if the database is Oracle Database 10*g* release 2 or later, the sort_list setting in CREATE_QUEUE_TABLE is set to commit_time. If the database is a release prior to Oracle Database 10*g* release 2, the sort_list setting in CREATE_QUEUE_TABLE is set to enq_time.
- If the specified queue table already exists, then the queue uses the properties of the existing queue table.
- If the specified queue name does not exist, then this procedure runs the CREATE_QUEUE procedure in the DBMS_AQADM package to create the queue.
- This procedure starts the queue.
- If a queue user is specified, then this procedure configures this user as a secure queue user of the queue and grants ENQUEUE and DEQUEUE privileges on the queue to the specified queue user.

  To configure the queue user as a secure queue user, this procedure creates an Advanced Queuing agent with the same name as the user name, if one does not already exist. If an agent with this name already exists and is associated with the queue user only, then it is used. SET_UP_QUEUE then runs the ENABLE_DB_ACCESS procedure in the DBMS_AQADM package, specifying the agent and the user.

Note:

- To enqueue messages into and dequeue messages from a queue, a queue user must have `EXECUTE` privilege on the `DBMS_STREAMS_MESSAGING` package or the `DBMS_AQ` package. The `SET_UP_QUEUE` procedure does not grant this privilege.
- If the agent that `SET_UP_QUEUE` tries to create already exists and is associated with a user other than the user specified by `queue_user`, then the procedure raises an error. In this case, rename or remove the existing agent, and retry `SET_UP_QUEUE`.

See Also: *Oracle Streams Concepts and Administration* for more information about secure queue users

SPLIT_STREAMS Procedure

This procedure splits one stream flowing from a capture process off from all of the other streams flowing from the capture process.

This procedure is intended for an Oracle Streams replication environment in which a capture process captures changes that are propagated to two or more destination databases. When one destination of a propagation stops accepting the captured changes, the changes remain in the capture process's queue. The queue can grow and begin to spill messages to the hard disk, degrading the performance of the Oracle Streams environment. A destination might stop accepting changes for several reasons. For example, the destination database might be down.

Specifically, this procedure performs the following actions:

1. Creates a new queue at the database running the capture process. The new queue is called the cloned queue because it is a clone of the queue used by the original stream. The new queue will be used by the new, cloned capture process, and it will be the source queue for the new, cloned propagation.
2. Creates a new propagation that propagates messages from the source queue created in Step 1 to the existing destination queue. The new propagation is called the cloned propagation because it is a clone of the propagation used by the original stream. The cloned propagation uses the same rule set as the original propagation.
3. Stops the capture process.
4. Queries the acknowledge SCN for the original propagation. The acknowledged SCN is the last SCN acknowledged by the apply process that applies the changes sent by the propagation.
5. Creates a new capture process. The new capture process is called the cloned capture process because it is a clone of the capture process used by the original stream. The procedure sets the start SCN for the cloned capture process to the value of the acknowledged SCN queried in Step 4. The cloned capture process uses the same rule set as the original capture process.
6. Drops the original propagation.
7. Starts the original capture process with the start SCN set to the acknowledged SCN queried in Step 4.
8. If the `auto_merge_threshold` parameter is set to a positive number, then creates an Oracle Scheduler job to run the `MERGE_STREAMS_JOB` procedure at set intervals according to its schedule. When the two streams are within the specified merge threshold, the `MERGE_STREAMS_JOB` procedure runs the `MERGE_STREAMS` procedure to merge the streams automatically.

After the `SPLIT_STREAMS` procedure has finished running, the cloned capture process is disabled. When the problem at the destination database is solved, and the destination queue can accept changes, you should start the cloned capture process using the `START_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

The `DBA_STREAMS_SPLIT_MERGE` view contains the name of each cloned component, as well as other information about the split and merge operation.

Note: If the original capture process is a downstream capture process, then you must configure the cloned capture process to read the redo log from the source database before you start the cloned capture process.

See Also:

- "MERGE_STREAMS Procedure" on page 141-126
- "MERGE_STREAMS_JOB Procedure" on page 141-129
- *Oracle Streams Replication Administrator's Guide* for instructions on using the SPLIT_STREAMS procedure

Syntax

```
DBMS_STREAMS_ADM.SPLIT_STREAMS(
   propagation_name         IN      VARCHAR2,
   cloned_propagation_name  IN      VARCHAR2  DEFAULT NULL,
   cloned_queue_name        IN      VARCHAR2  DEFAULT NULL,
   cloned_capture_name      IN      VARCHAR2  DEFAULT NULL,
   perform_actions          IN      BOOLEAN   DEFAULT TRUE,
   script_name              IN      VARCHAR2  DEFAULT NULL,
   script_directory_object  IN      VARCHAR2  DEFAULT NULL,
   auto_merge_threshold     IN      NUMBER    DEFAULT NULL,
   schedule_name            IN OUT  VARCHAR2,
   merge_job_name           IN OUT  VARCHAR2);
```

Parameters

Table 141–42 SPLIT_STREAMS Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation that cannot send messages to its destination queue. The specified propagation is the propagation for the stream that is being split off from the other streams. You must specify an existing propagation name. Do not specify an owner.
cloned_propagation_name	The name of the new propagation created by this procedure for the stream that is split off. If NULL, then the system generates a propagation name.
cloned_queue_name	The name of the new queue created by this procedure for the stream that is split off. If NULL, then the system generates a queue name.
cloned_capture_name	The name of the new capture process created by this procedure for the stream that is split off. If NULL, then the system generates a capture process name.

Table 141–42 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
perform_actions	If TRUE, then the procedure performs the necessary actions to split the stream directly. If FALSE, then the procedure does not perform the necessary actions to split the stream directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL: ▪ script_name ▪ script_directory_object
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to split the stream. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to split the stream directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to split the stream directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

Table 141–42 (Cont.) SPLIT_STREAMS Procedure Parameters

Parameter	Description
auto_merge_threshold	If a positive number is specified, then the stream that was split off is automatically merged back into all of the other streams flowing from the capture process by an Oracle Scheduler job. The job runs the MERGE_STREAMS_JOB procedure at set intervals according to its schedule. The value of the CAPTURE_MESSAGE_CREATE_TIME column for each capture process in the GV$STREAMS_CAPTURE dynamic performance view determines when the streams are merged. Specifically, if the difference, in seconds, between CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for the auto_merge_threshold parameter, then the two streams are merged automatically. The cloned capture process must be started before the split stream can be merged back with the original stream. If NULL or 0 (zero) is specified, then the split stream is not merged back with the original stream automatically. To merge the split stream with the original stream, run the MERGE_STREAM procedure manually when the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process catches up to, or nearly catches up to, the CAPTURE_MESSAGE_CREATE_TIME of the original capture process. The CAPTURE_MESSAGE_CREATE_TIME records the time when a captured change was recorded in the redo log.
schedule_name	The Oracle Scheduler schedule name, specified as [*schema_name.*]*schedule_name*. For example, strmadmin.merge_schedule. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the schedule is used by the job that will automatically merge the streams at the appropriate time. You can specify a schedule name if you want to adhere to naming conventions or if you want to track the schedule more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a schedule name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If this procedure creates a schedule, the schedule starts when the procedure completes. You can modify the schedule to control how often the merge job is run. If an existing schedule name is specified, an error is raised.
merge_job_name	The Oracle Scheduler job name, specified as [*schema_name.*]*merge_job_name*. For example, strmadmin.merge_job. If the schema is not specified, then the current user is the default. If auto_merge_threshold is a non-NULL positive number, then the job will automatically merge the streams at the appropriate time. Specify a merge job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL and auto_merge_threshold is a non-NULL positive number, then the system generates a job name. If auto_merge_threshold is NULL or 0 (zero), then this parameter must be NULL. If an existing job name is specified, an error is raised.

142

DBMS_STREAMS_ADVISOR_ADM

The DBMS_STREAMS_ADVISOR_ADM package, one of a set of Oracle Streams packages, provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered. This package is part of the Oracle Streams Performance Advisor.

This chapter contains the following topics:

- Using DBMS_STREAMS_ADVISOR_ADM
  - Overview
  - Constants
  - Views
- Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

> **See Also:** *Oracle Streams Concepts and Administration* for instructions about using this package

Using DBMS_STREAMS_ADVISOR_ADM

This section contains topics which relate to using the `DBMS_STREAMS_ADVISOR_ADM` package.

- Overview
- Constants
- Views

Overview

The DBMS_STREAMS_ADVISOR_ADM package enables you to gather and analyze information about an Oracle Streams environment. You can use this information in the following ways:

- To populate data dictionary views with an Oracle Streams topology that contains information about the Oracle Streams components at one or more databases
- To examine the Oracle Streams components at one or more databases in your environment and the ways in which information flows through streams that include these components
- To analyze the performance of the Oracle Streams components in your environment
- To detect performance problems with Oracle Streams components and correct these problems

Constants

The DBMS_STREAMS_ADVISOR_ADM package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_DBMS_ADVISOR_ADM.CAPTURE_TYPE.

Table 142–1 DBMS_STREAMS_ADVISOR_ADM Parameters With Enumerated Constants

Parameter	Option	Type	Description
component_type	■ CAPTURE_TYPE ■ PROPAGATION_SENDER_TYPE ■ PROPAGATION_RECEIVER_TYPE ■ APPLY_TYPE ■ QUEUE_TYPE	NUMBER	CAPTURE_TYPE indicates that the Oracle Streams component is a capture process. The constant number for this option is 1. PROPAGATION_SENDER_TYPE indicates that the Oracle Streams component is a propagation sender. The constant number for this option is 2. PROPAGATION_RECEIVER_TYPE indicates that the Oracle Streams component is a propagation receiver. The constant number for this option is 3. APPLY_TYPE indicates that the Oracle Streams component is an apply process. The constant number for this option is 4. QUEUE_TYPE indicates that the Oracle Streams component is a queue. The constant number for this option is 5.

Views

The DBMS_STREAMS_ADVISOR_ADM package uses the following views:

- DBA_STREAMS_TP_COMPONENT contains information about each Oracle Streams component at each database.
- DBA_STREAMS_TP_COMPONENT_LINK contains information about how messages flow between Oracle Streams components.
- DBA_STREAMS_TP_COMPONENT_STAT contains temporary performance statistics about each Oracle Streams component.
- DBA_STREAMS_TP_DATABASE contains information about each database that contains Oracle Streams components.
- DBA_STREAMS_TP_PATH_BOTTLENECK contains temporary information about Oracle Streams components that might be slowing down the flow of a stream.
- DBA_STREAMS_TP_PATH_STAT contains temporary performance statistics about each stream path that exists in the Oracle Streams topology.

The topology information is stored permanently in the following data dictionary views: DBA_STREAMS_TP_DATABASE, DBA_STREAMS_TP_COMPONENT, and DBA_STREAMS_TP_COMPONENT_LINK.

However, the following views contain temporary information: DBA_STREAMS_TP_COMPONENT_STAT, DBA_STREAMS_TP_PATH_BOTTLENECK, and DBA_STREAMS_TP_PATH_STAT. Some of the data in these views is retained only for the user session that runs the ANALYZE_CURRENT_PERFORMANCE procedure. When this user session ends, this temporary information is purged.

See Also:

- *Oracle Database Reference*
- *Oracle Streams Concepts and Administration* for sample queries that use these views

Operational Notes

This section contains the following operational notes for the DBMS_STREAMS_ADVISOR_ADM package:

- Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package
- General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

Oracle Streams Components Analyzed by the DBMS_STREAMS_ADVISOR_ADM Package

The DBMS_STREAMS_ADVISOR_ADM analyzes the following Oracle Streams components at the specified databases:

- Capture processes
- Propagations
- Apply processes
- Queues

The DBMS_STREAMS_ADVISOR_ADM package does not analyze the following Oracle Streams components:

- Synchronous captures
- Messaging clients

General Steps for Running the Oracle Streams Performance Advisor and Analyzing the Information

To use the DBMS_STREAMS_ADVISOR_ADM package, complete the following general steps:

1. Identify the database that you will use to gather the information.

   An administrative user at this database must meet the following requirements:

   - The user must have access to a database link to each database that contains Oracle Streams components.
   - The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.

   Typically, in an Oracle Streams environment, the Oracle Streams administrator uses this package.

   If no database in your environment meets these requirements, then choose a database, configure the necessary database links, and grant the necessary privileges to the users before proceeding.
2. Connect as the administrative user to the database you identified in Step 1, and remain connected to the session while you complete the remaining steps.
3. Run the ANALYZE_CURRENT_PERFORMACE procedure.
4. Optionally, allow messages to flow in the environment for some time.
5. Optionally, rerun the ANALYZE_CURRENT_PERFORMACE procedure one or more times.

6. Query the data dictionary views listed in "Views" on page 142-5 to analyze the Oracle Streams environment.
7. If you want to update the information in the data dictionary views or if you add new Oracle Streams components to any database in the environment, repeat Steps 2-6.

Note: When you exit the user session, the rate, bandwidth, event, and flow control statistics are purged from the data dictionary views.

Summary of DBMS_STREAMS_ADVISOR_ADM Subprograms

Table 142–2 DBMS_STREAMS_ADVISOR_ADM Package Subprograms

Subprogram	Description
ANALYZE_CURRENT_PERFORMANCE Procedure on page 142-9	Gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered

ANALYZE_CURRENT_PERFORMANCE Procedure

This procedure gathers information about the Oracle Streams components at one or more databases in your environment and analyzes Oracle Streams performance based on the information gathered.

The performance analyses includes:

- Calculating bottleneck components for each separate stream
- Calculating the throughput of each Oracle Streams component
- Calculating the latency of each Oracle Streams component
- Calculating the top wait event of each Oracle Streams component
- Calculating the message rate of each stream
- Calculating the transaction rate of each stream

The procedure places the gathered information in data dictionary views.

Note: The parameters in this procedure must all be either non-`NULL` or `NULL`.

See Also:

- *Oracle Streams Concepts and Administration* for instructions on using this procedure
- "Views" on page 142-5

Syntax

```
DBMS_STREAMS_ADVISOR_ADM.ANALYZE_CURRENT_PERFORMANCE(
   component_name  IN  VARCHAR2  DEFAULT NULL,
   component_db    IN  VARCHAR2  DEFAULT NULL,
   component_type  IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 142–3 ANALYZE_CURRENT_PERFORMANCE Procedure Parameters

Parameter	Description
`component_name`	The name of the Oracle Streams component to analyze. For example, to analyze a capture process named `capture01`, then specify `capture01`. If `NULL`, then all of the Oracle Streams components are analyzed, and the other two parameters must also be `NULL`.
`component_db`	The global name of the database that contains the component specified in the `component_name` parameter. For example, if the `db.net` database contains the component, then specify `db.net`. If `NULL`, then all of the Oracle Streams components are analyzed, and the other two parameters must also be `NULL`.

Table 142–3 (Cont.) ANALYZE_CURRENT_PERFORMANCE Procedure Parameters

Parameter	Description
component_type	The type of the component specified in the component_name parameter. If the component_name parameter is non-NULL, then specify one of the following: ■ DBMS_STREAMS_ADVISOR_ADM.CAPTURE_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_SENDER_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.PROPAGATION_RECEIVER_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.APPLY_TYPE ■ DBMS_STREAMS_ADVISOR_ADM.QUEUE_TYPE See "Constants" on page 142-4 for information about these constants. If NULL, then all of the Oracle Streams components are analyzed, and the other two parameters must also be NULL.

143

DBMS_STREAMS_AUTH

The DBMS_STREAMS_AUTH package, one of a set of Oracle Streams packages, provides subprograms for granting privileges to Oracle Streams administrators and revoking privileges from Oracle Streams administrators.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams administrators

This chapter contains the following topic:

- Summary of DBMS_STREAMS_AUTH Subprograms

Summary of DBMS_STREAMS_AUTH Subprograms

Table 143–1 DBMS_STREAMS_AUTH Package Subprograms

Subprogram	Description
GRANT_ADMIN_PRIVILEGE Procedure on page 143-3	Either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that can be used to grant these privileges
GRANT_REMOTE_ADMIN_ACCESS Procedure on page 143-6	Enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link
REVOKE_ADMIN_PRIVILEGE Procedure on page 143-7	Either revokes Oracle Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges
REVOKE_REMOTE_ADMIN_ACCESS Procedure on page 143-9	Disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link

Note: All subprograms commit unless specified otherwise.

GRANT_ADMIN_PRIVILEGE Procedure

This procedure either grants the privileges needed by a user to be an Oracle Streams administrator directly, or generates a script that can be used to grant these privileges.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE(
   grantee           IN  VARCHAR2,
   grant_privileges  IN  BOOLEAN   DEFAULT TRUE,
   file_name         IN  VARCHAR2  DEFAULT NULL,
   directory_name    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 143–2 GRANT_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user to whom privileges are granted
grant_privileges	If TRUE, then the procedure grants the privileges to the specified grantee directly, and adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry, and no error is raised. If TRUE and any of the grant statements fail, then the procedure raises an error. If FALSE, then the procedure does not grant the privileges to the specified grantee directly, and does not add the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure raises an error.
file_name	The name of the file generated by the procedure. The file contains all of the statements that grant the privileges. If a file with the specified file name exists in the specified directory name, then the grant statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The RESTRICTED SESSION system privilege

- EXECUTE on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_PROPAGATION_ADM
  - DBMS_RULE_ADM
  - DBMS_STREAMS_ADM
  - DBMS_STREAMS_MESSAGING
  - DBMS_TRANSFORM
- Privileges to enqueue messages into and dequeue messages from any queue
- Privileges to manage any queue
- Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  - Evaluation contexts
  - Rule sets
  - Rules

  In addition, the grantee has the ability to grant these privileges to other users.
- SELECT_CATALOG_ROLE
- SELECT privilege on data dictionary views related to Oracle Streams
- The ability to allow a remote Oracle Streams administrator to perform administrative actions through a database link by connecting to the grantee. This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

Note:

- To view all of the statements run by the procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.
- This procedure does not grant any roles to the grantee.
- This procedure grants only the privileges necessary to configure and administer an Oracle Streams environment. You can grant more privileges to the grantee if necessary.

See Also:

- "GRANT_REMOTE_ADMIN_ACCESS Procedure" on page 143-6
- *Oracle Streams Replication Administrator's Guide* for more information about configuring an Oracle Streams administrator

GRANT_REMOTE_ADMIN_ACCESS Procedure

This procedure enables a remote Oracle Streams administrator to perform administrative actions at the local database by connecting to the grantee using a database link.

Syntax

```
DBMS_STREAMS_AUTH.GRANT_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 143–3 GRANT_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user who allows remote access. The procedure adds the grantee to the DBA_STREAMS_ADMINISTRATOR data dictionary view with YES for the ACCESS_FROM_REMOTE column. If the user already has an entry in this data dictionary view, then the procedure does not make another entry. Instead, it updates the ACCESS_FROM_REMOTE column to YES.

Usage Notes

Typically, you run the procedure and specify a grantee at a local source database if a downstream capture process captures changes originating at the local source database. The Oracle Streams administrator at a downstream capture database administers the source database using this connection. You can also run the procedure at a database running an apply process so that a remote Oracle Streams administrator can set instantiation SCNs at the local database.

Note: The GRANT_ADMIN_PRIVILEGE procedure runs this procedure.

See Also: "GRANT_ADMIN_PRIVILEGE Procedure" on page 143-3

REVOKE_ADMIN_PRIVILEGE Procedure

This procedure either revokes Oracle Streams administrator privileges from a user directly, or generates a script that can be used to revoke these privileges.

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_ADMIN_PRIVILEGE(
   grantee            IN  VARCHAR2,
   revoke_privileges  IN  BOOLEAN   DEFAULT TRUE,
   file_name          IN  VARCHAR2  DEFAULT NULL,
   directory_name     IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 143–4 REVOKE_ADMIN_PRIVILEGE Procedure Parameters

Parameter	Description
grantee	The user from whom privileges are revoked
revoke_privileges	If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fail, then the procedure raises an error. A revoke statement will fail if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges to the specified user directly, and does not remove the user from the DBA_STREAMS_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will edit and then run. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.
file_name	The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.
directory_name	The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.

Note: To view all of the statements run by this procedure in detail, you can use the procedure to generate a script and then view the script in a text editor.

See Also: "GRANT_ADMIN_PRIVILEGE Procedure" on page 143-3

REVOKE_REMOTE_ADMIN_ACCESS Procedure

This procedure disables a remote Oracle Streams administrator from performing administrative actions by connecting to the grantee using a database link.

Note: The REVOKE_ADMIN_PRIVILEGE procedure runs this procedure.

See Also: "REVOKE_ADMIN_PRIVILEGE Procedure" on page 143-7

Syntax

```
DBMS_STREAMS_AUTH.REVOKE_REMOTE_ADMIN_ACCESS(
   grantee  IN  VARCHAR2);
```

Parameters

Table 143–5 REVOKE_REMOTE_ADMIN_ACCESS Procedure Parameter

Parameter	Description
grantee	The user for whom access from a remote Oracle Streams administrator is disabled. If a row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure updates the ACCESS_FROM_REMOTE column for the grantee to NO. If, after this update, both the LOCAL_PRIVILEGES column and the ACCESS_FROM_REMOTE column are NO for the grantee, then the procedure removes the grantee from the view. If no row for the grantee exists in the DBA_STREAMS_ADMINISTRATOR data dictionary view, then the procedure does not update the view and does not raise an error.

144

DBMS_STREAMS_HANDLER_ADM

The DBMS_STREAMS_HANDLER_ADM package, one of a set of Oracle Streams packages, provides interfaces to manage statement DML handlers.

This chapter contains the following topics:

- Using DBMS_STREAMS_HANDLER_ADM
  - Overview
  - Views
  - Operational Notes
- Summary of DBMS_STREAMS_HANDLER_ADM Subprograms

Using DBMS_STREAMS_HANDLER_ADM

This section contains topics that relate to using the `DBMS_STREAMS_HANDLER_ADM` package.

- Overview
- Views
- Operational Notes

Overview

A statement DML handler runs one or more data manipulation language (DML) statements on row logical change records (row LCRs) that are dequeued by an apply process. A single statement DML handler can include multiple statements, and you control the execution order of the statements.

Statement DML handlers are similar to procedure DML handlers for apply processes. Both statement DML handlers and procedure DML handlers provide custom processing of row changes that are encapsulated in row LCRs. Statement DML handlers and procedure DML handlers both run when an apply process dequeues a row LCR. However, statement DML handlers have the following advantages over procedure DML handlers:

- Statement DML handlers typically perform better than procedure DML handlers because statement DML handlers do not require PL/SQL processing.
- The syntax for statement DML handlers is same as DML syntax. Statement DML handlers do not require PL/SQL programming. Procedure DML handlers require PL/SQL programming.
- Statement DML handlers do not require the manipulation of `ANYDATA` values to access the information in row LCRs. Typically, procedure DML handlers must manipulate `ANYDATA` values.
- A statement DML handler can co-exist with an error handler for same operation on the same database object. In contrast, you cannot specify both a procedure DML handler and an error handler for the same operation on the same database object.

Note: You can specify multiple statement DML handlers for the same operation on the database object. In this case, the statement DML handlers can execute in any order, and each statement DML handler receives a copy of the original row LCR that was dequeued by the apply process.

See Also: *Oracle Streams Concepts and Administration*

Views

The DBMS_STREAMS_HANDLER_ADM package uses the views listed in the *Oracle Database Reference*.

- DBA_APPLY_DML_HANDLERS
- DBA_STREAMS_STMTS
- DBA_STREAMS_STMT_HANDLERS

Operational Notes

The following sections contain operational notes about the DBMS_STREAMS_HANDLER_ADM package:

- Statement Execution Order
- Supported SQL Statements
- Supported Row LCR Column Attributes
- Supported Row LCR Attributes
- Supported Row LCR Extra Attributes
- Supported Row LCR Method

Statement Execution Order

Each statement in a statement DML handler has a unique execution sequence number. When a statement DML handler is invoked, it executes its statements in order from the statement with the lowest execution sequence number to the statement with the highest execution sequence number.

Supported SQL Statements

You can use statement DML handlers for any valid DML operation on a row logical change record (row LCR). For example, a statement DML handler can audit the DML changes made to a table.

The following SQL statements are supported in statement DML handlers:

- INSERT
- UPDATE
- DELETE
- MERGE

In addition, define variables are not supported in the SQL statements in a statement DML handler.

However, the SQL statements in a statement DML handler can include calls to member subprograms for the row LCR type (LCR$_ROW_RECORD), such as ADD_COLUMN, DELETE_COLUMN, KEEP_COLUMNS, and RENAME_COLUMN.

Note: A statement DML handler cannot modify the value of a column in a row LCR.

See Also: "LCR$_ROW_RECORD Type" on page 245-11

Supported Row LCR Column Attributes

Statements in statement DML handlers can contain the row LCR column attributes described in Table 144–1.

Table 144–1 Row LCR Column Attributes

Attribute	Description
new	Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns the old value.
new_exists	Returns TRUE if a new column value exists in a row LCR. Returns FALSE is a new column value does not exist in a row LCR.
new_only	Returns the new column value in a row LCR. If the new value does not exist, then this attribute returns NULL and does not return the old column value.
old	Returns the old column value in a row LCR.
old_exists	Returns TRUE if an old column value exists in a row LCR. Returns FALSE is an old column value does not exist in a row LCR.

Specify these attributes in the following way in a statement:

```
:attribute.column_name
```

For example, to specify the new_only attribute for the salary column, enter the following in a statement:

```
:new_only.salary
```

Supported Row LCR Attributes

Statements in statement DML handlers can contain the row LCR attributes described in Table 144–2.

Table 144–2 Row LCR Attributes

Attribute	Description
command_type	Returns the type of DML statement that produced the change, either INSERT, UPDATE, or DELETE. DBMS_LOB piecewise LOB operations are not supported by statement DML handlers.
commit_scn	Returns the commit system change number (SCN) of the transaction to which the LCR belongs.
compatible	Returns the minimal database compatibility required to support the LCR.
instance_number	Returns the instance number of the database instance that made the change that is encapsulated in the LCR. Typically, the instance number is relevant in an Oracle Real Application Clusters (Oracle RAC) configuration.
object_owner	Returns the schema name that contains the table with the changed row.
object_name	Returns the name of the table that contains the changed row.
scn	Returns the SCN at the time when the change was made.
source_database_name	Returns the name of the source database where the row change occurred.
source_time	Returns the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.
tag	Returns a raw tag that can be used to track the LCR.

Table 144–2 (Cont.) Row LCR Attributes

Attribute	Description
transaction_id	Returns the identifier of the transaction in which the DML statement was run.

Specify these attributes in the following way in a statement:

```
:attribute_name
```

For example, to specify the source_database_name attribute for a row LCR, enter the following in a statement:

```
:source_database_name
```

Supported Row LCR Extra Attributes

Statements in statement DML handlers can contain the row LCR extra attributes described in Table 144–3.

Table 144–3 Row LCR Extra Attributes

Attribute	Description
row_id	Returns the rowid of the row changed in a row LCR.
serial#	Returns the serial number of the session that performed the change captured in the LCR.
session#	Returns the identifier of the session that performed the change captured in the LCR.
thread#	Returns the thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle RAC configuration.
tx_name	Returns the name of the transaction that includes the LCR.
username	Returns the name of the current user who performed the change captured in the LCR.

Specify these attributes in the following way in a statement:

```
:extra_attribute.attribute_name
```

For example, to specify the row_id extra attribute for a row LCR, enter the following in a statement:

```
:extra_attribute.row_id
```

Supported Row LCR Method

A statement in a statement DML handler can include a call to the EXECUTE member procedure for row LCRs. The EXECUTE member procedure executes the row LCR under the security domain of the current user.

A statement that runs the EXECUTE member procedure can be placed anywhere in the execution sequence order of the statement DML handler. It is not necessary to execute a row LCR unless the goal is to apply the changes in the row LCR to a table in addition to performing any other SQL statements in the statement DML handler.

When you call the EXECUTE member procedure in a statement, the conflict_resolution parameter controls whether any conflict resolution defined for the table

using the SET_UPDATE_CONFLICT_HANDLER procedure in the DBMS_APPLY_ADM package is used to resolve conflicts resulting from the execution of the LCR:

```
:lcr.execute TRUE|FALSE
```

A TRUE argument indicates that conflict resolution is used. A FALSE argument indicates that conflict resolution is not used.

For example, to use conflict resolution, enter the following in a statement:

```
:lcr.execute TRUE
```

An error is raised if this parameter is not specified or is set to NULL.

Summary of DBMS_STREAMS_HANDLER_ADM Subprograms

Table 144–4 DBMS_STREAMS_HANDLER_ADM Package Subprograms

Subprogram	Description
ADD_STMT_TO_HANDLER Procedure on page 144-10	Adds a statement to a statement DML handler
CREATE_STMT_HANDLER Procedure on page 144-11	Creates a statement DML handler
DROP_STMT_HANDLER Procedure on page 144-12	Drops a statement DML handler
REMOVE_STMT_FROM_HANDLER Procedure on page 144-13	Removes a statement from a statement DML handler

Note: The subprograms in this package do not commit.

ADD_STMT_TO_HANDLER Procedure

This procedure adds a statement to a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.ADD_STMT_TO_HANDLER(
   handler_name       IN VARCHAR2,
   statement          IN CLOB,
   execution_sequence IN NUMBER  DEFAULT NULL);
```

Parameters

Table 144–5 ADD_STMT_TO_HANDLER Procedure Parameters

Parameter	Description
`handler_name`	The name of the statement DML handler.
`statement`	The text of the SQL statement to add to the statement DML handler. If `NULL`, then the procedure raises an error.
`execution_ sequence`	The position of the statement in the statement DML handler at which a SQL statement is to be set to execute. Statements are executed in order from the lowest execution sequence number to the highest execution sequence number. You can specify a positive or negative integer or decimal, or you can specify 0 (zero). If you specify an execution sequence number that is used by an existing statement in the statement DML handler, then the statement in the `statement` parameter replaces the existing statement. If `NULL`, then the statement is added to the statement DML handler with an execution sequence number that is larger than the execution sequence number for any statement in the statement DML handler.

CREATE_STMT_HANDLER Procedure

This procedure creates a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.CREATE_STMT_HANDLER(
   handler_name IN VARCHAR2,
   comment      IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 144–6 CREATE_STMT_HANDLER Procedure Parameters

Parameter	Description
`handler_name`	The name of the statement DML handler.
`comment`	A comment for the statement DML handler. If `NULL`, then no comment is recorded for the statement DML handler.

DROP_STMT_HANDLER Procedure

This procedure drops a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.DROP_STMT_HANDLER(
   handler_name IN VARCHAR2);
```

Parameters

Table 144–7 DROP_STMT_HANDLER Procedure Parameters

Parameter	Description
handler_name	The name of the statement DML handler.

REMOVE_STMT_FROM_HANDLER Procedure

This procedure removes a statement from a statement DML handler.

Syntax

```
DBMS_STREAMS_HANDLER_ADM.REMOVE_STMT_FROM_HANDLER(
   handler_name       IN VARCHAR2,
   execution_sequence IN NUMBER  DEFAULT NULL);
```

Parameters

Table 144–8 REMOVE_STMT_FROM_HANDLER Procedure Parameters

Parameter	Description
`handler_name`	The name of the statement DML handler.
`execution_ sequence`	The position of the statement to remove. You can specify a positive or negative integer or decimal, or you can specify 0 (zero). If `NULL`, the procedure removes the last statement in the statement DML handler. If the specified execution sequence number does not exist for the statement DML handler, then the procedure raises an error.

145

DBMS_STREAMS_MESSAGING

The DBMS_STREAMS_MESSAGING package, one of a set of Oracle Streams packages, provides interfaces to enqueue messages into and dequeue messages from a ANYDATA queue.

Note: Currently, messaging clients cannot dequeue buffered messages. In addition, the DBMS_STREAMS_MESSAGING package cannot be used to enqueue messages into or dequeue messages from a buffered queue. However, the DBMS_AQ package can be used to enqueue and dequeue buffered messages.

See Also:

- *Oracle Database 2 Day + Data Replication and Integration Guide* for more information about Oracle Streams and for an example that uses the procedures in this package
- *Oracle Streams Advanced Queuing User's Guide* for more information about queues, messaging, and the DBMS_AQ package

This chapter contains the following topic:

- Summary of DBMS_STREAMS_MESSAGING Subprograms

Summary of DBMS_STREAMS_MESSAGING Subprograms

Table 145–1 DBMS_STREAMS_MESSAGING Package Subprograms

Subprogram	Description
DEQUEUE Procedure on page 145-3	Uses the specified Oracle Streams messaging client to dequeue a message from the specified queue
ENQUEUE Procedure on page 145-5	The current user enqueues a message into the specified queue

Note: The subprograms in this package do not commit.

DEQUEUE Procedure

This procedure uses the specified Oracle Streams messaging client to dequeue a message from the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid OUT` parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.DEQUEUE(
   queue_name    IN   VARCHAR2,
   streams_name  IN   VARCHAR2,
   payload       OUT  ANYDATA,
   dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
   navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
   wait          IN   BINARY_INTEGER  DEFAULT FOREVER,
   msgid         OUT  RAW);

DBMS_STREAMS_MESSAGING.DEQUEUE(
   queue_name    IN   VARCHAR2,
   streams_name  IN   VARCHAR2,
   payload       OUT  ANYDATA,
   dequeue_mode  IN   VARCHAR2        DEFAULT 'REMOVE',
   navigation    IN   VARCHAR2        DEFAULT 'NEXT MESSAGE',
   wait          IN   BINARY_INTEGER  DEFAULT FOREVER);
```

Parameters

Table 145–2 DEQUEUE Procedure Parameters

Parameter	Description
`queue_name`	The name of the local queue from which messages will be dequeued, specified as `[`*`schema_name`*`.]`*`queue_name`*. The current database must contain the queue, and the queue must be a secure queue of `ANYDATA` type. For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.
`streams_name`	The name of the Oracle Streams messaging client. For example, if the user `strmadmin` is the messaging client, then specify `strmadmin`. If `NULL` and a relevant messaging client for the queue exists, then the procedure uses the relevant messaging client. If `NULL` and multiple relevant messaging clients for the queue exist, then the procedure raises an error.
`payload`	The payload that is dequeued
`dequeue_mode`	Specify one of the following settings: `REMOVE`: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. `LOCKED`: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. `BROWSE`: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.

Table 145–2 (Cont.) DEQUEUE Procedure Parameters

Parameter	Description
navigation	Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Specify one of the following settings: NEXT MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then retrieve the next available message that matches the search criteria and belongs to the message group. This setting is the default. NEXT TRANSACTION: Skip the remainder of the current message group (if any) and retrieve the first message of the next message group. This setting can only be used if message grouping is enabled for the current queue. FIRST MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue. **Note:** Each message group contains the messages in a single transaction. **See Also:** *Oracle Streams Advanced Queuing User's Guide* for more information about dequeue options
wait	Either FOREVER or NO_WAIT If FOREVER, then the dequeue call is blocked without a time out until a message is available in the queue. If NO_WAIT, then a wait time of zero seconds is used. In this case, the dequeue will return immediately even if there are no messages in the queue.
msgid	Specifies the message identifier of the message that is dequeued

Exceptions

Table 145–3 DEQUEUE Procedure Exceptions

Exception	Description
ENDOFCURTRANS	Dequeue has reached the end of the messages in the current transaction. Specify this exception in the following way: SYS.DBMS_STREAMS_MESSAGING.ENDOFCURTRANS Every dequeue procedure should include an exception handler that handles this exception.
NOMOREMSGS	There are no more messages in the queue for the dequeue operation. Specify this exception in the following way: SYS.DBMS_STREAMS_MESSAGING.NOMOREMSGS A dequeue procedure that specifies NO_WAIT for the wait parameter should include an exception handler that handles this exception.

ENQUEUE Procedure

This procedure enables the current user to enqueue a message into the specified queue.

This procedure is overloaded. One version of this procedure contains the `msgid OUT` parameter, and the other does not.

Syntax

```
DBMS_STREAMS_MESSAGING.ENQUEUE(
   queue_name  IN   VARCHAR2,
   payload     IN   ANYDATA,
   msgid       OUT  RAW);

DBMS_STREAMS_MESSAGING.ENQUEUE(
   queue_name  IN   VARCHAR2,
   payload     IN   ANYDATA);
```

Parameters

Table 145–4 ENQUEUE Procedure Parameters

Parameter	Description
`queue_name`	The name of the local queue into which messages will be enqueued, specified as `[`*`schema_name`*`.]`*`queue_name`*. The current database must contain the queue, and the queue must be a secure queue of `ANYDATA` type. For example, to specify a queue named `streams_queue` in the `strmadmin` schema, enter `strmadmin.streams_queue` for this parameter. If the schema is not specified, then the current user is the default.
`payload`	The payload that is enqueued
`msgid`	Specifies the message identifier of the message that is enqueued

Usage Notes

To successfully enqueue messages into a queue, the current user must be mapped to a unique Advanced Queuing agent with the same name as the current user. You can run the `DBMS_STREAMS_ADM.SET_UP_QUEUE` procedure and specify a user as the queue user to grant the necessary privileges to the user to perform enqueues. The Advanced Queuing agent is created automatically when you run `SET_UP_QUEUE` and specify a queue user.

See Also: SET_UP_QUEUE Procedure on page 141-168

DBMS_STREAMS_TABLESPACE_ADM

The DBMS_STREAMS_TABLESPACE_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for copying tablespaces between databases and moving tablespaces from one database to another. This package uses transportable tablespaces, Data Pump, the DBMS_FILE_TRANSFER package, and the DBMS_FILE_GROUP package.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

This chapter contains the following topics:

- Using DBMS_STREAMS_TABLESPACE_ADM
  - Overview
- Data Structures
- Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

Using DBMS_STREAMS_TABLESPACE_ADM

This section contains topics which relate to using the `DBMS_STREAMS_TABLESPACE_ADM` package.

- Overview

Overview

Either a simple tablespace or a self-contained tablespace set must be specified in each procedure in this package.

A **self-contained tablespace** has no references from the tablespace pointing outside of the tablespace. For example, if an index in the tablespace is for a table in a different tablespace, then the tablespace is not self-contained. A **simple tablespace** is a self-contained tablespace that uses only one datafile.

A simple tablespace must be specified in the following procedures:

- ATTACH_SIMPLE_TABLESPACE Procedure
- CLONE_SIMPLE_TABLESPACE Procedure
- DETACH_SIMPLE_TABLESPACE Procedure
- PULL_SIMPLE_TABLESPACE Procedure

A **self-contained tablespace set** has no references from inside the set of tablespaces pointing outside of the set of tablespaces. For example, if a partitioned table is partially contained in the set of tablespaces, then the set of tablespaces is not self-contained.

A self-contained tablespace set must be specified in the following procedures:

- ATTACH_TABLESPACES Procedure
- CLONE_TABLESPACES Procedure
- DETACH_TABLESPACES Procedure
- PULL_TABLESPACES Procedure

To determine whether a set of tablespaces is self-contained, use the `TRANSPORT_SET_CHECK` procedure in the Oracle supplied package `DBMS_TTS`.

> **See Also:** *Oracle Database Administrator's Guide* for more information about self-contained tablespaces and tablespace sets

Data Structures

The DBMS_STREAMS_TABLESPACE_ADM package defines RECORD types and TABLE types.

RECORD Types

- FILE Record Type

TABLE Types

- DIRECTORY_OBJECT_SET Table Type
- FILE_SET Table Type
- TABLESPACE_SET Table Type

DIRECTORY_OBJECT_SET Table Type

Contains the names of one or more directory objects. Each name must be a directory object created using the SQL statement `CREATE DIRECTORY`.

Syntax

```
TYPE DIRECTORY_OBJECT_SET IS TABLE OF VARCHAR2(32)
  INDEX BY BINARY_INTEGER;
```

FILE Record Type

Contains the directory object associated with a directory and the name of the file in the directory.

Syntax

```
TYPE FILE IS RECORD(
   directory_object VARCHAR2(32),
   file_name        VARCHAR2(4000));
```

Fields

Table 146–1 FILE Fields

Field	Description
`directory_object`	The name of a directory object. You must specify the name of a directory object created using the SQL statement `CREATE DIRECTORY`.
`file_name`	The name of the file in the corresponding directory associated with the directory object

FILE_SET Table Type

Contains one or more files.

Syntax

```
TYPE FILE_SET IS TABLE OF FILE
   INDEX BY BINARY_INTEGER;
```

TABLESPACE_SET Table Type

Contains the names of one or more tablespaces.

Syntax

```
TYPE TABLESPACE_SET IS TABLE OF VARCHAR2(32)
   INDEX BY BINARY_INTEGER;
```

Summary of DBMS_STREAMS_TABLESPACE_ADM Subprograms

Table 146–2 DBMS_STREAMS_TABLESPACE_ADM Package Subprograms

Subprogram	Description
ATTACH_SIMPLE_TABLESPACE Procedure on page 146-10	Uses Data Pump to import a simple tablespace previously exported using the `DBMS_STREAMS_TABLESPACE_ADM` package or Data Pump export
ATTACH_TABLESPACES Procedure on page 146-12	Uses Data Pump to import a self-contained tablespace set previously exported using the `DBMS_STREAMS_TABLESPACE_ADM` package, Data Pump export, or the Recovery Manager (RMAN) `TRANSPORT TABLESPACE` command
CLONE_SIMPLE_TABLESPACE Procedure on page 146-17	Clones a simple tablespace. The tablespace can later be attached to a database.
CLONE_TABLESPACES Procedure on page 146-19	Clones a set of self-contained tablespaces. The tablespaces can later be attached to a database.
DETACH_SIMPLE_TABLESPACE Procedure on page 146-23	Detaches a simple tablespace. The tablespace can later be attached to a database.
DETACH_TABLESPACES Procedure on page 146-25	Detaches a set of self-contained tablespaces. The tablespaces can later be attached to a database.
PULL_SIMPLE_TABLESPACE Procedure on page 146-29	Copies a simple tablespace from a remote database and attaches it to the current database
PULL_TABLESPACES Procedure on page 146-31	Copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database

Note: All subprograms commit unless specified otherwise.

ATTACH_SIMPLE_TABLESPACE Procedure

This procedure uses Data Pump to import a simple tablespace previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_SIMPLE_TABLESPACE(
   directory_object      IN  VARCHAR2,
   tablespace_file_name  IN  VARCHAR2,
   converted_file_name   IN  VARCHAR2  DEFAULT NULL,
   datafile_platform     IN  VARCHAR2  DEFAULT NULL,
   tablespace_name       OUT VARCHAR2);
```

Parameters

Table 146–3 ATTACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
directory_object	The directory that contains the Data Pump dump file and the datafile for the tablespace. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.
	The name of the Data Pump export dump file must be the same as the data file name for the tablespace, except with a .dmp extension. If the converted_file_name is non-NULL, specify the dump file produced by the export database, not the file name after conversion.
	The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with an .alg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
	If NULL, then the procedure raises an error.
tablespace_file_name	The name of the datafile for the tablespace being imported.
	If NULL, then the procedure raises an error.
converted_file_name	If the datafile_platform parameter is non-NULL and is not the same as the platform of the local import database, then specify a file name for the converted datafile. The datafile is converted to the platform of the local import database and copied to the new file name. The existing datafile is not modified nor deleted.
	If non-NULL and the datafile_platform parameter is NULL, then the procedure ignores this parameter.
	If non-NULL and the datafile_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter.
	If NULL and the datafile_platform parameter is non-NULL, then the procedure raises an error.

Table 146–3 (Cont.) ATTACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
datafile_platform	Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
tablespace_name	Contains the name of the attached tablespace. The attached tablespace is read-only. Use an ALTER TABLESPACE statement to make the tablespace read/write if necessary.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role
- Have READ and WRITE privilege on the directory object that contains the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the directory_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: Overview on page 146-3

ATTACH_TABLESPACES Procedure

This procedure uses Data Pump to import a self-contained tablespace set previously exported using the DBMS_STREAMS_TABLESPACE_ADM package, Data Pump export, or the Recovery Manager (RMAN) TRANSPORT TABLESPACE command.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the datapump_job_name parameter. This job performs the Data Pump import to complete the attach operation. In addition, if the platform at the export database is different than the local database platform, then this procedure optionally can create datafiles for the tablespace set that can be used with the local platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump import is performed. This version of the procedure uses the files in a file group version and can copy the export dump file, export log file, and the datafiles that comprise the tablespace set into the specified directories. The file group and version are specified using the file_group_name and version_name parameters, respectively. This version of the procedure does not require a datafiles platform specification if the platform at the export database is different than the local database platform. Instead, the tablespace set is migrated automatically to the correct platform when it is attached.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
   datapump_job_name          IN OUT VARCHAR2,
   dump_file                  IN     FILE,
   tablespace_files           IN     FILE_SET,
   converted_files            IN     FILE_SET,
   datafiles_platform         IN     VARCHAR2  DEFAULT NULL,
   log_file                   IN     FILE      DEFAULT NULL,
   tablespace_names           OUT    TABLESPACE_SET);

DBMS_STREAMS_TABLESPACE_ADM.ATTACH_TABLESPACES(
   file_group_name            IN   VARCHAR2,
   version_name               IN   VARCHAR2  DEFAULT NULL,
   datafiles_directory_object IN   VARCHAR2  DEFAULT NULL,
   logfile_directory_object   IN   VARCHAR2  DEFAULT NULL,
   repository_db_link         IN   VARCHAR2  DEFAULT NULL,
   tablespace_names           OUT  TABLESPACE_SET);
```

Parameters

Table 146–4 ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.

Table 146–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
dump_file	The file name of the Data Pump dump file to import. If NULL or if a file attribute is NULL, then the procedure raises an error.
tablespace_files	The file set that contains the datafiles for the tablespace set being imported. If NULL, then the procedure raises an error.
converted_files	If the datafiles_platform parameter is non-NULL and is not the same as the platform for the local import database, then specify a file set with the names of the converted datafiles. The datafiles are converted to the platform of the local import database and copied to the new file names. In this case, the number of files in the specified file set must match the number of files in the file set specified for the tablespace_files parameter. The existing datafiles are not modified nor deleted. If non-NULL and the datafiles_platform parameter is NULL, then the procedure ignores this parameter. If non-NULL and the datafiles_platform parameter specifies the same platform as the local import database, then the procedure ignores this parameter. If NULL and the datafiles_platform parameter is non-NULL, then the procedure raises an error.
datafiles_platform	Specify NULL if the platform is the same for the export database and the current import database. Specify the platform for the export database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
log_file	Specify the log file name for the Data Pump import. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .alg and places it in the Data Pump export dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default.
version_name	The name of the file group version to attach. If NULL, then the procedure uses the version with the latest creation time for the file group.

Table 146–4 (Cont.) ATTACH_TABLESPACES Procedure Parameters

Parameter	Description
datafiles_directory_object	The directory object into which the datafiles and Data Pump export dump file are copied. The files are copied from the tablespace repository directories to this directory. If non-NULL, the attached tablespaces use the files in specified directory. However, the file group version specified in the version_name parameter consists of the files in the original directory, not in the directory specified by this datafiles_directory_object parameter. If NULL, then the procedure does not copy the datafiles and dump file.
logfile_directory_object	The directory object into which the Data Pump import log file is placed. The system generates a log file name with the extension .alg. If NULL, then the procedure places the import log file in the same directory as the dump file.
repository_db_link	If the file group is in a different database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then meet the following requirements: ■ Each directory object that contains files in the version being attached must exist on both databases. ■ The corresponding directory objects must have the same names on both databases. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.
tablespace_names	Contains the names of the attached tablespaces. The attached tablespaces are read-only. Use ALTER TABLESPACE statements to make the tablespaces read/write if necessary.

Usage Notes

The following sections contain usage notes for this procedure:

- User Requirements
- Procedures Used to Clone or Detach a Tablespace Set
- When the Attach Database Is Different Than the Clone or Detach Database
- Automatic Storage Management Directories

See Also:

- Overview on page 146-3
- *Oracle Streams Concepts and Administration*

User Requirements

To run either version of this procedure, a user must meet the following requirements:

- Have IMP_FULL_DATABASE role

- Have READ and WRITE privilege on the directory objects that contain the Data Pump export dump file and the datafiles for the tablespaces in the set, specified by the dump_file and tablespace_files parameters, or by the datafiles_directory_object parameter
- Have WRITE privilege on the directory object that will hold the Data Pump import log file, specified by the log_file parameter or logfile_directory_object parameter if it is non-NULL

If the Data Pump job version of the procedure is run, then the user must have WRITE privilege on the directory objects that will hold the converted datafiles for the tablespaces in the set if platform conversion is necessary. These directory objects are specified by the converted_files parameter if it is non-NULL.

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Procedures Used to Clone or Detach a Tablespace Set

After a tablespace set is cloned or detached using the CLONE_TABLESPACES or DETACH_TABLEPSACES procedure, respectively, the tablespace set can be attached to a database using the ATTACH_TABLESPACES procedure. If the Data Pump job version of the CLONE_TABLESPACES or DETACH_TABLEPSACES procedure was used, then use the Data Pump job version of the ATTACH_TABLESPACES procedure. If the file group version of the CLONE_TABLESPACES or DETACH_TABLEPSACES procedure was used, then use the file group version of the ATTACH_TABLESPACES procedure.

See Also:

- CLONE_TABLESPACES Procedure on page 146-19
- DETACH_TABLESPACES Procedure on page 146-25

When the Attach Database Is Different Than the Clone or Detach Database

You can attach a tablespace set to a different database than the database from which the tablespace set was cloned or detached. The two databases might or might not share a file system. If the two databases do not share a file system, then you must transfer the dump file and datafiles to the remote system using the DBMS_FILE_TRANSFER package, FTP, or some other method. You can attach the tablespace set in one of the following ways depending on the version of the ATTACH_TABLESPACES procedure you use:

- If you use the Data Pump job version of the procedure, then specify the relevant files on the file system. The directory object names can be different in the databases.
- If you use the file group version of the procedure, then you can use the repository_db_link parameter to specify the database where tablespace repository resides. The directory objects for the files must exist and must match in the databases.

See Also:

- CLONE_TABLESPACES Procedure on page 146-19
- DETACH_TABLESPACES Procedure on page 146-25
- Chapter 64, "DBMS_FILE_GROUP" for more information about file groups

Automatic Storage Management Directories

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

> **See Also:** *Oracle Database Utilities* for information about specifying ASM directories for directory objects

CLONE_SIMPLE_TABLESPACE Procedure

This procedure clones a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the specified directory
3. Places the datafile for the specified tablespace in the specified directory
4. If this procedure made the tablespace read-only, then makes the tablespace read/write

In addition, this procedure optionally can create a datafile for the tablespace that can be used with a platform that is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_SIMPLE_TABLESPACE(
   tablespace_name      IN  VARCHAR2,
   directory_object     IN  VARCHAR2,
   destination_platform IN  VARCHAR2  DEFAULT NULL,
   tablespace_file_name OUT VARCHAR2);
```

Parameters

Table 146–5 CLONE_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
`tablespace_name`	The tablespace to be cloned. If `NULL`, then the procedure raises an error.
`directory_object`	The directory where the Data Pump export dump file, the Data Pump export log file, and the datafile for the tablespace are placed. You must specify the name of a directory object created using the SQL statement `CREATE DIRECTORY`. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a `.dmp` extension. If a file already exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a `.clg` extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file. If `NULL`, then the procedure raises an error.
`destination_platform`	Specify `NULL` if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the `PLATFORM_NAME` column in the `V$DATABASE` dynamic performance view. The `V$TRANSPORTABLE_PLATFORM` dynamic performance view lists all platforms that support cross-platform transportable tablespaces.

Table 146–5 (Cont.) CLONE_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
`tablespace_file_name`	Contains the name of the cloned tablespace datafile. This datafile is placed in the directory specified by the parameter `directory_object`.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have `EXP_FULL_DATABASE` role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include `DBA_TABLESPACES` and `USER_TABLESPACES`.
- Have `MANAGE TABLESPACE` or `ALTER TABLESPACE` on a tablespace if the tablespace must be made read-only
- Have `READ` privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.
- Have `READ` and `WRITE` privilege on the directory object that will contain the Data Pump export dump file, specified by the `directory_object` parameter
- If the file group version of the procedure is run, then the user must have the necessary privileges to manage file group.

After cloning a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

- Overview on page 146-3
- ATTACH_SIMPLE_TABLESPACE Procedure on page 146-10 and PULL_SIMPLE_TABLESPACE Procedure on page 146-29

CLONE_TABLESPACES Procedure

This procedure clones a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set and places the dump file in the specified directory
3. Places the datafiles that comprise the specified tablespace set in the specified directory
4. If this procedure made a tablespace read-only, then makes the tablespace read/write

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the specified directories, but the files are not added to a file group version. In addition, this version of the procedure optionally can create datafiles for the tablespace set that can be used with a platform that is different than the local database platform.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the clone operation by placing the export dump file, export log file, and the datafiles that comprise the tablespace set in the appropriate file group version. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. This version of the procedure does not require a destination platform specification if the destination platform is different. Instead, the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
   datapump_job_name            IN OUT VARCHAR2,
   tablespace_names             IN     TABLESPACE_SET,
   dump_file                    IN     FILE,
   tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
   destination_platform         IN     VARCHAR2  DEFAULT NULL,
   log_file                     IN     FILE      DEFAULT NULL,
   tablespace_files             OUT    FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.CLONE_TABLESPACES(
   tablespace_names             IN  TABLESPACE_SET,
   tablespace_directory_object  IN  VARCHAR2  DEFAULT NULL,
   log_file_directory_object    IN  VARCHAR2  DEFAULT NULL,
   file_group_name              IN  VARCHAR2,
   version_name                 IN  VARCHAR2  DEFAULT NULL,
   repository_db_link           IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 146–6 CLONE_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.
tablespace_names	The tablespace set to be cloned. If NULL, then the procedure raises an error.
dump_file	The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file already exists, then the procedure raises an error.
tablespace_directory_objects	The set of directory objects into which the datafiles for the tablespaces are copied. If more than one directory object is in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure copies datafiles for the tablespace set to the dump file directory.
destination_platform	Specify NULL if the platform is the same for the current export database and the intended import database. Specify the platform for the intended import database if the platform is different for the export database and the import database. You can determine the platform of a database by querying the PLATFORM_NAME column in the V$DATABASE dynamic performance view. The V$TRANSPORTABLE_PLATFORM dynamic performance view lists all platforms that support cross-platform transportable tablespaces.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .clg and places it in the dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.

Table 146–6 (Cont.) CLONE_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_directory_object	The directory object into which the data files are copied and Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp. If NULL, then the procedure copies the datafiles to and places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error.
log_file_directory_object	The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .clg. If NULL, then the procedure uses the directory object specified in tablespace_directory_object.
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default. If the specified file group does not exist, then the procedure creates it.
version_name	The name of the version into which the cloned tablespace set is placed. The specified version name cannot be a positive integer. If the specified version does not exist, then the procedure creates it. If the specified version exists, then the procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version. If NULL, then the procedure creates a new version, and the version number can be used to manage the version.
repository_db_link	If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then the directory object specified in tablespace_directory_object must exist on the local database and on the remote database. If tablespace_directory_object is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.
tablespace_files	Contains the datafiles for the cloned tablespace set. These datafiles are placed in the directories specified by the directory objects in the parameter tablespace_directory_objects.

Usage Notes

To run either version of this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the tablespace_names parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the dump_file parameter or the tablespace_directory_object parameter
- Have WRITE privilege on the directory objects that will contain the copied datafiles for the tablespaces in the set, specified by the tablespace_directory_objects parameter if non-NULL or the tablespace_directory_object parameter
- Have WRITE privilege on the directory object that will contain the Data Pump export log file, specified by the log_file parameter if non-NULL or the log_file_directory_object parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After cloning a tablespace set using this procedure, you can attach the tablespaces to a different database using the ATTACH_TABLESPACES procedure.

See Also:

- Overview on page 146-3
- ATTACH_TABLESPACES Procedure on page 146-12
- Chapter 64, "DBMS_FILE_GROUP" for more information about file groups
- *Oracle Streams Concepts and Administration*

DETACH_SIMPLE_TABLESPACE Procedure

This procedure detaches a simple tablespace. The specified tablespace must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace and places the dump file in the directory that contains the tablespace datafile
3. Drops the tablespace and its contents from the database

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_SIMPLE_TABLESPACE(
   tablespace_name       IN  VARCHAR2,
   directory_object      OUT VARCHAR2,
   tablespace_file_name  OUT VARCHAR2);
```

Parameters

Table 146–7 DETACH_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.
directory_object	Contains the directory where the Data Pump export dump file and the Data Pump export log file are placed. The procedure uses the directory of the datafile for the tablespace. Therefore, make sure a directory object created using the SQL statement CREATE DIRECTORY exists for this directory. The name of the Data Pump export dump file is the same as the data file name for the tablespace, except with a .dmp extension. If a file already exists with the same name as the dump file in the directory, then the procedure raises an error. The name of the log file is the same as the data file name for the tablespace, except with a .dlg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
tablespace_file_name	Contains the name of the detached tablespace datafile.

Usage Notes

To run this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only

- Have `READ` and `WRITE` privilege on the directory object for the directory that contains the tablespace datafile. The name of this tablespace is specified by the `tablespace_name` parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure. This directory also will contain the Data Pump export dump file generated by this procedure.

After detaching a tablespace using this procedure, you can add the tablespace to a different database using the `ATTACH_SIMPLE_TABLESPACE` procedure. If the database is a remote database and you want to use the `ATTACH_SIMPLE_TABLESPACE` procedure, then you can transfer the dump file and datafile to the remote system using the `DBMS_FILE_TRANSFER` package, FTP, or some other method. You can use the two `OUT` parameters in this procedure to accomplish the attach or pull operation.

Automatic Storage Management (ASM) directories cannot be used with this procedure.

Note: Do not use the `DETACH_SIMPLE_TABLESPACE` procedure on a tablespace if the tablespace is using the Oracle-managed files feature. If you do, then the datafile for the tablespace is dropped automatically when the tablespace is dropped.

See Also:

- Overview on page 146-3
- ATTACH_SIMPLE_TABLESPACE Procedure on page 146-10 and PULL_SIMPLE_TABLESPACE Procedure on page 146-29
- *Oracle Database Administrator's Guide* for more information about the Oracle-managed files feature

DETACH_TABLESPACES Procedure

This procedure detaches a set of self-contained tablespaces. All of the tablespaces in the specified tablespace set must be online and any table partitions must not span tablespaces in the tablespace set.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set read-only
2. Uses Data Pump to export the metadata for the tablespace set and places the dump file in the specified directory
3. Drops the tablespaces in the specified tablespace set and their contents from the database

This procedure does not move or copy the datafiles that comprise the specified tablespace set.

This procedure is overloaded and consists of the following versions:

- One version of the procedure uses a Data Pump job name in the `datapump_job_name` parameter. This job performs the Data Pump export. This version of the procedure completes the detach operation by placing the export dump file and export log file in the specified directories, but the files are not added to a file group version.
- The other version of the procedure uses a file group that can consist of multiple versions of the tablespace set in a tablespace repository. A tablespace repository is a collection of tablespace sets in a file group repository. When this version of the procedure is run, a Data Pump export is performed, and this version of the procedure completes the detach operation by placing the export dump file and export log file in the appropriate file group version. The datafiles that comprise the tablespace set are not moved or copied, but they are referenced in the version that is detached. The file group and version are specified using the `file_group_name` and `version_name` parameters, respectively. Also, if the destination platform is different, then the tablespace set is migrated automatically to the correct platform when it is attached at the destination database using the file group version of the `ATTACH_TABLESPACES` procedure.

> **Note:** Do not use the `DETACH_TABLESPACES` procedure if any of the tablespaces in the tablespace set are using the Oracle-managed files feature. If you do, then the datafiles for these tablespaces are dropped automatically when the tablespaces are dropped.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
   datapump_job_name         IN OUT VARCHAR2,
   tablespace_names          IN     TABLESPACE_SET,
   dump_file                 IN     FILE,
   log_file                  IN     FILE  DEFAULT NULL,
   tablespace_files          OUT    FILE_SET);

DBMS_STREAMS_TABLESPACE_ADM.DETACH_TABLESPACES(
   tablespace_names          IN TABLESPACE_SET,
   export_directory_object   IN VARCHAR2  DEFAULT NULL,
   log_file_directory_object IN VARCHAR2  DEFAULT NULL,
   file_group_name           IN VARCHAR2,
```

```
  version_name              IN VARCHAR2  DEFAULT NULL,
  repository_db_link        IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 146–8 DETACH_TABLESPACES Procedure Parameters

Parameter	Description
data_pump_job_name	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If NULL, then the system generates a Data Pump job name.
tablespace_names	The tablespace set to be detached. If NULL, then the procedure raises an error.
dump_file	The file name of the Data Pump dump file that is exported. If NULL or if a file attribute is NULL, then the procedure raises an error. If the specified file already exists, then the procedure raises an error.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .dlg and places it in the dump file directory. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
tablespace_files	Contains the names of the datafiles for the detached tablespace set.
export_directory_object	The directory object into which the Data Pump export dump file is placed. The system generates a dump file name with the extension .dmp. If NULL, then procedure places the dump file in the default directory object for the version. If the version does not have a default directory object, then the procedure uses the default directory object for the file group. If NULL and no default directory object exists for the version or file group, then the procedure raises an error.
log_file_directory_object	The directory object into which the Data Pump export log file is placed. The system generates a log file name with the extension .dlg. If NULL, then the procedure places the export log file in the same directory as the export dump file.
file_group_name	The name of the file group, specified as *[schema_name.]file_group_name*. For example, if the schema is hq_dba and the file group name is sales, then specify hq_dba.sales. If the schema is not specified, then the current user is the default. If the specified file group does not exist, then the procedure creates it.

Table 146–8 (Cont.) DETACH_TABLESPACES Procedure Parameters

Parameter	Description
version_name	The name of the version into which the detached tablespace set is placed. The specified version name cannot be a positive integer. If the specified version does not exist, then the procedure creates it. If the specified version exists, then procedure adds the tablespace set to the version. Only one Data Pump export dump file can exist in a version. If NULL, then the procedure creates a new version, and the version number can be used to manage the version.
repository_db_link	If the file group is in a remote database, then specify the name of the database link to the database that contains the file group. The database link must be accessible to the user who runs the procedure. If this parameter is non-NULL, then the directory object specified in export_directory_object must exist on the local database and on the remote database. If export_directory_object is NULL, then the default directory object must exist on both databases. The directory object must have the same name on each database and must correspond to the same directory on a shared file system. If NULL, then the procedure does not use a database link, and the procedure uses the file group in the local database.

Usage Notes

To run this either version of this procedure, a user must meet the following requirements:

- Have EXP_FULL_DATABASE role
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have DROP TABLESPACE privilege
- Have MANAGE TABLESPACE or ALTER TABLESPACE on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the tablespace_names parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.
- Have READ and WRITE privilege on the directory object that will contain the Data Pump export dump file, specified by the dump_file parameter or the export_directory_object parameter
- Have WRITE privilege on the directory object that will contain the Data Pump export the log file, specified by the log_file parameter if non-NULL or by the log_file_directory_object parameter if non-NULL

If the file group version of the procedure is run, then the user must have the necessary privileges to manage the file group.

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

After detaching a tablespace set using this procedure, you can attach the tablespaces to a different database using the `ATTACH_TABLESPACES` procedure.

PULL_SIMPLE_TABLESPACE Procedure

This procedure copies a simple tablespace from a remote database and attaches it to the current database. The specified tablespace at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes the specified tablespace read-only at the remote database if it is not read-only
2. Uses Data Pump to export the metadata for the tablespace
3. Uses a database link and the DBMS_FILE_TRANSFER package to transfer the datafile for the tablespace and the log file for the Data Pump export to the current database
4. Places the datafile for the specified tablespace and the log file for the Data Pump export in the specified directory at the local database
5. If this procedure made the tablespace read-only, then makes the tablespace read/write
6. Uses Data Pump to import the metadata for the tablespace in the local database

In addition, this procedure optionally can create a datafile for the tablespace that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_SIMPLE_TABLESPACE(
   tablespace_name          IN VARCHAR2,
   database_link            IN VARCHAR2,
   directory_object         IN VARCHAR2  DEFAULT NULL,
   conversion_extension     IN VARCHAR2  DEFAULT NULL,
   convert_directory_object IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 146–9 PULL_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
tablespace_name	The tablespace to be pulled. If NULL, then the procedure raises an error.
database_link	The name of the database link to the database that contains the tablespace to pull. The database link must be accessible to the user who runs the procedure. If NULL, then the procedure raises an error.
directory_object	The directory object to which the datafile for the tablespace is copied on the local database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY. The Data Pump import log file is written to this directory. The name of the log file is the same as the data file name for the tablespace, except with a .plg extension. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file. If NULL, then the procedure raises an error.

Table 146–9 (Cont.) PULL_SIMPLE_TABLESPACE Procedure Parameters

Parameter	Description
conversion_extension	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafile that is different than the extension for the tablespace datafile at the remote database. In this case, the procedure transfers the datafile to the import database and converts it to be compatible with the current import database platform automatically. After conversion is complete, the original datafile is deleted at the import database.
convert_directory_object	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the EXP_FULL_DATABASE role
- Have EXECUTE privilege on the DBMS_STREAMS_TABLESPACE_ADM package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE privilege on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory object for the directory that contains the datafile for the tablespace. The name of this tablespace is specified by the tablespace_name parameter. If a directory object does not exist for this directory, then create the directory object and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles IMP_FULL_DATABASE and EXECUTE_CATALOG_ROLE
- Have WRITE privilege on the directory object that will contain the Data Pump export the log file, specified by the log_file parameter if non-NULL
- Have WRITE privilege on the directory object that will hold the datafile for the tablespace, specified by the directory_object parameter

Automatic Storage Management (ASM) directories cannot be used with this procedure.

See Also: Overview on page 146-3

PULL_TABLESPACES Procedure

This procedure copies a set of self-contained tablespaces from a remote database and attaches the tablespaces to the current database. All of the tablespaces in the specified tablespace set at the remote database must be online.

Specifically, this procedure performs the following actions:

1. Makes any read/write tablespace in the specified tablespace set at the remote database read-only
2. Uses Data Pump to export the metadata for the tablespaces in the tablespace set
3. Uses a database link and the `DBMS_FILE_TRANSFER` package to transfer the datafiles for the tablespace set and the log file for the Data Pump export to the current database
4. Places the datafiles that comprise the specified tablespace set in the specified directories at the local database
5. Places the log file for the Data Pump export in the specified directory at the local database
6. If this procedure made a tablespace read-only, then makes the tablespace read/write
7. Uses Data Pump to import the metadata for the tablespaces in the tablespace set at the local database

In addition, this procedure optionally can create datafiles for the tablespace set that can be used with the local platform, if the platform at the remote database is different than the local database platform.

Syntax

```
DBMS_STREAMS_TABLESPACE_ADM.PULL_TABLESPACES(
   datapump_job_name            IN OUT VARCHAR2,
   database_link                IN     VARCHAR2,
   tablespace_names             IN     TABLESPACE_SET,
   tablespace_directory_objects IN     DIRECTORY_OBJECT_SET,
   log_file                     IN     FILE,
   conversion_extension         IN     VARCHAR2  DEFAULT NULL,
   convert_directory_object     IN     VARCHAR2  DEFAULT NULL);
```

Parameters

Table 146–10 PULL_TABLESPACES Procedure Parameters

Parameter	Description
`data_pump_job_name`	The Data Pump job name. Specify a Data Pump job name if you want to adhere to naming conventions or if you want to track the job more easily. If `NULL`, then the system generates a Data Pump job name.
`database_link`	The name of the database link to the database that contains the tablespace set to pull. The database link must be accessible to the user who runs the procedure. If `NULL`, then the procedure raises an error.

Table 146–10 (Cont.) PULL_TABLESPACES Procedure Parameters

Parameter	Description
tablespace_names	The tablespace set to be pulled. If NULL, then the procedure raises an error.
tablespace_directory_objects	The set of directory objects to which the datafiles for the tablespaces are copied. If more than one directory object is in the set, then the procedure copies a datafile to each directory object in the set in sequence. In this case, if the end of the directory object set is reached, then datafile copying starts again with the first directory object in the set. If NULL, then the procedure raises an error.
log_file	Specify the log file name for the Data Pump export. If NULL or if at least one file parameter is NULL, then the system generates a log file name with the extension .plg and places it in one of the data file directories. If a file already exists with the same name as the log file in the directory, then the procedure overwrites the file.
conversion_extension	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify an extension for the tablespace datafiles that is different than the extension for the tablespace datafiles at the remote database. In this case, the procedure transfers the datafiles to the import database and converts them to be compatible with the current import database platform automatically. After conversion is complete, the original datafiles are deleted at the import database.
convert_directory_object	Specify NULL if the platform is the same for the remote export database and the current import database. If the platform is different for the export database and the import database, then specify a directory object in the local export database. The procedure uses the directory object for platform conversion before it transfers the files to the remote database. You must specify the name of a directory object created using the SQL statement CREATE DIRECTORY.

Usage Notes

To run this procedure, a user must meet the following requirements on the remote database:

- Have the EXP_FULL_DATABASE role
- Have EXECUTE privilege on the DBMS_STREAMS_TABLESPACE_ADM package
- Have access to at least one data dictionary view that contains information about the tablespaces. These views include DBA_TABLESPACES and USER_TABLESPACES.
- Have MANAGE TABLESPACE or ALTER TABLESPACE privilege on a tablespace if the tablespace must be made read-only
- Have READ privilege on the directory objects for the directories that contain the datafiles for the tablespace set. The names of these tablespaces are specified by the

`tablespace_names` parameter. If a directory object does not exist for one or more of these directories, then create the directory objects and grant the necessary privileges before you run this procedure.

To run this procedure, a user must meet the following requirements on the local database:

- Have the roles `IMP_FULL_DATABASE` and `EXECUTE_CATALOG_ROLE`
- Have `WRITE` privilege on the directory object that will contain the Data Pump export the log file, specified by the `log_file` parameter if non-`NULL`
- Have `WRITE` privilege on the directory objects that will hold the datafiles for the tablespaces in the set, specified by the `tablespace_directory_objects` parameter

Automatic Storage Management (ASM) directories can be specified for the directory objects that store datafiles and export dump files, but ASM directories cannot be specified for directory objects that store log files.

147

DBMS_TDB

The DBMS_TDB package reports whether a database can be transported between platforms using the RMAN CONVERT DATABASE command. The package verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.

> **See Also:** *Oracle Database Backup and Recovery User's Guide* regarding database transport using CONVERT DATABASE

This chapter contains the following topics:

- Using DBMS_TDB
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- Summary of DBMS_TDB Subprograms

Using DBMS_TDB

This section contains topics which relate to using `DBMS_TDB`.

- Overview
- Constants
- Views
- Operational Notes

Overview

In many cases, Oracle supports transporting databases between platforms which have the same endian format. However, even when the endian formats are the same, a database must undergo a conversion process to move from one platform to another. There are also preconditions required for the process of transporting a database, such as having the database to be transported open read-only.

The `DBMS_TDB` package serves two purposes:

- Confirming that Oracle supports transporting a database from a given source platform to a given target platform
- Determining whether a database to be transported has been properly prepared for transport, and if not, identifying the condition that prevents database transport

The actual conversion is performed using the Recovery Manager `CONVERT DATABASE` command. For a complete discussion of the requirements for transporting a database, the process of converting a database for transport across platforms, and examples of the use of the `DBMS_TDB` subprograms in the conversion process, see *Oracle Database Backup and Recovery User's Guide*.

Security Model

Use of this package requires the `DBA` privilege.

Constants

The DBMS_TDB package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_TDB.SKIP_NONE.

The DBMS_TDB package uses the constants shown in Table 147–1.

Table 147–1 DBMS_TDB Constants

Name	Type	Value	Description
SKIP_NONE	NUMBER	0	Check all files when checking whether a database is ready for transport.
SKIP_OFFLINE	NUMBER	2	Skip files in offline tablespaces when checking whether a database is ready for transport.
SKIP_READONLY	NUMBER	3	Skip files in readonly tablespaces when checking whether a database is ready for transport.

Views

The DBMS_TDB package uses the following view listed in *Oracle Database Reference*:

- V$DB_TRANSPORTABLE_PLATFORM, which specifies which combinations of source and target platforms support database transport

Operational Notes

- The subprograms in this package are useful both in determining whether the desired cross-platform database conversion is possible, and in checking whether the database is ready for conversion. See *Oracle Database Backup and Recovery User's Guide* for details on the different uses of these subprograms are used in the conversion process.
- The subprograms in this package return simple `TRUE` or `FALSE` results to indicate whether database transport is possible. Use the subprograms with `SERVEROUTPUT ON` for informative messages about why transport is not possible.

Summary of DBMS_TDB Subprograms

Table 147–2 DBMS_TDB Package Subprograms

Subprogram	Description
CHECK_DB Function on page 147-9	Checks whether a database can be transported to a target platform
CHECK_EXTERNAL Function on page 147-9	Checks whether a database has external tables, directory or BFILEs

CHECK_DB Function

This function checks whether a database can be transported to a target platform. It tests whether transport is supported at all for a given source and destination platform, and whether the database is currently in the correct state for transport.

You can specify whether to skip checking parts of the database that are read-only or offline, if you do not plan to transport them.

The function is overloaded. The different functionality of each form of syntax is presented along with the definition.

Syntax

```
DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2,
     skip_option            IN  NUMBER)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB (
     target_platform_name   IN VARCHAR2)
   RETURN BOOLEAN;

DBMS_TDB.CHECK_DB
   RETURN BOOLEAN;
```

Parameters

Table 147–3 CHECK_DB Function Parameters

Parameter	Description
target_platform_name	The name of the destination platform, as it appears in V$DB_TRANSPORTABLE_PLATFORM.
skip_option	Specifies which, if any, parts of the database to skip when checking whether the database can be transported. Supported values are listed in Table 147–1, " DBMS_TDB Constants" on page 147-5.

Return Values

If the database cannot be transported to the target platform or is not ready to be transported, returns FALSE. If the database is ready for transport, returns TRUE.

Usage Notes

- If SERVEROUTPUT is ON, then the output will contain the reasons why the database cannot be transported and how to fix the problems. For details on possible reasons and fixes, see Table 147–4, " Reasons for CHECK_DB Function to Return FALSE" on page 147-9.

Table 147–4 Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Unrecognized target platform name.	Check V$DB_TRANSPORTABLE_PLATFORM for recognized platform names.

Table 147–4 (Cont.) Reasons for CHECK_DB Function to Return FALSE

Cause	Action
Target platform has a different endian format.	Conversion is not supported.
Database is not open read-only.	Open database read-only and retry.
There are active or in-doubt transactions in the database.	Open the database read-write. After the active transactions are rolled back, open the database read-only and retry the operation. This situation can occur if users flash back the database and open it read only. The active transactions will be rolled back when the database is opened read-write.
Deferred transaction rollback needs to be done.	Open the database read-write and bring online the necessary tablespaces. Once the deferred transaction rollback is complete, open the database read-only and retry the operation.
Database compatibility version is below 10.0.0.	Change the `COMPATIBLE` initialization parameter to 10.0.0 or higher, open the database read-only, and retry the operation.
Some tablespaces have not been open read-write with compatibility version is 10.0.0 or higher.	Change the `COMPATIBLE` initialization parameter to 10.0.0 or higher, then open the affected tablespaces read-write. Shut down the database, open it read-only, and retry the operation.

Examples

This example illustrates the use of `CHECK_DB` with a database that is open read-write:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
       db_ready BOOLEAN;
     BEGIN
       db_ready := DBMS_TDB.CHECK_DB('Microsoft Windows IA (32-bit)');
     END;
     /

Database is not open READ ONLY. Please open database READ ONLY and retry.

PL/SQL procedure successfully completed.
```

CHECK_EXTERNAL Function

This function determines whether a database has external tables, directories, or BFILEs.

Syntax

```
DBMS_TDB.CHECK_EXTERNAL
   RETURN BOOLEAN;
```

Return Values

If the database has external tables, directories, or BFILEs, return `TRUE`. Otherwise, return `FALSE`.

Usage Notes

- If `SERVEROUTPUT` is `ON`, then the function will output the names of the external tables, directories, and BFILEs in the database.
- The database must be open read-write.

Examples

This example illustrates the use of `CHECK_EXTERNAL` with a database that has several external tables, directories, and BFILEs:

```
SQL> SET SERVEROUTPUT ON
SQL> DECLARE
        external BOOLEAN;
     BEGIN
       external := DBMS_TDB.CHECK_EXTERNAL;
     END;
     /
The following external tables exist in the database:
SH.SALES_TRANSACTIONS_EXT
The following directories exist in the database:
SYS.MEDIA_DIR, SYS.DATA_FILE_DIR, SYS.LOG_FILE_DIR, SYS.DATA_PUMP_DIR
The following BFILEs exist in the database:
PM.PRINT_MEDIA

PL/SQL procedure successfully completed.
```

148

DBMS_TRACE

The DBMS_TRACE package contains the interface to trace PL/SQL functions, procedures, and exceptions.

This chapter contains the following topics:

- Using DBMS_TRACE
  - Overview
  - Security Model
  - Constants
  - Restrictions
  - Operational Notes
- Summary of DBMS_TRACE Subprograms

Using DBMS_TRACE

- Overview
- Security Model
- Constants
- Restrictions
- Operational Notes

Overview

DBMS_TRACE provides subprograms to start and stop PL/SQL tracing in a session. Oracle collects the trace data as the program executes and writes it to database tables.

A typical session involves:

- Starting PL/SQL tracing in session (DBMS_TRACE.SET_PLSQL_TRACE).
- Running an application to be traced.
- Stopping PL/SQL tracing in session (DBMS_TRACE.CLEAR_PLSQL_TRACE).

Security Model

This package must be created under `SYS`.

Constants

The DBMS_TRACE package uses the constants shown in Table 148–1, " DBMS_TRACE Constants":

Table 148–1 DBMS_TRACE Constants

Name	Type	Value	Description
TRACE_MINOR_VERSION	INTEGER	0	
TRACE_MAJOR_VERSION	INTEGER	1	
TRACE_ALL_CALLS	INTEGER	1	Traces calls or returns
TRACE_ENABLED_CALLS	INTEGER	2	
TRACE_ALL_EXCEPTIONS	INTEGER	4	Traces exceptions
TRACE_ENABLED_EXCEPTIONS	INTEGER	8	Traces exceptions and handlers
TRACE_LIMIT	INTEGER	16	Save only the last few records. This allows tracing up to a problem area, without filling the database up with masses of irrelevant information. If event 10940 is set, the limit is 1023*(the value of event 10940). This can be overridden by the use of "TRACE_LIMIT" flag.
TRACE_ALL_SQL	INTEGER	32	Traces SQL statements
TRACE_ENABLED_SQL	INTEGER	64	Traces SQL statements at PL/SQL level. This does not invoke SQL Trace
TRACE_ALL_LINES	INTEGER	128	Traces each line
TRACE_ENABLED_LINES	INTEGER	256	
TRACE_PAUSE	INTEGER	4096	Pauses trancing
TRACE_RESUME	INTEGER	8192	Resume tracing
TRACE_STOP	INTEGER	16384	Stops tracing
NO_TRACE_ADMINISTRATIVE	INTEGER	32768	Prevents tracing of 'administrative events such as ■ PL/SQL Trace Tool started ■ Trace flags changed ■ PL/SQL Virtual Machine started ■ PL/SQL Virtual Machine stopped
NO_TRACE_HANDLED_EXCEPTIONS	INTEGER	65536	Prevents tracing of handled exceptions

Oracle recommends using the symbolic form for all these constants.

Restrictions

You cannot use PL/SQL tracing in a shared server environment.

Operational Notes

- Controlling Data Volume
- Creating Database Tables to Collect DBMS_TRACE Output
- Collecting Trace Data
- Collected Data
- Trace Control

Controlling Data Volume

Profiling large applications may produce a large volume of data. You can control the volume of data collected by *enabling* specific program units for trace data collection.

You can enable a program unit by compiling it debug. This can be done in one of two ways:

```
alter session set plsql_debug=true;
create or replace ... /* create the library units - debug information will be
generated */
```

or:

```
/* recompile specific library unit with debug option */
alter [PROCEDURE | FUNCTION | PACKAGE BODY]  <libunit-name> compile debug;
```

Note: You cannot use the second method for anonymous blocks.

You can limit the amount of storage used in the database by retaining only the most recent 8,192 records (approximately) by including `TRACE_LIMIT` in the `TRACE_LEVEL` parameter of the `SET_PLSQL_TRACE` procedure.

Creating Database Tables to Collect DBMS_TRACE Output

You must create database tables into which the DBMS_TRACE package writes output. Otherwise, the data is not collected. To create these tables, run the script `TRACETAB.SQL`. The tables this script creates are owned by SYS.

Collecting Trace Data

The PL/SQL features you can trace are described in the script `DBMSPBT.SQL`. Some of the key tracing features are:

- Tracing Calls
- Tracing Exceptions
- Tracing SQL
- Tracing Lines

Additional features of DBMS_TRACE also allow pausing and resuming trace, and limiting the output.

Tracing Calls

Two levels of call tracing are available:

- Level 1: Trace all calls. This corresponds to the constant `TRACE_ALL_CALLS`.

- Level 2: Trace calls to enabled program units only. This corresponds to the constant TRACE_ENABLED_CALLS.

Enabling cannot be detected for remote procedure calls (RPCs); hence, RPCs are only traced with level 1.

Tracing Exceptions

Two levels of exception tracing are available:

- Level 1: Trace all exceptions. This corresponds to TRACE_ALL_EXCEPTIONS.
- Level 2: Trace exceptions raised in enabled program units only. This corresponds to TRACE_ENABLED_EXCEPTIONS.

Tracing SQL

Two levels of SQL tracing are available:

- Level 1: Trace all SQL. This corresponds to the constant TRACE_ALL_SQL.
- Level 2: Trace SQL in enabled program units only. This corresponds to the constant TRACE_ENABLED_SQL.

Tracing Lines

Two levels of line tracing are available:

- Level 1: Trace all lines. This corresponds to the constant TRACE_ALL_LINES.
- Level 2: Trace lines in enabled program units only. This corresponds to the constant TRACE_ENABLED_LINES.

When tracing lines, Oracle adds a record to the database each time the line number changes. This includes line number changes due to procedure calls and returns.

Note: For all types of tracing, level 1 overrides level 2. For example, if both level 1 and level 2 are enabled, then level 1 takes precedence.

Collected Data

If tracing is requested only for enabled program units, and if the current program unit is not enabled, then no trace data is written.

When tracing calls, both the call and return are traced. The check for whether tracing is "enabled" passes if either the called routine or the calling routine is "enabled".

Call tracing will always output the program unit type, program unit name, and line number for both the caller and the callee. It will output the caller's stack depth. If the caller's unit is enabled, the calling procedure name will also be output. If the callee's unit is enabled, the called procedure name will be output

Exception tracing writes out the line number. Raising the exception shows information on whether the exception is user-defined or pre-defined. It also shows the exception number in the case of pre-defined exceptions. Both the place where the exceptions are raised and their handler is traced. The check for tracing being "enabled" is done independently for the place where the exception is raised and the place where the exception is handled.

All calls to DBMS_TRACE.SET_PLSQL_TRACE and DBMS_TRACE.CLEAR_PLSQL_TRACE place a special trace record in the database. Therefore, it is always possible to determine when trace settings were changed.

Trace Control

As well as determining which items are collected, you can pause and resume the trace process. No information is gathered between the time that tracing is paused and the time that it is resumed. The constants `TRACE_PAUSE` and `TRACE_RESUME` are used to accomplish this. Trace records are generated to indicate that the trace was paused/resumed.

It is also possible to retain only the last 8,192 trace events of a run by using the constant `TRACE_LIMIT`. This allows tracing to be turned on without filling up the database. When tracing stops, the last 8,192 records are saved. The limit is approximate, since it is not checked on every trace record. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. At least the requested number of trace records will be generated; up to 1,000 additional records may be generated. The 8,192 record limit can be changed. Setting event 10940 to level *n* changes the record limit to 1024 * *n*.

Summary of DBMS_TRACE Subprograms

Table 148–2 DBMS_TRACE Package Subprograms

Subprogram	Description
CLEAR_PLSQL_TRACE Procedure on page 148-11	Stops trace data dumping in session
GET_PLSQL_TRACE_LEVEL Function on page 148-12	Gets the trace level
PLSQL_TRACE_VERSION Procedure on page 148-13	Gets the version number of the trace package
SET_PLSQL_TRACE Procedure on page 148-14	Starts tracing in the current session

CLEAR_PLSQL_TRACE Procedure

This procedure disables trace data collection.

Syntax

```
DBMS_TRACE.CLEAR_PLSQL_TRACE;
```

GET_PLSQL_TRACE_LEVEL Function

This procedure returns the current trace level as a list of the enabled constants.

Syntax

```
DBMS_TRACE.GET_PLSQL_TRACE_LEVEL
  RETURN BINARY_INTEGER;
```

PLSQL_TRACE_VERSION Procedure

This procedure gets the version number of the trace package. It returns the major and minor version number of the DBMS_TRACE package.

Syntax

```
DBMS_TRACE.PLSQL_TRACE_VERSION (
   major OUT BINARY_INTEGER,
   minor OUT BINARY_INTEGER);
```

Parameters

Table 148–3 PLSQL_TRACE_VERSION Procedure Parameters

Parameter	Description
major	Major version number of DBMS_TRACE.
minor	Minor version number of DBMS_TRACE.

SET_PLSQL_TRACE Procedure

This procedure enables PL/SQL trace data collection.

Syntax

```
DBMS_TRACE.SET_PLSQL_TRACE (
   trace_level INTEGER);
```

Parameters

Table 148–4 SET_PLSQL_TRACE Procedure Parameters

Parameter	Description
`trace_level`	You must supply one or more of the constants as listed in Table 148–1, " DBMS_TRACE Constants". By summing the constants, you can enable tracing of multiple PL/SQL language features simultaneously. The control constants "`TRACE_PAUSE`", "`TRACE_RESUME`" and "`TRACE_STOP`" should not be used in combination with other constants Also see "Collecting Trace Data" on page 148-7 for more information.

149

DBMS_TRANSACTION

The DBMS_TRANSACTION package provides access to SQL transaction statements from stored procedures.

> **See Also:** *Oracle Database SQL Language Reference*

This chapter contains the following topics:

- Using DBMS_TRANSACTION
  - Security Model
- Summary of DBMS_TRANSACTION Subprograms

Using DBMS_TRANSACTION

- Security Model

Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

Summary of DBMS_TRANSACTION Subprograms

Table 149–1 DBMS_TRANSACTION Package Subprograms

Subprogram	Description
ADVISE_COMMIT Procedure on page 149-6	Equivalent to the SQL statement: `ALTER SESSION ADVISE COMMIT`
ADVISE_NOTHING Procedure on page 149-7	Equivalent to the SQL statement: `ALTER SESSION ADVISE NOTHING`
ADVISE_ROLLBACK Procedure on page 149-8	Equivalent to the SQL statement: `ALTER SESSION ADVISE ROLLBACK`
BEGIN_DISCRETE_TRANSACTION Procedure on page 149-9	Sets "discrete transaction mode" for this transaction
COMMIT Procedure on page 149-10	Equivalent to the SQL statement: `COMMIT`
COMMIT_COMMENT Procedure on page 149-11	Equivalent to the SQL statement: `COMMIT COMMENT <text>`
COMMIT_FORCE Procedure on page 149-12	Equivalent to the SQL statement: `COMMIT FORCE <text>, <number>"`
LOCAL_TRANSACTION_ID Function on page 149-13	Returns the local (to instance) unique identifier for the current transaction
PURGE_LOST_DB_ENTRY Procedure on page 149-14	Enables removal of incomplete transactions from the local site when the remote database is destroyed or re-created before recovery completes
PURGE_MIXED Procedure on page 149-16	Deletes information about a given mixed outcome transaction
READ_ONLY Procedure on page 149-17	Equivalent to the SQL statement: `SET TRANSACTION READ ONLY`
READ_WRITE Procedure on page 149-18	equivalent to the SQL statement: `SET TRANSACTION READ WRITE`
ROLLBACK Procedure on page 149-19	Equivalent to the SQL statement: `ROLLBACK`
ROLLBACK_FORCE Procedure on page 149-20	Equivalent to the SQL statement: `ROLLBACK FORCE <text>`
ROLLBACK_SAVEPOINT Procedure on page 149-21	Equivalent to the SQL statement: `ROLLBACK TO SAVEPOINT <savepoint_name>`
SAVEPOINT Procedure on page 149-22	Equivalent to the SQL statement: `SAVEPOINT <savepoint_name>`
STEP_ID Function on page 149-23	Returns local (to local transaction) unique positive integer that orders the DML operations of a transaction

Table 149–1 (Cont.) DBMS_TRANSACTION Package Subprograms

Subprogram	Description
USE_ROLLBACK_SEGMENT Procedure on page 149-24	Equivalent to the SQL statement: `SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>`

ADVISE_COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE COMMIT
```

Syntax

```
DBMS_TRANSACTION.ADVISE_COMMIT;
```

ADVISE_NOTHING Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE NOTHING
```

Syntax

```
DBMS_TRANSACTION.ADVISE_NOTHING;
```

ADVISE_ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ALTER SESSION ADVISE ROLLBACK
```

Syntax

```
DBMS_TRANSACTION.ADVISE_ROLLBACK;
```

BEGIN_DISCRETE_TRANSACTION Procedure

This procedure sets "discrete transaction mode" for this transaction.

Syntax

```
DBMS_TRANSACTION.BEGIN_DISCRETE_TRANSACTION;
```

Exceptions

Table 149–2 BEGIN_DISCRETE_TRANSACTION Procedure Exceptions

Exception	Description
ORA-08175	A transaction attempted an operation which cannot be performed as a discrete transaction. If this exception is encountered, then rollback and retry the transaction
ORA-08176	A transaction encountered data changed by an operation that does not generate rollback data: create index, direct load or discrete transaction. If this exception is encountered, then retry the operation that received the exception.

Examples

```
DISCRETE_TRANSACTION_FAILED exception;
    pragma exception_init(DISCRETE_TRANSACTION_FAILED, -8175);
CONSISTENT_READ_FAILURE exception;
    pragma exception_init(CONSISTENT_READ_FAILURE, -8176);
```

COMMIT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.COMMIT;
```

COMMIT_COMMENT Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT COMMENT <text>
```

Syntax

```
DBMS_TRANSACTION.COMMIT_COMMENT (
   cmnt VARCHAR2);
```

Parameters

Table 149–3 COMMIT_COMMENT Procedure Parameters

Parameter	Description
cmnt	Comment to associate with this commit.

COMMIT_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
COMMIT FORCE <text>, <number>"
```

Syntax

```
DBMS_TRANSACTION.COMMIT_FORCE (
   xid VARCHAR2,
   scn VARCHAR2 DEFAULT NULL);
```

Parameters

Table 149–4 COMMIT_FORCE Procedure Parameters

Parameter	Description
xid	Local or global transaction ID.
scn	System change number.

LOCAL_TRANSACTION_ID Function

This function returns the local (to instance) unique identifier for the current transaction. It returns null if there is no current transaction.

Syntax

```
DBMS_TRANSACTION.LOCAL_TRANSACTION_ID (
   create_transaction BOOLEAN := FALSE)
  RETURN VARCHAR2;
```

Parameters

Table 149–5 LOCAL_TRANSACTION_ID Function Parameters

Parameter	Description
`create_transaction`	If true, then start a transaction if one is not currently active.

PURGE_LOST_DB_ENTRY Procedure

When a failure occurs during commit processing, automatic recovery consistently resolves the results at all sites involved in the transaction. However, if the remote database is destroyed or re-created before recovery completes, then the entries used to control recovery in DBA_2PC_PENDING and associated tables are never removed, and recovery will periodically retry. Procedure PURGE_LOST_DB_ENTRY enables removal of such transactions from the local site.

Syntax

```
DBMS_TRANSACTION.PURGE_LOST_DB_ENTRY (
   xid VARCHAR2);
```

Parameters

Table 149–6 PURGE_LOST_DB_ENTRY Procedure Parameters

Parameter	Description
xid	Must be set to the value of the LOCAL_TRAN_ID column in the DBA_2PC_PENDING table.

Usage Notes

WARNING: PURGE_LOST_DB_ENTRY should *only* be used when the other database is lost or has been re-created. Any other use may leave the other database in an unrecoverable or inconsistent state.

Before automatic recovery runs, the transaction may show up in DBA_2PC_PENDING as state "collecting", "committed", or "prepared". If the DBA has forced an in-doubt transaction to have a particular result by using "commit force" or "rollback force", then states "forced commit" or "forced rollback" may also appear. Automatic recovery normally deletes entries in any of these states. The only exception is when recovery finds a forced transaction which is in a state inconsistent with other sites in the transaction; in this case, the entry is left in the table and the MIXED column has the value 'yes'.

However, under certain conditions, it may not be possible for automatic recovery to run. For example, a remote database may have been permanently lost. Even if it is re-created, it gets a new database ID, so that recovery cannot identify it (a possible symptom is ORA-02062). In this case, the DBA may use the procedure PURGE_LOST_DB_ENTRY to clean up the entries in any state other than "prepared". The DBA does not need to be in any particular hurry to resolve these entries, because they are not holding any database resources.

The following table indicates what the various states indicate about the transaction and what the DBA actions should be:

Table 149–7 PURGE_LOST_DB_ENTRY Procedure States

State of Column	State of Global Transaction	State of Local Transaction	Normal DBA Action	Alternative DBA Action
Collecting	Rolled back	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Committed	Committed	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Prepared	Unknown	Prepared	None	FORCE COMMIT or ROLLBACK
Forced commit	Unknown	Committed	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced rollback	Unknown	Rolled back	None	PURGE_LOST_DB_ENTRY (See Note 1)
Forced commit (mixed)	Mixed	Committed	(See Note 2)	
Forced rollback (mixed)	Mixed	Rolled back	(See Note 2)	

NOTE 1: Use only if significant reconfiguration has occurred so that automatic recovery cannot resolve the transaction. Examples are total loss of the remote database, reconfiguration in software resulting in loss of two-phase commit capability, or loss of information from an external transaction coordinator such as a TP monitor.

NOTE 2: Examine and take any manual action to remove inconsistencies; then use the procedure PURGE_MIXED.

PURGE_MIXED Procedure

When in-doubt transactions are forced to commit or rollback (instead of letting automatic recovery resolve their outcomes), there is a possibility that a transaction can have a mixed outcome: Some sites commit, and others rollback. Such inconsistency cannot be resolved automatically by Oracle; however, Oracle flags entries in `DBA_2PC_PENDING` by setting the `MIXED` column to a value of 'yes'.

Oracle never automatically deletes information about a mixed outcome transaction. When the application or DBA is certain that all inconsistencies that might have arisen as a result of the mixed transaction have been resolved, this procedure can be used to delete the information about a given mixed outcome transaction.

Syntax

```
DBMS_TRANSACTION.PURGE_MIXED (
   xid VARCHAR2);
```

Parameters

Table 149–8 PURGE_MIXED Procedure Parameters

Parameter	Description
`xid`	Must be set to the value of the `LOCAL_TRAN_ID` column in the `DBA_2PC_PENDING` table.

READ_ONLY Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ ONLY
```

Syntax

```
DBMS_TRANSACTION.READ_ONLY;
```

READ_WRITE Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION READ WRITE
```

Syntax

```
DBMS_TRANSACTION.READ_WRITE;
```

ROLLBACK Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK;
```

ROLLBACK_FORCE Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK FORCE <text>
```

Syntax

```
DBMS_TRANSACTION.ROLLBACK_FORCE (
   xid VARCHAR2);
```

Parameters

Table 149–9 ROLLBACK_FORCE Procedure Parameters

Parameter	Description
`xid`	Local or global transaction ID.

ROLLBACK_SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
ROLLBACK TO SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the functionality being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.ROLLBACK_SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 149–10 ROLLBACK_SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

SAVEPOINT Procedure

This procedure is equivalent to the SQL statement:

```
SAVEPOINT <savepoint_name>
```

This procedure is included for completeness, the feature being already implemented as part of PL/SQL.

Syntax

```
DBMS_TRANSACTION.SAVEPOINT (
   savept VARCHAR2);
```

Parameters

Table 149–11 SAVEPOINT Procedure Parameters

Parameter	Description
savept	Savepoint identifier.

STEP_ID Function

This function returns local (to local transaction) unique positive integer that orders the DML operations of a transaction.

Syntax

```
DBMS_TRANSACTION.STEP_ID
   RETURN NUMBER;
```

USE_ROLLBACK_SEGMENT Procedure

This procedure is equivalent to the SQL statement:

```
SET TRANSACTION USE ROLLBACK SEGMENT <rb_seg_name>
```

Syntax

```
DBMS_TRANSACTION.USE_ROLLBACK_SEGMENT (
   rb_name VARCHAR2);
```

Parameters

Table 149–12 USE_ROLLBACK_SEGMENT Procedure Parameters

Parameter	Description
rb_name	Name of rollback segment to use.

150

DBMS_TRANSFORM

The DBMS_TRANSFORM package provides an interface to the message format transformation features of Oracle Advanced Queuing.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide* for more on message format transformations.

This chapter contains the following topic:

- Summary of DBMS_TRANSFORM Subprograms

Summary of DBMS_TRANSFORM Subprograms

Table 150–1 DBMS_TRANSFORM Package Subprograms

Subprograms	Description
CREATE_ TRANSFORMATION Procedure on page 150-3	Creates a transformation that maps an object of the source type to an object of the destination type
DROP_ TRANSFORMATION Procedure on page 150-5	Drops the given transformation
MODIFY_ TRANSFORMATION Procedure on page 150-6	Modifies an existing transformation

CREATE_TRANSFORMATION Procedure

This procedure creates a transformation that maps an object of the source type to an object of the target type. The transformation expression can be a SQL expression or a PL/SQL function. It must return an object of the target type.

Syntax

```
DBMS_TRANSFORM.CREATE_TRANSFORMATION (
    schema               VARCHAR2(30),
    name                 VARCHAR2(30),
    from_schema          VARCHAR2(30),
    from_type            VARCHAR2(30),
    to_schema            VARCHAR2(30),
    to_type              VARCHAR2(30),
    transformation       VARCHAR2(4000));
```

Parameters

Table 150–2 CREATE_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.
from_schema	Specifies the schema of the source type.
from_type	Specifies the source type.
to_schema	Specifies the target type schema.
to_type	Specifies the target type.
transformation	Specifies the transformation expression, returning an object of the target type. The expression must be a function returning an object of the target type or a constructor expression for the target type. You can choose not to specify a transformation expression and instead specify transformations for attributes of the target type using MODIFY_TRANSFORMATION.

Usage Notes

- The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type.
- To create, modify or drop transformations, a user must be granted execute privileges on DBMS_TRANSFORM. The user must also have execute privileges on the user defined types that are the source and destination types of the transformation. In addition, the user must also have execute privileges on any PLSQL function being used in the transformation function.
- The transformation cannot write database state (perform DML) or commit or rollback the current transaction.
- The transformation must be a SQL function with source type as input type, returning an object of the target type. It could also be a SQL expression of target type, referring to a source type. All references to the source type must be of the form *source.user_data*.

- Both source and target types must be non-scalar database types. A null transformation expression maps to a null target object.

For using the transformation at enqueue and dequeue time, the login user invoking the operation must have execute privileges on the PLSQL functions used by the transformation. For propagation, the owning schema of the queue must have these privileges.

DROP_TRANSFORMATION Procedure

This procedure drops the given transformation.

Syntax

```
DBMS_TRANSFORM.DROP_TRANSFORMATION (
  schema      VARCHAR2(30),
  name        VARCHAR2(30));
```

Parameters

Table 150–3 DROP_TRANSFORMATION Procedure Parameters

Parameter	Description
schema	Specifies the schema of the transformation.
name	Specifies the name of the transformation.

MODIFY_TRANSFORMATION Procedure

This procedure modifies the transformation expression for the given transformation.

Syntax

```
DBMS_TRANSFORM.MODIFY_TRANSFORMATION (
   schema             VARCHAR2(30),
   name               VARCHAR2(30),
   attribute_number   INTEGER,
   transformation     VARCHAR2(4000));
```

Parameters

Table 150–4 MODIFY_TRANSFORMATION Procedure Parameters

Parameter	Description
`schema`	Specifies the schema of the transformation.
`name`	Specifies the name of the transformation.
`attribute_number`	The attribute of the target type for which the new transformation expression is being specified. When specifying the new transformation as a single expression of the target type, specify a value of 0.
`transformation`	The transformation expression must be a SQL expression or a PL/SQL function returning the type of the specified attribute of the target type. If the attribute_number is 0, then the expression must be a PL/SQL function returning an object of the target type or a constructor expression for the target type.

Usage Notes

- If the new transformation is a single expression of the target type, it may be specified with an `attribute_number` of 0. The new transformation may also be specified for each attribute of the target type.
- You can use this procedure to define the transformation as a separate expression for each attribute of the target type. For large transformations, this representation may be more readable and allow the application of fine grain control over the transformation. If the transformation expression was left unspecified for some of the attributes of the target type, they are evaluated to null when the transformation is applied.

151

DBMS_TTS

The DBMS_TTS package checks if the transportable set is self-contained. All violations are inserted into a temporary table that can be selected from the view `TRANSPORT_SET_VIOLATIONS`.

See Also:

- *Oracle Database Administrator's Guide*
- *Oracle Database Upgrade Guide*

This chapter contains the following topics:

- Using DBMS_TTS
  - Security Model
  - Exceptions
  - Operational Notes
- Summary of DBMS_TTS Subprograms

Using DBMS_TTS

- Security Model
- Exceptions
- Operational Notes

Security Model

Only users having the `execute_catalog_role` can execute this procedure. This role is initially only assigned to user SYS.

Exceptions

```
ts_not_found  EXCEPTION;
PRAGMA exception_init(ts_not_found, -29304);
ts_not_found_num NUMBER := -29304;

invalid_ts_list  EXCEPTION;
PRAGMA exception_init(invalid_ts_list, -29346);
invalid_ts_list_num NUMBER := -29346;

sys_or_tmp_ts     EXCEPTION;
PRAGMA exception_init(sys_or_tmp_ts, -29351);
sys_or_tmp_ts_num NUMBER := -29351;
```

Operational Notes

With respect to transportable tablespaces, disabled and enabled referential integrity constraints are handled differently:

- A disabled referential integrity constraint does not violate the transportability rules and is dropped during the import phase.
- An enabled referential integrity constraint violates the transportability rules if it references a table in a tablespace outside the transportable set.

Summary of DBMS_TTS Subprograms

These two procedures are designed to be called by database administrators.

Table 151–1 DBMS_TTS Package Subprograms

Subprogram	Description
DOWNGRADE Procedure on page 151-7	Downgrades transportable tablespace related data
TRANSPORT_SET_CHECK Procedure on page 151-8	Checks if a set of tablespaces (to be transported) is self-contained

DOWNGRADE Procedure

This procedure downgrades transportable tablespace related data.

Syntax

```
DBMS_TTS.DOWNGRADE;
```

TRANSPORT_SET_CHECK Procedure

This procedure checks if a set of tablespaces (to be transported) is self-contained. After calling this procedure, the user may select from a view to see a list of violations, if there are any.

Syntax

```
DBMS_TTS.TRANSPORT_SET_CHECK (
   ts_list          IN CLOB,
   incl_constraints IN BOOLEAN DEFAULT FALSE,
   full_check       IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 151–2 TRANSPORT_SET_CHECK Procedure Parameters

Parameter	Description
ts_list	List of tablespace, separated by comma.
incl_constraints	TRUE if you want to count in referential integrity constraints when examining if the set of tablespaces is self-contained. (The incl_constraints parameter is a default so that TRANSPORT_SET_CHECK will work if it is called with only the ts_list argument.)
full_check	Indicates whether a full or partial dependency check is required. If TRUE, treats all IN and OUT pointers (dependencies) and captures them as violations if they are not self-contained in the transportable set. The parameter should be set to TRUE for TSPITR or if a strict version of transportable is desired. By default the parameter is set to false. It will only consider OUT pointers as violations.

Examples

If the view does not return any rows, then the set of tablespaces is self-contained. For example,

```
SQLPLUS> EXECUTE DBMS_TTS.TRANSPORT_SET_CHECK('foo,bar', TRUE);
SQLPLUS> SELECT * FROM TRANSPORT_SET_VIOLATIONS;
```

152

DBMS_TYPES

The DBMS_TYPES package consists of constants, which represent the built-in and user-defined types.

This chapter contains the following topics:

- Using DBMS_TYPES
  - Constants
  - Exceptions

Using DBMS_TYPES

- Constants
- Exceptions

Constants

The following table lists the constants in the DBMS_TYPES package.

Table 152–1 DBMS_TYPES Constants

Constant	Description
NO_DATA	Is only relevant if PieceWise is called, for a collection or anydataset. Denotes the end of collection/anydataset when all the elements have been accessed
SUCCESS	The operation succeeded
TYPECODE_BDOUBLE	A NUMBER type
TYPECODE_BFILE	A BFILE type
TYPECODE_BFLOAT	A NUMBER type
TYPECODE_BLOB	A BLOB type
TYPECODE_CFILE	A CFILE type
TYPECODE_CHAR	A CHAR type
TYPECODE_CLOB	A CLOB type
TYPECODE_DATE	A DATE type
TYPECODE_INTERVAL_DS	An INTERVAL_DS type
TYPECODE_INTERVAL_YM	A INTERVAL_YM type
TYPECODE_MLSLABEL	An MLSLABEL type
TYPECODE_NAMEDCOLLECTION	A named collection (VARRAY/nested table) type
TYPECODE_NCHAR	A NCHAR type
TYPECODE_NCLOB	A NCLOB type
TYPECODE_NUMBER	A NUMBER type
TYPECODE_NVARCHAR2	A NVARCHAR2 type
TYPECODE_OBJECT	An OBJECT type
TYPECODE_OPAQUE	An OPAQUE type
TYPECODE_RAW	A RAW type
TYPECODE_REF	A REF type
TYPECODE_TABLE	A nested table collection type
TYPECODE_TIMESTAMP	A TIMESTAMP type
TYPECODE_TIMESTAMP_LTZ	A TIMESTAMP_LTZ type
TYPECODE_TIMESTAMP_TZ	A TIMESTAMP_TZ type
TYPECODE_UROWID	A UROWID type
TYPECODE_VARCHAR2	A VARCHAR2 type
TYPECODE_VARCHAR	A VARCHAR type
TYPECODE_VARRAY	A VARRAY collection type

Exceptions

- INVALID_PARAMETERS
- INCORRECT_USAGE
- TYPE_MISMATCH

153

DBMS_UTILITY

The DBMS_UTILITY package provides various utility subprograms.

This chapter contains the following topics:

- Using DBMS_UTILITY
  - Security Model
  - Constants
  - Types
  - Exceptions
- Data Structures
- Summary of DBMS_UTILITY Subprograms

Using DBMS_UTILITY

- Security Model
- Constants
- DBLINK_ARRAY Table Type
- Exceptions

Security Model

DBMS_UTILITY runs with the privileges of the calling user for the NAME_RESOLVE Procedure and the COMPILE_SCHEMA Procedure. This is necessary for the SQL to work correctly.

The package does not run as SYS. The privileges are checked using DBMS_DDL.

Constants

The DBMS_UTILITY package uses the constants shown in Table 153–1, " DBMS_ UTILITY Constants".

Table 153–1 DBMS_UTILITY Constants

Name	Type	Value	Description
INV_ERROR_ON_ RESTRICTIONS	PLS_INTEGER	1	Only legal value for the p_option_ flags parameter of the INVALIDATE Procedure

Exceptions

The following table lists the exceptions raised by DBMS_UTILITY.

Table 153–2 Exceptions Raised by DBMS_UTILITY

Exception	Error Code	Description
INV_NOT_EXIST_OR_NO_PRIV	-24237	Raised by the INVALIDATE subprogram when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	-24238	Raised by the INVALIDATE subprogram if a compiler setting is specified more than once in the p_plsql_object_settings parameter
INV_RESTRICTED_OBJECT	-24239	Raised by the INVALIDATE subprogram when different combinations of conditions pertaining to the p_object_id parameter are contravened

Data Structures

The DBMS_UTILITY package defines a RECORD type and TABLE types.

Record Types

- INSTANCE_RECORD Record Type

Table Types

- DBLINK_ARRAY Table Type
- INDEX_TABLE_TYPE Table Type
- INSTANCE_TABLE Table Type
- LNAME_ARRAY Table Type
- NAME_ARRAY Table Type
- NUMBER_ARRAY Table Type
- UNCL_ARRAY Table Type

INSTANCE_RECORD Record Type

This type describes a list of active instance number-name pairs.

Syntax

```
TYPE instance_record IS RECORD (
     inst_number   NUMBER,
     inst_name     VARCHAR2(60));
```

Fields

Table 153–3 MOUNT_T Fields

Field	Description
inst_number	Active instance number
inst_name	Instance name

DBLINK_ARRAY Table Type

This type stores a list of database links.

Syntax

```
TYPE dblink_array IS TABLE OF VARCHAR2(128) INDEX BY BINARY_INTEGER;
```

INDEX_TABLE_TYPE Table Type

This type describes the order in which generated objects are returnedto a user.

Syntax

```
TYPE index_table_type IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

INSTANCE_TABLE Table Type

This type describes a table of INSTANCE_RECORD Record Type.

Syntax

```
TYPE instance_table IS TABLE OF instance_record INDEX BY BINARY_INTEGER;
```

Usage Notes

The starting index of `INSTANCE_TABLE` is 1; `INSTANCE_TABLE` is dense.

LNAME_ARRAY Table Type

This type stores lists of LONG NAME including fully qualified attribute names.

Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) index by BINARY_INTEGER;
```

NAME_ARRAY Table Type

This type stores lists of NAME.

Syntax

```
TYPE name_array IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

NUMBER_ARRAY Table Type

This type describes the order in which generated objects are returned to users.

Syntax

```
TYPE number_array IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

UNCL_ARRAY Table Type

This type stores lists of "USER"."NAME"."COLUMN"@LINK

Syntax

```
TYPE uncl_array IS TABLE OF VARCHAR2(227) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_UTILITY Subprograms

Table 153–4 DBMS_UTILITY Package Subprograms

Subprogram	Description
ACTIVE_INSTANCES Procedure on page 153-17	Returns the active instance
ANALYZE_DATABASE Procedure on page 153-18	Analyzes all the tables, clusters and indexes in a database
ANALYZE_PART_OBJECT Procedure on page 153-19	Analyzes the given tables and indexes
ANALYZE_SCHEMA Procedure on page 153-20	Analyzes all the tables, clusters and indexes in a schema
CANONICALIZE Procedure on page 153-21	Canonicalizes a given string
COMMA_TO_TABLE Procedures on page 153-22	Converts a comma-delimited list of names into a PL/SQL table of names
COMPILE_SCHEMA Procedure on page 153-23	Compiles all procedures, functions, packages, views and triggers in the specified schema
CREATE_ALTER_TYPE_ERROR_TABLE Procedure on page 153-24	Creates an error table for use in the `EXCEPTION` clause of the `ALTER TYPE` statement
CURRENT_INSTANCE Function on page 153-25	Returns the current connected instance number
DATA_BLOCK_ADDRESS_BLOCK Function on page 153-26	Gets the block number part of a data block address
DATA_BLOCK_ADDRESS_FILE Function on page 153-27	Gets the file number part of a data block address
DB_VERSION Procedure on page 153-28	Returns version information for the database
EXEC_DDL_STATEMENT Procedure on page 153-29	Executes the DDL statement in `parse_string`
FORMAT_CALL_STACK Function on page 153-30	Formats the current call stack
FORMAT_ERROR_BACKTRACE Function on page 153-31	Formats the backtrace from the point of the current error to the exception handler where the error was caught
FORMAT_ERROR_STACK Function on page 153-34	Formats the current error stack
GET_CPU_TIME Function on page 153-35	Returns the current CPU time in 100th's of a second
GET_DEPENDENCY Procedure on page 153-36	Shows the dependencies on the given object
GET_ENDIANNESS Function on page 153-37	Gets the endianness of the database platform
GET_HASH_VALUE Function on page 153-38	Computes a hash value for the given string
GET_PARAMETER_VALUE Function on page 153-39	Gets the value of specified `init.ora` parameter

Table 153–4 (Cont.) DBMS_UTILITY Package Subprograms

Subprogram	Description
GET_SQL_HASH Function on page 153-41	Computes a hash value for the given string using MD5 algorithm
GET_TIME Function on page 153-42	Determines the current time in 100th's of a second
INVALIDATE Procedure on page 153-43	Invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings
IS_BIT_SET Function on page 153-46	Checks the bit setting for the given bit in the given `RAW` source
IS_CLUSTER_DATABASE Function on page 153-47	Determines if this database is running in cluster database mode
MAKE_DATA_BLOCK_ ADDRESS Function on page 153-48	Creates a data block address given a file number and a block number
NAME_RESOLVE Procedure on page 153-49	Resolves the given name
NAME_TOKENIZE Procedure on page 153-51	Calls the parser to parse the given name
OLD_CURRENT_SCHEMA Function on page 153-52	Returns the session value from `SYS_CONTEXT ('USERENV', 'CURRENT_SCHEMA')`
OLD_CURRENT_USER Function on page 153-53	Returns the session value from `SYS_CONTEXT ('USERENV', 'CURRENT_USER')`
PORT_STRING Function on page 153-54	Returns a string that identifies the operating system and the `TWO TASK PROTOCOL` version of the database
SQLID_TO_SQLHASH Function on page 153-55	Converts a SQL ID into a hash value
TABLE_TO_COMMA Procedures on page 153-56	Converts a PL/SQL table of names into a comma-delimited list of names
VALIDATE Procedure on page 153-57	Makes invalid database objects valid
WAIT_ON_PENDING_DML Procedure on page 153-59	Waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back

ACTIVE_INSTANCES Procedure

This procedure returns the active instance.

Syntax

```
DBMS_UTILITY.ACTIVE_INSTANCES (
   instance_table   OUT INSTANCE_TABLE,
   instance_count   OUT NUMBER);
```

Parameters

Table 153–5 ACTIVE_INSTANCES Procedure Parameters

Procedure	Description
`instance_table`	Contains a list of the active instance numbers and names. When no instance is up, the list is empty.
`instance_count`	Number of active instances.

ANALYZE_DATABASE Procedure

This procedure analyzes all the tables, clusters and indexes in a database.

Syntax

```
DBMS_UTILITY.ANALYZE_DATABASE (
   method             IN  VARCHAR2,
   estimate_rows      IN  NUMBER DEFAULT NULL,
   estimate_percent   IN  NUMBER DEFAULT NULL,
   method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153–6 ANALYZE_DATABASE Procedure Parameters

Parameter	Description
`method`	One of `ESTIMATE`, `COMPUTE` or `DELETE`. If `ESTIMATE` then either `estimate_rows` or `estimate_percent` must be nonzero.
`estimate_rows`	Number of rows to estimate
`estimate_percent`	Percentage of rows to estimate. If `estimate_rows` is specified ignore this parameter.
`method_opt`	Method options of the following format: [`FOR TABLE`] [`FOR ALL [INDEXED] COLUMNS] [SIZE n]` [`FOR ALL INDEXES`]

Exceptions

`ORA-20000`: Insufficient privileges for some object in this database

ANALYZE_PART_OBJECT Procedure

This procedure is equivalent to SQL:

```
"ANALYZE TABLE|INDEX [<schema>.]<object_name> PARTITION <pname> [<command_type>]
[<command_opt>] [<sample_clause>]
```

Syntax

```
DBMS_UTILITY.ANALYZE_PART_OBJECT (
   schema        IN VARCHAR2 DEFAULT NULL,
   object_name   IN VARCHAR2 DEFAULT NULL,
   object_type   IN CHAR     DEFAULT 'T',
   command_type  IN CHAR     DEFAULT 'E',
   command_opt   IN VARCHAR2 DEFAULT NULL,
   sample_clause IN VARCHAR2 DEFAULT 'sample 5 percent ');
```

Parameters

Table 153–7 ANALYZE_PART_OBJECT Procedure Parameters

Parameter	Description
schema	Schema of the object_name.
object_name	Name of object to be analyzed, must be partitioned.
object_type	Type of object, must be T (table) or I (index).
command_type	Must be V (validate structure)
command_opt	Other options for the command type. For C, E it can be FOR table, FOR all LOCAL indexes, FOR all columns or combination of some of the 'for' options of analyze statistics (table). For V, it can be CASCADE when object_type is T.
sample_clause	The sample clause to use when command_type is 'E'.

Usage Notes

For each partition of the object, run in parallel using job queues.

ANALYZE_SCHEMA Procedure

This procedure analyzes all the tables, clusters and indexes in a schema.

Syntax

```
DBMS_UTILITY.ANALYZE_SCHEMA (
   schema             IN  VARCHAR2,
   method             IN  VARCHAR2,
   estimate_rows      IN  NUMBER DEFAULT NULL,
   estimate_percent   IN  NUMBER DEFAULT NULL,
   method_opt         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 153–8 ANALYZE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
method	One of ESTIMATE, COMPUTE or DELETE. If ESTIMATE then either estimate_rows or estimate_percent must be nonzero.
estimate_rows	Number of rows to estimate
estimate_percent	Percentage of rows to estimate. If estimate_rows is specified ignore this parameter.
method_opt	Method options of the following format: [FOR TABLE] [FOR ALL [INDEXED] COLUMNS] [SIZE n] [FOR ALL INDEXES]

Exceptions

ORA-20000: Insufficient privileges for some object in this schema

CANONICALIZE Procedure

This procedure canonicalizes the given string. The procedure handles a single reserved or key word (such as 'table'), and strips off white spaces for a single identifier so that ' table ' becomes TABLE.

Syntax

```
DBMS_UTILITY.CANONICALIZE(
   name           IN    VARCHAR2,
   canon_name     OUT   VARCHAR2,
   canon_len      IN    BINARY_INTEGER);
```

Parameters

Table 153–9 CANONICALIZE Procedure Parameters

Parameter	Description
name	The string to be canonicalized
canon_name	The canonicalized string
canon_len	The length of the string (in bytes) to canonicalize

Return Values

Returns the first canon_len bytes in canon_name.

Usage Notes

- If name is NULL, canon_name becomes NULL.
- If name is not a dotted name, and if name begins and ends with a double quote, remove both quotes. Alternatively, convert to upper case with NLS_UPPER. Note that this case does not include a name with special characters, such as a space, but is not doubly quoted.
- If name is a dotted name (such as a."b".c), for each component in the dotted name in the case in which the component begins and ends with a double quote, no transformation will be performed on this component. Alternatively, convert to upper case with NLS_UPPER and apply begin and end double quotes to the capitalized form of this component. In such a case, each canonicalized component will be concatenated together in the input position, separated by ".".
- Any other character after a[.b]* will be ignored.
- The procedure does not handle cases like 'A B.'

Examples

- a becomes A
- "a" becomes a
- "a".b becomes "a"."B"
- "a".b,c.f becomes "a"."B" with",c.f" ignored.

COMMA_TO_TABLE Procedures

These procedures converts a comma-delimited list of names into a PL/SQL table of names. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT uncl_array);

DBMS_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT lname_array);
```

Parameters

Table 153–10 COMMA_TO_TABLE Procedure Parameters

Parameter	Description

`list`	Comma separated list of list of 'names', where a name should have the following format for the first overloading:
	`a [. b [. c ]][ @ d ]`
	and the following format for the second overloading:
	`a [. b]*`
	where `a`, `b`, `c`, `d` are simple identifiers (quoted or unquoted).

`tablen`	Number of tables in the PL/SQL table.
`tab`	PL/SQL table which contains list of names.

Return Values

A PL/SQL table is returned, with values `1..n` and `n+1 is null`.

Usage Notes

The `list` must be a non-empty comma-delimited list: Anything other than a comma-delimited list is rejected. Commas inside double quotes do not count.

Entries in the comma-delimited list cannot include multibyte characters.

The values in `tab` are copied from the original list, with no transformations.

COMPILE_SCHEMA Procedure

This procedure compiles all procedures, functions, packages, views and triggers in the specified schema.

Syntax

```
DBMS_UTILITY.COMPILE_SCHEMA (
   schema          VARCHAR2,
   compile_all     BOOLEAN DEFAULT TRUE,
   reuse_settings  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 153–11 COMPILE_SCHEMA Procedure Parameters

Parameter	Description
schema	Name of the schema
compile_all	If TRUE, will compile everything within the schema regardless of whether it is VALID If FALSE, will compile only INVALID objects
reuse_settings	Indicates whether the session settings in the objects should be reused, or whether the current session settings should be adopted instead

Exceptions

Table 153–12 COMPILE_SCHEMA Procedure Exceptions

Exception	Description
ORA-20000	Insufficient privileges for some object in this schema
ORA-20001	Cannot recompile SYS objects
ORA-20002	Maximum iterations exceeded. Some objects may not have been recompiled.

Usage Notes

- Note that this subprogram is a wrapper for RECOMP_SERIAL Procedure included with the UTL_RECOMP package.
- After calling this procedure, you should select from view ALL_OBJECTS for items with status of INVALID to see if all objects were successfully compiled.
- To see the errors associated with INVALID objects, you may use the Enterprise Manager command:

  ```
  SHOW ERRORS <type> <schema>.<name>
  ```

CREATE_ALTER_TYPE_ERROR_TABLE Procedure

This procedure creates an error table for use in the `EXCEPTION` clause of the `ALTER TYPE` statement.

Syntax

```
DBMS_UTILITY.CREATE_ALTER_TYPE_ERROR_TABLE(
   schema_name      IN     VARCHAR2,
   table_name       IN     VARCHAR2);
```

Parameters

Table 153–13 CREATE_ALTER_TYPE_ERROR_TABLE Procedure Parameters

Parameter	Description
`schema_name`	The name of the schema.
`table_name`	The name of the table created.

Exceptions

An error is returned if the table already exists.

CURRENT_INSTANCE Function

This function returns the current connected instance number. It returns `NULL` when connected instance is down.

Syntax

```
DBMS_UTILITY.CURRENT_INSTANCE
   RETURN NUMBER;
```

DATA_BLOCK_ADDRESS_BLOCK Function

This function gets the block number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_BLOCK (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 153–14 DATA_BLOCK_ADDRESS_BLOCK Function Parameters

Parameter	Description
dba	Data block address.

Pragmas

```
pragma restrict_references(data_block_address_block, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Block offset of the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

DATA_BLOCK_ADDRESS_FILE Function

This function gets the file number part of a data block address.

Syntax

```
DBMS_UTILITY.DATA_BLOCK_ADDRESS_FILE (
   dba NUMBER)
  RETURN NUMBER;
```

Parameters

Table 153–15 DATA_BLOCK_ADDRESS_FILE Function Parameters

Parameter	Description
dba	Data block address.

Pragmas

```
pragma restrict_references (data_block_address_file, WNDS, RNDS, WNPS, RNPS);
```

Return Values

File that contains the block.

Usage Notes

This function should not be used with datablocks which belong to bigfile tablespaces.

DB_VERSION Procedure

This procedure returns version information for the database.

Syntax

```
DBMS_UTILITY.DB_VERSION (
   version       OUT VARCHAR2,
   compatibility OUT VARCHAR2);
```

Parameters

Table 153–16 DB_VERSION Procedure Parameters

Parameter	Description
`version`	A string which represents the internal software version of the database (for example, 7.1.0.0.0). The length of this string is variable and is determined by the database version.
`compatibility`	The compatibility setting of the database determined by the "compatible" `init.ora` parameter. If the parameter is not specified in the `init.ora` file, then `NULL` is returned.

EXEC_DDL_STATEMENT Procedure

This procedure executes the DDL statement in `parse_string`.

Syntax

```
DBMS_UTILITY.EXEC_DDL_STATEMENT (
   parse_string IN VARCHAR2);
```

Parameters

Table 153–17 EXEC_DDL_STATEMENT Procedure Parameters

Parameter	Description
`parse_string`	DDL statement to be executed.

FORMAT_CALL_STACK Function

This function formats the current call stack. This can be used on any stored procedure or trigger to access the call stack. This can be useful for debugging.

Syntax

```
DBMS_UTILITY.FORMAT_CALL_STACK
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(format_call_stack,WNDS);
```

Return Values

This returns the call stack, up to 2000 bytes.

FORMAT_ERROR_BACKTRACE Function

This procedure displays the call stack at the point where an exception was raised, even if the procedure is called from an exception handler in an outer scope. The output is similar to the output of the SQLERRM function, but not subject to the same size limitation.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_BACKTRACE
  RETURN VARCHAR2;
```

Return Values

The backtrace string. A NULL string is returned if no error is currently being handled.

Examples

```
CREATE OR REPLACE PROCEDURE Log_Errors ( i_buff in varchar2 ) IS
  g_start_pos integer := 1;
  g_end_pos  integer;

  FUNCTION Output_One_Line RETURN BOOLEAN IS
  BEGIN
    g_end_pos := Instr ( i_buff, Chr(10), g_start_pos );

    CASE g_end_pos > 0
      WHEN true THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
g_end_pos-g_start_pos ) );
        g_start_pos := g_end_pos+1;
        RETURN TRUE;

      WHEN FALSE THEN
        DBMS_OUTPUT.PUT_LINE ( Substr ( i_buff, g_start_pos,
(Length(i_buff)-g_start_pos)+1 ) );
        RETURN FALSE;
    END CASE;
  END Output_One_Line;

    Or you may need to contact your application administrator
    or database administrator.
*/
```

FORMAT_ERROR_STACK Function

This function formats the current error stack. This can be used in exception handlers to look at the full error stack.

Syntax

```
DBMS_UTILITY.FORMAT_ERROR_STACK
  RETURN VARCHAR2;
```

Return Values

This returns the error stack, up to 2000 bytes.

Return Values

See FORMAT_ERROR_BACKTRACE Function on page 153-31.

GET_CPU_TIME Function

This function returns the current CPU time in 100th's of a second. The returned CPU time is the number of 100th's of a second from some arbitrary epoch.

Syntax

```
DBMS_UTILITY.GET_CPU_TIME
 RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from some arbitrary epoch.

Usage Notes

This subprogram reports cycles (CPU time) used in performing work, and is unrelated to clock time or any other fixed reference. Since the base line is rubricator, and the relationship between work performed and the number generated is Operating System specific, the amount of work performed is calculated by measuring the difference between a start point and end point for a particular operation.

GET_DEPENDENCY Procedure

This procedure shows the dependencies on the given object.

Syntax

```
DBMS_UTILITY.GET_DEPENDENCY (
 type      IN     VARCHAR2,
 schema    IN     VARCHAR2,
 name      IN     VARCHAR2);
```

Parameters

Table 153–18 GET_DEPENDENCY Procedure Parameters

Parameter	Description
`type`	The type of the object, for example if the object is a table give the type as '`TABLE`'.
`schema`	The schema name of the object.
`name`	The name of the object.

Usage Notes

This procedure uses the DBMS_OUTPUTpackage to display results, and so you must declare `SET SERVEROUTPUT ON` if you wish to view dependencies. Alternatively, any application that checks the `DBMS_OUTPUT` output buffers can invoke this subprogram and then retrieve the output by means of `DBMS_OUTPUT` subprograms such as `GET_LINES`.

GET_ENDIANNESS Function

This function gets the endianness of the database platform.

Syntax

```
DBMS_UTILITY.GET_ENDIANNESS
 RETURN NUMBER;
```

Return Values

The endianness of the database platform.

GET_HASH_VALUE Function

This function computes a hash value for the given string.

Syntax

```
DBMS_UTILITY.GET_HASH_VALUE (
   name        IN   VARCHAR2,
   base        IN   NUMBER,
   hash_size   IN   NUMBER)
  RETURN NUMBER;
```

Parameters

Table 153–19 GET_HASH_VALUE Function Parameters

Parameter	Description
name	String to be hashed.
base	Base value for the returned hash value to start at.
hash_size	Desired size of the hash table.

Pragmas

```
pragma restrict_references(get_hash_value, WNDS, RNDS, WNPS, RNPS);
```

Return Values

A hash value based on the input string. For example, to get a hash value on a string where the hash value should be between 1000 and 3047, use 1000 as the base value and 2048 as the hash_size value. Using a power of 2 for the hash_size parameter works best.

GET_PARAMETER_VALUE Function

This function gets the value of specified `init.ora` parameter.

Syntax

```
DBMS_UTILITY.GET_PARAMETER_VALUE (
   parnam     IN        VARCHAR2,
   intval     IN OUT    BINARY_INTEGER,
   strval     IN OUT    VARCHAR2,
   listno     IN        BINARY_INTEGER DEFAULT 1)
  RETURN BINARY_INTEGER;
```

Parameters

Table 153–20 GET_PARAMETER_VALUE Function Parameters

Parameter	Description
`parnam`	Parameter name.
`intval`	Value of an integer parameter or the value length of a string parameter.
`strval`	Value of a string parameter.
`listno`	List item number. If retrieving parameter values for a parameter that can be specified multiple times to accumulate values, use this parameter to get each individual parameter.

Return Values

Parameter type:

- 0 if parameter is an `INTEGER/BOOLEAN` parameter
- 1 if parameter is a string/file parameter

Usage Notes

When using `DBMS_UTILITY.GET_PARAMETER_VALUE`, only the first parameter setting of `/dir1` is returned when `init.ora` is set as follows:

```
utl_file_dir = /dir1
utl_file_dir = /dir2
```

However, the full comma-delimited string is returned if you are using:

```
utl_file_dir = /dir1, /dir2
```

Examples

```
DECLARE
  parnam VARCHAR2(256);
  intval BINARY_INTEGER;
  strval VARCHAR2(256);
  partyp BINARY_INTEGER;
BEGIN
  partyp := dbms_utility.get_parameter_value('max_dump_file_size',
                                             intval, strval);
  dbms_output.put('parameter value is: ');
  IF partyp = 1 THEN
    dbms_output.put_line(strval);
```

```
  ELSE
    dbms_output.put_line(intval);
  END IF;
  IF partyp = 1 THEN
    dbms_output.put('parameter value length is: ');
    dbms_output.put_line(intval);
  END IF;
  dbms_output.put('parameter type is: ');
  IF partyp = 1 THEN
    dbms_output.put_line('string');
  ELSE
    dbms_output.put_line('integer');
  END IF;
END;
```

GET_SQL_HASH Function

This function computes a hash value for the given string using MD5 algorithm.

Syntax

```
DBMS_UTILITY.GET_SQL_HASH (
   name          IN   VARCHAR2,
   hash          OUT  RAW,
   pre10ihash    OUT  NUMBER)
  RETURN NUMBER;
```

Pragmas

pragma restrict_references(GET_SQL_HASH, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 153–21 GET_SQL_HASH Procedure Parameters

Parameter	Description
name	String to be hashed
hash	An optional field to store all 16 bytes of returned hash value
pre10ihash	An optional field to store the pre 10i database version hash value

Return Values

A hash value (last 4 bytes) based on the input string. The MD5 hash algorithm computes a 16 byte hash value, but we only return the last 4 bytes so that we can return an actual number. One could use an optional RAW parameter to get all 16 bytes and to store the pre 10i hash value of 4 bytes in the pre10ihash optional parameter.

GET_TIME Function

This function determines the current time in 100th's of a second. This subprogram is primarily used for determining elapsed time. The subprogram is called twice – at the beginning and end of some process – and then the first (earlier) number is subtracted from the second (later) number to determine the time elapsed.

Syntax

```
DBMS_UTILITY.GET_TIME
  RETURN NUMBER;
```

Return Values

Time is the number of 100th's of a second from the point in time at which the subprogram is invoked.

Usage Notes

Numbers are returned in the range -2147483648 to 2147483647 depending on platform and machine, and your application must take the sign of the number into account in determining the interval. For instance, in the case of two negative numbers, application logic must allow that the first (earlier) number will be larger than the second (later) number which is closer to zero. By the same token, your application should also allow that the first (earlier) number be negative and the second (later) number be positive.

INVALIDATE Procedure

This procedure invalidates a database object and (optionally) modifies its PL/SQL compiler parameter settings. It also invalidates any objects that (directly or indirectly) depend on the object being invalidated.

Syntax

```
DBMS_UTILITY.INVALIDATE (
   p_object_id              IN   NUMBER,
   p_plsql_object_settings  IN   VARCHAR2 DEFAULT NULL,
   p_option_flags           IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 153–22 INVALIDATE Procedure Parameters

Parameter	Description
p_object_id	ID number of object to be invalidated. This is the same as the value of the OBJECT_ID column from ALL_OBJECTS. If the object_id argument is NULL or invalid then the exception inv_not_exist_or_no_priv is raised. The caller of this procedure must have create privileges on the object being invalidated else the inv_not_exist_or_no_priv exception is raised.
p_plsql_object_ settings	This optional parameter is ignored if the object specified by p_ object_id is not a PL/SQL object. If no value is specified for this parameter then the PL/SQL compiler settings are left unchanged, that is, equivalent to REUSE SETTINGS. If a value is provided, it must specify the values of the PL/SQL compiler settings separated by one or more spaces. Each setting can be specified only once else inv_malformed_settings exception will be raised. The setting values are changed only for the object specified by p_object_id and do not affect dependent objects that may be invalidated. The setting names and values are case insensitive. If a setting is omitted and REUSE SETTINGS is specified, then if a value was specified for the compiler setting in an earlier compilation of this library unit, Oracle Database uses that earlier value. If a setting is omitted and REUSE SETTINGS was not specified or no value was specified for the parameter in an earlier compilation, then the database will obtain the value for that setting from the session environment.
p_option_flags	This parameter is optional and defaults to zero (no flags). Option flags supported by invalidate. ▪ inv_error_on_restrictions (see Constants on page 153-4): The subprogram imposes various restrictions on the objects that can be invalidated. For example, the object specified by p_object_id cannot be a table. By default, invalidate quietly returns on these conditions (and does not raise an exception). If the caller sets this flag, the exception inv_restricted_object is raised.

Exceptions

Table 153–23 INVALIDATE Procedure Exceptions

Exception	Description
INV_NOT_EXIST_OR_NO_PRIV	Raised when the object_id argument is NULL or invalid, or when the caller does not have CREATE privileges on the object being invalidated
INV_MALFORMED_SETTINGS	Raised if a compiler setting is specified more than once in the p_plsql_object_settings parameter
INV_RESTRICTED_OBJECT	Raised when different combinations of conditions pertaining to the p_object_id parameter are contravened

Usage Notes

The object type (object_type column from ALL_OBJECTS) of the object specified by p_object_id must be a PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY, TRIGGER, TYPE, TYPE BODY, LIBRARY, VIEW, OPERATOR, SYNONYM, or JAVA CLASS. If the object is not one of these types and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is the package specification of STANDARD, DBMS_STANDARD, or specification or body of DBMS_UTILITY and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

If the object specified by p_object_id is an object type specification and there exist tables which depend on the type and the flag inv_error_on_restrictions is specified in p_option_flags then the exception inv_restricted_object is raised, else no action is taken.

Examples

Example 1

```
DBMS_UTILITY.INVALIDATE (1232, 'PLSQL_OPTIMIZE_LEVEL = 2 REUSE SETTINGS');
```

Assume that the object_id 1232 refers to the procedure remove_emp in the HR schema. Then the above call will mark the remove_emp procedure invalid and change its PLSQL_OPTIMIZE_LEVEL compiler setting to 2. The values of other compiler settings will remain unchanged since REUSE SETTINGS is specified.

Objects that depend on hr.remove_emp will also get marked invalid. Their compiler parameters will not be changed.

Example 2

```
DBMS_UTILITY.INVALIDATE (40775, 'plsql_code_type = native');
```

Assume that the object_id 40775 refers to the type body leaf_category_typ in the OE schema. Then the above call will mark the type body invalid and change its PLSQL_CODE_TYPE compiler setting to NATIVE. The values of other compiler settings will be picked up from the current session environment since REUSE SETTINGS has not been specified.

Since no objects can depend on bodies, there are no cascaded invalidations.

Example 3

```
DBMS_UTILITY.INVALIDATE (40796);
```

Assume that the `object_id` 40796 refers to the view `oc_orders` in the `OE` schema. Then the above call will mark the `oc_orders` view invalid.

Objects that depend on `oe.oc_orders` will also get marked invalid.

IS_BIT_SET Function

This function checks the bit setting for the given bit in the given RAW source.

Syntax

```
DBMS_UTILITY.IS_BIT_SET (
   r       IN RAW,
   n       IN NUMBER)
  RETURN NUMBER;
```

Pragmas

pragma restrict_references (IS_BIT_SET, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 153–24 IS_BIT_SET Procedure Parameters

Parameter	Description
r	Source raw
n	Which bit in r to check

Return Values

This function returns 1 if bit n in RAW r is set. Bits are numbered high to low with the lowest bit being bit number 1.

IS_CLUSTER_DATABASE Function

This function determines if this database is running in cluster database mode.

Syntax

```
DBMS_UTILITY.IS_CLUSTER_DATABASE
  RETURN BOOLEAN;
```

Return Values

This function returns `TRUE` if this instance was started in cluster database mode; `FALSE` otherwise.

MAKE_DATA_BLOCK_ADDRESS Function

This function creates a data block address given a file number and a block number. A data block address is the internal structure used to identify a block in the database. This function is useful when accessing certain fixed tables that contain data block addresses.

Syntax

```
DBMS_UTILITY.MAKE_DATA_BLOCK_ADDRESS (
   file  NUMBER,
   block NUMBER)
  RETURN NUMBER;
```

Parameters

Table 153–25 MAKE_DATA_BLOCK_ADDRESS Function Parameters

Parameter	Description
`file`	File that contains the block.
`block`	Offset of the block within the file in terms of block increments.

Pragmas

```
pragma restrict_references (make_data_block_address, WNDS, RNDS, WNPS, RNPS);
```

Return Values

Data block address.

NAME_RESOLVE Procedure

This procedure resolves the given name, including synonym translation and authorization checking as necessary.

Syntax

```
DBMS_UTILITY.NAME_RESOLVE (
   name          IN  VARCHAR2,
   context       IN  NUMBER,
   schema        OUT VARCHAR2,
   part1         OUT VARCHAR2,
   part2         OUT VARCHAR2,
   dblink        OUT VARCHAR2,
   part1_type    OUT NUMBER,
   object_number OUT NUMBER);
```

Parameters

Table 153–26 NAME_RESOLVE Procedure Parameters

Parameter	Description
name	Name of the object. This can be of the form [[a.]b.]c[@d], where a, b, c are SQL identifier and d is a dblink. No syntax checking is performed on the dblink. If a dblink is specified, or if the name resolves to something with a dblink, then object is not resolved, but the schema, part1, part2 and dblink OUT parameters are filled in. a, b and c may be delimited identifiers, and may contain Globalization Support (NLS) characters (single and multibyte).
context	Must be an integer between 0 and 9. ■ 0 - table ■ 1 - PL/SQL (for 2 part names) ■ 2 - sequences ■ 3 - trigger ■ 4 - Java Source ■ 5 - Java resource ■ 6 - Java class ■ 7 - type ■ 8 - Java shared data ■ 9 - index
schema	Schema of the object: c. If no schema is specified in name, then the schema is determined by resolving the name.
part1	First part of the name. The type of this name is specified part1_type (synonym or package).
part2	If this is non-NULL, then this is a subprogram name. If part1 is non-NULL, then the subprogram is within the package indicated by part1. If part1 is NULL, then the subprogram is a top-level subprogram.

Table 153–26 (Cont.) NAME_RESOLVE Procedure Parameters

Parameter	Description
dblink	If this is non-NULL, then a database link was either specified as part of name or name was a synonym which resolved to something with a database link. In this case, if further name translation is desired, then you must call the DBMS_UTILITY.NAME_RESOLVE procedure on this remote node.
part1_type	Type of part1 is: ■ 5 - synonym ■ 7 - procedure (top level) ■ 8 - function (top level) ■ 9 - package
object_number	Object identifier

Exceptions

All errors are handled by raising exceptions. A wide variety of exceptions are possible, based on the various syntax error that are possible when specifying object names.

NAME_TOKENIZE Procedure

This procedure calls the parser to parse the given name as "a [. b [. c]][@ dblink]". It strips double quotes, or converts to uppercase if there are no quotes. It ignores comments of all sorts, and does no semantic analysis. Missing values are left as NULL.

Syntax

```
DBMS_UTILITY.NAME_TOKENIZE (
   name    IN  VARCHAR2,
   a       OUT VARCHAR2,
   b       OUT VARCHAR2,
   c       OUT VARCHAR2,
   dblink  OUT VARCHAR2,
   nextpos OUT BINARY_INTEGER);
```

Parameters

For each of a, b, c, dblink, tell where the following token starts in anext, bnext, cnext, dnext respectively.

OLD_CURRENT_SCHEMA Function

This function returns the session value from `SYS_CONTEXT` ('`USERENV`', '`CURRENT_SCHEMA`').

Syntax

```
DBMS_UTILITY.OLD_CURRENT_SCHEMA
 RETURN VARCHAR2;
```

OLD_CURRENT_USER Function

This function returns the session value from `SYS_CONTEXT` ('`USERENV`', '`CURRENT_USER`').

Syntax

```
DBMS_UTILITY.OLD_CURRENT_USER
 RETURN VARCHAR2;
```

PORT_STRING Function

This function returns a string that identifies the operating system and the `TWO TASK PROTOCOL` version of the database. For example, "`VAX/VMX-7.1.0.0`"

The maximum length is port-specific.

Syntax

```
DBMS_UTILITY.PORT_STRING
   RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(port_string, WNDS, RNDS, WNPS, RNPS);
```

SQLID_TO_SQLHASH Function

This function converts a SQL ID into a hash value.

Syntax

```
DBMS_UTILITY.SQLID_TO_SQLHASH (
   sql_id    IN   VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 153–27 SQLID_TO_SQLHASH Function Parameters

Parameter	Description
`sql_id`	SQL ID of a SQL statement. Must be `VARCHAR2(13)`.

TABLE_TO_COMMA Procedures

These procedures converts a PL/SQL table of names into a comma-delimited list of names. This takes a PL/SQL table, `1..n`, terminated with `n+1 null`. The second version supports fully-qualified attribute names.

Syntax

```
DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  UNCL_ARRAY,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);

DBMS_UTILITY.TABLE_TO_COMMA (
   tab    IN  lname_array,
   tablen OUT BINARY_INTEGER,
   list   OUT VARCHAR2);
```

Parameters

Table 153–28 TABLE_TO_COMMA Procedure Parameters

Parameter	Description
`tab`	PL/SQL table which contains list of table names.
`tablen`	Number of tables in the PL/SQL table.
`list`	Comma separated list of tables.

Return Values

A comma-delimited list and the number of elements found in the table.

VALIDATE Procedure

This procedure makes invalid database objects valid.

Syntax

```
DBMS_UTILITY.VALIDATE(
    object_id       IN   NUMBER);

DBMS_UTILITY.VALIDATE(
   owner          IN   VARCHAR2,
   objname        IN   VARCHAR2,
   namespace      IN   NUMBER,
   edition_name   IN   := SYS_CONTEXT ('USERENV', 'CURRENT_EDITION_NAME'));
```

Parameters

Table 153–29 VALIDATE Procedure Parameters

Parameter	Description
owner	Name of the user who owns the object. Same as the OWNER field in ALL_OBJECTS.
objname	Name of the object to be validated. Same as the OBJECT_NAME field in ALL_OBJECTS.
namespace	Namespace of the object. Same as the namespace field in obj$. Equivalent numeric values are as follows: ■ 1 = TABLE/PROCEDURE/TYPE ■ 2 = BODY ■ 3 = TRIGGER ■ 4 = INDEX ■ 5 = CLUSTER ■ 8 = LOB ■ 9 = DIRECTORY ■ 10 = QUEUE ■ 11 = REPLICATION OBJECT GROUP ■ 12 = REPLICATION PROPAGATOR ■ 13 = JAVA SOURCE ■ 14 = JAVA RESOURCE ■ 58 = (Data Mining) MODEL
edition_name	Edition in which the object resides. Same as edition_name field in ALL_OBJECTS.

Usage Notes

- No errors are raised if the object does not exist or is already valid or is an object that cannot be validated.
- If the object being validated is not actual in the specified edition, the subprogram automatically switches into the edition in which the object is actual prior to validation. That is, a call to VALIDATE will not actualize the object in the specified edition.

- The INVALIDATE Procedure invalidates a database object and optionally changes its PL/SQL compiler parameter settings. The object to be invalidated is specified by its `object_id`. The subprogram automatically switches to the edition in which the object is actual prior to invalidation. That is, a call to `INVALIDATE` will not actualize the object in the current edition.

WAIT_ON_PENDING_DML Procedure

This procedure waits until all transactions (other than the caller's own) that have locks on the listed tables and began prior to the specified SCN have either committed or been rolled back.

Syntax

```
DBMS_UTILITY.WAIT_ON_PENDING_DML (
    tables     IN       VARCHAR2,
    timeout    IN       BINARY_INTEGER,
    scn        IN OUT   NUMBER);
```

Parameters

Table 153–30 WAIT_ON_PENDING_DML Procedure Parameters

Parameter	Description
tables	Comma-separated list of one or more table names. The list must be valid for COMMA_TO_TABLE Procedures, and each item valid to the NAME_RESOLVE Procedure. Neither column specifiers nor DBLINK (database link) specifiers are allowed in the names, and each name must resolve to an existing table in the local database.
timeout	Maximum number of seconds to wait, totalled across all tables/transactions. A NULL or negative value will cause a very long wait.
scn	The SCN prior to which transactions must have begun to be considered relevant to this request. If the value is null or not recognized as a meaningful scn on input, the most current SCN across all instances will be used and will be set into the passed argument as an output. If a meaningful value is passed in, its value will be preserved in the output. Output: TRUE if all relevant transactions have committed or been rolled back, FALSE if the timeout occurred prior to all relevant transactions committing or being rolled back

154

DBMS_WARNING

The DBMS_WARNING package provides a way to manipulate the behavior of PL/SQL warning messages, in particular by reading and changing the setting of the PLSQL_WARNINGS initialization parameter to control what kinds of warnings are suppressed, displayed, or treated as errors. This package provides the interface to query, modify and delete current system or session settings.

This chapter contains the following topics:

- Using DBMS_WARNING
  - Security Model
- Summary of DBMS_WARNING Subprograms

Using DBMS_WARNING

- Security Model

Security Model

Note that for all the following interfaces, if value of the scope parameter is `SYSTEM`, then the user must have `ALTER SYSTEM` privilege.

Summary of DBMS_WARNING Subprograms

Table 154–1 DBMS_WARNING Package Subprograms

Subprogram	Description
ADD_WARNING_SETTING_CAT Procedure on page 154-5	Modifies the current `session` or `system` warning settings of the `warning_category` previously supplied
ADD_WARNING_SETTING_NUM Procedure on page 154-6	Modifies the current `session` or `system` warning settings of the or `warning_number` previously supplied
GET_CATEGORY Function on page 154-7	Returns the category name, given the message number
GET_WARNING_SETTING_CAT Function on page 154-8	Returns the specific warning category in the session
GET_WARNING_SETTING_NUM Function on page 154-9	Returns the specific warning number in the session
GET_WARNING_SETTING_STRING Function on page 154-10	Returns the entire warning string for the current session
SET_WARNING_SETTING_STRING Procedure on page 154-11	Replaces previous settings with the new value

ADD_WARNING_SETTING_CAT Procedure

You can modify the current session's or system's warning settings with the value supplied. The value will be added to the existing parameter setting if the value for the `warning_category` or `warning_value` has not been set, or override the existing value. The effect of calling this function is same as adding the qualifier (`ENABLE/DISABLE/ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 154–2 ADD_WARNING_SETTING_CAT Procedure Parameters

Parameter	Description
`warning_category`	Name of the category. Allowed values are `ALL`, `INFORMATIONAL`, `SEVERE` and `PERFORMANCE`.
`warning_value`	Value for the category. Allowed values are `ENABLE`, `DISABLE`, and `ERROR`.
`scope`	Specifies if the changes are being performed in the session context or the system context. Allowed values are `SESSION` or `SYSTEM`.

ADD_WARNING_SETTING_NUM Procedure

You can modify the current `session` or `system` warning settings with the value supplied. If the value was already set, you will override the existing value. The effect of calling this function is same as adding the qualifier (`ENABLE` / `DISABLE`/ `ERROR`) on the category specified to the end of the current session or system setting.

Syntax

```
DBMS_WARNING.ADD_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER,
   warning_value       IN    VARCHAR2,
   scope               IN    VARCHAR2);
```

Parameters

Table 154–3 ADD_WARNING_SETTING_NUM Procedure Parameters

Parameter	Description
`warning_number`	The warning number. Allowed values are all valid warning numbers.
`warning_value`	Value for the category. Allowed values are `ENABLE`, `DISABLE`, and `ERROR`.
`scope`	Specifies if the changes are being performed in the session context or the system context. Allowed values are `SESSION` or `SYSTEM`.

GET_CATEGORY Function

This function returns the category name, given the message number.

Syntax

```
DBMS_WARNING.GET_CATEGORY (
   warning_number  IN   pls_integer)
RETURN VARCHAR2;
```

Parameters

Table 154–4 GET_CATEGORY Function Parameters

Parameter	Description
warning_number	The warning message number.

GET_WARNING_SETTING_CAT Function

This function returns the specific warning category setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_CAT (
   warning_category    IN    VARCHAR2)
RETURN warning_value;
```

Parameters

Table 154–5 GET_WARNING_SETTING_CAT Function Parameters

Parameter	Description
warning_category	Name of the category. Allowed values are all valid category names (ALL, INFORMATIONAL, SEVERE and PERFORMANCE).

GET_WARNING_SETTING_NUM Function

This function returns the specific warning number setting for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_NUM (
   warning_number      IN    NUMBER)
RETURN warning_value;
```

Parameters

Table 154–6 GET_WARNING_SETTING_NUM Function Parameters

Parameter	Description
warning_number	Warning number. Allowed values are all valid warning numbers.

GET_WARNING_SETTING_STRING Function

This function returns the entire warning string for the current session.

Syntax

```
DBMS_WARNING.GET_WARNING_SETTING_STRING
 RETURN pls_integer;
```

Usage Notes

Use this function when you do not have `SELECT` privilege on `v$parameter` or `v$paramater2` fixed tables, or if you want to parse the warning string yourself and then modify and set the new value using `SET_WARNING_SETTING_STRING`.

SET_WARNING_SETTING_STRING Procedure

This procedureS replaces previous settings with the new value. The warning string may contain mix of category and warning numbers using the same syntax as used on the right hand side of '=' when issuing an `ALTER SESSION` or `SYSTEM SET PLSQL_WARNINGS` command. This will have same effect as `ALTER SESSION` OR `ALTER SYSTEM` command.

Syntax

```
DBMS_WARNING.SET_WARNING_SETTING_STRING (
   warning_value   IN   VARCHAR2,
   scope           IN   VARCHAR2);
```

Parameters

Table 154–7 SET_WARNING_SETTING_STRING Procedure Parameters

Parameter	Description
`warning_value`	The new string that will constitute the new value.
`scope`	This will specify if the changes are being done in the session context, or system context. Allowed values are `SESSION` or `SYSTEM`.

155

DBMS_WM

The `DBMS_WM` package provides an interface to Oracle Database Workspace Manager (often referred to as Workspace Manager).

- Documentation of DBMS_WM

Documentation of DBMS_WM

For a complete description of this package, see `DBMS_WM` in *Oracle Database Workspace Manager Developer's Guide.*

156

DBMS_WORKLOAD_CAPTURE

The DBMS_WORKLOAD_CAPTURE package configures the Workload Capture system and produce the workload capture data. Replay of this capture is implemented by way of the DBMS_WORKLOAD_REPLAYpackage.

> **See Also:** *Oracle Database Real Application Testing User's Guide* for more information about "Database Replay"

This chapter contains the following topics:

- Using DBMS_WORKLOAD_CAPTURE
  - Overview
  - Security Model
- Summary of DBMS_WORKLOAD_CAPTURE Subprograms

Using DBMS_WORKLOAD_CAPTURE

- Overview
- Security Model

Overview

Since the capture infrastructure is instance wide (and RAC-wide) only one workload capture is being produced at any point in time. Thus capture interfaces do not need a state object passed in as a parameter since there is one single state at any point in time. This means that all subprograms cannot be methods of an object but are package wide PL/SQL subprograms

Security Model

The following code describes the minimal set of privileges required to

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (wrc `someuser/somepassword` or wrc `USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that are used for the replay clients and be able to access the file system appropriately to copy the capture to the replay clients' hosts if required.

Summary of DBMS_WORKLOAD_CAPTURE Subprograms

This table list the package subprograms in alphabetical order.

Table 156–1 DBMS_WORKLOAD_CAPTURE Package Subprograms

Subprogram	Description
ADD_FILTER Procedures on page 156-6	Adds a specified filter
DELETE_CAPTURE_INFO Procedure on page 156-7	Deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID
DELETE_FILTER Procedure on page 156-8	Deletes a specified filter
EXPORT_AWR Procedure on page 156-9	Exports the AWR snapshots associated with a given capture ID
FINISH_CAPTURE Procedure on page 156-10	Finalizes the workload capture by signaling all connected sessions to stop capture, and stops future requests to the database from being captured
GET_CAPTURE_INFO Function on page 156-11	Retrieves all the information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID
IMPORT_AWR Function on page 156-12	Imports the AWR snapshots associated with a given capture ID
PROCESS_CAPTURE Procedure on page 156-13	Processes the workload capture found in capture_dir in place, analyzes it, and creates new workload replay specific metadata files that are required to replay the given workload capture.
REPORT Function on page 156-14	Returns a report on the workload capture under consideration using one or more different sources
START_CAPTURE Procedure	Initiates workload capture on all instances

ADD_FILTER Procedures

This procedure adds a filter to capture a subset of the workload.

Syntax

```
DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue          IN   VARCHAR2 NOT NULL);

DBMS_WORKLOAD_CAPTURE.ADD_FILTER (
   fname           IN   VARCHAR2 NOT NULL,
   fattribute      IN   VARCHAR2 NOT NULL,
   fvalue         IN   NUMBER NOT NULL);
```

Parameters

Table 156–2 ADD_FILTER Procedure Parameters

Parameter	Description
fname	A name for the filter to be added. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	Specifies the attribute on which the filter needs to be applied (Mandatory). The possible values are: ■ INSTANCE_NUMBER - type NUMBER ■ USER - type STRING ■ MODULE - type STRING ■ ACTION - type STRING ■ PROGRAM - type STRING ■ SERVICE - type STRING
fvalue	Specifies the value to which the given attribute should be equal to for the filter to be considered active. Wildcards like '%' are acceptable for all attributes that are of type STRING. This means that the filter for a NUMBER attribute is parsed as "attribute = value", with the filter for a STRING attribute parsed as "attribute like value" (Mandatory)

Usage Notes

- The workload capture filters work in either the DEFAULT INCLUSION or the DEFAULT EXCLUSION mode as determined by the default_action input to the START_CAPTURE Procedure.
- ADD_FILTER adds a new filter that affects the next workload capture, and whether the filters are considered as INCLUSION filters or EXCLUSION filters depends on the value of the default_action input to START_CAPTURE Procedure.
- Filters once specified are valid only for the next workload capture. If the same set of filters need to be used for subsequent capture, they need to be specified each time before the START_CAPTURE Procedure is executed.
- All the filters are listed in the DBA_WORKLOAD_FILTERS view.

DELETE_CAPTURE_INFO Procedure

This procedure deletes the rows in the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views that corresponds to the given workload capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_CAPTURE_INFO
   capture_id     IN   NUMBER);
```

Parameters

Table 156–3 DELETE_CAPTURE_INFO Procedure Parameters

Parameter	Description
capture_id	ID of the workload capture that needs to be deleted. Corresponds to DBA_WORKLOAD_CAPTURES.ID. (Mandatory)

Usage Notes

Passing the ID of a capture that is in progress will first automatically stop that capture.

DELETE_FILTER Procedure

This procedure deletes a specified filter.

Syntax

```
DBMS_WORKLOAD_CAPTURE.DELETE_FILTER (
   filter_name           IN   VARCHAR2(40) NOT NULL);
```

Parameters

Table 156–4 DELETE_FILTER Procedure Parameters

Parameter	Description
filter_name	The filter to be deleted

Usage Notes

The DELETE_FILTER Procedure only affects filters that have not been used by any previous capture. Consequently, filters can be deleted only if they have been added using the ADD_FILTER Procedures after any capture has been completed. Filters that have been added using ADD_FILTER before a START_CAPTURE and FINISH_CAPTURE cannot be deleted anymore using this subprogram.

EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a given capture ID.

Syntax

```
DBMS_WORKLOAD_CAPTURE.EXPORT_AWR (
   capture_id     IN NUMBER);
```

Parameters

Table 156–5 EXPORT_AWR Procedure Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots are to be exported. (Mandatory)

Usage Notes

This procedure works only if the corresponding workload capture was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_CAPTURES was not created by calling the GET_CAPTURE_INFO Function) and the AWR snapshots that correspond to the original capture time period are still available.

FINISH_CAPTURE Procedure

This procedure signals all connected sessions to stop the workload capture and stops future requests to the database from being captured.

Syntax

```
DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
   timneout     IN   NUMBER  DEFAULT 30
   reason       IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 156–6 FINISH_CAPTURE Procedure Parameters

Parameter	Description
timeout	Specifies in seconds for how long the procedure should wait before it times out. Pass 0 if you want to cancel the current workload capture and not wait for any sessions to flush it's capture buffers. Default value: 30 seconds
reason	Specifies a reason for calling the procedure. The reason appears in the column ERROR_MESSAGE of the view DBA_WORKLOAD_CAPTURES.

Usage Notes

- By default, FINISH_CAPTURE waits for 30 seconds to receive a successful acknowledgement from all sessions in the database cluster before timing out.
- All sessions that either were in the middle of executing a user request or received a new user request, while FINISH_CAPTURE was waiting for acknowledgements, flush their buffers and send back their acknowledgement to FINISH_CAPTURE.
- If a database session remains idle (waiting for the next user request) throughout the duration of FINISH_CAPTURE, the session might have unflushed capture buffers and does not send it's acknowledgement to FINISH_CAPTURE.

  To avoid this, do not have sessions that remain idle (waiting for the next user request) while invoking FINISH_CAPTURE. Either close the database session(s) before running FINISH_CAPTURE or send new database requests to those sessions during FINISH_CAPTURE.

GET_CAPTURE_INFO Function

This procedure retrieves all information regarding a workload capture present in the stipulated directory, imports the information into the DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_FILTERS views, and returns the appropriate DBA_WORKLOAD_CAPTURES.ID

Syntax

```
DBMS_WORKLOAD_CAPTURE.GET_CAPTURE_INFO
   dir      IN   VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 156–7 GET_CAPTURE_INFO Function Parameters

Parameter	Description
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are located (Mandatory)

Usage Notes

If an appropriate row describing the capture in the stipulated directory already exists in DBA_WORKLOAD_CAPTURES, the GET_CAPTURE_INFO Function simply returns that row's DBA_WORKLOAD_CAPTURES.ID. If no existing row matches the capture present in the stipulated directory a new row is inserted to DBA_WORKLOAD_CAPTURES and that row's ID is returned.

IMPORT_AWR Function

This procedure imports the AWR snapshots associated with a given capture ID provided those AWR snapshots were exported earlier from the original capture system using the EXPORT_AWR Procedure.

Syntax

```
DBMS_WORKLOAD_CAPTURE.IMPORT_AWR (
   capture_id       IN   NUMBER,
   staging_schema   IN   VARCHAR2,
   force_cleanup    IN   BOOLEAN DEFAULT FALSE)
 RETURN NUMBER;
```

Parameters

Table 156–8 IMPORT_AWR Function Parameters

Parameter	Description
capture_id	ID of the capture whose AWR snapshots should be imported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the capture directory to the SYS AWR schema.The SYS schema is not a valid input. (Mandatory, Case sensitive).
force_cleanup	Values: ■ TRUE - any AWR data present in the given staging_schema are removed before the actual import operation. All tables with names that match any of the tables in AWR are dropped before the actual import.This typically is equivalent to dropping all tables returned by the following SQL: `SELECT table_name FROM dba_tables WHERE owner = staging_schema AND table_name like 'WR_$%';` Use this option only if you are sure that there are no important data in any such tables in the staging_schema. ■ FALSE - (default) no tables are dropped from the staging_schema prior to the import operation

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_CAPTURES view.

Usage Notes

IMPORT_AWR fails if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in `capture_dir` in place, analyzes it, and creates new workload replay specific metadata files that are required to replay the given workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.PROCESS_CAPTURE (
   capture_dir        IN VARCHAR2,
   parallel_level     IN NUMBER DEFAULT NULL);
```

Parameters

Table 156–9 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
`capture_dir`	Name of the workload capture directory object (case sensitive).The directory object must point to a valid OS directory that has appropriate permissions. New files are added to this directory. (Mandatory)
`parallel_level`	Number of oracle processes used to process the capture in a parallel fashion. The `NULL` default value auto-computes the parallelism level, whereas a value of 1 enforces serial execution.

Usage Notes

This procedure can be run multiple times on the same capture directory, which is useful when it encounters unexpected errors or is cancelled by the user.

Once this procedure runs successfully, the `capture_dir` can be used as input to INITIALIZE_REPLAY Procedure in the DBMS_WORKLOAD_REPLAY package in order to replay the captured workload present in `capture_dir`.

REPORT Function

This function generates a report on the stipulated workload capture.

Syntax

```
DBMS_WORKLOAD_CAPTURE.REPORT (
   capture_id      IN   NUMBER,
   format          IN   VARCHAR2)
 RETURN CLOB;
```

Parameters

Table 156–10 REPORT Function Parameters

Parameter	Description
capture_id	ID of the workload capture whose capture report is required. (Mandatory) This relates to the directory that contains the workload capture on which the Report needs to be generated. Should be a valid DIRECTORY object that points to a valid directory in the host system that contains a workload capture.
format	Specifies the report format. Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_TEXT and DBMS_WORKLOAD_CAPTURE.TYPE_HTML.(Mandatory)

Return Values

The report body in the desired format returned as a CLOB

Table 156–11 Constants Used by Report Function

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Generates the HTML version of the report
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Use this as input to the format argument to generate the text version of the report.

START_CAPTURE Procedure

This procedure initiates workload capture on all instances.

Syntax

```
DBMS_WORKLOAD_CAPTURE.START_CAPTURE (
   name              IN  VARCHAR2,
   dir               IN  VARCHAR2,
   duration          IN  NUMBER   DEFAULT NULL,
   default_action    IN  VARCHAR2 DEFAULT 'INCLUDE',
   auto_unrestrict   IN  BOOLEAN  DEFAULT TRUE);
```

Parameters

Table 156–12 START_CAPTURE Procedure Parameters

Parameter	Description
name	Name of the workload capture. Allows the workload capture to be given a label, such as "Thanksgiving weekend" or "Christmas peak workload" for future reference. The workload capture's name is preserved along with the captured workload actions. (Mandatory)
dir	Name of the DIRECTORY object (case sensitive) where all the workload capture files are stored. Should contain enough space to hold all the workload capture files. (Mandatory)
duration	Optional input to specify the duration (in seconds) for which the workload needs to be captured. DEFAULT is NULL which means that workload capture continues until the user executes DBMS_WORKLOAD_CAPTURE.FINISH_CAPTURE
default_action	Can be either INCLUDE or EXCLUDE. Determines whether, by default, every user request should be captured or not. Also determines whether the workload filters specified should be considered as INCLUSION filters or EXCLUSION filters. ▪ If INCLUDE, by default all user requests to the database are captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as EXCLUSION filters, determining the workload that is not captured. (DEFAULT, and so all the filters specified are assumed to be EXCLUSION filters.) ▪ If EXCLUDE, by default no user request to the database is captured, except for the part of the workload defined by the filters. In this case, all the filters specified using the ADD_FILTER Procedures are treated as INCLUSION filters, determining the workload that is captured.
auto_unrestrict	Can be either TRUE or FALSE. ▪ If TRUE, all instances started up in RESTRICTED mode using STARTUP RESTRICT are automatically unrestricted upon a successful START_CAPTURE. (DEFAULT) ▪ If FALSE, no database instance is automatically unrestricted.

Usage Notes

- All user requests sent to database after a successful invocation of START_CAPTURE are recorded in the given dir directory for the given duration provided that one

was specified. If no duration was specified, the capture lasts indefinitely until the FINISH_CAPTURE Procedure is executed.

- A workload capture once started continues to record user requests across database instance shutdowns and startups for the specified duration, or until `FINISH_CAPTURE` is executed, whichever occurs first.
- One can use workload filters (as described with regard to the ADD_FILTER Procedures) to capture only a subset of the user requests sent to the database. By default, when no workload filters are defined, all user requests are captured.
- Workload that is initiated from Oracle Database background processes (such as `SMON`, `PMON`, `MMON`) and Oracle Database Scheduler Jobs (as detailed in the DBMS_SCHEDULER package) is not captured, no matter how the workload filters are defined. These activities should happen automatically on an appropriately configured replay system.
- By default, all database instances that were started up in `RESTRICTED` mode using `STARTUP RESTRICT` are `UNRESTRICTED` upon a successful invocation of START_CAPTURE Use `FALSE` for the `auto_unrestrict` input parameter, if you do not want this behavior.
- It is important to have a well-defined starting point for the workload so that the replay system can be restored to that point before initiating a replay of the captured workload. To have a well-defined starting point for the workload capture, it is preferable not to have any active user sessions when `START_CAPTURE` is executed. If ongoing sessions have ongoing transactions, those transactions are not replayed properly in subsequent database replays, since only that part of the transaction whose calls were executed after `START_CAPTURE` are replayed.

157

DBMS_WORKLOAD_REPLAY

The DBMS_WORKLOAD_REPLAY package provides an interface to replay a workload capture that was originally created by way of the DBMS_WORKLOAD_CAPTURE package. Typically, the DBMS_WORKLOAD_CAPTURE package will be used in the production system to capture a production workload, and the DBMS_WORKLOAD_REPLAY package will be subsequently used in a test system to replay the captured production workload for testing purposes.

> **See Also:** *Oracle Database Real Application Testing User's Guide* for more information about "Database Replay"

This chapter contains the following topics:

- Using DBMS_WORKLOAD_REPLAY
  - Security Model
- Summary of DBMS_WORKLOAD_REPLAY Subprograms

Using DBMS_WORKLOAD_REPLAY

- Security Model

Security Model

The following code describes the minimal set of privileges required to

- Create directory objects
- Operate the interface provided by the `DBMS_WORKLOAD_CAPTURE` and `DBMS_WORKLOAD_REPLAY` packages
- Act as a replay client user (wrc `someuser/somepassword` or wrc `USER=someuser PASSWORD=somepassword`)

```
DROP USER rom1 CASCADE;
CREATE USER rom1 IDENTIFIED BY rom1;

GRANT EXECUTE ON DBMS_WORKLOAD_CAPTURE TO rom1;
GRANT EXECUTE ON DBMS_WORKLOAD_REPLAY TO rom1;

GRANT CREATE SESSION TO rom1;
GRANT CREATE ANY DIRECTORY TO rom1;
GRANT SELECT_CATALOG_ROLE TO rom1;
GRANT BECOME USER TO rom1;
```

Appropriate OS permissions are required to access and manipulate files and directories on both the capture and replay system. This means that the Oracle process(es) and the OS user performing the capture or replay must be able to access and manipulate at least one common directory accessible from the host where the instance is running. Additionally, the OS user performing the replay should be able to execute wrc on hosts that will be used for the replay clients and be able to access the file system appropriately to be able to copy the capture to the replay clients' hosts if required.

Summary of DBMS_WORKLOAD_REPLAY Subprograms

This table list the package subprograms in alphabetical order.

Table 157–1 DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
ADD_FILTER Procedure on page 157-6	Adds a filter to replay only a subset of the captured workload
CALIBRATE Function on page 157-7	Operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload
CANCEL_REPLAY Procedure on page 157-8	Cancels the workload replay in progress
COMPARE_PERIOD_ REPORT Procedure on page 157-9	Generates a report comparing a replay to its capture or to another replay of the same capture
CREATE_FILTER_SET Procedure on page 157-10	Uses the replay filters added to create a set of filters to use against the replay in `replay_dir`.
DELETE_FILTER Procedure on page 157-11	Deletes the named filter
DELETE_REPLAY_INFO Procedure on page 157-12	Deletes the rows in `DBA_WORKLOAD_REPLAYS` that corresponds to the given workload replay ID
EXPORT_AWR Procedure on page 157-13	Exports the AWR snapshots associated with a given replay ID
GET_DIVERGING_ STATEMENT Function on page 157-14	Exports the AWR snapshots associated with a given replay ID
GET_REPLAY_INFO Function on page 157-15	Retrieves information about the workload capture and the history of all the workload replay attempts from the related directory
IMPORT_AWR Function on page 157-16	Imports the AWR snapshots associated with a given replay ID
INITIALIZE_REPLAY Procedure on page 157-17	Initializes replay, and loads specific data produced during processing into the database
IS_REPLAY_PAUSED Function on page 157-18	Reports whether the replay is currently paused
PAUSE_REPLAY Procedure on page 157-19	Pauses the in-progress workload replay
POPULATE_ DIVERGENCE Procedure on page 157-19	Precomputes the divergence information for the given call, stream or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls
PREPARE_REPLAY Procedure on page 157-21	Puts the RDBMS in a special "Prepare" mode
PROCESS_CAPTURE Procedure on page 157-24	Processes the workload capture found in `capture_dir` in place
REMAP_CONNECTION Procedure on page 157-25	Remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.
REPORT Function on page 157-26	Generates a report on the given workload replay

Table 157–1 (Cont.) DBMS_WORKLOAD_REPLAY Package Subprograms

Subprogram	Description
RESUME_REPLAY Procedure on page 157-27	Resumes a paused workload replay
SET_ADVANCED_ PARAMETER Procedure on page 157-28	Sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure
START_REPLAY Procedure on page 157-29	Starts the workload replay
USE_FILTER_SET Procedure on page 157-30	Uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay

ADD_FILTER Procedure

This procedure adds a filter to replay only a subset of the captured workload.

The procedure adds a new filter that is used in the next replay filter set created using the CREATE_FILTER_SET Procedure. This filter will be considered an "INCLUSION" or "EXCLUSION" filter depending on the argument passed to CREATE_FILTER_SET when creating the filter set.

Syntax

```
DBMS_WORKLOAD_REPLAY.ADD_FILTER (
   fname          IN VARCHAR2,
   fattribute     IN VARCHAR2,
   fvalue         IN VARCHAR2);

DBMS_WORKLOAD_REPLAY.ADD_FILTER (
   fname          IN VARCHAR2,
   fattribute     IN VARCHAR2,
   fvalue         IN NUMBER);
```

Parameters

Table 157–2 ADD_FILTER Procedure Parameters

Parameter	Description
fname	Name of the filter. Can be used to delete the filter later if it is not required. (Mandatory)
fattribute	(Mandatory) Specifies the attribute on which the filter is defined as one of the following values: ■ USER - type STRING ■ MODULE - type STRING ■ ACTION - type STRING ■ PROGRAM - type STRING ■ SERVICE - type STRING ■ CONNECTION_STRING - type STRING
fvalue	Specifies the value to which the given 'attribute' should be equal to for the filter to be considered active. Wildcards such as '%' are acceptable for all attributes that are of type STRING. (Mandatory)

CALIBRATE Function

This function operates on a processed workload capture directory to estimate the number of hosts and workload replay clients needed to faithfully replay the given workload. This function returns the results as an XML CLOB.

Syntax

```
DBMS_WORKLOAD_REPLAY.CALIBRATE (
   capture_dir          IN VARCHAR2,
   process_per_cpu      IN BINARY_INTEGER DEFAULT 4,
   threads_per_process  IN BINARY_INTEGER DEFAULT 50)
  RETURN CLOB;
```

Parameters

Table 157–3 CALIBRATE Function Parameters

Parameter	Description
capture_dir	Name of the directory object that points to the (case sensitive) OS directory that contains processed capture data
process_per_cpu	Maximum number of process allowed per CPU (default is 4)
threads_per_process	Maximum number of threads allowed per process (default is 50)

Return Values

Returns a CLOB formatted as XML, that contains:

- Information about the capture
- Current database version
- Input parameters to this function
- Number of CPUs and replay clients needed to replay the given workload
- Information about the sessions captured (total number and maximum concurrency)

Usage Notes

- Prerequisite: The input workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
- This procedure will return the same results as the workload replay client in calibrate mode, which can be run as follows.

  ```
  $ wrc mode=calibrate replaydir=
  ```

CANCEL_REPLAY Procedure

This procedure cancels workload replay in progress. All the external replay clients (WRC) will automatically be notified to stop issuing the captured workload and exit.

Syntax

```
DBMS_WORKLOAD_REPLAY.CANCEL_REPLAY (
   error_msg    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 157–4 CANCEL_REPLAY Procedure Parameters

Parameter	Description
error_msg	An optional reason for cancelling the replay can be passed which will be recorded into DBA_WORKLOAD_REPLAYS.ERROR_MESSAGE. DEFAULT is NULL

Usage Notes

Prerequisite: A call to the INITIALIZE_REPLAY Procedure, or PREPARE_REPLAY Procedure, or START_REPLAY Procedure was already issued.

COMPARE_PERIOD_REPORT Procedure

This procedure generates a report comparing a replay to its capture or to another replay of the same capture.

Syntax

```
DBMS_WORKLOAD_REPLAY.COMPARE_PERIOD_REPORT (
   replay_id1   IN   NUMBER,
   replay_id2   IN   NUMBER,
   format       IN   VARCHAR2,
   result       OUT  CLOB );
```

Parameters

Table 157–5 COMPARE_PERIOD_REPORT Procedure Parameters

Parameter	Description
replay_id1	First ID of the workload replay whose report is requested
replay_id2	Second ID of the workload replay whose report is requested. If this is NULL, the comparison is done with the capture.
format	Specifies the report format Valid values are DBMS_WORKLOAD_CAPTURE.TYPE_HTML and DBMS_WORKLOAD_CAPTURE.TYPE_XML.
result	Output of the report (CLOB)

CREATE_FILTER_SET Procedure

This procedure uses the replay filters added since the previous successful call to create a set of filters to use against the replay in `replay_dir`. After that procedure completed successfully and the filter set has created, it can be used to filter the replay in `replay_dir` by calling the USE_FILTER_SET Procedure after the replay has been initialized.

Syntax

```
DBMS_WORKLOAD_REPLAY.CREATE_FILTER_SET(
   replay_dir       IN  VARCHAR2,
   filter_set       IN  VARCHAR2,
   default_action   IN  VARCHAR2 DEFAULT 'INCLUDE');
```

Parameters

Table 157–6 CREATE_FILTER_SET Procedure Parameters

Parameter	Description
`replay_dir`	Object directory of the replay to be filtered
`filter_set`	Name of the filter set to create (to use in USE_FILTER_SET Procedure)
`default_action`	Can be either `INCLUDE` or `EXCLUDE`. Determines whether, by default, every captured call should be replayed or not. Also determines, whether the workload filters specified should be considered as `INCLUSION` filters or `EXCLUSION` filters.) If it is `INCLUDE` by default all captured calls will be replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using the ADD_FILTER Procedure will be treated as `EXCLUSION` filters, and will determine the workload that will not be replayed. If it is `EXCLUDE` then by default no captured call to the database will be replayed, except for the part of the workload defined by the filters. In this case, all the filters that were specified using he ADD_FILTER Procedure will be treated as `INCLUSION` filters, and will determine the workload that will be replayed. Default: `INCLUDE` and all the filters specified will be assumed to be `EXCLUSION` filters

Usage Notes

This operation needs to be done when no replay is initialized, prepared or in progress.

DELETE_FILTER Procedure

This procedure deletes the named filter.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_FILTER(
   fname    IN  VARCHAR2);
```

Parameters

Table 157–7 DELETE_FILTER Procedure Parameters

Parameter	Description
fname	Name of the filter that should be deleted (Mandatory)

DELETE_REPLAY_INFO Procedure

This procedure deletes the rows in DBA_WORKLOAD_REPLAYS that corresponds to the given workload replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.DELETE_REPLAY_INFO (
   replay_id    IN  NUMBER);
```

Parameters

Table 157–8 DELETE_REPLAY_INFO Procedure Parameters

Parameter	Description
replay_id	ID of the workload replay that needs to be deleted. Corresponds To DBA_WORKLOAD_REPLAYS.ID (Mandatory)

EXPORT_AWR Procedure

This procedure exports the AWR snapshots associated with a stipulated replay ID.

Syntax

```
DBMS_WORKLOAD_REPLAY.EXPORT_AWR (
   replay_id    IN  NUMBER);
```

Parameters

Table 157–9 EXPORT_AWR Function Parameters

Parameter	Description
replay_id	ID of the replay whose AWR snapshots should be exported. (Mandatory)

Usage Notes

- At the end of each replay, the corresponding AWR snapshots are automatically exported. Consequently, there is no need to do this manually after a workload replay is complete, unless the automatic EXPORT_AWR invocation failed.
- This procedure will work only if the corresponding workload replay was performed in the current database (meaning that the corresponding row in DBA_WORKLOAD_REPLAYS was not created by calling the GET_REPLAY_INFO Function) and the AWR snapshots that correspond to that replay time period are still available.

GET_DIVERGING_STATEMENT Function

This function retrieves information about a diverging call, including the statement text, the SQL ID and the binds.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_DIVERGING_STATEMENT (
   replay_id    IN NUMBER,
   stream_id    IN NUMBER,
   call_counter IN NUMBER)
  RETURN CLOB;
```

Parameters

Table 157–10 GET_DIVERGING_STATEMENT Function Parameters

Parameter	Description
`replay_id`	ID of the replay in which that call diverged
`stream_id`	Stream ID of the diverging call
`call_counter`	Call counter of the diverging call

Usage Notes

- Returns a CLOB formatted as XML that contains:
  - SQL ID
  - SQL Text
  - Bind information: position, name and value
- This function will silently invoke the POPULATE_DIVERGENCE Procedure to read the information from the capture files. Therefore, if divergence has not been populated, the first call to this function for a particular diverging call might take longer, especially in very large captures.

GET_REPLAY_INFO Function

This function retrieves information about the workload capture and the history of all the workload replay attempts from the stipulated directory.

Syntax

```
DBMS_WORKLOAD_REPLAY.GET_REPLAY_INFO (
   dir    IN VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 157–11 GET_REPLAY_INFO Function Parameters

Parameter	Description
dir	Name of the workload replay directory object (case sensitive). (Mandatory)

Return Values

The procedure returns the CAPTURE_ID which can be associated with both DBA_WORKLOAD_CAPTURE_ID and DBA_WORKLOAD_REPLAYS.CAPTURE.ID to access the imported information.

Usage Notes

- The procedure first imports a row into DBA_WORKLOAD_CAPTURES which will contain information about the capture. It then, imports a row for every replay attempt retrieved from the given replay directory into DBA_WORKLOAD_REPLAYS.
- The procedure will not insert new rows to DBA_WORKLOAD_CAPTURES and DBA_WORKLOAD_REPLAYS if these views already contain rows describing the capture and replay history present in the given directory.

IMPORT_AWR Function

This procedure imports the AWR snapshots from a given replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.IMPORT_AWR (
   replay_id       IN   NUMBER,
   staging_schema  IN   VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 157–12 IMPORT_AWR Function Parameters

Parameter	Description
replay_id	ID of the replay whose AWR snapshots should be exported. (Mandatory)
staging_schema	Name of a valid schema in the current database which can be used as a staging area while importing the AWR snapshots from the replay directory to the SYS AWR schema. The SYS schema is not a valid input. (Mandatory)

Return Values

Returns the new randomly generated database ID that was used to import the AWR snapshots. The same value can be found in the AWR_DBID column in the DBA_WORKLOAD_REPLAYS view.

Usage Notes

- This procedure will work provided those AWR snapshots were exported earlier from the original replay system using the EXPORT_AWR Procedure.
- IMPORT_AWR will fail if the staging_schema provided as input contains any tables with the same name as any of the AWR tables, such as WRM$_SNAPSHOT or WRH$_PARAMETER. Please drop any such tables in the staging_schema before invoking IMPORT_AWR.

INITIALIZE_REPLAY Procedure

This procedure puts the database state in `INIT` for `REPLAY` mode, and loads data into the replay system that is required before preparing for the replay (by executing the PAUSE_REPLAY Procedure).

Syntax

```
DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY (
   replay_name     IN  VARCHAR2,
   replay_dir      IN  VARCHAR2);
```

Parameters

Table 157–13 INITIALIZE_REPLAY Procedure Parameters

Parameter	Description
`replay_name`	Name of the workload replay. Every replay of a processed workload capture can be given a name. (Mandatory)
`replay_dir`	Name of the directory object that points to the OS directory (case sensitive) that contains processed capture data

Usage Notes

- Prerequisites:
  - Workload capture was already processed using the PROCESS_CAPTURE Procedure in the same database version.
  - Database state has been logically restored to what it was at the beginning of the original workload capture.
- The subprogram loads data into the replay system that is required before preparing for the replay by calling the PAUSE_REPLAY Procedure.

  For instance, during capture we may record the connection string each session used to connect to the server. The INITIALIZE_REPLAY Procedure loads this data and allows the user to re-map the recorded connection string to new connection strings or service points.

  Elaborating on the example described in the PROCESS_CAPTURE Procedure, one could invoke the following:

  ```
  DBMS_WORKLOAD_REPLAY.INITIALIZE_REPLAY('replay foo #1', 'rec_dir');
  ```

  This command will load up the connection map and by default will set all replay time connection strings to be equal to `NULL`. A `NULL` replay time connection string means that the workload replay clients (WRCs) will connect to the default host as determined by the replay client's runtime environment settings. The user can change a particular connection string to a new one (or a new service point) for replay by using the REMAP_CONNECTION Procedure.

IS_REPLAY_PAUSED Function

This function reports whether the replay is currently paused.

Syntax

```
DBMS_WORKLOAD_REPLAY.IS_REPLAY_PAUSED
   RETURN BOOLEAN;
```

Return Values

Returns `TRUE` if the `PAUSE_REPLAY Procedure` has been called successfully and the RESUME_REPLAY Procedure has not been called yet.

Usage Notes

A call to the START_REPLAY Procedure must have already been issued as a pre-requisite.

PAUSE_REPLAY Procedure

This procedure pauses the in-progress workload replay. All subsequent user calls from the replay clients will be stalled until either a call to the RESUME_REPLAY Procedure is issued or the replay is cancelled.

Syntax

```
DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY;
```

Usage Notes

- Prerequisite: A call to the START_REPLAY Procedure must have already ben issued.
- User calls that were already in-progress when PAUSE_REPLAY was issued will be allowed to run to completion. Only subsequent user calls, when issued, will be paused.

POPULATE_DIVERGENCE Procedure

This procedure precomputes the divergence information for the given call, stream or the whole replay so that the GET_DIVERGING_STATEMENT Function returns as quickly as possible for the precomputed calls.

Syntax

```
DBMS_WORKLOAD_REPLAY.POPULATE_DIVERGENCE (
   replay_id    IN   NUMBER,
   stream_id    IN   NUMBER DEFAULT NULL,
   call_counter IN   NUMBER DEFAULT NULL);
```

Parameters

Table 157–14 POPULATE_DIVERGENCE Procedure Parameters

Parameter	Description
replay_id	ID of the replay
stream_id	Stream ID of the diverging call. If NULL is provided, divergence information will be precomputed for all diverging calls in the given replay.
call_counter	Call counter of the diverging call. If NULL is provided, divergence information will be precomputed for all diverging calls in the given stream.

PREPARE_REPLAY Procedure

This procedure puts the database state in PREPARE FOR REPLAY mode.

Syntax

```
DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
   synchronization           IN BOOLEAN   DEFAULT TRUE,
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   scale_up_multiplier       IN NUMBER    DEFAULT 1);

DBMS_WORKLOAD_REPLAY.PREPARE_REPLAY (
   synchronization           IN VARCHAR2  DEFAULT 'SCN',,
   connect_time_scale        IN NUMBER    DEFAULT 100,
   think_time_scale          IN NUMBER    DEFAULT 100,
   think_time_auto_correct   IN BOOLEAN   DEFAULT TRUE,
   scale_up_multiplier       IN NUMBER    DEFAULT 1);
```

Parameters

Table 157–15 PREPARE_REPLAY Procedure Parameters

Parameter	Description
synchronization	Turns synchronization ON or OFF during workload replay. When synchronization is ON, the COMMIT order observed during the original workload capture will be preserved during replay. Every action that is replayed will be executed ONLY AFTER all of it's dependent COMMITs (all COMMITs that were issued before the given action in the original workload capture) have finished execution. DEFAULT is TRUE which preserves commit order. When synchronization is OBJECT_ID, a more advanced synchronization scheme is used. Every action that is replayed will be executed only after the relevant COMMITs have finished executing. The relevant COMMITs are the ones that were issued before the given action in the original workload capture and that had modified at least one of the database objects the given action is referencing (either implicitly or explicitly). This object_id scheme has the same logical property of making sure that any action will see the same data it saw during capture, but will allow more concurrency during replays for the actions that do not touch the same objects/tables. DEFAULT VALUE: SCN, preserve commit order. For legacy reasons, there is a boolean version of this procedure: ■ TRUE means 'SCN' ■ FALSE means 'OFF''
connect_time_scale	Scales the time elapsed between the instant the workload capture was started and session connects with the given value. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See Application of the connect_time_scale Parameter.
think_time_scale	Scales the time elapsed between two successive user calls from the same session. The input is interpreted as a % value. Can potentially be used to increase or decrease the number of concurrent users during the workload replay. DEFAULT VALUE is 100. See Application of the think_time_scale Parameter.

Table 157–15 (Cont.) PREPARE_REPLAY Procedure Parameters

Parameter	Description
think_time_auto_correct	Auto corrects the think time between calls appropriately when user calls takes longer time to complete during replay than how long the same user call took to complete during the original capture. DEFAULT is TRUE which is to reduce think time if replay goes slower than capture. See Application of the think_time_auto_correct Parameter
scale_up_multiplier	Defines the number of times the query workload is scaled up during replay. Each captured session is replayed concurrently as many times as the value of the scale_up_multiplier. However, only one of the sessions in each set of identical replay sessions executes both queries and updates. The remaining sessions only execute queries.

Usage Notes

- Prerequisites:
  - The database has been initialized for replay using the INITIALIZE_REPLAY Procedure.
  - Any capture time connection strings that require remapping have been already done using the REMAP_CONNECTION Procedure.
- One or more external replay clients (WRC) can be started once the PREPARE_REPLAY procedure has been executed.
- With regard to scale_up_multiplier:
  - One replay session (base session) of each set of identical sessions will replay every call from the capture as usual
  - The remaining sessions (scale-up sessions) will only replay calls that are read-only. Thus, DDL, DML, and PL/SQL calls that modified the database will be skipped. SELECT FOR UPDATE statements are also skipped.
  - Readonly calls from the scale-up are synchronized appropriately and obey the timings defined by think_time_scale, connect_time_scale, and think_time_auto_correct. Also, the queries are made to wait for the appropriate commits.
  - No replay data or error divergence records will be generated for the scale-up sessions.
  - All base or scale-up sessions that replay the same capture file will connect from the same workload replay client.

Examples

Application of the connect_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : Capture was started
12:10 : First session connect  (10m after)
12:30 : Second session connect (30m after)
12:42 : Third session connect  (42m after)
```

If the connect_time_scale is 50, then the session connects will happen as follows:

```
12:00 : Replay was started with 50% connect time scale
```

```
12:05 : First session connect  ( 5m after)
12:15 : Second session connect (15m after)
12:21 : Third session connect  (21m after)
```

If the connect_time_scale is 200, then the session connects will happen as follows:

```
12:00 : Replay was started with 200% connect time scale
12:20 : First session connect  (20m after)
13:00 : Second session connect (60m after)
13:24 : Third session connect  (84m after)
```

Application of the think_time_scale Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4mins
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 50 during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:05 : First user call issued 5 mins (50% of 10m) after the completion of
        previous call
12:10 : First user call completes in 5m (takes a minute longer)
12:18 : Second user call issued 8 mins (50% of 16m) after the completion of prev
        call
12:25 : Second user call completes in 7m (takes 3 minutes less)
12:26 : Third user call issued 1 min  (50% of 2m) after the completion of prev
        call
12:35 : Third user call completes in 9m (takes a minute longer)
```

Application of the think_time_auto_correct Parameter

If the following was observed during the original workload capture:

```
12:00 : User SCOTT connects
12:10 : First user call issued (10m after completion of prevcall)
12:14 : First user call completes in 4m
12:30 : Second user call issued (16m after completion of prevcall)
12:40 : Second user call completes in 10m
12:42 : Third user call issued ( 2m after completion of prevcall)
12:50 : Third user call completes in 8m
```

If the think_time_scale is 100 and the think_time_auto_correct is TRUE during the workload replay, then the user calls will look something like below:

```
12:00 : User SCOTT connects
12:10 : First user call issued 10 mins after the completion of prev call
12:15 : First user call completes in 5m (takes 1 minute longer)
12:30 : Second user call issued 15 mins (16m minus the extra time of 1m the prev
        call took) after the completion of prev call
12:44 : Second user call completes in 14m (takes 4 minutes longer)
12:44 : Third user call issued immediately (2m minus the extra time of 4m the prev
        call took) after the completion of prev call
12:52 : Third user call completes in 8m
```

PROCESS_CAPTURE Procedure

This procedure processes the workload capture found in capture_dir in place.

Syntax

```
DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (
   capture_dir            IN   VARCHAR2);
```

Parameters

Table 157–16 PROCESS_CAPTURE Procedure Parameters

Parameter	Description
`catpure_dir`	Name of the workload capture directory object (case sensitive). The directory object must point to a valid OS directory that has the appropriate permissions. New files will be added to this directory. (Mandatory)

Usage Notes

- This subprogram analyzes the workload capture found in the `capture_dir` and creates new workload replay specific metadata files that are required to replay the given workload capture. It only creates new files and does not modify any files that were originally created during the workload capture. Therefore, this procedure can be run multiple times on the same capture directory, such as when the procedure encounters unexpected errors or is cancelled by the user.
- Once this procedure runs successfully, the capture_dir can be used as input to the INITIALIZE_REPLAY Procedure in order to replay the captured workload present in `capture_dir`.
- Before a workload capture can be replayed in a particular database version, the capture needs to be "processed" using this PROCESS_CAPTURE procedure in the same database version. Once created, a processed workload capture can be used to replay the captured workload multiple times in the same database version.

  For example, suppose workload "foo" was captured in `rec_dir` in Oracle database version 10.2.0.5. In order to replay the workload "foo" in version 11.1.0.1 the workload needs to be processed in version 11.1.0.1. The following procedure needs to be executed in a 11.1.0.1 database in order to process the capture directory `rec_dir`:

  ```
  DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE('rec_dir');
  ```

  Now, `rec_dir` contains a valid 11.1.0.1 processed workload capture that can be used to replay the workload "foo" in 11.1.0.1 databases as many number of times as required.

REMAP_CONNECTION Procedure

This procedure remaps the captured connection to a new one so that the user sessions can connect to the database in a desired way during workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REMAP_CONNECTION (
   connection_id         IN  NUMBER,
   replay_connection     IN  VARCHAR2);
```

Parameters

Table 157–17 REMAP_CONNECTION Procedure Parameters

Parameter	Description
`connection_id`	ID of the connection to be remapped.Corresponds to `DBA_WORKLOAD_CONNECTION_MAP.CONN_ID`
`replay_connection`	New connection string to be used during replay

Usage Notes

- By default, all instances of `replay_connection` will be equal to `NULL`. When `replay_connection` is `NULL` (default), replay sessions will connect to the default host as determined by the replay client's runtime environment. Consequently, if no capture time connect strings are remapped, then all the replay sessions will simply connect to the default host to replay the workload.
- A valid `replay_connection` should specify a connect identifier or a service point. Please refer to the *Oracle Database Net Services Reference* for ways to specify connect identifiers (such as net service names, database service names, and net service aliases) and naming methods that can be used to resolve a connect identifier to a connect descriptor.
- An error is returned if no row matches the given `connection_id`.
- Use the `DBA_WORKLOAD_CONNECTION_MAP` view to review all the connection strings that will be used by the subsequent workload replay, and also to examine connection string remappings used for previous workload replays.

REPORT Function

This function generates a report on the stipulated workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.REPORT (
   replay_id          IN NUMBER,
   format             IN VARCHAR2 )
  RETURN CLOB;
```

Parameters

Table 157–18 REPORT Function Parameters

Parameter	Description
`replay_id`	Specifies the ID of the workload replay whose report is requested. (Mandatory)
`format`	Specifies the report format. Valid values are `XML`, `HTML`, or `TEXT`. (Mandatory)

Return Values

The report body in the desired format returned as a `CLOB`

Table 157–19 Constants Used by Report Function

Constant	Type	Value	Description
`TYPE_HTML`	`VARCHAR2`(4)	'HTML'	Generates the HTML version of the report
`TYPE_TEXT`	`VARCHAR2`(4)	'TEXT'	Use this as input to the `format` argument to generate the text version of the report.
`TYPE_XML`	`VARCHAR2`(3)	'XML'	Generates the XML version of the report

RESUME_REPLAY Procedure

This procedure resumes a paused workload replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.RESUME_REPLAY;
```

Usage Notes

Prerequisite: A call to the PAUSE_REPLAY Procedure must have already been issued.

SET_ADVANCED_PARAMETER Procedure

This procedure sets an advanced parameter for replay besides the ones used with the PREPARE_REPLAY Procedure. The advanced parameters control aspects of the replay that are more specialized. The advanced parameters are reset to their default values after the replay has finished.

Syntax

```
DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   VARCHAR2);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   NUMBER);

DBMS_WORKLOAD_REPLAY.SET_ADVANCED_PARAMETER(
   pname    IN   VARCHAR2,
   pvalue   IN   BOOLEAN);
```

Parameters

Table 157–20 SET_ADVANCED_PARAMETER Procedure Parameters

Parameter	Description
pname	Name of the parameter (case insensitive)
pvalue	Value of the parameter

Usage Notes

The current parameters and values that can be used are:

```
'DO_NO_WAIT_COMMITS': (default: FALSE)
```

This parameter controls whether the COMMITs issued by replay sessions will be NOWAIT. The default value for this parameter is FALSE. In this case all the COMMITs are issued with the mode they were captured (wait, no-wait, batch, no-batch). If the parameter is set to TRUE then all COMMITs are issued in no-wait mode. This is useful in cases where the replay is becoming noticeably slow because of a high volume of concurrent COMMITs. Setting the parameter to TRUE will significantly decrease the waits on the 'log file sync' event during the replay with respect to capture.

START_REPLAY Procedure

This procedure starts the workload replay. All the external replay clients (WRC) that are currently connected to the replay database will automatically be notified and those replay clients (WRC) will begin issuing the captured workload.

Syntax

```
DBMS_WORKLOAD_REPLAY.START_REPLAY;
```

Usage Notes

- Prerequisites:
  - The call to the PREPARE_REPLAY Procedure was already issued.
  - Enough number of external replay clients (WRC) that can faithfully replay the captured workload have already been started. The status of such external replay clients can be monitored using `V$WORKLOAD_REPLAY_CLIENTS`.
- Use the WRC's `CALIBRATE` mode to determine the number of replay clients that might be required to faithfully replay the captured workload. For example:

  ```
  $ wrc mode=calibrate replaydir=.
  ```

USE_FILTER_SET Procedure

This procedure uses the given filter set that has been created by calling the CREATE_FILTER_SET Procedure to filter the current replay.

Syntax

```
DBMS_WORKLOAD_REPLAY.USE_FILTER_SET(
   filter_set     IN VARCHAR2);
```

Parameters

Table 157–21 USE_FILTER_SET Procedure Parameters

Parameter	Description
filter_set	Name of the filter set use in this replay

Usage Notes

This procedure should be called after the replay has been initialized and before it is prepared.

158

DBMS_WORKLOAD_REPOSITORY

The DBMS_WORKLOAD_REPOSITORY package lets you manage the Workload Repository, performing operations such as managing snapshots and baselines.

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about the "Automatic Workload Repository"

The chapter contains the following topics:

- Using DBMS_WORKLOAD_REPOSITORY
  - Examples
- Data Structures
  - Object Types
  - Table Types
- Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

Using DBMS_WORKLOAD_REPOSITORY

This section contains topics which relate to using the DBMS_WORKLOAD_REPOSITORY package.

- Examples

Examples

This example shows how to generate an AWR text report with the DBMS_WORKLOAD_REPOSITORY package for database identifier 1557521192, instance id 1, snapshot ids 5390 and 5391 and with default options.

```
-- make sure to set line size appropriately
-- set linesize 152
SELECT output FROM TABLE(
   DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
     1557521192,  1, 5390, 5392) ) ;
```

You can call the DBMS_WORKLOAD_REPOSITORY packaged functions directly as in the example, but Oracle recommends you use the corresponding supplied SQL script (awrrpt.sql in this case) for the packaged function, which prompts the user for required information.

Data Structures

The DBMS_WORKLOAD_REPOSITORY package defines an object and associated table type.

OBJECT Types

- AWR_BASELINE_METRIC_TYPE Object Type

TABLE Types

- AWR_BASELINE_METRIC_TYPE_TABLE Table Type
- AWRRPT_INSTANCE_LIST_TYPE Table Type

AWR_BASELINE_METRIC_TYPE Object Type

This type shows the values of the metrics corresponding to a baseline.

Syntax

```
TYPE breakpoint_info AS OBJECT (
   baseline_name      VARCHAR2(64),
   dbid               NUMBER NOT NULL,
   instance_number    NUMBER NOT NULL,
   beg_time           DATE NOT NULL,
   end_time           DATE NOT NULL,
   metric_id          NUMBER NOT NULL,
   metric_name        VARCHAR2(64) NOT NULL,
   metric_unit        VARCHAR2(64) NOT NULL,
   num_interval       NUMBER NOT NULL,
   interval_size      NUMBER NOT NULL,
   average            NUMBER NOT NULL,
   minimum            NUMBER NOT NULL,
   maximum            NUMBER NOT NULL);
```

Fields

Table 158–1 RUNTIME_INFO Fields

Field	Description
baseline_name	Name of the Baseline
dbid	Database ID for the snapshot
instance_number	Instance number for the snapshot
beg_time	Begin time of the interval
end_time	End time of the interval
metric_id	Metric ID
metric_name	Metric name
metric_unit	Unit of measurement
num_interval	Number of intervals observed
interval_size	Interval size (in hundredths of a second)
average	Average over the period
minimum	Minimum value observed
maximum	Maximum value observed

AWR_BASELINE_METRIC_TYPE_TABLE Table Type

This type is used by the SELECT_BASELINE_METRICS Function.

Syntax

```
CREATE TYPE awr_baseline_metric_type_table AS TABLE OF awr_baseline_metric_type;
```

AWRRPT_INSTANCE_LIST_TYPE Table Type

This type provides an alternative to a comma-separated list.

Syntax

```
CREATE TYPE awrrpt_instance_list_type AS TABLE OF NUMBER;
```

Summary of DBMS_WORKLOAD_REPOSITORY Subprograms

Table 158–2 DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
ADD_COLORED_SQL Procedure on page 158-10	Adds a colored SQL ID
ASH_GLOBAL_REPORT_ HTML Function on page 158-11	Displays a global or Oracle Real Application Clusters (RAC) ASH Spot report in HTML format.
ASH_GLOBAL_REPORT_TEXT Function on page 158-13	Displays a global or Oracle Real Application Clusters (RAC) ASH Spot report in Text format.
ASH_REPORT_HTML Function on page 158-16	Displays the ASH report in HTML
ASH_REPORT_TEXT Function on page 158-19	Displays the ASH report in text
AWR_DIFF_REPORT_HTML Function on page 158-22	Displays the AWR Diff-Diff report in HTML
AWR_DIFF_REPORT_TEXT Function on page 158-23	Displays the AWR Diff-Diff report in text
AWR_GLOBAL_DIFF_REPORT_ HTML Functions on page 158-24	Displays the Global AWR Compare Periods Report in HTML
AWR_GLOBAL_DIFF_REPORT_ TEXT Functions on page 158-25	Displays the Global AWR Compare Periods Report in text
AWR_GLOBAL_REPORT_ HTML Functions on page 158-26	Displays the Global AWR report in HTML
AWR_GLOBAL_REPORT_TEXT Functions on page 158-27	Displays the Global AWR report in text
AWR_REPORT_HTML Function on page 158-28	Displays the AWR report in HTML
AWR_REPORT_TEXT Function on page 158-29	Displays the AWR report in text
AWR_SQL_REPORT_HTML Function on page 158-30	Displays the AWR SQL Report in HTML format
AWR_SQL_REPORT_TEXT Function on page 158-31	Displays the AWR SQL Report in text format
CREATE_BASELINE Functions & Procedures on page 158-32	Creates a single baseline
CREATE_BASELINE_ TEMPLATE Procedures on page 158-32	Creates a baseline template
CREATE_SNAPSHOT Function and Procedure on page 158-35	Creates a manual snapshot immediately
DROP_BASELINE Procedure on page 158-36	Drops a range of snapshots
DROP_BASELINE_TEMPLATE Procedure on page 158-37	Removes a baseline template that is no longer needed
DROP_SNAPSHOT_RANGE Procedure on page 158-38	Activates service

Table 158–2 (Cont.) DBMS_WORKLOAD_REPOSITORY Package Subprograms

Subprogram	Description
MODIFY_SNAPSHOT_ SETTINGS Procedures on page 158-39	Modifies the snapshot settings
MODIFY_BASELINE_ WINDOW_SIZE Procedure on page 158-41	Modifies the window size for the Default Moving Window Baseline
RENAME_BASELINE Procedure on page 158-43	Renames a baseline
SELECT_BASELINE_METRICS Function on page 158-44	Shows the values of the metrics corresponding to a baseline

ADD_COLORED_SQL Procedure

This procedure adds a colored SQL ID. If an SQL ID is colored, it will be captured in every snapshot, independent of its level of activities (so that it does not have to be a `TOP SQL`). Capture occurs if the SQL is found in the cursor cache at snapshot time.

To uncolor the SQL, invoke the REMOVE_COLORED_SQL Procedure.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   sql_id          IN VARCHAR2,
   dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 158–3 ADD_COLORED_SQL Procedure Parameters

Parameter	Description
`sql_id`	13-character external SQL ID
`dbid`	Optional dbid, defaults to Local `DBID`

ASH_GLOBAL_REPORT_HTML Function

This table function displays a global or Oracle Real Application Clusters (RAC) ASH Spot report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_HTML(
   l_dbid          IN NUMBER,
   l_inst_num      IN VARCHAR2((1023),
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 158–4 ASH_GLOBAL_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only

Return Values

The output will be one column of VARCHAR2(1500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpt.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

  ```
  l_data_src =>  1
  ```

  Similarly, to generate a report on samples found only on disk, use

  ```
  l_data_src => 2
  ```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the l_sql_id argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

  Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 158–5 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

ASH_GLOBAL_REPORT_TEXT Function

This table function Displays a global or Oracle Real Application Clusters (RAC) ASH Spot report in Text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_GLOBAL_REPORT_TEXT(
   l_dbid          IN VARCHAR2(1023),
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 158–6 ASH_GLOBAL_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instances (such as '1,2,3'), or NULL to report on all instances in the database
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)
l_data_src	Ignored since the report works off of data on disk only

Return Values

The output will be one column of VARCHAR2(320).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpt.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

  ```
  l_data_src =>  1
  ```

  Similarly, to generate a report on samples found only on disk, use

  ```
  l_data_src => 2
  ```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the l_sql_id argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

Table 158–7 ASH_GLOBAL_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_plsql_entry	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to

generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

```
l_module =>  'PAYROLL', l_action =>  'PROCESS'
```

Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

ASH_REPORT_HTML Function

This table function displays the ASH Spot report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 158–8 ASH_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Table 158–8 (Cont.) ASH_REPORT_HTML Parameters

Parameter	Description
l_data_src	Can be used to specify a data source (see Usage Notes) ■ 1 => memory (V$ACTIVE_SESION_HISTORY) ■ 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) ■ 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpt.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

  ```
  l_data_src =>  1
  ```

  Similarly, to generate a report on samples found only on disk, use

  ```
  l_data_src => 2
  ```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the l_sql_id argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

  Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

Table 158–9 ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes

Table 158–9 (Cont.) ASH_REPORT_HTML: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

ASH_REPORT_TEXT Function

This table function displays the ASH Spot report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_TEXT(
   l_dbid          IN NUMBER,
   l_inst_num      IN NUMBER,
   l_btime         IN DATE,
   l_etime         IN DATE,
   l_options       IN NUMBER    DEFAULT 0,
   l_slot_width    IN NUMBER    DEFAULT 0,
   l_sid           IN NUMBER    DEFAULT NULL,
   l_sql_id        IN VARCHAR2  DEFAULT NULL,
   l_wait_class    IN VARCHAR2  DEFAULT NULL,
   l_service_hash  IN NUMBER    DEFAULT NULL,
   l_module        IN VARCHAR2  DEFAULT NULL,
   l_action        IN VARCHAR2  DEFAULT NULL,
   l_client_id     IN VARCHAR2  DEFAULT NULL,
   l_plsql_entry   IN VARCHAR2  DEFAULT NULL,
   l_data_src      IN NUMBER    DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 158–10 ASH_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_btime	The 'begin time'
l_etime	The 'end time'
l_options	Report level (currently not used)
l_slot_width	Specifies (in seconds) how wide the slots used in the "Top Activity" section of the report should be. This argument is optional, and if it is not specified the time interval between l_btime and l_etime is appropriately split into not more than 10 slots.
l_sid	Session ID (see Usage Notes)
l_sql_id	SQL ID (see Usage Notes)
l_wait_class	Wait class name (see Usage Notes)
l_service_hash	Service name hash (see Usage Notes)
l_module	Module name (see Usage Notes)
l_action	Action name (see Usage Notes)
l_client_id	Client ID for end-to-end backtracing (see Usage Notes)
l_plsql_entry	PL/SQL entry point (see Usage Notes)

Table 158–10 (Cont.) ASH_REPORT_TEXT Parameters

Parameter	Description
l_data_src	Can be used to specify a data source (see Usage Notes) ■ 1 => memory (V$ACTIVE_SESION_HISTORY) ■ 2 => disk (DBA_HIST_ACTIVE_SESS_HISTORY) ■ 0 => both. This is the default value. Here, the begin and end time parameters are used to get the samples from the appropriate data source, which can be memory, disk, or both.

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

- You can call the function directly but Oracle recommends you use the ashrpt.sql script which prompts users for the required information.
- By default, the report uses the begin and end time parameters (l_btime and l_etime, respectively) to find all rows in that time range either from memory, or disk, or both. However, using l_data_src, one can explicitly specify one of those data sources. For example, to generate an ASH report on all rows between l_btime and l_time found in memory, use

  ```
  l_data_src =>  1
  ```

  Similarly, to generate a report on samples found only on disk, use

  ```
  l_data_src => 2
  ```

- The unspecified optional arguments are used to generate an ASH Reports that specify 'report targets' such as a SQL statement, or a session, or a particular Service/Module combination. These arguments are specified to restrict the ASH rows that would be used to generate the report. For example, to generate an ASH report on a particular SQL statement, such as SQL_ID 'abcdefghij123 ' pass that sql_id value to the l_sql_id argument:

  ```
  l_sql_id =>  'abcdefghij123'
  ```

Table 158–11 ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_sid	Session ID (for example, V$SESSION.SID)	No
l_sql_id	SQL ID (for example, V$SQL.SQL_ID)	Yes
l_wait_class	Wait class name (for example, V$EVENT_NAME.WAIT_CLASS)	Yes
l_service_hash	Service name hash (for example, V$ACTIVE_SERVICES.NAME_HASH)	No
l_module	Module name (for example, V$SESSION.MODULE)	Yes
l_action	Action name (for example, V$SESSION.ACTION)	Yes

Table 158–11 (Cont.) ASH_REPORT_TEXT: Wildcards Allowed (or Not) in Arguments

Argument Name	Comment	Wildcard Allowed
l_client_id	Client ID for end-to-end backtracing (for example, V$SESSION.CLIENT_IDENTIFIER)	Yes
l_plsql_entry	PL/SQL entry point (for example, "SYS.DBMS_LOB.*")	Yes
l_data_src	Wildcards are not allowed for l_data_src as it is of numeric datatype	No

- Any combination of those optional arguments can be passed in, and only rows in ASH that satisfy all of those 'report targets' will be used. If multiple 'report targets' are specified, AND conditional logic is used to connect them. For example, to generate an ASH report on MODULE "PAYROLL" and ACTION "PROCESS", use the following predicate:

  ```
  l_module =>  'PAYROLL', l_action =>  'PROCESS'
  ```

  Valid SQL wildcards can be used in all the arguments that are of type VARCHAR2.

AWR_DIFF_REPORT_HTML Function

This table function displays the AWR Compare Periods report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_HTML(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
   inst_num2 IN NUMBER,
   bid2      IN NUMBER,
   eid2      IN NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 158–12 AWR_DIFF_REPORT_HTML Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrddrpt.sql script which prompts users for the required information.

AWR_DIFF_REPORT_TEXT Function

This table function displays the AWR Compare Periods report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_DIFF_REPORT_TEXT(
   dbid1     IN NUMBER,
   inst_num1 IN NUMBER,
   bid1      IN NUMBER,
   eid1      IN NUMBER,
   dbid2     IN NUMBER,
   inst_num2 IN NUMBER,
   bid2      IN NUMBER,
   eid2      IN NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 158–13 AWR_DIFF_REPORT_TEXT Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st instance number
bid1	1st 'Begin Snapshot' ID
eid1	1st 'End Snapshot' ID
dbid2	2nd database identifier
inst_num2	2nd instance number
bid2	2nd 'Begin Snapshot' ID
eid2	2nd 'End Snapshot' ID

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrddrpt.sql script which prompts users for the required information.

AWR_GLOBAL_DIFF_REPORT_HTML Functions

This table function displays Global AWR Compare Periods Report in HTML format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
   dbid1        IN    NUMBER,
   inst_num1    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrrpt_html_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_HTML (
   dbid1        IN    NUMBER,
   inst_num1    IN    VARCHAR2,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    VARCHAR2,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 158–14 AWR_GLOBAL_DIFF_REPORT_HTML Function Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st Begin Snap ID
eid1	1st End Snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd Begin Snap ID
eid2	2nd End Snapshot ID

Return Values

The output will be one column of `VARCHAR2(1500)`.

AWR_GLOBAL_DIFF_REPORT_TEXT Functions

This table function displays Global AWR Compare Periods Report in text format.

The first overload accepts comma-separated lists of instance numbers for `inst_num1` and `inst_num2`. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
   dbid1        IN    NUMBER,
   inst_num1    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    AWRRPT_INSTANCE_LIST_TYPE,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_DIFF_REPORT_TEXT (
   dbid1        IN    NUMBER,
   inst_num1    IN    VARCHAR2,
   bid1         IN    NUMBER,
   eid1         IN    NUMBER,
   dbid2        IN    NUMBER,
   inst_num2    IN    VARCHAR2,
   bid2         IN    NUMBER,
   eid2         IN    NUMBER)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 158–15 AWR_GLOBAL_DIFF_REPORT_TEXT Functions Parameters

Parameter	Description
dbid1	1st database identifier
inst_num1	1st list of instance numbers. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid1	1st Begin Snap ID
eid1	1st End Snapshot ID
dbid2	2nd database identifier
inst_num2	2nd list of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
bid2	2nd Begin Snap ID
eid2	2nd End Snapshot ID

Return Values

The output will be one column of `VARCHAR2(320)`.

AWR_GLOBAL_REPORT_HTML Functions

This table function displays the Global AWR report in HTML.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
   l_dbid        IN    NUMBER,
   l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,
   l_bid         IN    NUMBER,
   l_eid         IN    NUMBER,
   l_options     IN    NUMBER DEFAULT 0)
  RETURN awrrpt_html_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_HTML (
   l_dbid       IN    NUMBER,
   l_inst_num   IN    VARCHAR2,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
  RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 158–16 AWR_GLOBAL_REPORT_HTML Function Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
l_bid	Begin Snap ID
l_eid	End Snapshot ID
l_options	

Return Values

The output will be one column of VARCHAR2(1500).

AWR_GLOBAL_REPORT_TEXT Functions

This table function displays the Global AWR report in text.

The first overload accepts a comma-separated list of instance numbers. No leading zeroes are allowed and there is a limit of 1023 characters

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
   l_dbid        IN    NUMBER,
   l_inst_num    IN    AWRRPT_INSTANCE_LIST_TYPE,
   l_bid         IN    NUMBER,
   l_eid         IN    NUMBER,
   l_options     IN    NUMBER DEFAULT 0)
  RETURN awrdrpt_text_type_table PIPELINED;

DBMS_WORKLOAD_REPOSITORY.AWR_GLOBAL_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    VARCHAR2,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
  RETURN awrdrpt_text_type_table PIPELINED;
```

Parameters

Table 158–17 AWR_GLOBAL_REPORT_TEXT Function Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	List of instance numbers to be included in report. If set to NULL, all instances for which begin and end snapshots are available, and which have not been restarted between snapshots, will be included in the report.
l_bid	Begin Snap ID
l_eid	End Snapshot ID
l_options	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(320).

AWR_REPORT_HTML Function

This table function displays the AWR report in HTML.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 158–18 AWR_REPORT_HTML Parameters

Parameter	Description
`l_dbid`	Database identifier
`l_inst_num`	Instance number
`l_bid`	The `'Begin Snapshot' ID`
`l_eid`	The `'End Snapshot' ID`
`l_options`	A flag to specify to control the output of the report. Currently, Oracle supports one value: ▪ `l_options - 8`. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of `VARCHAR2(1500)`.

Usage Notes

You can call the function directly but Oracle recommends you use the `awrrpt.sql` script which prompts users for the required information.

AWR_REPORT_TEXT Function

This table function displays the AWR report in text.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 158–19 AWR_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_insT_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_options	A flag to specify to control the output of the report. Currently, Oracle supports one value: ■ l_options - 8. Displays the ADDM specific portions of the report. These sections include the Buffer Pool Advice, Shared Pool Advice, and PGA Target Advice.

Return Values

The output will be one column of VARCHAR2(80).

Usage Notes

You can call the function directly but Oracle recommends you use the awrrpt.sql script which prompts users for the required information.

AWR_SQL_REPORT_HTML Function

This table function displays the AWR SQL Report in HTML format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_HTML(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_html_type_table PIPELINED;
```

Parameters

Table 158–20 AWR_SQL_REPORT_HTML Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_sqlid	SQL ID of statement to be analyzed
l_options	A flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(500).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

AWR_SQL_REPORT_TEXT Function

This table function displays the AWR SQL Report in text format.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.AWR_SQL_REPORT_TEXT(
   l_dbid       IN    NUMBER,
   l_inst_num   IN    NUMBER,
   l_bid        IN    NUMBER,
   l_eid        IN    NUMBER,
   l_sqlid      IN    VARCHAR2,
   l_options    IN    NUMBER DEFAULT 0)
 RETURN awrrpt_text_type_table PIPELINED;
```

Parameters

Table 158–21 AWR_SQL_REPORT_TEXT Parameters

Parameter	Description
l_dbid	Database identifier
l_inst_num	Instance number
l_bid	The 'Begin Snapshot' ID
l_eid	The 'End Snapshot' ID
l_sqlid	SQL ID of statement to be analyzed
l_options	Flag to specify to control the output of the report. Currently, not used.

Return Values

The output will be one column of VARCHAR2(120).

Usage Notes

You can call the function directly but Oracle recommends you use the awrsqrpt.sql script which prompts users for the required information.

CREATE_BASELINE Functions & Procedures

This function and procedure creates a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_snap_id    IN  NUMBER,
   end_snap_id      IN  NUMBER,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL)
 RETURN NUMBER;

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE(
   start_time       IN  DATE,
   end_time         IN  DATE,
   baseline_name    IN  VARCHAR2,
   dbid             IN  NUMBER DEFAULT NULL,
   expiration       IN  NUMBER DEFAULT NULL);
 RETURN NUMBER;
```

Parameters

Table 158–22 CREATE_BASELINE Function & Procedure Parameters

Parameter	Description
start_snap_id	Start snapshot sequence number for the baseline'
end_snap_id	End snapshot sequence number for the baseline
start_time	Start time for the baseline'
end_time	End time for the baseline
baseline_name	Name of baseline.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL.

Exceptions

- An error will be returned if this baseline name already exists in the system.

- The snapshot range that is specified for this interface must be an existing pair of snapshots in the database. An error will be returned if the inputted snapshots do not exist in the system.

Examples

This example creates a baseline (named 'oltp_peakload_bl') between snapshots 105 and 107 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE (start_snap_id => 105,
end_snap_id => 107,
baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the CREATE BASELINE action, you will see the newly created baseline in the Workload Repository.

CREATE_BASELINE_TEMPLATE Procedures

This procedure specifies a template for how they would like baselines to be created for future time periods.

Syntax

Specifies a template for generating a baseline for a single time period in the future.

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name           IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER DEFAULT NULL);
```

Specifies a template for creating and dropping baseline based on repeating time periods:

```
DBMS_WORKLOAD_REPOSITORY.CREATE_BASELINE_TEMPLATE(
   day_of_week             IN VARCHAR2,
   hour_in_day             IN NUMBER,
   duration                IN NUMBER,
   start_time              IN DATE,
   end_time                IN DATE,
   baseline_name_prefix    IN VARCHAR2,
   template_name           IN VARCHAR2,
   expiration              IN NUMBER,
   dbid                    IN NUMBER DEFAULT NULL);
```

Parameters

Table 158–23 CREATE_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
start_time	Start Time for the baseline to be created'
end_time	End Time for the baseline to be created
baseline_name	Name of baseline to be created
template_name	Name for the template
expiration	Expiration in number of days for the baseline. If NULL, then expiration is infinite, meaning do not drop baseline ever. Defaults to NULL
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.
day_of_week	Day of week that the baseline should repeat on. Specify one of the following values: SUNDAY, MONDAY, TUESDAY, WEDNESDAY, THURSDAY, FRIDAY, SATURDAY.
hour_in_day	Value of 0-23 to specify the Hour in the Day the baseline should start
duration	Duration (in number of hours) after hour in the day that the baseline should last
baseline_name_prefix	Name for baseline prefix. When creating the baseline, the name of the baseline will be the prefix appended with the date information.

CREATE_SNAPSHOT Function and Procedure

This function and procedure create snapshots. In the case of the function, the snapshot ID is returned.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'TYPICAL');

DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT(
   flush_level IN VARCHAR2 DEFAULT 'TYPICAL')
 RETURN NUMBER;
```

Parameters

Table 158–24 CREATE_SNAPSHOT Parameters

Parameter	Description
flush_level	Flush level for the snapshot is either 'TYPICAL' or 'ALL'

Examples

This example creates a manual snapshot at the TYPICAL level:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.CREATE_SNAPSHOT();
```

If you query the DBA_HIST_SNAPSHOT view after the CREATE_SNAPSHOT action, you will see one more snapshot ID added to the Workload Repository.

DROP_BASELINE Procedure

This procedure drops a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE(
   baseline_name  IN  VARCHAR2,
   cascade        IN  BOOLEAN DEFAULT FALSE,
   dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

Table 158–25 DROP_BASELINE Parameters

Parameter	Description
baseline_name	Name of baseline to drop from the system
cascade	If TRUE, the pair of snapshots associated with the baseline will also be dropped. Otherwise, only the baseline is removed.
dbid	Database Identifier for baseline. If NULL, this takes the database identifier for the local database. Defaults to NULL.

Examples

This example drops the baseline 'oltp_peakload_bl' without dropping the underlying snapshots:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE (
       baseline_name => 'oltp_peakload_bl');
```

If you query the DBA_HIST_BASELINE view after the DROP_BASELINE action, you will see the specified baseline definition is removed. You can query the DBA_HIST_SNAPSHOT view to find that the underlying snapshots are left intact.

DROP_BASELINE_TEMPLATE Procedure

This procedure removes a template that is no longer needed.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_BASELINE_TEMPLATE(
   template_name           IN VARCHAR2,
   dbid                    IN NUMBER DEFAULT NULL);
```

Parameters

Table 158–26 DROP_BASELINE_TEMPLATE Procedure Parameters

Parameter	Description
`template_name`	Name of the template to remove
`dbid`	Database Identifier for baseline. If `NULL`, this takes the database identifier for the local database. Defaults to `NULL`.

DROP_SNAPSHOT_RANGE Procedure

This procedure drops a range of snapshots.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(
   low_snap_id    IN  NUMBER,
   high_snap_id   IN  NUMBER
   dbid           IN  NUMBER DEFAULT NULL);
```

Parameters

Table 158–27 DROP_SNAPSHOT_RANGE Procedure Parameters

Parameter	Description
low_snap_id	Low snapshot id of snapshots to drop.
high_snap_id	High snapshot id of snapshots to drop.
dbid	Database id (default to local DBID.

Examples

This example drops the range of snapshots between snapshot id 102 to 105 for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.DROP_SNAPSHOT_RANGE(102, 105);
```

If you query the dba_hist_snapshot view after the Drop Snapshot action, you will see that snapshots 102 to 105 are removed from the Workload Repository.

MODIFY_SNAPSHOT_SETTINGS Procedures

This procedure controls three aspects of snapshot generation.

- The INTERVAL setting affects how often snapshots are automatically captured.
- The RETENTION setting affects how long snapshots are retained in the Workload Repository.
- The number of SQL captured for each Top criteria. If the user manually specifies a value for Top N SQL, the AWR SQL collection will use the user-specified number for both automatic and manual snapshots.

There are two overloads. The first takes a NUMBER and the second takes a VARCHAR2 for the topnsql argument. The differences are described under the Parameters description.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention   IN  NUMBER    DEFAULT NULL,
   interval    IN  NUMBER    DEFAULT NULL,
   topnsql     IN  NUMBER    DEFAULT NULL,
   dbid        IN  NUMBER    DEFAULT NULL);

DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
   retention   IN  NUMBER    DEFAULT NULL,
   interval    IN  NUMBER    DEFAULT NULL,
   topnsql     IN  VARCHAR2,
   dbid        IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 158–28 MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
retention	New retention time (in minutes). The specified value must be in the range of MIN_RETENTION (1 day) to MAX_RETENTION (100 years). If ZERO is specified, snapshots will be retained forever. A large system-defined value will be used as the retention setting. If NULL is specified, the old value for retention is preserved. NOTE: The retention setting must be greater than or equal to the window size of the 'SYSTEM_MOVING_WINDOW' baseline. If the retention needs to be less than the window size, the MODIFY_BASELINE_WINDOW_SIZE Procedure can be used to adjust the window size.
interval	New interval setting between each snapshot, in units of minutes. The specified value must be in the range MIN_INTERVAL (10 minutes) to MAX_INTERVAL (1 year). If ZERO is specified, automatic and manual snapshots will be disabled. A large system-defined value will be used as the retention setting. If NULL is specified, the current value is preserved.

Table 158–28 (Cont.) MODIFY_SNAPSHOT_SETTINGS Procedure Parameters

Parameter	Description
topnsql	■ If NUMBER: Top N SQL size. The number of Top SQL to flush for each SQL criteria (Elapsed Time, CPU Time, Parse Calls, Shareable Memory, Version Count). The value for this setting will not be affected by the statistics/flush level and will override the system default behavior for the AWR SQL collection. The setting will have a minimum value of 30 and a maximum value of 50,000. Specifying NULL will keep the current setting. ■ If VARCHAR2: Users are allowed to specify the following values: (DEFAULT, MAXIMUM, N), where N is the number of Top SQL to flush for each SQL criteria. Specifying DEFAULT will revert the system back to the default behavior of Top 30 for statistics level TYPICAL and Top 100 for statistics level ALL. Specifying MAXIMUM will cause the system to capture the complete set of SQL in the cursor cache. Specifying the number N is equivalent to setting the Top N SQL with the NUMBER type. Specifying NULL for this argument will keep the current setting.
dbid	Database identifier in AWR for which to modify the snapshot settings. If NULL is specified, the local dbid will be used. Defaults to NULL.

Examples

This example changes the interval setting to one hour and the retention setting to two weeks for the local database:

```
EXECUTE DBMS_WORKLOAD_REPOSITORY.MODIFY_SNAPSHOT_SETTINGS(
  interval  =>  60,
  retention =>  20160);
```

If you query the DBA_HIST_WR_CONTROL table after this procedure is executed, you will see the changes to these settings.

MODIFY_BASELINE_WINDOW_SIZE Procedure

This procedure modifies the window size for the Default Moving Window Baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.MODIFY_BASELINE_WINDOW_SIZE(
   window_size     IN   NUMBER,
   dbid            IN   NUMBER DEFAULT NULL);
```

Parameters

Table 158–29 MODIFY_BASELINE_WINDOW_SIZE Procedure Parameters

Parameter	Description
window_size	New Window size for the default Moving Window Baseline, in number of days.
dbid	Database ID (default to local DBID)

Usage Notes

The window size must be less than or equal to the AWR retention setting. If the window size needs to be greater than the retention setting, the MODIFY_SNAPSHOT_SETTINGS Procedures can be used to adjust the retention setting.

REMOVE_COLORED_SQL Procedure

This procedure removes a colored SQL ID. After a SQL is uncolored, it will no longer be captured in a snapshot automatically, unless it makes the `TOP` list.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.ASH_REPORT_HTML(
   sql_id          IN VARCHAR2,
   dbid            IN NUMBER DEFAULT NULL);
```

Parameters

Table 158–30 REMOVE_COLORED_SQL Procedure Parameters

Parameter	Description
`sql_id`	13-character external SQL ID
`dbid`	Optional dbid, defaults to Local `DBID`

RENAME_BASELINE Procedure

This procedure renames a baseline.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.RENAME_BASELINE(
   old_baseline_name     IN   VARCHAR2,
   new_baseline_name     IN VARCHAR2,
   dbid                  IN NUMBER DEFAULT NULL);
```

Parameters

Table 158–31 RENAME_BASELINE Procedure Parameters

Parameter	Description
old_baseline_name	Old baseline name
new_baseline_name	New baseline name
dbid	Database ID (default to local DBID)

SELECT_BASELINE_METRICS Function

This table function shows the values of the metrics corresponding to a baseline. The table function will return an object of the AWR_BASELINE_METRIC_TYPE Object Type.

Syntax

```
DBMS_WORKLOAD_REPOSITORY.SELECT_BASELINE_METRICS(
   baseline_name     IN VARCHAR2,
   dbid              IN NUMBER DEFAULT NULL,
   instance_num      IN NUMBER DEFAULT NULL)
 RETURN awr_baseline_metric_type_table PIPELINED;
```

Parameters

Table 158–32 SELECT_BASELINE_METRICS Function Parameters

Parameter	Description
baseline_name	Name of the baseline for which we would like to view metrics
dbid	Database Identifier for baseline. If NULL, then use the database identifier for the local database. Defaults to NULL.
instance_num	Instance for which number the user wants to see statistics. If NULL, show statistics for the local instance. Defaults to NULL.

159

DBMS_XA

The DBMS_XA package contains the XA/Open interface for applications to call XA interface in PL/SQL. Using this package, application developers can switch or share transactions across SQL*Plus sessions or processes using PL/SQL.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for more information about "Developing Applications with Oracle XA"

The chapter contains the following topics:

- Using DBMS_XA
  - Overview
  - Security Model
  - Constants
  - Operational Notes
- Data Structures
  - OBJECT Types
  - TABLE Types
- Summary of DBMS_XA Subprograms

Using DBMS_XA

- Overview
- Security Model
- Constants
- Operational Notes

Overview

These subprograms allow a PL/SQL application to define a global transaction branch ID (`XID`) and associate or disassociate the current session with the transaction branch.

Subsequently, these transaction branches may be prepared and committed by following the two-phase commit protocol. A single-phase commit protocol is also supported if only one resource manager is involved.

Interfaces are also provided for a PL/SQL application to set the timeout values for any new global transaction branches that may start with the current session.

Security Model

This package is created under SYS. Operations provided by this package are performed under the current calling user, not under the package owner SYS.

Any DBMS_XA subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any DBMS_XA subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

SELECT privilege on SYS.DBA_PENDING_TRANSACTIONS is required for users who need to execute XA_RECOVER subprogram.

FORCE ANY TRANSACTION privilege is required for users who need to manipulate XA transactions created by other users.

Constants

The DBMS_XA package uses the constants shown in Table 159–1 for use in the flag field of the XA_START Function and the XA_END Function.

Table 159–1 DBMS_XA Constants for Flag Field of XA_START & XA_END Functions

Name	Type	Value	Description
TMNOFLAGS	PLS_INTEGER	00000000	Indicates no flag value is selected.
TMSUCCESS	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('04000000')	Dissociates caller from transaction branch
TMJOIN	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('00200000')	Caller is joining existing transaction branch.
TMSUSPEND	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('02000000')	Caller is suspending, not ending, association
TMRESUME	PLS_INTEGER	UTL_RAW.CAST_TO_BINARY_INTEGER ('08000000')	Caller is resuming association with suspended transaction branch.

The DBMS_XA package uses the constants shown in Table 159–2 for Possible Return Values

Table 159–2 DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_RBBASE	PLS_INTEGER	100	Inclusive lower bound of the rollback codes
XA_RBROLLBACK	PLS_INTEGER	XA_RBBASE	Rollback was caused by an unspecified reason
XA_RBCOMMFAIL	PLS_INTEGER	XA_RBBASE+1	Rollback was caused by a communication failure
XA_RBDEADLOCK	PLS_INTEGER	XA_RBBASE+2	Deadlock was detected
XA_RBINTEGRITY	PLS_INTEGER	XA_RBBASE+3	Condition that violates the integrity of the resources was detected
XA_RBOTHER	PLS_INTEGER	XA_RBBASE+4	Resource manager rolled back the transaction for an unlisted reason
XA_RBPROTO	PLS_INTEGER	XA_RBBASE+5	Protocol error occurred in the resource manager
XA_RBTIMEOUT	PLS_INTEGER	XA_RBBASE+6	transaction branch took long
XA_RBTRANSIENT	PLS_INTEGER	XA_RBBASE+7	May retry the transaction branch
XA_RBEND	PLS_INTEGER	XA_RBTRANSIENT	Inclusive upper bound of the rollback codes
XA_NOMIGRATE	PLS_INTEGER	9	Transaction branch may have been heuristically completed

Table 159–2 (Cont.) DBMS_XA Constants for Possible Return Values

Name	Type	Value	Description
XA_HEURHAZ	PLS_INTEGER	8	Transaction branch may have been heuristically completed
XA_HEURCOM	PLS_INTEGER	7	Transaction branch has been heuristically committed
XA_HEURRB	PLS_INTEGER	6	Transaction branch has been heuristically rolled back
XA_HEURMIX	PLS_INTEGER	5	Some of the transaction branches have been heuristically committed, others rolled back
XA_RETRY	PLS_INTEGER	4	Routine returned with no effect and may be re-issued
XA_RDONLY	PLS_INTEGER	3	Transaction was read-only and has been committed
XA_OK	PLS_INTEGER	0	Normal execution
XAER_ASYNC	PLS_INTEGER	-2	Asynchronous operation already outstanding
XAER_RMERR	PLS_INTEGER	-3	Resource manager error occurred in the transaction branch
XAER_NOTA	PLS_INTEGER	-4	XID is not valid
XAER_INVAL	PLS_INTEGER	-5	Invalid arguments were given
XAER_PROTO	PLS_INTEGER	-6	Routine invoked in an improper context
XAER_RMFAIL	PLS_INTEGER	-7	Resource manager unavailable
XAER_DUPID	PLS_INTEGER	-8	XID already exists
XAER_OUTSIDE	PLS_INTEGER	-9	Resource manager doing work outside global transaction

Operational Notes

In compliance with the XA specification of the X/Open CAE Standard for Distributed Transaction Processing, XA_PREPARE/COMMIT/ ROLLBACK/FORGET may not be called when the transaction is still associated with the current session. Only after XA_END has been called so that there is not any transaction associated with the current session, the application may call XA_PREPARE/COMMIT/ ROLLBACK/FORGET.

XAER_PROTO error is returned from XA_PREPARE/COMMIT/ROLLBACK/FORGET if a transaction is being associated with the current session.

Prior to calling any of the package subprograms, a connection/session must have already been established to the Oracle database server backend, or a resource manager. Resource manager identifiers are not supported. If multiple resource managers are involved, multiple connections/sessions must be pre-established to each resource manager before calling any the package subprograms. If multiple connections/sessions are established during the course of global transaction processing, the caller must ensure that all of those connections/sessions associated with a specific global transaction branch identifier (XID) are established to the same resource manager.

Data Structures

The DBMS_XA package uses the following OBJECT type and associated TABLE type.

OBJECT Types

- DBMS_XA_XID Object Type

TABLE Types

- DBMS_XA_XID_ARRAY Table Type

DBMS_XA_XID Object Type

The PL/SQL XA interface allows the PL/SQL application to define a global transaction branch id (XID) and associate/disassociate the current session with the transaction branch. XID is defined as a PL/SQL object type.

> **See Also:** For more information, see "Distributed Transaction Processing: The XA Specification" in the public XA Standard.

Syntax

```
TYPE DBMS_XA_XID IS OBJECT(
  formatid      NUMBER,
  gtrid         RAW(64),
  bqual         RAW(64),
  constructor function DBMS_XA_XID(
       gtrid     IN   NUMBER)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID (
       gtrid     IN   RAW,
       bqual     IN   RAW)
    RETURN SELF AS RESULT,
  constructor function DBMS_XA_XID(
       formatid  IN   NUMBER,
       gtrid     IN   RAW,
       bqual     IN   RAW DEFAULT HEXTORAW('00000000000000000000000000000001'))
    RETURN SELF AS RESULT)
```

Attributes

Table 159–3 DBMS_XA_XID Object Type

Attribute	Description
`formatid`	Format identifier, a number identifying different transaction managers (TM)
`gtrid`	Global transaction identifier uniquely identifying a global transaction, of which the maximum size is 64 bytes
`bqual`	Branch qualifier, of which the maximum size is 64 bytes

DBMS_XA_XID_ARRAY Table Type

This type is used to define an array of `xid` that represent a list of global transaction branches.

Syntax

```
TYPE DBMS_XA_XID_ARRAY as TABLE of DBMS_XA_XID
```

Summary of DBMS_XA Subprograms

Table 159–4 DBMS_Xa Package Subprograms

Subprogram	Description
DIST_TXN_SYNC Procedure on page 159-12	Used in recovery of synchronization when utilizing Oracle Real Application Clusters (RAC)
XA_COMMIT Function on page 159-13	Commits the global transaction specified by `xid`
XA_END Function on page 159-14	Disassociates the current session from the transaction branch specified by `xid`
XA_FORGET Function on page 159-15	Informs the resource manager to forget about a heuristically committed or rolled back transaction branch.
XA_GETLASTOER Function on page 159-16	Obtains the last Oracle error code, in case of failure of previous XA calls.
XA_PREPARE Function on page 159-17	Prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible
XA_RECOVER Function on page 159-18	Obtains a list of prepared or heuristically completed transaction branches from a resource manager
XA_ROLLBACK Function on page 159-19	Informs the resource manager to roll back work done on behalf of a transaction branch
XA_SETTIMEOUT Function on page 159-20	Sets the transaction timeout in seconds for the current session
XA_START Function on page 159-21	Associates the current session with the transaction branch specified by `xid`

DIST_TXN_SYNC Procedure

This procedure can be used to synchronize in-doubt transactions when one of the Oracle Real Application Clusters (RAC) instances fails.

Syntax

```
DBMS_XA.DIST_TXN_SYNC;
```

XA_COMMIT Function

This function commits the global transaction specified by `xid`.

Syntax

```
DBMS_XA.XA_COMMIT (
   xid       IN  DBMS_XA_XID,
   onePhase  IN  BOOLEAN)
RETURN PLS_INTEGER;
```

Parameters

Table 159–5 XA_COMMIT Function Parameters

Parameter	Description
`xid`	See DBMS_XA_XID Object Type on page 159-9
`onePhase`	If `TRUE`, apply single phase commit

Return Values

See Table 159–2, " DBMS_XA Constants for Possible Return Values". Possible return values indicating error are: `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`. Other possible return values include: `XA_OK`, `XA_RB*`, `XA_HEURHAZ`, `XA_HEURCOM`, `XA_HEURRB`, and `XA_HEURMIX`.

Usage Notes

- An application must not call `COMMIT`, but instead must call `XA_COMMIT` to commit the global transaction specified by `xid`. If a user needs to commit a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- If `onePhase` is `TRUE`, the resource manager should use a one-phase commit protocol to commit the work done on behalf of `xid`. Otherwise, only if all branches of the global transaction have been prepared successfully and the preceding `XA_PREPARE` call has returned `XA_OK`, should `XA_COMMIT` be called.
- The application must make a separate `XA_COMMIT` call for each of the transaction branches of the global transaction for which `XA_PREPARE` has returned `XA_OK`.
- If the resource manager did not commit the transaction and the parameter `onePhase` is set to `TRUE`, the resource manager may return one of the `XA_RB*` code. Upon return, the resource manager has rolled back the branch's work and has released all held resources.

XA_END Function

This function disassociates the current session from the transaction branch specified by xid

A transaction manager calls XA_END when a thread of control finishes, or needs to suspend work on, a transaction branch. This occurs when the application completes a portion of its work, either partially or in its entirety (for example, before blocking on some event in order to let other threads of control work on the branch). When XA_END successfully returns, the calling thread of control is no longer actively associated with the branch but the branch still exists

Syntax

```
DBMS_XA.XA_END (
   xid   IN  DBMS_XA_XID,
   flag  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 159–6 XA_END Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 159-9
flag	See Table 159–1, " DBMS_XA Constants for Flag Field of XA_START & XA_END Functions".

Return Values

See Table 159–2, " DBMS_XA Constants for Possible Return Values". Possible return values in error are XAER_RMERR, XAER_RMFAILED, XAER_NOTA, XAER_INVAL, XAER_PROTO, or XA_RB*.

Usage Notes

- TMSUCCESS or TMSUSPEND may be specified in flag, and the transaction branch is disassociated with the current session in detached state if the return value is XA_OK. TMFAIL is not supported. XA_END may be called with either TMSUCCESS or TMSUSPEND to disassociate the transaction branch identified by xid from the current session.
- XA_OK is returned if XA_END succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the application should proceed for other normal operations.
- Executing a ROLLBACK statement without calling XA_END first will rollback the changes made by the current transaction. However, the transaction context is still associated with the current session until XA_END is called.
- Executing a COMMIT statement without calling XA_END first will result in ORA-02089: COMMIT is not allowed in a subordinate session.
- Executing a COMMIT or a ROLLBACK statement after XA_END has no effect on the transaction identified by xid, since this transaction is no longer associated with the current session. To commit the transaction ID or the XA_ROLLBACK Function to commit/rollback the transaction specified by the xid.

XA_FORGET Function

This function informs the resource manager to forget about a heuristically committed or rolled back transaction branch.

Syntax

```
DBMS_XA.XA_FORGET (
   xid       IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 159–7 XA_FORGET Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 159-9

Return Values

See Table 159–2, " DBMS_XA Constants for Possible Return Values". Possible return values are XA_OK, XAER_RMERR, XAER_RMFAIL, XAER_NOTA, XAER_INVAL, or XAER_PROTO.

XA_GETLASTOER Function

This function obtains the last Oracle error code, in case of failure of previous XA calls.

Syntax

```
DBMS_XA.XA_GETLASTOER
 RETURN PLS_INTEGER;
```

Return Values

The return value carries the last Oracle error code.

XA_PREPARE Function

This function prepares the transaction branch specified in `xid` for committing the transaction subsequently if possible.

Syntax

```
DBMS_XA.XA_PREPARE (
   xid   IN  DBMS_XA_XID)
RETURN PLS_INTEGER;
```

Parameters

Table 159–8 XA_PREPARE Function Parameters

Parameter	Description
`xid`	See DBMS_XA_XID Object Type on page 159-9

Return Values

See Table 159–2, " DBMS_XA Constants for Possible Return Values". Possible return codes include: `XA_OK`, `XA_RDONLY`, `XA_RB*`, `XAER_RMERR`, `XAER_RMFAIL`, `XAER_NOTA`, `XAER_INVAL`, or `XAER_PROTO`.

Usage Notes

- If a user needs to prepare a transaction branch that is created by other users, `FORCE ANY TRANSACTION` must be granted to the user.
- An application must keep track of all the branches of one global transaction, and prepare each transaction branch. Only if all branches of the global transaction have been prepared successfully and `XA_PREPARE` has returned `XA_OK`, the application may proceed to call `XA_COMMIT`.

XA_RECOVER Function

This function obtains a list of prepared or heuristically completed transaction branches from a resource manager.

Syntax

```
DBMS_XA.XA_RECOVER
 RETURN DBMS_XA_XID_ARRAY;
```

Return Values

See DBMS_XA_XID_ARRAY Table Type

Usage Notes

- The flags `TMSTARTSCAN`, `TMENDSCAN`, `TMNOFLAGS` are not supported.
- The privilege `SELECT ON DBA_PENDING_TRANSACTIONS` must be granted to the user who needs to call `XA_RECOVER`.

XA_ROLLBACK Function

This function informs the resource manager to roll back work done on behalf of a transaction branch.

Syntax

```
DBMS_XA.XA_ROLLBACK (
   xid       IN  DBMS_XA_XID)
 RETURN PLS_INTEGER;
```

Parameters

Table 159–9 XA_ROLLBACK Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 159-9

Return Values

See Table 159–2, " DBMS_XA Constants for Possible Return Values". Possible return values are: XA_OK, XA_RB*, XA_HEURHAZ, XA_HEURCOM, XA_HEURRB, or XA_HEURMIX.

Usage Notes

If a user needs to rollback a transaction branch that created by other users, the privilege FORCE ANY TRANSACTION must be granted to the user.

XA_SETTIMEOUT Function

This function sets the transaction timeout in seconds for the current session.

Syntax

```
DBMS_XA.XA_SETTIMEOUT (
   seconds  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 159–10 XA_SETTIMEOUT Function Parameters

Parameter	Description
`seconds`	The timeout value indicates the maximum time in seconds that a transaction branch may be disassociated from the session before the system automatically aborts the transaction. The default value is 60 seconds.

Return Values

See Table 159–2, " DBMS_XA Constants for Possible Return Values". Possible return values are `XA_OK`, `XAER_RMERR`, `XAER_RMFAIL`, or `XAER_INVAL`.

Usage Notes

Only if return value is `XA_OK`, is the timeout value successfully set.

XA_START Function

This function associates the current session with a transaction branch specified by the xid.

Syntax

```
DBMS_XA.XA_START (
   xid   IN  DBMS_XA_XID,
   flag  IN  PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 159–11 XA_START Function Parameters

Parameter	Description
xid	See DBMS_XA_XID Object Type on page 159-9
flag	See Table 159–1, " DBMS_XA Constants for Flag Field of XA_START & XA_END Functions".

Return Values

See Table 159–2, " DBMS_XA Constants for Possible Return Values"

Usage Notes

- If TMJOIN or TMRESUME is specified in flag, the start is for joining an existing transaction branch identified by the xid. TMJOIN flag should be used when the transaction is detached with TMSUCCESS flag. TMRESUME should be used when the transaction branch is detached with TMSUSPEND flag. XA_START may be called with either flag to join an existing transaction branch.
- If TMNOFLAGS is specified in flag, and neither TMJOIN nor TMRESUME is specified, a new transaction branch is to be started. If the transaction branch specified in xid already exists, XA_START returns an XAER_DUPID error code.
- Possible return values in error include: XAER_RMERR, XAER_RMFAIL, XAER_DUPID, XAER_OUTSIDE, XAER_NOTA, XAER_INVAL, and XAER_PROTO.
- XA_OK is returned if XA_START succeeds. An application must check the return value and handle error cases. Only when XA_OK is returned, the PL/SQL application should proceed for other normal operations.
- Transaction stacking is not supported. If there is an active transaction associated with the current session, may not be called to start or join another transaction. XAER_PROTO will be returned if XA_START is called with an active global transaction branch associated with the session. XAER_OUTSIDE will be returned if XA_START is called with a local transaction associated with the current session.

DBMS_XDB

The DBMS_XDB package supports the following features:

- Resource Management subprograms which complement Resource Views
- The Access Control List (ACL)-based Security Mechanism
- Configuration Session Management
- Creation of the XDB username

This chapter contains the following topics:

- Using DBMS_XDB
  - Overview
  - Constants
- Summary of DBMS_XDB Subprograms

Using DBMS_XDB

This section contains topics which relate to using the `DBMS_XDB` package.

- Overview
- Constants

Overview

The DBMS_XDB package supports the following features:

- The Resource Management functionality providesLINK Procedures, EXISTSRESOURCE Function, LOCKRESOURCE Function, GETLOCKTOKEN Procedure, UNLOCKRESOURCE Function, CREATERESOURCE Functions, RENAMERESOURCE Procedure, DELETERESOURCE Procedure, GETRESOID Function, CREATEOIDPATH Function, REBUILDHIERARCHICALINDEX Procedure and CREATEFOLDER Function subprograms which complement Resource Views.
- The Access Control List (ACL)-based Security Mechanism can be used with in-hierarchy ACLs stored by the database or in-memory ACLs that may be stored outside the database. Some of these methods can be used for both Oracle resources and arbitrary database objects. Use CHECKPRIVILEGES Function, GETACLDOCUMENT Function, CHANGEPRIVILEGES Function and GETCHILDRESPATHS Function for Oracle Resources. ACLCHECKPRIVILEGES Function provides access to Oracle's ACL-based Security mechanism without storing objects in the Hierarchy.
- Configuration Session Management is supported by CFG_REFRESH Procedure, CFG_GET Function and CFG_UPDATE Procedure. methods.
- The XDB username is created during XDB installation. This user owns a set of default tables and packages. GETXDB_TABLESPACE Function and MOVEXDB_TABLESPACE Procedure enable movement of schemas to a specified tablespace, and support the default SYSAUX tablespace introduction

Constants

Table 160–1 Defined Constants for DBMS_XDB

Constant	Type	Value	Description
DELETE_RESOURCE	NUMBER	1	Deletes a resource; fails if the resource has children.
DELETE_RECURSIVE	NUMBER	2	Deletes a resource and its children, if any.
DELETE_FORCE	NUMBER	3	Deletes the resource, even if the object it contains is invalid.
DELETE_RECURSIVE_FORCE	NUMBER	4	Deletes a resource and its children, if any, even if the object it contains is invalid.

Summary of DBMS_XDB Subprograms

Table 160–2 DBMS_XDB Package Subprograms

Subprogram	Description
ACLCHECKPRIVILEGES Function on page 160-8	Checks access privileges granted to the current user by specified ACL document on a resource whose owner is specified by the 'owner' parameter.
ADDMIMEMAPPING Procedure on page 160-9	Adds a mime mapping to the XDB configuration
ADDSCHEMALOCMAPPING Procedure on page 160-10	Adds a schema location mapping to the XDB configuration
ADDSERVLET Procedure on page 160-11	Adds a servlet to XDB configuration
ADDSERVLETMAPPING Procedure on page 160-12	Adds a servlet mapping to XDB configuration
ADDSERVLETSECROLE Procedure on page 160-13	Adds a security role `REF` to a specified servlet in the XDB configuration
ADDXMLEXTENSION Procedure on page 160-14	Adds adds an XML extension to the XDB configuration
APPENDPATH Procedure on page 160-15	Appends a childpath to a parentpath
APPENDPATH Procedure on page 160-15	Takes in user-defined metadata either as a `REF` to `XMLTYPE` or an `XMLTYPE` and adds it to the desired resource
CFG_GET Function on page 160-17	Retrieves the session's configuration information
CFG_REFRESH Procedure on page 160-18	Refreshes the session's configuration information to the latest configuration
CFG_UPDATE Procedure on page 160-19	Updates the configuration information
CHANGEOWNER Procedure on page 160-20	Changes the owner of the resource/s to the specified owner.
CHANGEPRIVILEGES Function on page 160-21	Adds a specified ACE to a specified resource's ACL
CHECKPRIVILEGES Function on page 160-22	Checks access privileges granted to the current user on the specified resource
CREATEFOLDER Function on page 160-23	Creates a new folder resource in the hierarchy
CREATEOIDPATH Function on page 160-24	Creates a virtual path to the resource based on object ID
CREATERESOURCE Functions on page 160-25	Creates a new resource
DELETEMIMEMAPPING Procedure on page 160-27	Deletes the mime mapping from the XDB configuration
DELETERESOURCE Procedure on page 160-28	Deletes a resource from the hierarchy
DELETERESOURCEMETADATA Procedures on page 160-29	Deletes metadata from a resource (can be used for schema-based or nonschema-based metadata)

Table 160–2 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
DELETESCHEMALOCMAPPING Procedure on page 160-30	Deletes the schema location mapping for the specified schema URL from the XDB configuration.
DELETESERVLET Procedure on page 160-31	Deletes a servlet from XDB configuration
DELETESERVLETMAPPING Procedure on page 160-32	Deletes the servlet mapping for the specified servlet name from the XDB configuration
DELETESERVLETSECROLE Procedure on page 160-33	Deletes the specified role from a servlet in the XDB configuration
DELETEXMLEXTENSION Procedure on page 160-34	Deletes the specified XML extension from the XDB configuration
EXISTSRESOURCE Function on page 160-35	Determines if a resource is the hierarchy, based on its absolute path
GETACLDOCUMENT Function on page 160-36	Retrieves ACL document that protects resource given its path name
GETCHILDRESPATHS Function on page 160-37	Returns a cursor over the absolute paths of all the child resources
GETCONTENTBLOB Function on page 160-38	Retrieves the contents of a resource returned as a BLOB
GETCONTENTCLOB Function on page 160-39	Retrieves the contents of a resource returned as a CLOB
GETCONTENTVARCHAR2 Function on page 160-40	Retrieves the contents of a resource returned as a string
GETCONTENTXMLREF Function on page 160-41	Retrieves the contents of a resource returned as a a `REF` to an `XMLTYPE`
GETCONTENTXMLTYPE Function on page 160-42	Retrieves the contents of a resource returned as an `XMLTYPE`
GETFTPPORT Function on page 160-43	Gets the value of the current FTP port
GETHTTPPORT Function on page 160-44	Gets the value of the current HTTP port
GETLOCKTOKEN Procedure on page 160-46	Returns that resource's lock token for the current user given a path to a resource
GETLISTENERENDPOINT Procedure on page 160-45	Retrieves the parameters of a listener end point corresponding to the XML DB HTTP server
GETRESOID Function on page 160-48	Returns the object ID of the resource from its absolute path
GETXDB_TABLESPACE Function on page 160-49	Returns the current tablespace of the XDB (user)
HASBLOBCONTENT Function on page 160-50	Returns `TRUE` if the resource has BLOB content
HASCHARCONTENT Function on page 160-51	Returns `TRUE` if the resource has character content
HASXMLCONTENT Function on page 160-52	Returns `TRUE` if the resource has XML content
HASXMLREFERENCE Function on page 160-53	Returns `TRUE` if the resource has `REF` to XML content

Table 160–2 (Cont.) DBMS_XDB Package Subprograms

Subprogram	Description
ISFOLDER Function on page 160-54	Returns TRUE if the resource is a folder or container
LINK Procedures on page 160-55	Creates a link to an existing resource
LOCKRESOURCE Function on page 160-56	Gets a WebDAV-style lock on that resource given a path to that resource
MOVEXDB_TABLESPACE Procedure on page 160-57	Moves the XDB (user) to the specified tablespace
PROCESSLINKS Procedure on page 160-58	Processes document links in the specified resource
PURGERESOURCEMETADATA Procedure on page 160-59	Deletes all user metadata from a resource
REBUILDHIERARCHICALINDEX Procedure on page 160-60	Rebuilds the hierarchical index after import or export operations
RENAMERESOURCE Procedure on page 160-61	Renames the XDB resource
SETACL Procedure on page 160-62	Sets the ACL on a specified resource
SETCONTENT Procedures on page 160-63	Replaces the contents of a specified resource with specified datatype
SETFTPPORT Procedure on page 160-65	Sets the FTP port to a new value
SETHTTPPORT Procedure on page 160-66	Sets the HTTP port to a new value
SETLISTENERENDPOINT Procedure on page 160-67	Sets the parameters of a listener end point corresponding to the XML DB HTTP server
SETLISTENERLOCALACCESS Procedure on page 160-68	Restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface or on both localhost and non-localhost interfaces
SPLITPATH Procedure on page 160-69	Splits the path into a parentpath and childpath
TOUCHRESOURCE Procedure on page 160-70	Changes the modification time of the resource to the current time
UPDATERESOURCEMETADATA Procedures on page 160-71	Updates metadata for a resource
UNLOCKRESOURCE Function on page 160-73	Unlocks the resource given a lock token and resource path

ACLCHECKPRIVILEGES Function

This function checks access privileges granted to the current user by specified ACL document by the OWNER of the resource. Returns positive integer if all privileges are granted.

Syntax

```
DBMS_XDB.ACLCHECKPRIVILEGES(
   acl_path  IN  VARCHAR2,
   owner     IN  VARCHAR2,
   privs     IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 160–3 ACLCHECKPRIVILEGES Function Parameters

Parameter	Description
acl_path	Absolute path in the Hierarchy for ACL document
owner	Resource owner name; the pseudo user "DAV:owner" is replaced by this user during ACL privilege resolution
privs	An XMLType instance of the privilege element specifying the requested set of access privileges. See description for CHECKPRIVILEGES Function.

ADDMIMEMAPPING Procedure

This procedure adds the following mime mapping to XDB configuration:

```
<mime-mapping>
<extension>extension</extension>
<mime-type>mimetype</mime-type>
</mime-mapping>
```

Syntax

```
DBMS_XDB.ADDMIMEMAPPING(
     extension    IN   VARCHAR2,
     mimetype     IN   VARCHAR2);
```

Parameters

Table 160–4 ADDMIMEMAPPING Procedure Parameters

Parameter	Description
`extension`	Extension for which a mime type is being added
`mimetype`	Mime type

ADDSCHEMALOCMAPPING Procedure

This procedure adds the following schema location mapping to the XDB configuration:

```
<schemaLocation-mapping>
     <namespace>namespace</namespace>
     <element>element</element>
      <schemaURL>schemaURL</schemaURL>
</schemaLocation-mapping>
```

Syntax

```
DBMS_XDB.ADDSCHEMALOCMAPPING(
     namespace    IN   VARCHAR2,
     element      IN   VARCHAR2,
     schemaURL    IN   VARCHAR2);
```

Parameters

Table 160–5 ADDSCHEMALOCMAPPING Procedure Parameters

Parameter	Description
`namespace`	Namespace
`element`	Element
`schemaURL`	Schema URL

ADDSERVLET Procedure

This procedure adds the following servlet to XDB configuration:

```
<servlet>
     <servlet-name>name</servlet-name>
     <servlet-language>language</servlet-language>
     <display-name>dispname</display-name>
     <description>descript</description>
     <servlet-class>class</servlet-class>
     <servlet-schema>schema</servlet-schema>
</servlet>
```

Syntax

```
DBMS_XDB.ADDSERVLET(
     name       IN   VARCHAR2,
    language    IN   VARCHAR2,
    dispname    IN   VARCHAR2,
    icon        IN   VARCHAR2 := NULL,
    descript    IN   VARCHAR2 := NULL,
    class       IN   VARCHAR2 := NULL,
    jspfile     IN   VARCHAR2 := NULL,
    plsql       IN   VARCHAR2 := NULL);
```

Parameters

Table 160–6 ADDSERVLET Procedure Parameters

Parameter	Description
name	Servlet name
language	Must be one of "C", "Java", "PL/SQL"
dispname	Display name
icon	Icon
descript	Description
class	The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
jspfile	The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
plsql	The class / jspfile / plsql function corresponding to this servlet. The first non-NULL argument amongst these three is chosen, and the others are treated as NULL.
schema	Schema

ADDSERVLETMAPPING Procedure

This procedure adds the following servlet mapping to XDB configuration:

```
<servlet-mapping>
     <servlet-pattern>pattern</servlet-pattern>
     <servlet-name>name</servlet-name>
</servlet-mapping>
```

Syntax

```
DBMS_XDB.ADDSERVLETMAPPING(
     pattern   IN   VARCHAR2,
     name      IN   VARCHAR2);
```

Parameters

Table 160–7 ADDSERVLETMAPPING Procedure Parameters

Parameter	Description
pattern	Sservlet pattern
name	Servlet name

ADDSERVLETSECROLE Procedure

This procedure adds the following security role `REF` to a specified servlet in XDB configuration:

```
<security-role-ref>
     <role-name>rolename</role-name>
     <role-link>rolelink</role-link>
     <description>descript</description>
</security-role-ref>
```

Syntax

```
DBMS_XDB.ADDSERVLETSECROLE(
     servname    IN   VARCHAR2,
     rolename    IN   VARCHAR2,
     rolelink    IN   VARCHAR2,
     descript    IN   VARCHAR2 := NULL);
```

Parameters

Table 160–8 ADDSERVLETSECROLE Procedure Parameters

Parameter	Description
`servname`	Sservlet name
`rolename`	Role name
`rolelink`	Role link
`descript`	Description

ADDXMLEXTENSION Procedure

This procedure adds the following XML extension to the XDB configuration under `<xml-extensions>`:

```
<extension>extension</extension>
```

Syntax

```
DBMS_XDB.ADDXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 160–9 ADDXMLEXTENSION Procedure Parameters

Parameter	Description
`extension`	XML extension to be added

APPENDPATH Procedure

This procedure appends a childpath to a parentpath.

Syntax

```
DBMS_XDB.APPENDPATH (
     abspath       OUT   VARCHAR2,
     parentpath    IN    VARCHAR2,
    childpath      IN    VARCHAR2);
```

Parameters

Table 160–10 APPENDPATH Procedure

Parameter	Description
`abspath`	Absolute path of the resource
`parentpath`	Parentpath
`childpath`	Childpath

APPENDRESOURCEMETADATA Procedure

This procedure takes in user-defined metadata either as a REF to XMLTYPE or an XMLTYPE and adds it to the desired resource.

Syntax

```
DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  XMLTYPE);

DBMS_XDB.APPENDRESOURCEMETADATA (
 abspath   IN  VARCHAR2,
 metadata  IN  REF SYS.XMLTYPE);
```

Parameters

Table 160–11 APPENDRESOURCEMETADATA Procedure

Parameter	Description
abspath	Absolute path of the resource
metadata	Metadata can be schema based or nonschema-based. Schema-based metadata is stored in its own table.

Usage Notes

- In the case in which a REF is passed in, the procedure stores the REF in the resource, and the metadata is stored in a separate table. In this case you are responsible for populating the RESID column for the metadata table. Note that theREF passed in must be unique. In other words, there must not be aREF with the same value in the resource metadata, as this would violate uniqueness of properties. An error is thrown if users attempt to add a REF that already exists.
- In the case where the XMLTYPE is passed in, the data is parsed to determine if it is schema-based or not and stored accordingly.

CFG_GET Function

This function retrieves the session's configuration information as an `XMLType` instance.

Syntax

```
DBMS_XDB.CFG_GET
 RETURN SYS.XMLType;
```

CFG_REFRESH Procedure

This procedure refreshes the session's configuration information to the latest configuration.

Syntax

```
DBMS_XDB.CFG_REFRESH;
```

CFG_UPDATE Procedure

This procedure updates the configuration information and commits the change.

Syntax

```
DBMS_XDB.CFG_UPDATE(
   xdbconfig   IN  SYS.XMLTYPE);
```

Parameters

Table 160–12 CFG_UPDATE Procedure Parameters

Parameter	Description
xdbconfig	The new configuration data

CHANGEOWNER Procedure

This procedure changes the owner of the resource/s to the specified owner.

Syntax

```
DBMS_XDB.CHANGEOWNER(
     abspath    IN   VARCHAR2,
     owner      IN   VARCHAR2,
     recurse    IN   BOOLEAN := FALSE);
```

Parameters

Table 160–13 CHANGEOWNER Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`owner`	New owner for the resource
`recurse`	If `TRUE`, recursively change owner of all resources in the folder tree

CHANGEPRIVILEGES Function

This function adds a specified ACE to a specified resource's ACL.

Syntax

```
DBMS_XDB.CHANGEPRIVILEGES(
   res_path   IN    VARCHAR2,
   ace        IN    xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 160–14 CHANGEPRIVILEGES Function Parameters

Parameter	Description
res_path	Path name of the resource for which privileges need to be changed
ace	An XMLType instance of the <ace> element which specifies the <principal>, the operation <grant> and the list of privileges

Return Values

A positive integer if the ACL was successfully modified.

Usage Notes

If no ACE with the same principal and the same operation (grant/deny) already exists in the ACL, the new ACE is added at the end of the ACL.

CHECKPRIVILEGES Function

This function checks access privileges granted to the current user on the specified resource.

Syntax

```
DBMS_XDB.CHECKPRIVILEGES(
   res_path   IN  VARCHAR2,
   privs      IN  xmltype)
 RETURN PLS_INTEGER;
```

Parameters

Table 160–15 CHECKPRIVILEGES Function Parameters

Parameter	Description
`res_path`	Absolute path in the Hierarchy for resource
`privs`	An `XMLType` instance of the privilege element specifying the requested set of access privileges

Return Values

A positive integer if all requested privileges granted.

CREATEFOLDER Function

This function creates a new folder resource in the hierarchy.

Syntax

```
DBMS_XDB.CREATEFOLDER(
   path   IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 160–16 CREATEFOLDER Function Parameters

Parameter	Description
path	Path name for the new folder

Return Values

TRUE if operation successful; FALSE, otherwise.

Usage Notes

The given path name's parent folder must already exist in the hierarchy: if '/folder1/folder2' is passed as the path parameter, then '/folder1' must already exist.

CREATEOIDPATH Function

This function creates a virtual path to the resource based on object ID.

Syntax

```
DBMS_XDB.CREATEOIDPATH(
   oid    IN   RAW)
 RETURN VARCHAR2;
```

Parameters

Table 160–17 CREATEOIDPATH Function Parameters

Parameter	Description
`oid`	Object ID of the resource

CREATERESOURCE Functions

The functions create a new resource. The description of the overload options precede each version of the syntax

Syntax

Creates a new resource with a specified string as its contents:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  VARCHAR2,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a new resource with a specified XMLType data as its contents:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  SYS.XMLTYPE,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Given a REF to an existing XMLType row, creates a resource whose contents point to that row. That row should not already exist inside another resource:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     datarow        IN  REF SYS.XMLTYPE,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified BLOB as its contents, and specifies character set of the source BLOB:

```
DBMS_XDB.CREATERESOURCE(
     abspath        IN  VARCHAR2,
     data           IN  BLOB,
     csid           IN  NUMBER :=0,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified BFILE as its contents, and specifies character set of the source BFILE:

```
DBMS_XDB.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  BFILE,
     csid           IN  NUMBER :=0,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Creates a resource with a specified CLOB as its contents:

```
DBMS_XDB.CREATERESOURCE (
     abspath        IN  VARCHAR2,
     data           IN  CLOB,
     createfolders  IN  BOOLEAN := FALSE)
 RETURN BOOLEAN;
```

Given a string, inserts a new resource into the hierarchy with the string as the contents:

```
DBMS_XDB.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  VARCHAR2,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Given an XMLTYPE and a schema URL, inserts a new resource into the hierarchy with the XMLTYPE as the contents:

```
DBMS_XDB.CREATERESOURCE (
   abspath        IN  VARCHAR2,
   data           IN  SYS.XMLTYPE,
   schemaurl      IN  VARCHAR2 := NULL,
   elem           IN  VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Parameters

Table 160–18 CREATERESOURCE Function Parameters

Parameter	Description
abspath	Absolute path of the resource to create. The path name's parent folder must already exist in the hierarchy. In other words, if /foo/bar.txt is passed in, then folder /foo must already exist.
data	String buffer containing new resource's contents. The data is parsed to check if it contains a schema-based XML document, and the contents are stored as schema-based in the schema's default table. Otherwise, it is saved as binary data.
datarow	REF to an XMLType row to be used as the contents
csid	Character set id of the document. Must be a valid Oracle ID; otherwise returns an error. If CSID is not specified, or if a zero CSID is specified, then the character set id of the document is determined as follows: ■ From the abspath extension, determine the resource's MIME type. ■ If the MIME type is */xml, then the encoding is detected based on Appendix F of the W3C XML 1.0 Reference at http://www.w3.org/TR/2000/REC-xml-20001006; ■ Otherwise, it is defaulted to the database character set.
createfolders	If TRUE, create the parent folders if they do not exist
schemaurl	For XML data, schema URL data conforms to (default NULL)
elem	Element name (default NULL)

Return Values

TRUE if operation successful; FALSE, otherwise.

DELETEMIMEMAPPING Procedure

This procedure deletes the mime mapping for a specified extension from the XDB configuration.

Syntax

```
DBMS_XDB.DELETEMIMEMAPPING(
     extension    IN   VARCHAR2,);
```

Parameters

Table 160–19 DELETEMIMEMAPPING Procedure Parameters

Parameter	Description
extension	Extension for which a mime type is to be deleted

DELETERESOURCE Procedure

This procedure deletes a resource from the hierarchy.

Syntax

```
DBMS_XDB.DELETERESOURCE(
   path          IN      VARCHAR2,
   delete_option IN      PLS_INTEGER);
```

Parameters

Table 160–20 DELETERESOURCE Procedure Parameters

Parameter	Description
`path`	Path name of the resource to delete
`delete_option`	The option that controls how a a resource is deleted; defined in Table 160–1 on page 160-4: ■ `DELETE_RESOURCE` ■ `DELETE_RECURSIVE` ■ `DELETE_FORCE` ■ `DELETE_RECURSIVE_FORCE`

DELETERESOURCEMETADATA Procedures

This procedure takes in a resource by absolute path and removes either the schema-based metadata identified by the REF, or the metadata identified by the namespace and name combination, which can be either schema-based or non-schema based. It also takes an additional (optional) parameter that specifies how to delete it. This parameter is only relevant for schema-based resource metadata that needs to be deleted. For non-schema based metadata, this parameter is ignored.

Syntax

Can be used only for schema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN  VARCHAR2,
   metadata       IN  REF SYS.XMLTYPE,
   delete_option  IN  pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Can be used for schema-based or nonschema-based metadata:

```
DBMS_XDB.DELETERESOURCEMETADATA (
   abspath        IN VARCHAR2,
   metadatans     IN VARCHAR2,
   metadataname   IN VARCHAR2,
   delete_option  IN pls_integer := dbms_xdb.DELETE_RESOURCE_METADATA_CASCADE);
```

Parameters

Table 160–21 DELETERESOURCEMETADATA Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource
`metadata`	`REF` to the piece of metadata (schema based) to be deleted
`mettadatans`	Namespace of the metadata fragment to be removed
`mettadataname`	Local name of the metadata fragment to be removed
`delete_option`	Only applicable for schema-based metadata, this can be one of the following: ■ `DELETE_RES_METADATA_CASCADE` - deletes the corresponding row in the metadata table ■ `DELETE_RES_METADATA_NOCASCADE` - does not delete the row in the metadata table

DELETESCHEMALOCMAPPING Procedure

This procedure deletes the schema location mapping for a specified schema URL from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESCHEMALOCMAPPING(
     schemaURL     IN   VARCHAR2);
```

Parameters

Table 160–22 DELETESCHEMALOCMAPPING Procedure Parameters

Parameter	Description
schemaURL	Schema URL

DELETESERVLET Procedure

This procedure deletes a servlet from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLET(
     name         IN   VARCHAR2);
```

Parameters

Table 160–23 DELETESERVLET Procedure Parameters

Parameter	Description
name	Servlet name

DELETESERVLETMAPPING Procedure

This procedure deletes the servlet mapping for a specified servlet name from the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLETMAPPING(
     name       IN    VARCHAR2);
```

Parameters

Table 160–24 DELETESERVLETMAPPING Procedure Parameters

Parameter	Description
name	Servlet name

DELETESERVLETSECROLE Procedure

This procedure deletes the specified role from a servlet in the XDB configuration.

Syntax

```
DBMS_XDB.DELETESERVLETSECROLE(
     servname    IN   VARCHAR2,
     rolename    IN   VARCHAR2);
```

Parameters

Table 160–25 DELETESERVLETSECROLE Procedure Parameters

Parameter	Description
servname	Servlet name
rolename	Name of the role to be deleted

DELETEXMLEXTENSION Procedure

This procedure deletes the specified XML extension from the XDB configuration.

Syntax

```
DBMS_XDB.DELETEXMLEXTENSION(
     extension    IN   VARCHAR2);
```

Parameters

Table 160–26 DELETEXMLEXTENSION Procedure Parameters

Parameter	Description
extension	XML extension to be deleted

EXISTSRESOURCE Function

This function indicates if a resource is in the hierarchy. Matches resource by a string that represents its absolute path.

Syntax

```
DBMS_XDB.EXISTSRESOURCE(
   abspath    IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 160–27 EXISTSRESOURCE Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

TRUE if the resource is found.

GETACLDOCUMENT Function

This function retrieves ACL document that protects resource given its path name.

Syntax

```
DBMS_XDB.GETACLDOCUMENT(
   abspath  IN  VARCHAR2)
  RETURN sys.xmltype;
```

Parameters

Table 160–28 GETACLDOCUMENT Function Parameters

Parameter	Description
abspath	Path name of the resource whose ACL document is required

Return Values

The XMLType for ACL document.

GETCHILDRESPATHS Function

This function returns a cursor over the absolute paths of all the child resources.

Syntax

```
DBMS_XDB.GETCHILDRESPATHS(
     abspath    IN     VARCHAR2);
  RETURN SYS_REFCURSOR;
```

Parameters

Table 160–29 GETCHILDRESPATHS Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

A cursor over the absolute paths of all the child resources.

GETCONTENTBLOB Function

This function retrieves the contents of a resource returned as a BLOB.

Syntax

```
DBMS_XDB.GETCONTENTBLOB(
     abspath    IN     VARCHAR2,
     csid       OUT    PLS_INTEGER,
     locksrc    IN     BOOLEAN := FALSE)
  RETURN BLOB;
```

Parameters

Table 160–30 GETCONTENTBLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource
csid	If TRUE, lock and return the source LOB. If FALSE, return a temp LOB copy.
locksrc	Contents of the resource as a BLOB

Return Values

The contents of the resource as a BLOB.

GETCONTENTCLOB Function

This function gets the contents of a resource returned as a CLOB.

Syntax

```
DBMS_XDB.GETCONTENTCLOB(
     abspath    IN     VARCHAR2,
  RETURN CLOB;
```

Parameters

Table 160–31 GETCONTENTCLOB Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a CLOB.

GETCONTENTVARCHAR2 Function

This function gets the contents of a resource returned as a string.

Syntax

```
DBMS_XDB.GETCONTENTVARCHAR2(
     abspath    IN     VARCHAR2,
  RETURN BLOB;
```

Parameters

Table 160–32 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a string.

GETCONTENTXMLREF Function

This function retrieves the contents of a resource returned as a a REF to an XMLTYPE.

Syntax

```
DBMS_XDB.GETCONTENTXMLREF(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 160–33 GETCONTENTXMLREF Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as a REF to an XMLTYPE.

GETCONTENTXMLTYPE Function

This function retrieves the contents of a resource returned as an XMLTYPE.

Syntax

```
DBMS_XDB.GETCONTENTXMLTYPE(
     abspath    IN     VARCHAR2,
  RETURN SYS.XMLTYPE;
```

Parameters

Table 160–34 GETCONTENTXMLTYPE Function Parameters

Parameter	Description
abspath	Absolute path of the resource

Return Values

The contents of the resource as an XMLTYPE.

GETFTPPORT Function

This procedure gets the value of the current FTP port.

Syntax

```
DBMS_XDB.GETFTPPORT
 RETURN NUMBER;
```

GETHTTPPORT Function

This procedure gets the value of the current HTTP port.

Syntax

```
DBMS_XDB.GETHTTPPORT
 RETURN NUMBER;
```

GETLISTENERENDPOINT Procedure

This procedure retrieves the parameters of a listener end point corresponding to the XML DB HTTP server. The parameters of both HTTP and HTTP2 end points can be retrieved by invoking this procedure.

Syntax

```
DBMS_XDB.GETLISTENERENDPOINT (
   endpoint  IN   NUMBER,
   host      OUT  VARCHAR2,
   port      OUT  NUMBER,
   protocol  OUT  NUMBER);
```

Parameters

Table 160–35 GETLISTENERENDPOINT Procedure Parameters

Parameter	Description
`endpoint`	End point to be retrieved. Its value can be `XDB_ENDPOINT_HTTP` or `XDB_ENDPOINT_HTTP2`.
`host`	Interface on which the listener end point listens
`port`	Port on which the listener end point listens
`protocol`	Transport protocol accepted by the listener end point

GETLOCKTOKEN Procedure

Given a path to a resource, this procedure returns that resource's lock token for the current user.

Syntax

```
DBMS_XDB.GETLOCKTOKEN(
   path          IN      VARCHAR2,
   locktoken     OUT     VARCHAR2);
```

Parameters

Table 160–36 GETLOCKTOKEN Procedure Parameters

Parameter	Description
`path`	Path name to the resource
`locktoken`	Logged-in user's lock token for the resource

Usage Notes

The user must have `READPROPERTIES` privilege on the resource.

GETPRIVILEGES Function

This function gets all privileges granted to the current user on a specified resource.

Syntax

```
DBMS_XDB.GETPRIVILEGES(
   res_path    IN     VARCHAR2)
 RETURN sys.xmltype;
```

Parameters

Table 160–37 GETPRIVILEGES Function Parameters

Parameter	Description
res_path	Absolute path in the hierarchy of the resource

Return Values

An XMLType instance of <privilege> element, which contains the list of all leaf privileges granted on this resource to the current user.

GETRESOID Function

Returns the object ID of the resource from its absolute path.

Syntax

```
DBMS_XDB.GETRESOID(
   abspath IN VARCHAR2)
RETURN RAW;
```

Parameters

Table 160–38 GETRESOID Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

NULL if the resource is not present.

GETXDB_TABLESPACE Function

This function returns the current tablespace of the XDB (user).

Syntax

```
DBMS_XDB.GETXDB_TABLESPACE
 RETURN VARCHAR2;
```

HASBLOBCONTENT Function

This function returns TRUE if the resource has BLOB content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASBLOBCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 160–39 HASBLOBCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has BOB content.

HASCHARCONTENT Function

This function returns TRUE if the resource has character content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASCHARCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 160–40 HASCHARCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has character content.

HASXMLCONTENT Function

This function returns TRUE if the resource has XML content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASXMLCONTENT
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 160–41 HASXMLCONTENT Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource has XML content.

HASXMLREFERENCE Function

This function returns TRUE if the resource has a REF to XML content.

Syntax

```
DBMS_XDB.DBMS_XDB.HASXMLREFERENCE
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 160–42 HASXMLREFERENCE Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE resource has a REF to XML content.

ISFOLDER Function

This function returns TRUE if the resource is a folder or container.

Syntax

```
DBMS_XDB.DBMS_XDB.ISFOLDER
     abspath    IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 160–43 DBMS_XDB.ISFOLDER Function Parameters

Parameter	Description
abspath_path	Absolute path of the resource

Return Values

TRUE if the resource is a folder or container.

LINK Procedures

This procedure creates from a specified folder to a specified resource.

Syntax

```
DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2);

DBMS_XDB.LINK(
   srcpath      IN   VARCHAR2,
   linkfolder   IN   VARCHAR2,
   linkname     IN   VARCHAR2,
   linktype     IN   PLS_INTEGER := DBMS_XDB.LINK_TYPE_HARD);
```

Parameters

Table 160–44 LINK Procedure Parameters

Parameter	Description
`srcpath`	Path name of the resource to which a link is created
`linkfolder`	Folder in which the new link is placed
`linkname`	Name of the new link
`linktype`	Type of link to be created: ■ `DBMS_XDB.LINK_TYPE_HARD` (default) ■ `DBMS_XDB.LINK_TYPE_WEAK` ■ `DBMS_XDB.LINK_TYPE_SYMBOLIC`

LOCKRESOURCE Function

Given a path to a resource, this function gets a WebDAV-style lock on that resource.

Syntax

```
DBMS_XDB.LOCKRESOURCE(
   path      IN  VARCHAR2,
   depthzero IN  BOOLEAN,
   shared    IN  boolean)
RETURN BOOLEAN;
```

Parameters

Table 160–45 LOCKRESOURCE Function Parameters

Parameter	Description
`path`	Path name of the resource to lock.
`depthzero`	Currently not supported
`shared`	Passing `TRUE` obtains a shared write lock

Return Values

`TRUE` if successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

MOVEXDB_TABLESPACE Procedure

This procedure moves the XDB (user) to the specified tablespace.

Syntax

```
DBMS_XDB.MOVEXDB_TABLESPACE(
   new_tablespace   IN  VARCHAR2);
```

Parameters

Table 160–46 MOVEXDB_TABLESPACE Procedure Parameters

Parameter	Description
new_tablespace	Name of the tablespace to where the XDB is moved

Usage Notes

This operation waits for all concurrent XDB sessions to exit.

PROCESSLINKS Procedure

This procedure processes document links in the specified resource.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(
 abspath  IN  VARCHAR2,
 recurse  IN  BOOLEAN := FALSE);
```

Parameters

Table 160–47 PROCESSLINKS Procedure Parameters

Parameter	Description
`abspath`	Absolute path of the resource. If the path is a folder, use the `recurse` flag.
`recurse`	Used only if `abspath` specifies a folder. If `TRUE`, process links of all resources in the folder hierarchy rooted at the specified resource. If `FALSE`, process links of all documents in this folder only.

PURGERESOURCEMETADATA Procedure

This procedure deletes all user metadata from a resource. Schema-based metadata is removed in cascade mode, rows being deleted from the corresponding metadata tables.

Syntax

```
DBMS_XDB.PURGERESOURCEMETADATA(

 abspath  IN  VARCHAR2);
```

Parameters

Table 160–48 PURGERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource

REBUILDHIERARCHICALINDEX Procedure

This procedure rebuilds the hierarchical index after import or export operations. This is necessary because data cannot be exported from index tables.

Syntax

```
DBMS_XDB.REBUILDHIERARCHICALINDEX;
```

RENAMERESOURCE Procedure

This procedure renames the XDB resource.

Syntax

```
DBMS_XDB.RENAMERESOURCE(
   srcpath    IN  VARCHAR2,
   destfolder IN  CARCHAR2,
   newname    IN  VARCHAR2);
```

Parameters

Table 160–49 RENAMERESOURCE Procedure Parameters

Parameter	Description
`srcpath`	Absolute path in the Hierarchy for the source resource destination folder
`destfolder`	Absolute path in the Hierarchy for the destination folder
`newname`	Name of the child in the destination folder

SETACL Procedure

This procedure sets the ACL on a specified resource to be the ACL specified by path.

Syntax

```
DBMS_XDB.SETACL(
   res_path   IN  VARCHAR2,
   acl_path   IN  VARCHAR2);
```

Parameters

Table 160–50 SETACL Procedure Parameters

Parameter	Description
`res_path`	Absolute path in the Hierarchy for resource
`acl_path`	Absolute path in the Hierarchy for ACL

Usage Notes

The user must have `<write-acl>` privileges on the resource.

SETCONTENT Procedures

This procedure replaces the contents of a resource with a specified datatype.

Syntax

Replaces the contents of the a resource with a specified CLOB:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   CLOB);
```

Replaces the contents of a resource with a specified BLOB:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   BLOB,
     csid    IN PLS_INTEGER);
```

Replaces the contents of a resource with a specified XMLTYPE:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   SYS.XMLTYPE);
```

Replaces the contents of a resource with a specified string:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   VARCHAR2);
```

Replaces the contents of a resource with a specified REF to an XMLTYPE

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   CLOB,
     sticky     IN   BOOLEAN := TRUE);
```

Replaces the contents of a resource with a specified BFILE:

```
DBMS_XDB.SETCONTENT(
     abspath    IN   VARCHAR2,
     data       IN   CLOB,
     csid       IN   PLS_INTEGER);
```

Parameters

Table 160–51 SETCONTENT Procedure Parameters

Parameter	Description
abspath	Absolute path in the Hierarchy for resource
data	Input varying with overload: ■ CLOB data ■ BLOB data ■ XMLTYPE data ■ string data ■ REF to XMLTYPE data ■ a BFILE

Table 160–51 (Cont.) SETCONTENT Procedure Parameters

Parameter	Description
`csid`	Character set id of the BLOB or BFILE
`sticky`	Whether or not the `REF` is sticky

SETFTPPORT Procedure

This procedure sets the FTP port to a new value.

Syntax

```
DBMS_XDB.SETFTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 160–52 SETFTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the FTP port is set

SETHTTPPORT Procedure

This procedure sets the HTTP port to a new value.

Syntax

```
DBMS_XDB.SETHTTPPORT(
   new_port  IN  NUMBER);
```

Parameters

Table 160–53 SETHTTPPORT Procedure Parameters

Parameter	Description
new_port	Value to which the HTTP port is set

SETLISTENERENDPOINT Procedure

This procedure sets the parameters of a listener end point corresponding to the XML DB HTTP server. Both HTTP and HTTP2 end points can be set by invoking this procedure.

Syntax

```
DBMS_XDB.SETLISTENERENDPOINT (
   endpoint  IN  NUMBER,
   host      IN  VARCHAR2,
   port      IN  NUMBER,
   protocol  IN  NUMBER);
```

Parameters

Table 160–54 SETLISTENERENDPOINT Procedure Parameters

Parameter	Description
endpoint	End point to be set. Its value can be XDB_ENDPOINT_HTTP or XDB_ENDPOINT_HTTP2.
host	Interface on which the listener end point is to listen. Its value can be 'LOCALHOST,' NULL, or a hostname. If its value is 'LOCALHOST' the listener end point is permitted to only listen on the localhost interface. If its value is NULL or hostname, the listener end point is permitted to listen on both localhost and non-localhost interfaces.
port	Port on which the listener end point is to listen
protocol	Transport protocol that the listener end point is to accept. Its value can be XDB_PROTOCOL_TCP or XDB_PROTOCOL_TCPS

SETLISTENERLOCALACCESS Procedure

This procedure restricts all listener end points of the XML DB HTTP server to listen either only on the localhost interface (when `l_access` is set to `TRUE`) or to listen on both localhost and non-localhost interfaces (when `l_access` is set to `FALSE`).

Syntax

```
DBMS_XDB.SETLISTENERLOCALACCESS (
   l_access   BOOLEAN);
```

Parameters

Table 160–55 SETLISTENERLOCALACCESS Procedure Parameters

Parameter	Description
`l_access`.	`TRUE` or `FALSE`.

SPLITPATH Procedure

This procedure splits the path into a parentpath and childpath.

Syntax

```
DBMS_XDB.SPLITPATH(
      abspath     IN  VARCHAR2,
      parentpath  OUT VARCHAR2,
     childpath    OUT VARCHAR2);
```

Parameters

Table 160–56 SPLITPATH Procedure Parameters

Parameter	Description
`abspath`	Absolute path to be split
`parentpath`	Parentpath
`childpath`	Childpath

TOUCHRESOURCE Procedure

This procedure changes the modification time of the resource to the current time.

Syntax

```
DBMS_XDB.DBMS_XDB.TOUCHRESOURCE
     abspath    IN     VARCHAR2);
```

Parameters

Table 160–57 DBMS_XDB.TOUCHRESOURCE Procedure Parameters

Parameter	Description
`abspath_path`	Absolute path of the resource

UPDATERESOURCEMETADATA Procedures

This procedure updates metadata for a resource. The procedure takes in a resource identified by absolute path and the metadata in it to replace identified by its REF. It replaces that piece of metadata with user-defined metadata which is either in the form of a REF to XMLTYPE or an XMLTYPE.

Syntax

Can be used to update schema-based metadata only. The new metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath  IN VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   REF SYS.XMLTYPE)
```

Can be used to update schema-based metadata only. The new metadata must be schema-based or nonschema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldmetadata    IN   REF SYS.XMLTYPE,
   newmetadata    IN   XMLTYPE);
```

Can be used for both schema-based and nonschema-based metadata:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath        IN   VARCHAR2,
   oldns          IN   VARCHAR2,
   oldname IN VARCHAR,
   newmetadata IN XMLTYPE);
```

Can be used for both schema-based or nonschema-based metadata. New metadata must be schema-based:

```
DBMS_XDB.UPDATERESOURCEMETADATA(
   abspath       IN   VARCHAR2,
   oldns         IN   VARCHAR2,
   oldname       IN   VARCHAR,
   newmetadata   IN   REF SYS.XMLTYPE);
```

Parameters

Table 160–58 UPDATERESOURCEMETADATA Procedure Parameters

Parameter	Description
abspath	Absolute path of the resource
oldmetadata	REF to the old of metadata
newmetadata	REF to the new, replacement metadata (can be either schema-based or nonschema-based depending on the overload)
oldns	Namespace identifying old metadata
oldname	Local name identifying old metadata

Usage Notes

In the case of `REF`, it stores the `REF` in the resource and the metadata is stored in a separate table. Uniqueness of `REFs` is enforced. In the case where the `XMLTYPE` is passed in, data is parsed to determine if it is schema-based or not and is stored accordingly.

UNLOCKRESOURCE Function

This function unlocks the resource given a lock token and a path to the resource.

Syntax

```
DBMS_XDB.UNLOCKRESOURCE(
   path     IN  VARCHAR2,
   deltoken IN  VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 160–59 UNLOCKRESOURCE Function Parameters

Parameter	Description
`path`	Path name to the resource
`deltoken`	Lock token to be removed

Return Values

`TRUE` if operation successful.

Usage Notes

The user must have `UPDATE` privileges on the resource.

161

DBMS_XDB_ADMIN

The `DBMS_XDB_ADMIN` package provides an interface to manage the XMLIndex on the XML DB repository.

> **See Also:** *Oracle XML DB Developer's Guide* for information about "Using XMLIndex on Oracle XML DB Repository"

This chapter contains the following topics:

- Summary of DBMS_XDB_ADMIN Subprograms

Summary of DBMS_XDB_ADMIN Subprograms

This table list the package subprograms in alphabetical order.

Table 161–1 DBMS_XDB_ADM Package Subprograms

Subprogram	Description
CREATEREPOSITORYXMLINDEX Procedure on page 161-3	Creates an XMLIndex on the XML DB repository
DROPREPOSITORYXMLINDEX Procedure on page 161-4	Drops the XMLIndex on the XML DB repository
XMLINDEXADDPATH Procedure on page 161-5	Takes a path in XML DB repository as an input and index all the resources under this given path
XMLINDEXREMOVEPATH Procedure on page 161-6	Removes the index for the given path

CREATEREPOSITORYXMLINDEX Procedure

This procedure creates an XMLIndex on the XML DB repository.

Syntax

```
DBMS_XDB_ADMIN.CREATEREPOSITORYXMLINDEX;
```

DROPREPOSITORYXMLINDEX Procedure

This procedure drops the XMLIndex on the XML DB repository.

Syntax

```
DBMS_XDB_ADMIN.DROPREPOSITORYXMLINDEX;
```

XMLINDEXADDPATH Procedure

This procedure adds to the repository xmlindex the resource identified by path (when `recurse` is `FALSE`) or adds to the repository xmlindex the sub-tree of resources rooted at path (when `recurse` is `TRUE`). The default value for `recurse` is `TRUE`.

Syntax

```
DBMS_XDB_ADMIN.XMLINDEXADDPATH(
   path         IN  VARCHAR2,
   recurse      IN  BOOLEAN);
```

Parameters

Table 161–2 XMLINDEXADDPATH Procedure Parameters

Parameter	Description
`path`	Path to a resource
`recurse`	`TRUE` or `FALSE`

XMLINDEXREMOVEPATH Procedure

This procedure removes from the repository xmlindex the resource identified by path (when `recurse` is `FALSE`) or removes from the repository xmlindex the sub-tree of resources rooted at path (when `recurse` is `TRUE`). The default value for `recurse` is `TRUE`.

Syntax

```
DBMS_XDB_ADMIN.XMLINDEXREMOVEPATH(
   path              IN  VARCHAR2,
   isrecursive       IN  BOOLEAN);
```

Parameters

Table 161–3 XMLINDEXREMOVEPATH Procedure Parameters

Parameter	Description
`path`	Path to a resource
`recurse`	`TRUE` or `FALSE`

162

DBMS_XDB_VERSION

Oracle XML DB versioning interfaces are found in the `DBMS_XBD_VERSION` package. Functions and procedures of `DBMS_XDB_VERSION` help to create a VCR and manage the versions in the version history.

This chapter contains the following topic:

- Summary of DBMS_XDB_VERSION Subprograms

See Also: *Oracle XML DB Developer's Guide*

Summary of DBMS_XDB_VERSION Subprograms

Table 162–1 DBMS_XDB_VERSION Package Subprograms

Method	Description
CHECKIN Function on page 162-3	Checks in a checked-out VCR and returns the resource id of the newly-created version
CHECKOUT Procedure on page 162-4	Checks out a VCR before updating or deleting it
GETCONTENTSBLOBBYRESID Function on page 162-5	Obtain contents as a `BLOB`
GETCONTENTSCLOBBYRESID Function on page 162-6	Obtain contents as a `CLOB`
GETCONTENTSXMLBYRESID Function on page 162-7	Obtain contents as an `XMLType`
GETPREDECESSORS Function on page 162-8	Retrieves the list of predecessors by path name
GETPREDSBYRESID Function on page 162-9	Retrieves the list of predecessors by resource id
GETRESOURCEBYRESID Function on page 162-10	Obtains the resource as an `XMLType`, given the resource object ID
GETSUCCESSORS Function on page 162-11	Retrieves the list of successors by path name
GETSUCCSBYRESID Function on page 162-12	Retrieves the list of successors by resource id
MAKEVERSIONED Function on page 162-13	Turns a regular resource whose path name is given into a version-controlled resource
UNCHECKOUT Function on page 162-14	Checks in a checked-out resource, returns the resource id of the version before the resource is checked out

CHECKIN Function

This function checks in a checked-out VCR and returns the resource id of the newly-created version.

Syntax

```
DBMS_XDB_VERSION.CHECKIN(
   pathname VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 162–2 CHECKIN Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. CHECKIN Function doesn't have to take the same path name that was passed to CHECKOUT Procedure operation. However, the CHECKIN Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to CHECKIN Function because the old name is either invalid or is currently bound with a different resource. Exception is raised if the path name does not exist. If the path name has been changed, the new path name must be used to CHECKIN Function the resource.

CHECKOUT Procedure

This procedure checks out a VCR before updating or deleting it.

Syntax

```
DBMS_XDB_VERSION.Checkout(
   pathname    VARCHAR2);
```

Parameters

Table 162–3 CHECKOUT Procedure Parameters

Parameter	Description
pathname	The path name of the VCR to be checked out.

Usage Notes

This is not an auto-commit SQL operation. Two users of the same workspace cannot CHECKOUT Procedure the same VCR at the same time. If this happens, one user must rollback. As a result, it is good practice to commit the CHECKOUT Procedure operation before updating a resource and avoid loss of the update if the transaction is rolled back. An exception is raised if the given resource is not a VCR, if the VCR is already checked out, if the resource doesn't exist.

GETCONTENTSBLOBBYRESID Function

This function obtain contents as a BLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSBLOBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN BLOB;
```

Parameters

Table 162–4 GETCONTENTSBLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

GETCONTENTSCLOBBYRESID Function

This function obtains contents as a CLOB.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSCLOBYRESID(
   resid     DBMS_XDB.resid_type)
 RETURN CLOB;
```

Parameters

Table 162–5 GETCONTENTSCLOBYRESID Function Parameters

Parameter	Description
resid	The resource id.

GETCONTENTSXMLBYRESID Function

This function obtains contents as an `XMLType`.

Syntax

```
DBMS_XDB_VERSION.GETCONTENTSXMLBYRESID(
   resid      DBMS_XDB.resid_type)
 RETURN XMLType;
```

Parameters

Table 162–6 GETCONTENTSXMLBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

Return Values

If the contents are not valid XML, returns `NULL`.

GETPREDECESSORS Function

This function retrieves the list of predecessors by the path name.

Syntax

```
DBMS_XDB_VERSION.GETPREDECESSORS(
   pathname       VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 162–7 GETPREDECESSORS Function Parameters

Parameter	Description
pathname	The path name of the resource.

Return Values

An exception is raised if pathname is illegal.

GETPREDSBYRESID Function

This function retrieves the list of predecessors by resource id.

Syntax

```
DBMS_XDB_VERSION.GETPREDSBYRESID(
   resid      resid_type)
 RETURN resid_list_type;
```

Parameters

Table 162–8 GETPREDSBYRESID Function Parameters

Parameter	Description
resid	The resource id.

Usage Notes

Getting predecessors by RESID is more efficient than by pathname.

Exceptions

An exception is raised if the RESID is illegal.

GETRESOURCEBYRESID Function

This function obtains the resource as an `XMLType`, given the resource object ID. Because the system does not create a path name for versions, this function is useful for retrieving the resource using its resource id.

Syntax

```
DBMS_XDB_VERSION.GETRESOURCEBYRESID(
   resid      resid_type)
 RETURN XMLType;
```

Parameters

Table 162–9 GETRESOURCEBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

GETSUCCESSORS Function

Given a version resource or a VCR, this function retrieves the list of the successors of the resource by the path name.

Syntax

```
DBMS_XDB_VERSION.GETSUCCESSORS(
   pathname VARCHAR2)
 RETURN resid_list_type;
```

Parameters

Table 162–10 GETSUCCESSORS Function Parameters

Parameter	Description
`pathname`	The path name of the resource.

Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `pathname` is illegal.

GETSUCCSBYRESID Function

This function retrieves the list of the successors of the resource by resource id using version resource or VCR.

Syntax

```
DBMS_XDB_VERSION.GETSUCCSBYRESID(
   resid    resid_type)
  RETURN resid_list_type;
```

Parameters

Table 162–11 GETSUCCSBYRESID Function Parameters

Parameter	Description
`resid`	The resource id.

Usage Notes

Getting successors by `RESID` is more efficient than by `pathname`.

Exceptions

An exception is raised if the `pathname` is illegal.

MAKEVERSIONED Function

This function turns a regular resource whose path name is given into a version-controlled resource. This new resource is then put under version control. All other path names continue to refer to the original resource.

Syntax

```
DBMS_XDB_VERSION.MAKEVERSIONED(
   pathname   VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 162–12 MAKEVERSIONED Function Parameters

Parameter	Description
pathname	The path name of the resource to be put under version control.

Return Values

This function returns the resource ID of the first version, or root, of the VCR.

Usage Notes

If two or more path names are bound with the same resource, a copy of the resource is created, and the given path name is bound with the newly-created copy.

This is not an auto-commit SQL operation. An exception is raised if the resource doesn't exist.

- This call is legal for VCR, and neither exception nor warning is raised.
- This call is illegal for folder, version history, version resource, and ACL.
- No support for Schema-based resources is provided.

UNCHECKOUT Function

This function checks-in a checked-out resource and returns the resource id of the version before the resource is checked out.

Syntax

```
DBMS_XDB_VERSION.UNCHECKOUT(
   pathname     VARCHAR2)
 RETURN DBMS_XDB.resid_type;
```

Parameters

Table 162–13 UNCHECKOUT Function Parameters

Parameter	Description
pathname	The path name of the checked-out resource.

Usage Notes

This is not an auto-commit SQL operation. The UNCHECKOUT Function does not have to take the same path name that was passed to the operation by the CHECKOUT Procedure. However, the UNCHECKOUT Function path name and the CHECKOUT Procedure path name must be of the same resource for the operations to function correctly. If the resource has been renamed, the new name must be used to UNCHECKOUT Function, because the old name is either invalid or is currently bound with a different resource. If the path name has been changed, the new path name must be used to UNCHECKOUT Function the resource.

Exceptions

An exception is raised if the path name doesn't exist.

163

DBMS_XDBRESOURCE

The DBMS_XDBRESOURCE package provides the interface to operate on the resource's metadata and contents.

> **See Also:** Oracle XML DB Developer's Guide for examples of "Using DBMS_XDBRESOURCE"

This chapter contains the following topics:

- Using DBMS_XDBRESOURCE
  - Overview
- Summary of DBMS_XDBRESOURCE Subprograms

Using DBMS_XDBRESOURCE

- Overview

Overview

The DBMS_XDBRESOURCE package provides routines to get and set the resource's metadata and contents. To take advantage of the DOM traversal facility, provided in DBMS_XMLDOM package, an XDBResource instance could be converted to a DOMDocument type by using DBMS_XDBRESOURCE.MAKEDOCUMENT routine.

Summary of DBMS_XDBRESOURCE Subprograms

Table 163–1 DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
FREERESOURCE Procedure on page 163-7	Frees any memory associated with an XDBResource
GETACL Function on page 163-8	Given an XDBResource, returns its ACL as string
GETACLDOCFROMRES Function on page 163-9	Returns the ACL Document for the given resource as `XMLType`
GETAUTHOR Function on page 163-10	Given an XDBResource, returns its author
GETCHARACTERSET Function on page 163-11	Given an XDBResource, returns its character set
GETCOMMENT Function on page 163-12	Given an XDBResource, returns its comment
GETCONTENTBLOB Function on page 163-13	Returns the contents of the resource as a `BLOB`
GETCONTENTCLOB Function on page 163-14	Returns the contents of the resource as a `CLOB`
GETCONTENTREF Function on page 163-15	Returns the contents of the resource as an `XMLTypeRef`
GETCONTENTTYPE Function on page 163-16	Given an XDBResource, returns its content-type
GETCONTENTXML Function on page 163-17	Returns the contents of the resource as XML
GETCONTENTVARCHAR2 Function on page 163-18	Returns the contents of the resource as a string
GETCREATIONDATE Function on page 163-19	Given an XDBResource, returns its creation date
GETCREATOR Function on page 163-20	Given an XDBResource, returns its creator
GETCUSTOMMETADATA Function on page 163-21	Returns the requested custom metadata given the xpath and namespace to the metadata
GETDISPLAYNAME Function on page 163-22	Given an XDBResource, returns its display name
GETLANGUAGE Function on page 163-23	Given an XDBResource, returns its language
GETLASTMODIFIER Function on page 163-24	Given an XDBResource, returns its last modifier
GETMODIFICATIONDATE Function on page 163-25	Given an XDBResource, returns its modification date
GETOWNER Function on page 163-26	Given an XDBResource, returns its owner.
GETREFCOUNT Function on page 163-27	Given an XDBResource, returns its reference count
GETVERSIONID Function on page 163-28	Given an XDBResource, returns its version ID.
HASACLCHANGED Function on page 163-29	Returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise

Table 163–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
HASAUTHORCHANGED Function on page 163-30	Returns TRUE if the ACL of the given resource has changed FALSE otherwise
HASCHANGED Function on page 163-31	Returns TRUE if the element or attribute represented by the given XPath has changed, FALSE otherwise
HASCHARACTERSETCHANGED Function on page 163-32	Returns TRUE if the character set of the given resource has changed, FALSE otherwise
HASCOMMENTCHANGED Function on page 163-33	Returns TRUE if the comment of the given resource has changed, FALSE otherwise
HASCONTENTCHANGED Function on page 163-34	Returns TRUE if the contents of the given resource has changed, FALSE otherwise
HASCONTENTTYPECHANGED Function on page 163-35	Returns TRUE if the content-type of the given resource has changed, FALSE otherwise
HASCREATIONDATECHANGED Function on page 163-36	Returns TRUE if the creation date of the given resource has changed, FALSE otherwise
HASCREATORCHANGED Function on page 163-37	Returns TRUE the creator of the given resource has changed, FALSE otherwise
HASCUSTOMMETADATACHANGED Function on page 163-38	Returns TRUE if custom-metadata for this XPath has changed, FALSE otherwise
HASDISPLAYNAMECHANGED Function on page 163-39	Returns TRUE if the display name of the given resource has changed, FALSE otherwise
HASLANGUAGECHANGED Function on page 163-40	Returns TRUE if the language of the given resource has changed, FALSE otherwise
HASLASTMODIFIERCHANGED Function on page 163-41	Returns TRUE if the last modifier of the given resource has changed, FALSE otherwise
HASMODIFICATIONDATECHANGED Function on page 163-42	Returns TRUE if the modification date of the given resource has changed, FALSE otherwise
HASOWNERCHANGED Function on page 163-43	Returns TRUE if the owner of the given resource has changed, FALSE otherwise
HASREFCOUNTCHANGED Function on page 163-44	Returns TRUE if the reference count of the given resource has changed, FALSE otherwise
HASVERSIONIDCHANGED Function on page 163-45	Returns TRUE if the version ID of the given resource has changed, FALSE otherwise
ISFOLDER Function on page 163-46	Returns TRUE if the given resource is a folder, FALSE otherwise
ISNULL Function on page 163-47	Returns TRUE if input resource is NULL, FALSE otherwise
MAKEDOCUMENT Function on page 163-48	Converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface
SAVE Procedure on page 163-49	Updates the resource with any modifications
SETACL Procedure on page 163-50	Sets the ACL of the given XDBResource to the path specified
SETAUTHOR Procedure on page 163-51	Sets the author of the given XDBResource to the specified string
SETCHARACTERSET Procedure on page 163-52	Sets the character set of the given XDBResource to a specified character set

Table 163–1 (Cont.) DBMS_XDBRESOURCE Package Subprograms

Subprogram	Description
SETCOMMENT Procedure on page 163-53	Sets a comment associated with the given XDBResource
SETCONTENT Procedures on page 163-54	Replaces the contents of the given resource with the given `CLOB`
SETCONTENTTYPE Procedure on page 163-55	Sets the content-type of the given XDBResource
SETCUSTOMMETADATA Procedure on page 163-56	Sets the custom metadata specified by the XPath and namespace to new data
SETDISPLAYNAME Procedure on page 163-57	Sets the display name of the given XDBResource
SETLANGUAGE Procedure on page 163-58	Sets the language of the given XDBResource
SETOWNER Procedure on page 163-59	Sets the owner of the given XDBResource

FREERESOURCE Procedure

This procedure frees any memory associated with an XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.FREERESOURCE (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–2 FREERESOURCE Procedure Parameters

Parameter	Description
res	XDBResource to free

GETACL Function

Given an XDBResource, this function returns its ACL as string.

Syntax

```
DBMS_XDBRESEROUCE.GETACL (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–3 GETACL Function Parameters

Parameter	Description
`res`	XDBResource

GETACLDOCFROMRES Function

This function returns the ACL Document for the given resource as `XMLType`.

Syntax

```
DBMS_XDBRESEROUCE.GETACLDOCFROMRES (
   res    IN    XDBResource)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 163–4 GETACL Function Parameters

Parameter	Description
`res`	XDBResource

GETAUTHOR Function

Given an XDBResource, this function returns its author.

Syntax

```
DBMS_XDBRESEROUCE.GETAUTHOR (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–5 GETAUTHOR Function Parameters

Parameter	Description
`res`	XDBResource

GETCHARACTERSET Function

Given an XDBResource, this function returns its characterset.

Syntax

```
DBMS_XDBRESEROUCE.GETCHARACTERSET (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–6 GETCHARACTERSET Function Parameters

Parameter	Description
res	XDBResource

GETCOMMENT Function

Given an XDBResource, this function returns its comment.

Syntax

```
DBMS_XDBRESEROUCE.GETCOMMENT (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–7 GETCOMMENT Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTBLOB Function

This function returns the contents of the resource as a BLOB.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTBLOB (
   res    IN     XDBResource,
   csid   OUT    PLS_INTEGER)
 RETURN BLOB;
```

Parameters

Table 163–8 GETCONTENTBLOB Function Parameters

Parameter	Description
res	XDBResource
csid	Character set ID of the BLOB returned

GETCONTENTCLOB Function

This function returns the contents of the resource as a CLOB.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTCLOB (
   res   IN    XDBResource)
 RETURN CLOB;
```

Parameters

Table 163–9 GETCONTENTCLOB Function Parameters

Parameter	Description
res	XDBResource

GETCONTENTREF Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTREF (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–10 GETCONTENTREF Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTTYPE Function

Given an XDBResource, this function returns its content-type.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTTYPE (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–11 GETCONTENTTYPE Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTXML Function

This function returns the contents of the resource as an `XMLTypeRef`.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTXML (
   res    IN    XDBResource)
 RETURN XMLType;
```

Parameters

Table 163–12 GETCONTENTXML Function Parameters

Parameter	Description
`res`	XDBResource

GETCONTENTVARCHAR2 Function

This function returns the contents of the resource as a string.

Syntax

```
DBMS_XDBRESEROUCE.GETCONTENTVARCHAR2 (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–13 GETCONTENTVARCHAR2 Function Parameters

Parameter	Description
res	XDBResource

GETCREATIONDATE Function

Given an XDBResource, this function returns its creation date.

Syntax

```
DBMS_XDBRESEROUCE.GETCREATIONDATE (
   res    IN    XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 163–14 GETCREATIONDATE Function Parameters

Parameter	Description
res	XDBResource

GETCREATOR Function

Given an XDBResource, this function returns its creator.

Syntax

```
DBMS_XDBRESEROUCE.GETCREATOR (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–15 GETCREATOR Function Parameters

Parameter	Description
`res`	XDBResource

GETCUSTOMMETADATA Function

This function returns the requested custom metadata given the xpath and namespace to the metadata.

Syntax

```
DBMS_XDBRESEROUCE.GETCUSTOMMETADATA (
   res        IN    XDBResource,
   xpath      IN    VARCHAR2,
   namespace  IN    VARCHAR2)
 RETURN XMLType;
```

Parameters

Table 163–16 GETCUSTOMMETADATA Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath for custom metadata
namespace	Namespace

Usage Notes

The first component of the XPath expression must be "Resource".

GETDISPLAYNAME Function

Given an XDBResource, this function returns its display name.

Syntax

```
DBMS_XDBRESEROUCE.GETDISPLAYNAME (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–17 GETDISPLAYNAME Function Parameters

Parameter	Description
res	XDBResource

GETLANGUAGE Function

Given an XDBResource, this function returns its language.

Syntax

```
DBMS_XDBRESEROUCE.GETLANGUAGE (
   res    IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–18 GETLANGUAGE Function Parameters

Parameter	Description
res	XDBResource

GETLASTMODIFIER Function

Given an XDBResource, this function returns its last modifier.

Syntax

```
DBMS_XDBRESEROUCE.GETLASTMODIFIER (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–19 GETLASTMODIFIER Function Parameters

Parameter	Description
`res`	XDBResource

GETMODIFICATIONDATE Function

Given an XDBResource, this function returns its modification date.

Syntax

```
DBMS_XDBRESEROUCE.GETMODIFICATIONDATE (
   res    IN    XDBResource)
 RETURN TIMESTAMP;
```

Parameters

Table 163–20 GETMODIFICATIONDATE Function Parameters

Parameter	Description
res	XDBResource

GETOWNER Function

Given an XDBResource, this function returns its owner.

Syntax

```
DBMS_XDBRESEROUCE.GETOWNER (
   res   IN    XDBResource)
 RETURN VARCHAR2;
```

Parameters

Table 163–21 GETOWNER Function Parameters

Parameter	Description
res	XDBResource

GETREFCOUNT Function

Given an XDBResource, this function returns its reference count.

Syntax

```
DBMS_XDBRESEROUCE.GETREFCOUNT (
   res    IN    XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 163–22 GETREFCOUNT Function Parameters

Parameter	Description
res	XDBResource

GETVERSIONID Function

Given an XDBResource, this function returns its version ID.

Syntax

```
DBMS_XDBRESEROUCE.GETVERSIONID (
   res   IN    XDBResource)
 RETURN PLS_INTEGER;
```

Parameters

Table 163–23 GETVERSIONID Function Parameters

Parameter	Description
`res`	XDBResource

HASACLCHANGED Function

This function returns `TRUE` if the ACL of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASACLCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–24 GETACL Function Parameters

Parameter	Description
`res`	XDBResource

HASAUTHORCHANGED Function

This function returns `TRUE` if the author of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASAUTHORCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–25 HASAUTHORCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCHANGED Function

Given an XPath, this function determines whether the element or attribute represented by the XPath has changed.

Syntax

```
DBMS_XDBRESEROUCE.HASCHANGED (
   res         IN    XDBResource,
   xpath       IN    VARCHAR2,
   namespace   IN    VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 163–26 HASCHANGED Function Parameters

Parameter	Description
res	XDBResource
xpath	XPath to check
bnamespace	Namespace to use

HASCHARACTERSETCHANGED Function

This function returns `TRUE` if the character set of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCHARACTERSETCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–27 HASCHARACTERSETCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCOMMENTCHANGED Function

This function returns `TRUE` if the comment of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCOMMENTCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–28 HASCOMMENTCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCONTENTCHANGED Function

This function returns `TRUE` if the contents of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–29 HASCONTENTCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCONTENTTYPECHANGED Function

This function returns `TRUE` if the content-type of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCONTENTTYPECHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–30 HASCONTENTTYPECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCREATIONDATECHANGED Function

This function returns `TRUE` if the creation date of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCREATIONDATECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–31 HASCREATIONDATECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASCREATORCHANGED Function

This function returns TRUE if the creator of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASCREATORCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–32 HASCREATORCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASCUSTOMMETADATACHANGED Function

This function checks whether the custom-metadata for a given resource has changed.

Syntax

```
DBMS_XDBRESEROUCE.HASCUSTOMMETADATACHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–33 HASCUSTOMMETADATACHANGED Function Parameters

Parameter	Description
res	XDBResource

HASDISPLAYNAMECHANGED Function

This function returns `TRUE` if the display name of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASDISPLAYNAMECHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–34 HASDISPLAYNAMECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASLANGUAGECHANGED Function

This function returns `TRUE` if the language of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASLANGUAGECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–35 HASLANGUAGECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASLASTMODIFIERCHANGED Function

This function returns TRUE if the last modifier of the given resource has changed, FALSE otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASLASTMODIFIERCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–36 HASLASTMODIFIERCHANGED Function Parameters

Parameter	Description
res	XDBResource

HASMODIFICATIONDATECHANGED Function

This function returns `TRUE` if the modification date of the given resource has changed, `FALSE` otherwise

Syntax

```
DBMS_XDBRESEROUCE.HASMODIFICATIONDATECHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–37 HASMODIFICATIONDATECHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASOWNERCHANGED Function

This function returns `TRUE` if the owner of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASOWNERCHANGED (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–38 HASOWNERCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASREFCOUNTCHANGED Function

This function returns `TRUE` if the reference count of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASREFCOUNTCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–39 HASREFCOUNTCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

HASVERSIONIDCHANGED Function

This function returns `TRUE` if the version ID of the given resource has changed, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.HASVERSIONIDCHANGED (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–40 HASVERSIONIDCHANGED Function Parameters

Parameter	Description
`res`	XDBResource

ISFOLDER Function

This function returns `TRUE` if the given resource is a folder, `FALSE` otherwise.

Syntax

```
DBMS_XDBRESEROUCE.ISFOLDER (
   res   IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–41 ISFOLDER Function Parameters

Parameter	Description
`res`	XDBResource

ISNULL Function

This function returns `TRUE` if input resource is `NULL`.

Syntax

```
DBMS_XDBRESEROUCE.ISNULL (
   res    IN    XDBResource)
 RETURN BOOLEAN;
```

Parameters

Table 163–42 ISNULL Function Parameters

Parameter	Description
`res`	Input resource

MAKEDOCUMENT Function

This function converts the XDBResource to a DOMDocument which can be operated on using the XMLDOM interface.

See Also: The DBMS_XMLDOM package

Syntax

```
DBMS_XDBRESEROUCE.MAKEDOCUMENT (
   res   IN    XDBResource)
 RETURN DBMS_XMLDOM.DOMDocument;
```

Parameters

Table 163–43 MAKEDOCUMENT Function Parameters

Parameter	Description
res	XDBResource

SAVE Procedure

This procedures updates the resource with any modifications.

Syntax

```
DBMS_XDBRESEROUCE.SAVE (
   res    IN    XDBResource);
```

Parameters

Table 163–44 SAVE Procedure Parameters

Parameter	Description
res	XDBResource

SETACL Procedure

This procedure sets the ACL of the given XDBResource to the path specified.

Syntax

```
DBMS_XDBRESEROUCE.SETACL (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 163–45 SETACL Procedure Parameters

Parameter	Description
`res`	XDBResource
`ACLPath`	Absolute path of the new ACL

SETAUTHOR Procedure

This procedure sets the author of the given XDBResource to the specified string.

Syntax

```
DBMS_XDBRESEROUCE.SETAUTHOR (
   res     IN OUT  XDBResource,
   author  IN      VARCHAR2);
```

Parameters

Table 163–46 SETAUTHOR Procedure Parameters

Parameter	Description
`res`	XDBResource
`author`	Author

SETCHARACTERSET Procedure

This procedure sets the character set of the given XDBResource to a specified character set.

Syntax

```
DBMS_XDBRESEROUCE.SETCHARACTERSET (
   res      IN OUT  XDBResource,
   charSet  IN      VARCHAR2);
```

Parameters

Table 163–47 SETCHARACTERSET Procedure Parameters

Parameter	Description
`res`	XDBResource
`charset`	New character set

SETCOMMENT Procedure

This procedure sets a comment associated with the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETCOMMENT (
   res      IN OUT  XDBResource,
   comment  IN      VARCHAR2);
```

Parameters

Table 163–48 SETCOMMENT Procedure Parameters

Parameter	Description
`res`	XDBResource
`comment`	New comment

SETCONTENT Procedures

This procedurereplaces the contents of the given resource with the given datatype.

Syntax

```
DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BFILE,
   csid     IN      NUMBER);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      BLOB,
   csid     IN      PLS_INTEGER);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      CLOB);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      REF SYS.XMLType,
   sticky   IN      BOOLEAN := TRUE);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      VARCHAR2);

DBMS_XDBRESEROUCE.SETCONTENT (
   res      IN OUT  XDBResource,
   data     IN      SYS.XMLType);
```

Parameters

Table 163–49 SETCONTENT Procedure Parameters

Parameter	Description
`res`	XDBResource
`data`	Data input as `BFILE`, `BLOB`, `CLOB`, string, `XMLType`
`csid`	Character set ID of the `BFILE`, `BLOB`
`sticky`	If `TRUE` creates a sticky `REF`, otherwise non-sticky

SETCONTENTTYPE Procedure

This procedure sets the content-type of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETCONTENTTYPE (
   res         IN OUT  XDBResource,
   conttype    IN      VARCHAR2);
```

Parameters

Table 163–50 SETCONTENTTYPE Procedure Parameters

Parameter	Description
res	XDBResource
conttype	New content-type

SETCUSTOMMETADATA Procedure

This procedure sets the custom metadata specified by the xpath and namespace to new data.

Syntax

```
DBMS_XDBRESEROUCE.SETCUSTOMMETADATA (
   res          IN OUT  XDBResource,
   xpath        IN      VARCHAR2,
   namespace    IN      VARCHAR2,
   newMetadata  IN      XMLType);
```

Parameters

Table 163–51 SETCUSTOMMETADATA Procedure Parameters

Parameter	Description
res	XDBResource
xpath	XPath to change
namespace	Namespace to use
newMetadata	New data that should replace the metadata at the given XPath

Usage Notes

The first component of the XPath expression must be "Resource".

SETDISPLAYNAME Procedure

This procedure sets the display name of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETDISPLAYNAME (
   res      IN OUT  XDBResource,
   name     IN      VARCHAR2);
```

Parameters

Table 163–52 SETDISPLAYNAME Procedure Parameters

Parameter	Description
res	XDBResource
name	New display name

SETLANGUAGE Procedure

This procedure sets the language of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETLANGUAGE (
   res      IN OUT  XDBResource,
   ACLPath  IN      VARCHAR2);
```

Parameters

Table 163–53 SETLANGUAGE Procedure Parameters

Parameter	Description
`res`	XDBResource
`ACLPath`	New path

SETOWNER Procedure

This procedure sets the owner of the given XDBResource.

Syntax

```
DBMS_XDBRESEROUCE.SETOWNER (
   res      IN OUT  XDBResource,
   owner    IN      VARCHAR2);
```

Parameters

Table 163–54 SETOWNER Procedure Parameters

Parameter	Description
res	XDBResource
owner	New owner

164

DBMS_XDBT

The DBMS_XDBT package provides a convenient mechanism for administrators to set up a CONTEXT index on the Oracle XML DB hierarchy. The package contains procedures to create default preferences, create the index and set up automatic synchronization of the CONTEXT index

The DBMS_XDBT package also contains a set of package variables that describe the configuration settings for the index. These are intended to cover the basic customizations that installations may require, but is by no means a complete set.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- Using DBMS_XDBT
  - Overview
  - Operational Notes
- Summary of DBMS_XDBT Subprograms

Using DBMS_XDBT

- Overview
- Operational Notes

Overview

The DBMS_XDBT package can be used in the following fashion:

- Customize the package to set up the appropriate configuration.
- Use the DROPPREFERENCES Procedure to drop any existing index preferences
- Create new index preferences using the CREATEPREFERENCES Procedure procedure
- Create the CONTEXT index using the CREATEINDEX Procedure procedure
- Set up automatic synchronization of the index using the CONFIGUREAUTOSYNC Procedure

Operational Notes

The DBMS_XDBT package can be customized by using a PL/SQL procedure or an anonymous block to set the relevant package variables, configuration settings, and then execute the procedures. A more general approach would be to introduce the appropriate customizations by modifying this package in place, or as a copy. The system must be configured to use job queues, and the jobs can be viewed through the USER_JOBS catalog views. This section describes the configuration settings, or package variables, available to customize the DBMS_XDBT package.

Table 164–1 General Indexing Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
IndexName	XDB$CI	Name of the CONTEXT index.
IndexTablespace	XDB$RESINFO	Tablespace used by tables and indexes comprising the CONTEXT index.
IndexMemory	128M	Memory used by index creation and SYNC; less than or equal to the MAX_INDEX_MEMORY system parameter (see the CTX_ADMIN package).
LogFile	'XdbCtxLog'	The log file used for ROWID during indexing. The LOG_DIRECTORY system parameter must be set already. NULL turns off ROWID logging.

Table 164–2 Filtering Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SkipFilter_Types	image/%, audio/%, video/%, model/%	List of mime types that should not be indexed.
NullFilter_Types	text/plain, text/html, text/xml	List of mime types that do not need to use the INSO filter. Use this for text-based documents.
FilterPref	XDB$CI_FILTER	Name of the filter preference.

Table 164–3 Stoplist Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
StoplistPref	XDB$CI_STOPLIST	Name of the stoplist.
StopWords	0..9; 'a'..'z'; 'A'..'Z'	List of stopwords, in excess of CTXSYS.DEFAULT_STOPLIST.

Table 164–4 Sectioning and Section Group Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
SectionGroup	HTML_SECTION_GROUP	Default sectioner. Use PATH_SECTION_GROUP or AUTO_SECTION_GROUP if repository contains mainly XML documents.
SectiongroupPref	XDB$CI_SECTIONGROUP	Name of the section group.

Table 164–5 Other Index Preference Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
DatastorePref	XDB$CI_DATASTORE	Name of the datastore preference
StoragePref	XDB$CI_STORAGE	Name of the storage preference.
WordlistPref	XDB$CI_WORDLIST	Name of the wordlist preference.
DefaultLexerPref	XDB$CI_DEFAULT_LEXER	Name of the default lexer preference.

Table 164–6 SYNC (CONTEXT Synchronization) Settings for Customizing DBMS_XDBT

Parameter	Default Value	Description
AutoSyncPolicy	SYNC_BY_PENDING_COUNT	Indicates when the index should be SYNCed. One of SYNC_BY_PENDING_COUNT, SYNC_BY_TIME, or SYNC_BY_PENDING_COUNT_AND_TIME.
MaxPendingCount	2	Maximum number of documents in the CTX_USER_PENDING queue before an index SYNC is triggered. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
CheckPendingCountInterval	10 minutes	How often, in minutes, the pending queue should be checked. Only if the AutoSyncPolicy is SYNC_BY_PENDING_COUNT or SYNC_BY_PENDING_COUNT_AND_TIME.
SyncInterval	60 minutes	Indicates how often, in minutes, the index should be SYNCed. Only if the AutoSyncPolicy is SYNC_BY_TIME or SYNC_BY_PENDING_COUNT_AND_TIME

Summary of DBMS_XDBT Subprograms

Table 164–7 DBMS_XDBT Package Subprograms

Subprogram	Description
CONFIGUREAUTOSYNC Procedure on page 164-7	Configures the CONTEXT index for automatic maintenance, SYNC
CREATEDATASTOREPREF Procedure on page 164-8	Creates a USER datastore preference for the CONTEXT index
CREATEFILTERPREF Procedure on page 164-9	Creates a filter preference for the CONTEXT index
CREATEINDEX Procedure on page 164-10	Creates the CONTEXT index on the XML DB hierarchy
CREATELEXERPREF Procedure on page 164-11	Creates a lexer preference for the CONTEXT index
CREATEPREFERENCES Procedure on page 164-12	Creates preferences required for the CONTEXT index on the XML DB hierarchy
CREATESECTIONGROUPPREF Procedure on page 164-13	Creates a storage preference for the CONTEXT index
CREATESTOPLISTPREF Procedure on page 164-14	Creates a section group for the CONTEXT index
CREATESTORAGEPREF Procedure on page 164-15	Creates a wordlist preference for the CONTEXT index
CREATEWORLDLISTPREF Procedure on page 164-16	Creates a stoplist for the CONTEXT index
DROPPREFERENCES Procedure on page 164-17	Drops any existing preferences

CONFIGUREAUTOSYNC Procedure

This procedure sets up jobs for automatic SYNCs of the CONTEXT index.

Syntax

```
DBMS_XDBT.CONFIGUREAUTOSYNC;
```

Usage Notes

- The system must be configured for job queues for automatic synchronization. The jobs can be viewed using the USER_JOBS catalog views
- The configuration parameter AutoSyncPolicy can be set to choose an appropriate synchronization policy.

The synchronization can be based on one of the following:

Sync Basis	Description
SYNC_BY_PENDING_COUNT	The SYNC is triggered when the number of documents in the pending queue is greater than a threshold (See the MaxPendingCount configuration setting on page 164-5). The pending queue is polled at regular intervals (See the CheckPendingCountInterval configuration parameter on page 164-5) to determine if the number of documents exceeds the threshold.
SYNC_BY_TIME	The SYNC is triggered at regular intervals. (See the SyncInterval configuration parameter on page 164-5).
SYNC_BY_PENDING_COUNT_ AND_TIME	A combination of both of the preceding options.

CREATEDATASTOREPREF Procedure

This procedure creates a user datastore preference for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEDATASTOREPREF;
```

Usage Notes

- The name of the datastore preference can be modified; see the DatastorePref configuration setting.
- The default USER datastore procedure also filters the incoming document. The DBMS_XDBT package provides a set of configuration settings that control the filtering process.
- The SkipFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not indexed. Some of the properties of the document metadata, such as author, remain unindexed.
  - The NullFilter_Types array contains a list of regular expressions. Documents with a mime type that matches one of these expressions are not filtered; however, they are still indexed. This is intended to be used for documents that are text-based, such as HTML, XML and plain-text.
  - All other documents use the INSO filter through the IFILTER API.

CREATEFILTERPREF Procedure

This procedure creates a `NULL` filter preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEFILTERPREF;
```

Usage Notes

- The name of the filter preference can be modified; see `FilterPref` configuration setting.
- The `USER` datastore procedure filters the incoming document; see CREATEDATASTOREPREF Procedurefor more details.

CREATEINDEX Procedure

This procedure creates the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEINDEX;
```

Usage Notes

- The name of the index can be changed; see the `IndexName` configuration setting.
- Set the `LogFile` configuration parameter to enable `ROWID` logging during index creation.
- Set the `IndexMemory` configuration parameter to determine the amount of memory that index creation, and later SYNCs, will use.

CREATELEXERPREF Procedure

This procedure creates a BASIC `lexer` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATELEXERPREF;
```

Usage Notes

- The name of the `lexer` preference can be modified; see `LexerPref` configuration setting. No other configuration settings are provided.
- `MultiLexer` preferences are not supported.
- Base letter translation is turned on by default.

CREATEPREFERENCES Procedure

This procedure creates a set of default preferences based on the configuration settings.

Syntax

```
DBMS_XDBT.CREATEPREFERENCES;
```

CREATESECTIONGROUPPREF Procedure

This procedure creates a section group for the CONTEXT index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESECTIONGROUPPREF;
```

Usage Notes

- The name of the section group can be changed; see the SectiongroupPref configuration setting.
- The HTML sectioner is used by default. No zone sections are created by default. If the vast majority of documents are XML, consider using the AUTO_SECTION_GROUP or the PATH_SECTION_GROUP; see the SectionGroup configuration setting.

CREATESTOPLISTPREF Procedure

This procedure creates a stoplist for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTOPLISTPREF;
```

Usage Notes

- The name of the stoplist can be modified; see the `StoplistPref` configuration setting.
- Numbers are not indexed.
- The `StopWords` array is a configurable list of stopwords. These are meant to be stopwords in addition to the set of stopwords in `CTXSYS.DEFAULT_STOPLIST`.

CREATESTORAGEPREF Procedure

This procedure creates a `BASIC_STORAGE` preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATESTORAGEPREF;
```

Usage Notes

- The name of the storage preference can be modified; see the `StoragePref` configuration setting.
- A tablespace can be specified for the tables and indexes comprising the `CONTEXT` index; see the `IndexTablespace` configuration setting.
- Prefix and Substring indexing are not turned on by default.
- The `I_INDEX_CLAUSE` uses key compression.

CREATEWORLDLISTPREF Procedure

This procedure creates a word list preference for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.CREATEWORDLISTPREF;
```

Usage Notes

- The name of the word list preference can be modified; see the `WordlistPref` configuration setting. No other configuration settings are provided.
- `FUZZY_MATCH` and `STEMMER` attributes are set to `AUTO` (auto-language detection)

DROPPREFERENCES Procedure

This procedure drops any previously created preferences for the `CONTEXT` index on the XML DB hierarchy.

Syntax

```
DBMS_XDBT.DROPPREFERENCES;
```

165

DBMS_XDBZ

The DBMS_XDBZ package controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs).

This chapter contains the following topics:

- Using DBMS_XDBZ
  - Constants
- Summary of DBMS_XDBZ Subprograms

See Also: *Oracle XML DB Developer's Guide*

Using DBMS_XDBZ

This section contains topics which relate to using the `DBMS_XDBZ` package.

- Constants on page 165-3

Constants

The DBMS_XDBZ package uses the constants shown in following tables.

- DBMS_XDBZ Constants - Name Format on page 165-3
- DBMS_XDBZ Constants - Enable Option on page 165-3
- DBMS_XDBZ Constants - Enable Option Exercised on page 165-3

Table 165–1 DBMS_XDBZ Constants - Name Format

Constant	Type	Value	Description
NAME_FORMAT_SHORT	PLS_INTEGER	1	DB user name or LDAP nickname
NAME_FORMAT_ DISTINGUISHED	PLS_INTEGER	2	LDAP distinguished name

Table 165–2 DBMS_XDBZ Constants - Enable Option

Constant	Type	Value	Description
ENABLE_CONTENTS	PLS_INTEGER	1	Enables hierarchy for contents and is used by users when calling the ENABLE_ HIERARCHY Procedure
ENABLE_RESMETADATA	PLS_INTEGER	2	Enables hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources

Table 165–3 DBMS_XDBZ Constants - Enable Option Exercised

Constant	Type	Value	Description
IS_ENABLED_CONTENTS	PLS_INTEGER	1	If hierarchy was enabled for contents, that is, the ENABLE_ HIERARCHY Procedurewas called with hierarchy_type as ENABLE_CONTENTS
IS_ENABLED_RESMETADATA	PLS_INTEGER	2	If hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_ RESMETADATA

Summary of DBMS_XDBZ Subprograms

Table 165–4 DBMS_XDBZ Package Subprograms

Method	Description
DISABLE_HIERARCHY Procedure on page 165-5	Disables repository support for the specified `XMLTYPE` table or view
ENABLE_HIERARCHY Procedure on page 165-6	Enables repository support for the specified `XMLType` table or view
GET_ACLOID Function on page 165-7	Retrieves the ACL Object ID for the specified resource
GET_USERID Function on page 165-8	Retrieves the user ID for the specified user
IS_HIERARCHY_ENABLED Function on page 165-9	Determines if repository support for the specified `XMLType` table or view is enabled
PURGELDAPCACHE Function on page 165-10	Purges the LDAP nickname cache

DISABLE_HIERARCHY Procedure

This procedure disables repository support for a particular XMLType table or view.

Syntax

```
DBMS_XDBZ.DISABLE_HIERARCHY(
   object_schema IN VARCHAR2,
   object_name   IN VARCHAR2);
```

Parameters

Table 165–5 DISABLE_HIERARCHY Procedure Parameters

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view

ENABLE_HIERARCHY Procedure

This procedure enables repository support for a particular `XMLType` table or view. This allows the use of a uniform ACL-based security model across all documents in the repository.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about

Syntax

```
DBMS_XDBZ.ENABLE_HIERARCHY(
   object_schema   IN   VARCHAR2,
   object_name     IN   VARCHAR2,
   hierarchy_type  IN   PLS_INTEGER := DBMS_XDBZ.ENABLE_CONTENTS);
```

Parameters

Table 165–6 ENABLE_HIERARCHY Procedure Parameters

Parameter	Description
`object_schema`	The schema name of the `XMLType` table or view
`object_name`	The name of the `XMLType` table or view
`hierarchy_type`	How to enable the hierarchy. ■ `ENABLE_CONTENTS` - enable hierarchy for contents, that is, this table will store contents of resources in the repository ■ `ENABLE_RESMETADATA` - enable hierarchy for resource metadata, that is, this table will store schema based custom metadata for resources If this subprogram is called on a table, another call will have no effect. Note that you cannot enable hierarchy for both contents and resource metadata.

GET_ACLOID Function

This function retrieves the ACL Object ID for the specified resource, if the repository path is known.

Syntax

```
DBMS_XDBZ.GET_ACLOID(
   aclpath   IN   VARCHAR2,
   acloid    OUT  RAW)
 RETURN BOOLEAN;
```

Parameters

Table 165–7 GET_ACLOID Function Parameters

Parameter	Description
`aclpath`	ACL resource path for the repository
`acloid`	The returned Object ID

Return Values

Returns `TRUE` if successful.

GET_USERID Function

This function retrieves the user ID for the specified user name. The local database is searched first, and if found, the `USERID` is returned in 4-byte database format. Otherwise, the LDAP directory is searched, if available, and if found, the `USERID` is returned in 4-byte database format.

Syntax

```
DBMS_XDBZ.GET_USERID(
   username IN  VARCHAR2,
   userid   OUT RAW,
   format   IN  BINARY_INTEGER := NAME_FORMAT_SHORT)
 RETURN BOOLEAN;
```

Parameters

Table 165–8 GET_USERID Function Parameters

Parameter	Description
`username`	Name of the database or LDAP user.
`userid`	Return parameter for the matching user id.
`format`	Format of the specified user name; valid options are: ■ `DBMS_XDBZ.NAME_FORMAT_SHORT` (default) -- DB user name or LDAP nickname ■ `DBMS_XDBZ.NAME_FORMAT_DISTINGUISHIED` -- LDAP distinguished name.

Return Values

Returns `TRUE` if successful.

IS_HIERARCHY_ENABLED Function

This function determines if repository support for the specified XMLType table or view is enabled.

Syntax

```
DBMS_XDBZ.IS_HIERARCHY_ENABLED(
   object_schema    IN  VARCHAR2,
   object_name      IN  VARCHAR2,
   hierarchy_type   IN  PLS_INTEGER := IS_ENABLED_CONTENTS)
 RETURN BOOLEAN;
```

Parameters

Table 165–9 IS_HIERARCHY_ENABLED Function Parameters

Parameter	Description
object_schema	The schema name of the XMLType table or view
object_name	The name of the XMLType table or view
hierarchy_type	The type of hierarchy to check for. ▪ IS_ENABLED_CONTENTS - if hierarchy was enabled for contents, that is, the ENABLE_HIERARCHY Procedurewas called with hierarchy_type as ENABLE_CONTENTS ▪ IS_ENABLED_RESMETADATA - if hierarchy was enabled for resource metadata, that is, the ENABLE_HIERARCHY Procedure was called with hierarchy_type as ENABLE_RESMETADATA

Return Values

Returns TRUE if the given XMLTYPE table or view has the XDB Hierarchy enabled with the specified type.

PURGELDAPCACHE Function

This function purges the LDAP nickname cache. Returns `TRUE` if successful.

Syntax

```
DBMS_XDBZ.PURGELDAPCACHE
 RETURN BOOLEAN;
```

166

DBMS_XEVENT

The DBMS_XEVENTpackage provides event-related types and supporting subprograms.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about "Oracle XML DB Repository Events"

This chapter contains the following topics:

- Using DBMS_XEVENT
  - Constants
- Subprogram Groups
  - `XDBEvent` Type Subprograms
  - `XDBRepositoryEvent` Type Subprograms
  - `XDBHandlerList` Type Subprograms
  - `XDBHandler` Type Subprograms
  - `XDBPath` Type Subprograms
  - `XDBLink` Type Subprograms
- Summary of DBMS_XEVENT Subprograms

Using DBMS_XEVENT

- Constants

Constants

The DBMS_XEVENT package uses the constants shown in Table 166–1:

Table 166–1 DBMS_XEVENT Constants

Name	Type	Value	Description
RENDER_EVENT	PLS_INTEGER	1	
PRE_CREATE_EVENT	PLS_INTEGER	2	
POST_CREATE_EVENT	PLS_INTEGER	3	
PRE_DELETE_EVENT	PLS_INTEGER	4	
POST_DELETE_EVENT	PLS_INTEGER	5	
PRE_UPDATE_EVENT	PLS_INTEGER	6	
POST_UPDATE_EVENT	PLS_INTEGER	7	
PRE_LOCK_EVENT	PLS_INTEGER	8	
POST_LOCK_EVENT	PLS_INTEGER	9	
PRE_UNLOCK_EVENT	PLS_INTEGER	10	
POST_UNLOCK_EVENT	PLS_INTEGER	11	
PRE_LINKIN_EVENT	PLS_INTEGER	12	
POST_LINKIN_EVENT	PLS_INTEGER	13	
PRE_LINKTO_EVENT	PLS_INTEGER	14	
POST_LINKTO_EVENT	PLS_INTEGER	15	
PRE_UNLINKIN_EVENT	PLS_INTEGER	16	
POST_UNLINKIN_EVENT	PLS_INTEGER	17	
PRE_UNLINKFROM_EVENT	PLS_INTEGER	18	
POST_UNLINKFROM_EVENT	PLS_INTEGER	19	
PRE_CHECKIN_EVENT	PLS_INTEGER	20	
POST_CHECKIN_EVENT	PLS_INTEGER	21	
PRE_CHECKOUT_EVENT	PLS_INTEGER	22	
POST_CHECKOUT_EVENT	PLS_INTEGER	23	
PRE_UNCHECKOUT_EVENT	PLS_INTEGER	24	
POST_UNCHECKOUT_EVENT	PLS_INTEGER	25	
PRE_VERSIONCONTROL_EVENT	PLS_INTEGER	26	
POST_VERSIONCONTROL_EVENT	PLS_INTEGER	27	
PRE_OPEN_EVENT	PLS_INTEGER	28	
POST_OPEN_EVENT	PLS_INTEGER	29	
PRE_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	30	
POST_INCONSISTENT_UPDATE_EVENT	PLS_INTEGER	21	
POST_CHECKIN_EVENT	PLS_INTEGER	21	

Subprogram Groups

- XDBEvent Type Subprograms
- XDBRepositoryEvent Type Subprograms
- XDBHandlerList Type Subprograms
- XDBHandler Type Subprograms
- XDBPath Type Subprograms
- XDBLink Type Subprograms

XDBEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBEvent type.

Table 166–2 XDBEvent Subprograms

Subprogram	Description
GETCURRENTUSER Function on page 166-17	Returns the name of the user executing the operation that triggers the event
GETEVENT Function on page 166-18	Returns a value identifying the triggering event
ISNULL Functions on page 166-45	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBRepositoryEvent Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBRepositoryEvent type.

Table 166–3 XDBRepositoryEvent Subprograms

Subprogram	Description
GETAPPLICATIONDATA Function on page 166-15	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler
GETHANDLERLIST Function on page 166-20	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler
GETINTERFACE Function on page 166-21	Returns the top-level interface used to initiate the operation that triggered the event
GETLINK Function on page 166-23	Returns an `XDBLink` object for the target resource
GETLOCK Function on page 166-25	Returns the lock object corresponding to the current operation
GETOLDRESOURCE Function on page 166-29	Returns the original `XDBResource` object before the operation was executed
GETOPENACCESSMODE Function on page 166-30	Returns the access mode for the open operation
GETOPENDENYMODE Function on page 166-31	Returns the deny mode for the open operation
GETOUTPUTSTREAM Function on page 166-32	Returns the output BLOB in which the handler can write the rendered data
GETPARAMETER Function on page 166-33	Returns the value of a request or session-specific parameter
GETPARENT Function on page 166-34	Returns the resource object corresponding to a parent folder of the target resource
GETPATH Function on page 166-38	Returns the `XDBPath` object representing the path of the resource for which the event was fired
GETRESOURCE Function on page 166-39	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource
GETUPDATEBYTECOUNT Function on page 166-42	If the current operation is a byte-range write, returns the byte count
GETUPDATEBYTEOFFSET Function on page 166-43	If the current operation is a byte-range write, function returns the byte offset at which the range begins
GETXDBEVENT Function on page 166-44	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type
ISNULL Functions on page 166-45	Returns `TRUE` if input argument is `NULL`
SETRENDERPATH Procedure on page 166-48	Specifies the path of the resource that contains the rendered contents
SETRENDERSTREAM Procedure on page 166-49	sets the `BLOB` from which the rendered contents can be read

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBHandlerList Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandlerList type.

Table 166–4 XDBHandlerList Subprograms

Subprogram	Description
CLEAR Procedure on page 166-14	Clears the handler list
GETFIRST Function on page 166-19	Returns the first handler in the list
GETNAME Function on page 166-27	Returns the next handler in the list
ISNULL Functions on page 166-45	Returns `TRUE` if input argument is `NULL`
REMOVE Procedure on page 166-47	Removes the specified handler from the handler list

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBHandler Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBHandler type.

Table 166–5 XDBHandler Type Subprograms

Subprogram	Description
GETLANGUAGE Function on page 166-22	Returns the implementation language of the handler
GETSCHEMA Function on page 166-40	Returns the schema of the handler's source
GETSOURCE Function on page 166-41	Returns the name of the Java class, PL/SQL package or object type implementing the handler
ISNULL Functions on page 166-45	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBPath Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBPath type.

Table 166–6 XDBPath Type Subprograms

Subprogram	Description
GETNAME Function on page 166-27	Returns the string representation of the path
GETPARENTPATH Function on page 166-37	Returns the parent's path
ISNULL Functions on page 166-45	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

XDBLink Type Subprograms

This subprogram group provides an interface for use in conjunction with the XDBLink type.

Table 166–7 XDBLink Type Subprograms

Subprogram	Description
GETCHILDOID Function on page 166-16	Returns the OID of the resource to which the link is pointing
GETPARENTNAME Function on page 166-35	Returns the link's parent folder's name
GETPARENTOID Function on page 166-36	Returns the link's parent folder's OID
ISNULL Functions on page 166-45	Returns `TRUE` if input argument is `NULL`

The Summary of DBMS_XEVENT Subprograms contains a complete listing of all subprograms in the package.

Summary of DBMS_XEVENT Subprograms

Table 166–8 DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
CLEAR Procedure on page 166-14	Clears the handler list	XDBHandlerList Type Subprograms on page 166-7
GETAPPLICATIONDATA Function on page 166-15	Returns the `<applicationData>` element extracted from the resource configuration that defines the invoking handler	XDBRepositoryEvent Type Subprograms on page 166-6
GETCHILDOID Function on page 166-16	Returns the OID of the resource to which the link is pointing	XDBLink Type Subprograms on page 166-10
GETCURRENTUSER Function on page 166-17	Returns the name of the user executing the operation that triggers the event	XDBEvent Type Subprograms on page 166-5
GETEVENT Function on page 166-18	Returns a value identifying the triggering event	XDBEvent Type Subprograms on page 166-5
GETFIRST Function on page 166-19	Returns the first handler in the list	XDBHandlerList Type Subprograms on page 166-7
GETHANDLERLIST Function on page 166-20	Returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler	XDBRepositoryEvent Type Subprograms on page 166-6
GETINTERFACE Function on page 166-21	Returns the top-level interface used to initiate the operation that triggered the event	XDBRepositoryEvent Type Subprograms on page 166-6
GETLANGUAGE Function on page 166-22	Returns the implementation language of the handler	XDBHandler Type Subprograms on page 166-8
GETLINK Function on page 166-23	Returns an `XDBLink` object for the target resource	XDBRepositoryEvent Type Subprograms on page 166-6
GETLOCK Function on page 166-25	Returns the lock object corresponding to the current operation	XDBRepositoryEvent Type Subprograms on page 166-5
GETNAME Function on page 166-27	Returns the string representation of the path	XDBPath Type Subprograms on page 166-9
GETNAME Function on page 166-27	Returns the next handler in the list	XDBHandlerList Type Subprograms on page 166-7
GETOLDRESOURCE Function on page 166-29	Returns the original `XDBResource` object before the operation was executed	XDBRepositoryEvent Type Subprograms on page 166-5
GETOPENACCESSMODE Function on page 166-30	Returns the access mode for the open operation	XDBRepositoryEvent Type Subprograms on page 166-5

Table 166–8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
GETOPENDENYMODE Function on page 166-31	Returns the deny mode for the open operation	XDBRepositoryEvent Type Subprograms on page 166-5
GETOUTPUTSTREAM Function on page 166-32	Returns the output BLOB in which the handler can write the rendered data	XDBRepositoryEvent Type Subprograms on page 166-5
GETPARAMETER Function on page 166-33	Returns the value of a request or session-specific parameter	XDBRepositoryEvent Type Subprograms on page 166-5
GETPARENT Function on page 166-34	Returns the resource object corresponding to a parent folder of the target resource	XDBRepositoryEvent Type Subprograms on page 166-5
GETPARENTNAME Function on page 166-35	Returns the link's parent folder's name	XDBLink Type Subprograms on page 166-10
GETPARENTOID Function on page 166-36	Returns the link's parent folder's OID	XDBLink Type Subprograms on page 166-10
GETPARENTNAME Function on page 166-35	Returns the parent's path	XDBPath Type Subprograms on page 166-9
GETPATH Function on page 166-38	Returns the `XDBPath` object representing the path of the resource for which the event was fired	XDBRepositoryEvent Type Subprograms on page 166-5
GETRESOURCE Function on page 166-39	Returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource	XDBRepositoryEvent Type Subprograms on page 166-5
GETSCHEMA Function on page 166-40	Returns the schema of the handler's source	XDBHandler Type Subprograms on page 166-8
GETSOURCE Function on page 166-41	Returns the name of the Java class, PL/SQL package or object type implementing the handler	XDBHandler Type Subprograms on page 166-8
GETUPDATEBYTECOUNT Function on page 166-42	If the current operation is a byte-range write, returns the byte count	XDBRepositoryEvent Type Subprograms on page 166-5
GETUPDATEBYTEOFFSET Function on page 166-43	If the current operation is a byte-range write, function returns the byte offset at which the range begins	XDBRepositoryEvent Type Subprograms on page 166-5
GETXDBEVENT Function on page 166-44	Converts an `XDBRepositoryEvent` object to an `XDBEvent` type	XDBRepositoryEvent Type Subprograms on page 166-5

Table 166–8 (Cont.) DBMS_XEVENT Package Subprograms

Subprogram	Description	Group
ISNULL Functions on page 166-45	Returns `TRUE` if input argument is `NULL`	XDBEvent Type Subprograms on page 166-5 XDBRepositoryEvent Type Subprograms on page 166-6 XDBHandlerList Type Subprograms on page 166-7 XDBHandler Type Subprograms on page 166-8 XDBPath Type Subprograms on page 166-9
REMOVE Procedure on page 166-47	Removes the specified handler from the handler list	XDBHandlerList Type Subprograms on page 166-7
SETRENDERPATH Procedure on page 166-48	Specifies the path of the resource that contains the rendered contents	XDBRepositoryEvent Type Subprograms on page 166-5
SETRENDERSTREAM Procedure on page 166-49	sets the `BLOB` from which the rendered contents can be read	XDBRepositoryEvent Type Subprograms on page 166-5

CLEAR Procedure

this procedure clears the handler list.

> **See Also:** XDBHandlerList Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.CLEAR (
    hl       IN OUT   XDBHandlerList);
```

Parameters

Table 166–9 CLEAR Procedure Parameters

Parameter	Description
hl	Handler list

GETAPPLICATIONDATA Function

This function returns the <applicationData> element extracted from the resource configuration that defines the invoking handler.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETAPPLICATIONDATA (
    ev   IN   XDBRepositoryEvent)
  RETURN XMLType;
```

Parameters

Table 166–10 GETAPPLICATIONDATA Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETCHILDOID Function

This function returns the OID of the resource to which the link is pointing.

> **See Also:** XDBLink Type Subprograms on page 166-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCHILDOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 166–11 GETCHILDOID Function Parameters

Parameter	Description
`link`	Link

GETCURRENTUSER Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:** XDBEvent Type Subprograms on page 166-5 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETCURRENTUSER (
    ev   IN   XDBEvent)
  RETURN VARCHAR2;
```

Parameters

Table 166–12 GETCURRENTUSER Function Parameters

Parameter	Description
ev	Event of XDBEvent type

GETEVENT Function

This function returns the name of the user executing the operation that triggers the event.

> **See Also:** XDBEvent Type Subprograms on page 166-5 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETEVENT (
    ev   IN   XDBEvent)
  RETURN XDBEventID;
```

Parameters

Table 166–13 GETEVENT Function Parameters

Parameter	Description
ev	Event of XDBEvent type

GETFIRST Function

This function returns the first handler in the list.

> **See Also:** XDBHandlerList Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETFIRST (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 166–14 GETFIRST Function Parameters

Parameter	Description
hl	Handler list

GETHANDLERLIST Function

This function returns an `XDBHandlerList` object containing the list of handlers that will be executed after the currently executing handler. The current handler can then filter out some of the subsequent handlers if necessary, subject to security checks. An insufficient privilege exception is raised if the executing user does not have the required access privilege to any of the resource configuration associating with a handler in the list.

See Also: XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETHANDLERLIST (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBHandlerList;
```

Parameters

Table 166–15 GETHANDLERLIST Function Parameters

Parameter	Description
`ev`	Event of XDBRepositoryEvent type

GETINTERFACE Function

This function returns the top-level interface used to initiate the operation that triggered the event. This could be HTTP, FTP or SQL.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETINTERFACE (
    ev   IN   XDBRepositoryEvent)
  RETURN VARCHAR2;
```

Parameters

Table 166–16 GETINTERFACE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:** XDBHandler Type Subprograms on page 166-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 166–17 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

GETLINK Function

This function returns an `XDBLink` object for the target resource. For a link* or unlink* event, this will be the link involved in the operation. For other events, an error is returned. Using this object the handler can access link properties, such as, `ParentName`, `ParentOID`, `ChildOID` and `LinkName`.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINK (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLink;
```

Parameters

Table 166–18 GETLINK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLINKNAME Function

This function returns the name of the link.

> **See Also:** XDBLink Type Subprograms on page 166-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLINKNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 166–19 GETLINKNAME Function Parameters

Parameter	Description
`link`	Link

GETLOCK Function

This function returns the lock object corresponding to the current operation.I t is only valid for lock and unlock events.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLOCK  (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBLock;
```

Parameters

Table 166–20 GETLOCK Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETLANGUAGE Function

This function returns the implementation language of the handler.

> **See Also:** XDBHandler Type Subprograms on page 166-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETLANGUAGE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 166–21 GETLANGUAGE Function Parameters

Parameter	Description
handler	Handler

GETNAME Function

This function returns the string representation of the path.

> **See Also:** XDBPath Type Subprograms on page 166-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNAME (
    path   IN   XDBPath)
  RETURN VARCHAR2;
```

Parameters

Table 166–22 GETNAME Function Parameters

Parameter	Description
path	Path

GETNEXT Function

This function returns the next handler in the list.

> **See Also:** XDBHandlerList Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETNEXT (
    hl   IN   XDBHandlerList)
  RETURN XDBHandler;
```

Parameters

Table 166–23 GETNEXT Function Parameters

Parameter	Description
hl	Handler list

GETOLDRESOURCE Function

This function returns the original `XDBResource` object before the operation was executed. This method applies only to update event. For other events, an error is returned. This is a read-only object, and consequently none of the modifier methods will work on this object.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOLDRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 166–24 GETOLDRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETOPENACCESSMODE Function

This function returns the access mode for the open operation.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENACCESSMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 166–25 GETOPENACCESSMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_ACCESS_READ (value 1)
- XDBRepositoryEvent.OPEN_ACCESS_WRITE (value 2)
- XDBRepositoryEvent.OPEN_ACCESS_READ_WRITE (value 3)

GETOPENDENYMODE Function

This function returns the deny mode for the open operation. It is only valid for the open event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOPENDENYMODE (
    ev   IN   XDBRepositoryEvent)
  RETURN PLS_INTEGER;
```

Parameters

Table 166–26 GETOPENDENYMODE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

Return Values

- XDBRepositoryEvent.OPEN_DENY_NONE (value 0)
- XDBRepositoryEvent.OPEN_DENY_READ (value 1)
- XDBRepositoryEvent.OPEN_DENY_READ_WRITE (value 2)

GETOUTPUTSTREAM Function

This function returns the output BLOB in which the handler can write the rendered data. It is only valid for the render event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETOUTPUTSTREAM (
    ev   IN   XDBRepositoryEvent)
  RETURN BLOB;
```

Parameters

Table 166–27 GETOUTPUTSTREAM Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETPARAMETER Function

This function returns the value of a request or session-specific parameter. The definition of the `key` parameter can be found in RFC 2616 (HTTP/1.1). They will be mapped to equivalent SQL session parameters (if any).

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARAMETER (
    ev   IN   XDBRepositoryEvent,
    key  IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 166–28 GETPARAMETER Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type
key	Supported parameters: ■ ACCEPT ■ ACCEPT-LANGUAGE ■ ACCEPT-CHARSET ■ ACCEPT_ENCODING

GETPARENT Function

This function returns the resource object corresponding to a parent folder of the target resource. Note that this could be any folder that contains a link to the target resource. This is a read-only object, and consequently none of the modifier methods will work on this object. For a link* or unlink* event, this method returns the link's parent folder.

See Also: XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 166–29 GETPARENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETPARENTNAME Function

This function returns the link's parent folder's name.

> **See Also:** XDBLink Type Subprograms on page 166-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTNAME (
    link   IN   XDBLink)
  RETURN VARCHAR2;
```

Parameters

Table 166–30 GETPARENTNAME Function Parameters

Parameter	Description
link	Link

GETPARENTOID Function

This function returns the link's parent folder's OID.

> **See Also:** XDBLink Type Subprograms on page 166-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTOID (
    link   IN   XDBLink)
  RETURN RAW;
```

Parameters

Table 166–31 GETPARENTOID Function Parameters

Parameter	Description
`link`	Link

GETPARENTPATH Function

This function returns the parent's path. The level indicates the number of levels up the hierarchy. This value must be greater than zero. Level 1 means the immediate parent. If level exceeds the height of the tree then a NULL is returned.

> **See Also:** XDBPath Type Subprograms on page 166-9 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPARENTPATH (
    path   IN   XDBPath,
   level   IN   INTEGER)
  RETURN XDBPath;
```

Parameters

Table 166–32 GETPARENTPATH Function Parameters

Parameter	Description
path	Path
level	Number of levels up the hierarchy

GETPATH Function

This function returns the `XDBPath` object representing the path of the resource for which the event was fired. From this object, functions are provided to get the different path segments.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETPATH (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBPath;
```

Parameters

Table 166–33 GETPATH Function Parameters

Parameter	Description
`ev`	Event of XDBRepositoryEvent type

GETRESOURCE Function

This function returns an `XDBResource` object that provides methods to access and modify the contents and metadata of the target resource. This object reflects any changes made by previous handlers to the resource.

The modifier methods will work only in the pre-create and pre-update event handlers. For a link* or unlink* event, this method returns the resource that the link is pointing to. For a create event, this method returns the resource that is being created.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETRESOURCE (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBResource;
```

Parameters

Table 166–34 GETRESOURCE Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETSCHEMA Function

This function returns the schema of the handler's source.

> **See Also:** XDBHandler Type Subprograms on page 166-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSCHEMA (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 166–35 GETSCHEMA Function Parameters

Parameter	Description
handler	Handler

GETSOURCE Function

This function returns the name of the Java class, PL/SQL package or object type implementing the handler.

> **See Also:** XDBHandler Type Subprograms on page 166-8 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETSOURCE (
    handler   IN   XDBHandler)
  RETURN VARCHAR2;
```

Parameters

Table 166–36 GETSOURCE Function Parameters

Parameter	Description
handler	Handler

GETUPDATEBYTECOUNT Function

If the current operation is a byte-range write, the function returns the byte count. It is only valid for the inconsistent-update event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTECOUNT (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 166–37 GETUPDATEBYTECOUNT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETUPDATEBYTEOFFSET Function

If the current operation is a byte-range write, function returns the byte offset at which the range begins. It is only valid for the inconsistent-update event.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETUPDATEBYTEOFFSET (
    ev   IN   XDBRepositoryEvent)
  RETURN NUMBER;
```

Parameters

Table 166–38 GETUPDATEBYTEOFFSET Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

GETXDBEVENT Function

This function converts an `XDBRepositoryEvent` object to an `XDBEvent` type.

> **See Also:** XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.GETXDBETEVENT (
    ev   IN   XDBRepositoryEvent)
  RETURN XDBEvent;
```

Parameters

Table 166–39 GETXDBEVENT Function Parameters

Parameter	Description
ev	Event of XDBRepositoryEvent type

ISNULL Functions

This function returns `TRUE` if input argument is `NULL`.

See Also:

- XDBEvent Type Subprograms on page 166-5 for other subprograms in this group
- XDBRepositoryEvent Type Subprograms on page 166-6 for other subprograms in this group

- XDBPath Type Subprograms on page 166-9 for other subprograms in this group
- XDBLink Type Subprograms on page 166-10 for other subprograms in this group

Syntax

```
DBMS_XEVENT.ISNULL (
    ev          IN   XDBEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    ev          IN   XDBRepositoryEvent)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    hl          IN   XDBHandlerList)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    handler     IN   XDBHandler)
  RETURN BOOLEAN;
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    path        IN   XDBPath)
  RETURN BOOLEAN;

DBMS_XEVENT.ISNULL (
    link        IN   XDBLink)
  RETURN BOOLEAN;
```

Parameters

Table 166–40 ISNULL Function Parameters

Parameter	Description
`ev`	Event of specified type
`hl`	Handler list
`handler`	Handler

Table 166–40 (Cont.) ISNULL Function Parameters

Parameter	Description
`path`	Path

REMOVE Procedure

This procedure removes the specified handler from the handler list.

> **See Also:** XDBHandlerList Type Subprograms on page 166-6 for other subprograms in this group

Syntax

```
DBMS_XEVENT.REMOVE (
    hl       IN OUT   XDBHandlerList,
    handler  IN       XDBHandler);
```

Parameters

Table 166–41 REMOVE Procedure Parameters

Parameter	Description
`hl`	Handler list
`handler`	Handler

SETRENDERPATH Procedure

This procedure specifies the path of the resource that contains the rendered contents. This should not be called after the stream returned by GETOUTPUTSTREAM Function is written to or after the SETRENDERSTREAM Procedure is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERPATH (
    ev     IN   XDBRepositoryEvent,
    path   IN   VARCHAR2);
```

Parameters

Table 166–42 SETRENDERPATH Procedure Parameters

Parameter	Description
ev	XDB Repository Event object
path	Path of the resource containing the rendered contents

SETRENDERSTREAM Procedure

This procedure sets the BLOB from which the rendered contents can be read. This should not be called after the stream returned by GETOUTPUTSTREAM is written to or after SETRENDERPATH is called; doing so will result in an error. This is only valid for the render event.

Syntax

```
DBMS_XEVENT.SETRENDERSTREAM (
    ev    IN   XDBRepositoryEvent,
    istr  IN   BLOB);
```

Parameters

Table 166–43 SETRENDERSTREAM Procedure Parameters

Parameter	Description
ev	XDBRepositoryEvent object
istr	Input stream from which to get the rendered contents

167

DBMS_XMLDOM

The DBMS_XMLDOM package is used to access XMLType objects, and implements the Document Object Model (DOM), an application programming interface for HTML and XML documents.

> **See Also:** *Oracle XML Developer's Kit Programmer's Guide*

This chapter contains the following topics:

- Using DBMS_XMLDOM
  - Overview
  - Constants
  - Types
  - Exceptions
- Subprogram Groups
  - DOMNode Subprograms
  - DOMAttr Subprograms
  - DOMCDataSection Subprograms

- Summary of DBMS_XMLDOM Subprograms

Using DBMS_XMLDOM

- Overview
- Constants
- Types
- Exceptions
- Subprogram Groups

Overview

The Document Object Model (DOM) is an application programming interface (API) for HTML and XML documents. It defines the logical structure of documents, and the manner in which they are accessed and manipulated. In the DOM specification, the term "document" is used in the broad sense. XML is being increasingly used to represent many different kinds of information that may be stored in diverse systems. This information has been traditionally be seen as "data"; nevertheless, XML presents this data as documents, and the `DBMS_XMLDOM` package allows you access to both schema-based and non schema-based documents.

Note:

- Before database startup, the read-from and write-to directories in the `init.ORA` file must be specified; for example: `UTL_FILE_DIR=/mypath/insidemypath`.
- Read-from and write-to files must be on the server file system.

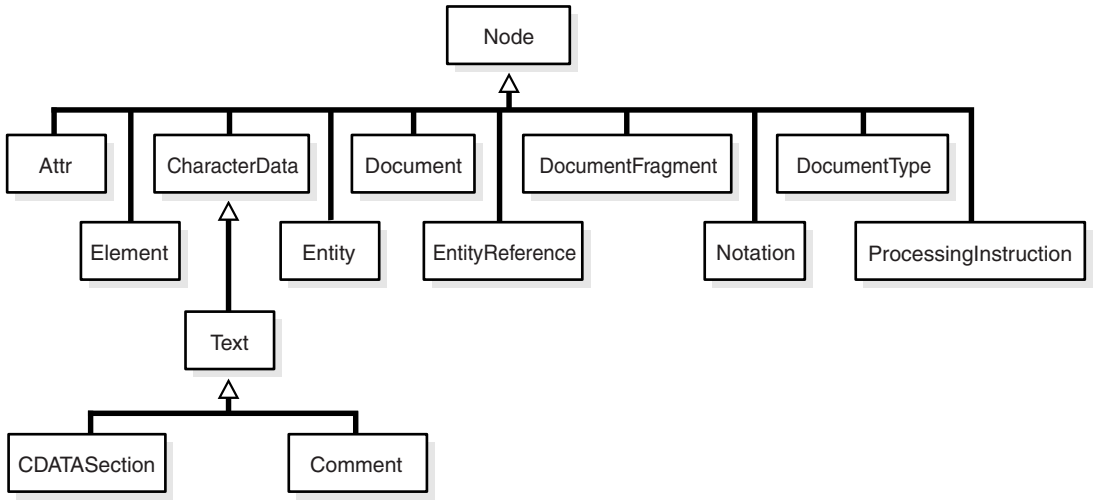
With DOM, anything found in an HTML or XML document can be accessed, changed, deleted, or added using the Document Object Model, with a few exceptions. In particular, the DOM interfaces for the XML internal and external subsets have not yet been specified.

One important objective of the W3C DOM specification is to provide a standard programming interface that can be used in a wide variety of environments, programming languages, and applications. Because the DOM standard is object-oriented while PL/SQL is essentially a procedural language, some changes had to be made:

- Various DOM interfaces such as `Node`, `Element`, and others have equivalent PL/SQL types `DOMNode`, `DOMElement`, respectively.
- Various `DOMException` codes such as `WRONG_DOCUMENT_ERR`, `HIERARCHY_REQUEST_ERR`, and others, have similarly named PL/SQL exceptions.
- Various DOM Node type codes such as `ELEMENT_NODE`, `ATTRIBUTE_NODE`, and others, have similarly named PL/SQL constants.
- Subprograms defined on a DOM type become functions or procedures that accept it as a parameter. For example, to perform APPENDCHILD Function on a `DOMNode n`, the APPENDCHILD FunctionPL/SQL function on page 167-40 is provided.
- To perform `setAttribute` on a `DOMElement elem`SETATTRIBUTE Procedures, use PL/SQL procedure on page 167-139.

DOM defines an inheritance hierarchy. For example, `Document`, `Element`, and `Attr` are defined to be subtypes of `Node` (see Figure 167–1). Thus, a method defined in the `Node` interface should be available in these as well. Since such inheritance is not supported in PL/SQL, it is implemented through direct invocation of the `MAKENODE` function. Calling `MAKENODE` on various DOM types converts these types into a `DOMNode`. The appropriate functions or procedures that accept `DOMNodes` can then be called to operate on these types. If, subsequently, type specific functionality is desired, the `DOMNode` can be converted back into the original type by the `make`*`XXX`* functions, where `DOM`*`XXX`* is the desired DOM type.

Figure 167–1 Inheritance Diagram for DOM Types



This is a text description of arpls010.gif. This figure provides a graphical representation of inheritance-type relationship between DOM types; methods defined on the supertype should be available on the subtype. Description of the inheritance structure follows:

1. Attr, CharacterData, Document, DocumentFragment, DocumentType, Element, Entity, EntityReference, Notation, and ProcessingInstruction are all subtypes of Node
2. Text is a subtype of CharacterData
3. CDATASection and Comment are subtypes of Text

****

The implementation of this interface follows the REC-DOM-Level-1-19981001.

Constants

Defined constants of DBMS_XMLDOM are listed in Table 167–1.

Table 167–1 Defined Constants for DBMS_XMLDOM

Constant	Type	Value	Description
ELEMENT_NODE	PLS_INTEGER	1	The Node is an Element.
ATTRIBUTE_NODE	PLS_INTEGER	2	The Node is an Attribute.
TEXT_NODE	PLS_INTEGER	3	The Node is a Text node.
CDATA_SECTION_NODE	PLS_INTEGER	4	The Node is a CDataSection.
ENTITY_REFERENCE_NODE	PLS_INTEGER	5	The Node is an Entity Reference.
ENTITY_NODE	PLS_INTEGER	6	The Node is an Entity.
PROCESSING_INSTRUCTION_NODE	PLS_INTEGER	7	The Node is a Processing Instruction.
COMMENT_NODE	PLS_INTEGER	8	The Node is a Comment.
DOCUMENT_NODE	PLS_INTEGER	9	The Node is a Document.
DOCUMENT_TYPE_NODE	PLS_INTEGER	10	The Node is a Document Type Definition.
DOCUMENT_FRAGMENT_NODE	PLS_INTEGER	11	The Node is a Document fragment.
NOTATION_NODE	PLS_INTEGER	12	The Node is a Notation.

Types

The following types for DBMS_XMLDOM.DOMTYPE are defined in Table 167–2:

Table 167–2 XDB_XMLDOM Types

Type	Description
DOMATTR	Implements the DOM Attribute interface.
DOMCDATASECTION	Implements the DOM CDataSection interface.
DOMCHARACTERDATA	Implements the DOM Character Data interface.
DOMCOMMENT	Implements the DOM Comment interface.
DOMDOCUMENT	Implements the DOM Document interface.
DOMDOCUMENTFRAGMENT	Implements the DOM DocumentFragment interface.
DOMDOCUMENTTYPE	Implements the DOM Document Type interface.
DOMELEMENT	Implements the DOM Element interface.
DOMENTITY	Implements the DOM Entity interface.
DOMENTITYREFERENCE	Implements the DOM EntityReference interface.
DOMIMPLEMENTATION	Implements the DOM Implementation interface.
DOMNAMEDNODEMAP	Implements the DOM Named Node Map interface.
DOMNODE	Implements the DOM Node interface.
DOMNODELIST	Implements the DOM NodeList interface.
DOMNOTATION	Implements the DOM Notation interface.
DOMPROCESSINGINSTRUCTION	Implements the DOM Processing instruction interface.
DOMTEXT	Implements the DOM Text interface.

Exceptions

The exceptions listed in Table 167–3 are defined for DBMS_XMLDOM:

Table 167–3 Exceptions for DBMS_XMLDOM

Exception	Description
DOMSTRING_SIZE_ERR	If the specified range of text does not fit into a DOMString.
HIERARCHY_REQUEST_ERR	If any node is inserted somewhere it doesn't belong.
INDEX_SIZE_ERR	If index or size is negative, or greater than the allowed value.
INUSE_ATTRIBUTE_ERR	If an attempt is made to add an attribute that is already in use elsewhere.
INVALID_CHARACTER_ERR	If an invalid or illegal character is specified, such as in a name. See production 2 in the XML specification for the definition of a legal character, and production 5 for the definition of a legal name character.
NO_DATA_ALLOWED_ERROR	If data is specified for a node that does not support data.
NOT_FOUND_ERR	If an attempt is made to reference a node in a context where it does not exist.
NO_MODIFICATION_ALLOWED_ERR	If an attempt is made to modify an object where modifications are not allowed.
NOT_SUPPORTED_ERR	If the implementation does not support the requested type of object or operation.
WRONG_DOCUMENT_ERR	If a node is used in a different document than the one that created it (that doesn't support it).

Subprogram Groups

DBMS_XMLDOM subprograms are divided into groups according to W3C Interfaces.

- DOMNode Subprograms on page 167-10
- DOMAttr Subprograms on page 167-12
- DOMCDataSection Subprograms on page 167-13
- DOMCharacterData Subprograms on page 167-14
- DOMComment Subprograms on page 167-15
- DOMDocument Subprograms on page 167-16
- DOMDocumentFragment Subprograms on page 167-18
- DOMDocumentType Subprograms on page 167-19
- DOMElement Subprograms on page 167-20
- DOMEntity Subprograms on page 167-21
- DOMEntityReference Subprograms on page 167-22
- DOMImplementation Subprograms on page 167-23
- DOMNamedNodeMap Subprograms on page 167-24
- DOMNodeList Subprograms on page 167-25
- DOMNotation Subprograms on page 167-26
- DOMProcessingInstruction Subprograms on page 167-27
- DOMText Subprograms on page 167-28

DOMNode Subprograms

Table 167–4 Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
ADOPTNODE Function on page 167-39	Adopts a node from another document
APPENDCHILD Function on page 167-40	Appends a new child to the node
CLONENODE Function on page 167-42	Clones the node
FREENODE Procedure on page 167-58	Frees all resources associated with the node
GETATTRIBUTES Function on page 167-62	Retrieves the attributes of the node
GETCHILDNODES Function on page 167-63	Retrieves the children of the node
GETEXPANDEDNAME Procedure and Functions on page 167-70	Retrieves the expanded name of the node
GETFIRSTCHILD Function on page 167-71	Retrieves the first child of the node
GETLASTCHILD Function on page 167-73	Retrieves the last child of the node
GETLOCALNAME Procedure and Functions on page 167-75	Retrieves the local part of the qualified name
GETNAMESPACE Procedure and Functions on page 167-78	Retrieves the node's namespace URI
GETNEXTSIBLING Function on page 167-79	Retrieves the next sibling of the node
GETNODENAME Function on page 167-81	Retrieves the Name of the Node
GETNODETYPE Function on page 167-80	Retrieves the Type of the node
GETNODEVALUE Function on page 167-82	Retrieves the Value of the Node
GETNODEVALUEASBINARYSTREAM Function & Procedure on page 167-83	Retrieves Node Value as binary stream
GETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 167-84	Retrieves Node Value as character stream
GETOWNERDOCUMENT Function on page 167-88	Retrieves the owner document of the node
GETPARENTNODE Function on page 167-90	Retrieves the parent of this node
GETPREFIX Function on page 167-91	Retrieves the namespace prefix
GETPREVIOUSSIBLING Function on page 167-92	Retrieves the previous sibling of the node
GETSCHEMANODE Function on page 167-95	Retrieves the associated schema URI
HASATTRIBUTES Function on page 167-104	Tests if the node has attributes
HASCHILDNODES Function on page 167-105	Tests if the node has child nodes
IMPORTNODE Function on page 167-107	Imports a node from another document
INSERTBEFORE Function on page 167-108	Inserts a child before the reference child
ISNULL Functions on page 167-110	Tests if the node is `NULL`
MAKEATTR Function on page 167-114	Casts the node to an Attribute
MAKECDATASECTION Function on page 167-115	Casts the node to a CData Section

Table 167–4 (Cont.) Summary of DOMNode Subprograms; DBMS_XMLDOM

Subprogram	Description
MAKECHARACTERDATA Function on page 167-116	Casts the node to Character Data
MAKECOMMENT Function on page 167-117	Casts the node to a Comment
MAKEDOCUMENT Function on page 167-118	Casts the node to a DOM Document
MAKEDOCUMENTFRAGMENT Function on page 167-119	Casts the node to a DOM Document Fragment
MAKEDOCUMENTTYPE Function on page 167-120	Casts the node to a DOM Document Type
MAKEELEMENT Function on page 167-121	Casts the node to a DOM Element
MAKEENTITY Function on page 167-122	Casts the node to a DOM Entity
MAKEENTITYREFERENCE Function on page 167-123	Casts the node to a DOM Entity Reference
MAKENOTATION Function on page 167-127	Casts the node to a DOM Notation
MAKEPROCESSINGINSTRUCTION Function on page 167-128	Casts the node to a DOM Processing Instruction
MAKETEXT Function on page 167-129	Casts the node to a DOM Text
REMOVECHILD Function on page 167-134	Removes a specified child from a node
REPLACECHILD Function on page 167-136	Replaces the old child with a new child
SETNODEVALUE Procedure on page 167-144	Sets the Value of the node
SETNODEVALUEASBINARYSTREAM Function & Procedure on page 167-145	Sets the Node Value as binary stream
SETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 167-146	Sets the Node Value as a character stream
SETPREFIX Procedure on page 167-147	Sets the namespace prefix
USEBINARYSTREAM Function on page 167-153	Establishes that the stream is valid
WRITETOBUFFER Procedures on page 167-154	Writes the contents of the node to a buffer
WRITETOCLOB Procedures on page 167-155	Writes the contents of the node to a `CLOB`
WRITETOFILE Procedures on page 167-156	Writes the contents of the node to a file

DOMAttr Subprograms

Table 167–5 Summary of DOMAttr Subprograms; DBMS_XMLDOM

Method	Description
GETEXPANDEDNAME Procedure and Functions on page 167-70	Retrieves the expanded name of the attribute
GETLOCALNAME Procedure and Functions on page 167-75	Retrieves the local name of the attribute
GETNAME Functions on page 167-76	Retrieves the name of the attribute
GETNAMESPACE Procedure and Functions on page 167-78	Retrieves the NS URI of the attribute
GETOWNERELEMENT Function on page 167-89	Retrieves the Element node, parent of the attribute
GETQUALIFIEDNAME Functions on page 167-94	Retrieves the Qualified Name of the attribute
GETSPECIFIED Function on page 167-96	Tests if attribute was specified in the element
GETVALUE Function on page 167-100	Retrieves the value of the attribute
ISNULL Functions on page 167-110	Tests if the Attribute node is `NULL`
MAKENODE Functions on page 167-124	Casts the Attribute to a node
SETVALUE Procedure on page 167-149	Sets the value of the attribute

DOMCDataSection Subprograms

Table 167–6 Summary of DOMCdata Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 167-110	Tests if the `CDataSection` is `NULL`
MAKENODE Functions on page 167-124	Casts the `CDatasection` to a node

DOMCharacterData Subprograms

Table 167–7 Summary of DOMCharacterData Subprograms; DBMS_XMLDOM

Method	Description
APPENDDATA Procedure on page 167-41	Appends the specified data to the node data
DELETEDATA Procedure on page 167-52	Deletes the data from the specified offSets
GETDATA Functions on page 167-65	Retrieves the data of the node
GETLENGTH Functions on page 167-74	Retrieves the length of the data
INSERTDATA Procedure on page 167-109	Inserts the data in the node at the specified offSets
ISNULL Functions on page 167-110	Tests if the CharacterData is `NULL`
MAKENODE Functions on page 167-124	Casts the CharacterData to a node
REPLACEDATA Procedure on page 167-137	Changes a range of characters in the node
SETDATA Procedures on page 167-141	Sets the data to the node
SUBSTRINGDATA Function on page 167-152	Retrieves the substring of the data

DOMComment Subprograms

Table 167–8 Summary of DOMComment Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 167-110	Tests if the comment is `NULL`
MAKENODE Functions on page 167-124	Casts the Comment to a node

DOMDocument Subprograms

Table 167–9 Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
CREATEATTRIBUTE Functions on page 167-43	Creates an Attribute
CREATECDATASECTION Function on page 167-44	Creates a `CDataSection` node
CREATECOMMENT Function on page 167-45	Creates a Comment node
CREATEDOCUMENT Function on page 167-46	Creates a new Document
CREATEDOCUMENTFRAGMENT Function on page 167-47	Creates a new Document Fragment
CREATEELEMENT Functions on page 167-48	Creates a new Element
CREATEENTITYREFERENCE Function on page 167-49	Creates an Entity reference
CREATEPROCESSINGINSTRUCTION Function on page 167-50	Creates a Processing Instruction
CREATETEXTNODE Function on page 167-51	Creates a Text node
FREEDOCFRAG Procedure on page 167-55	Frees the document fragment
FREEDOCUMENT Procedure on page 167-56	Frees the document
GETDOCTYPE Function on page 167-66	Retrieves the DTD of the document
GETDOCUMENTELEMENT Function on page 167-67	Retrieves the root element of the document
GETELEMENTSBYTAGNAME Functions on page 167-68	Retrieves ▪ the elements in the DOMNODEIIST by tag name ▪ elements in the subtree of a DOMNODELIST by tagname
GETIMPLEMENTATION Function on page 167-72	Retrieves the DOM implementation
GETSTANDALONE Function on page 167-97	Retrieves the standalone property of the document
GETVERSION Function on page 167-101	Retrieves the version of the document
GETXMLTYPE Function on page 167-102	Retrieves the `XMLType` associated with the DOM Document
ISNULL Functions on page 167-110	Tests if the document is `NULL`
MAKENODE Functions on page 167-124	Casts the document to a node
NEWDOMDOCUMENT Functions on page 167-130	Creates a new document
SETDOCTYPE Procedure on page 167-142	Sets the DTD of the document
SETSTANDALONE Procedure on page 167-148	Sets the standalone property of the document
SETVERSION Procedure on page 167-150	Sets the version of the document

Table 167–9 (Cont.) Summary of DOMDocument Subprograms; DBMS_XMLDOM

Method	Description
WRITETOBUFFER Procedures on page 167-154	Writes the document to a buffer
WRITETOCLOB Procedures on page 167-155	Writes the document to a `CLOB`
WRITETOFILE Procedures on page 167-156	Writes the document to a file

DOMDocumentFragment Subprograms

Table 167–10 Summary of DOMDocumentFragment Subprograms; DBMS_XMLDOM

Method	Description
FREEDOCFRAG Procedure on page 167-55	Frees the specified document fragment
ISNULL Functions on page 167-110	Tests if the DocumentFragment is `NULL`
MAKENODE Functions on page 167-124	Casts the Document Fragment to a node
WRITETOBUFFER Procedures on page 167-154	Writes the contents of a document fragment into a buffer

DOMDocumentType Subprograms

Table 167–11 Summary of DOMDocumentType Subprograms; DBMS_XMLDOM

Method	Description
FINDENTITY Function on page 167-53	Finds the specified entity in the document type
FINDNOTATION Function on page 167-54	Finds the specified notation in the document type
GETENTITIES Function on page 167-69	Retrieves the nodemap of entities in the Document type
GETNAME Functions on page 167-76	Retrieves the name of the Document type
GETNOTATIONS Function on page 167-86	Retrieves the nodemap of the notations in the Document type
GETPUBLICID Functions on page 167-93	Retrieves the public ID of the document type
GETSYSTEMID Functions on page 167-98	Retrieves the system ID of the document type
ISNULL Functions on page 167-110	Tests if the Document Type is `NULL`
MAKENODE Functions on page 167-124	Casts the document type to a node

DOMElement Subprograms

Table 167–12 Summary of DOMElement Subprograms; DBMS_XMLDOM

Method	Description
FREEELEMENT Procedure on page 167-57	Frees memory allocated to a DOMElement handle
GETATTRIBUTE Functions on page 167-60	Retrieves the attribute node by name
GETATTRIBUTENODE Functions on page 167-61	Retrieves the attribute node by name
GETCHILDRENBYTAGNAME Functions on page 167-64	Retrieves children of the element by tag name
GETELEMENTSBYTAGNAME Functions on page 167-68	Retrieves ■ the elements in the DOMNODEllST by tag name ■ elements in the subtree of a DOMNODELIST by tagname
GETEXPANDEDNAME Procedure and Functions on page 167-70	Retrieves the expanded name of the element
GETLOCALNAME Procedure and Functions on page 167-75	Retrieves the local name of the element
GETNAMESPACE Procedure and Functions on page 167-78	Retrieves the NS URI of the element
GETQUALIFIEDNAME Functions on page 167-94	Retrieves the qualified name of the element
GETTAGNAME Function on page 167-99	Retrieves the Tag name of the element
HASATTRIBUTE Functions on page 167-103	Tests if an attribute exists
ISNULL Functions on page 167-110	Tests if the Element is `NULL`
MAKENODE Functions on page 167-124	Casts the Element to a node
NORMALIZE Procedure on page 167-131	Normalizes the text children of the element
REMOVEATTRIBUTE Procedures on page 167-132	Removes the attribute specified by the name
REMOVEATTRIBUTENODE Function on page 167-133	Removes the attribute node in the element
RESOLVENAMESPACEPREFIX Function on page 167-138	Resolve the prefix to a namespace URI
SETATTRIBUTE Procedures on page 167-139	Sets the attribute specified by the name
SETATTRIBUTENODE Functions on page 167-140	Sets the attribute node in the element

DOMEntity Subprograms

Table 167–13 Summary of DOMEntity Subprograms; DBMS_XMLDOM

Method	Description
GETNOTATIONNAME Function on page 167-85	Retrieves the notation name of the entity
GETPUBLICID Functions on page 167-93	Retrieves the public Id of the entity
GETSYSTEMID Functions on page 167-98	Retrieves the system Id of the entity
ISNULL Functions on page 167-110	Tests if the Entity is `NULL`
MAKENODE Functions on page 167-124	Casts the Entity to a node

DOMEntityReference Subprograms

Table 167–14 Summary of DOMEntityReference Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 167-110	Tests if the `DOMEntityReference` is `NULL`
MAKENODE Functions on page 167-124	Casts the `DOMEntityReference` to `NULL`

DOMImplementation Subprograms

Table 167–15 Summary of DOMImplementation Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 167-110	Tests if the `DOMImplementation` node is `NULL`
HASFEATURE Function on page 167-106	Tests if the `DOMImplementation` implements a feature

DOMNamedNodeMap Subprograms

Table 167–16 Summary of DOMNamedNodeMap Subprograms; DBMS_XMLDOM

Method	Description
GETLENGTH Functions on page 167-74	Retrieves the number of items in the map
GETNAMEDITEM Function on page 167-77	Retrieves the item specified by the name
ISNULL Functions on page 167-110	Tests if the `NamedNodeMap` is `NULL`
ITEM Functions on page 167-113	Retrieves the item given the index in the map
REMOVENAMEDITEM Function on page 167-135	Removes the item specified by name
SETNAMEDITEM Function on page 167-143	Sets the item in the map specified by the name

DOMNodeList Subprograms

Table 167–17 Summary of DOMNodeList Subprograms; DBMS_XMLDOM

Method	Description
FREENODELIST Procedure on page 167-59	Frees all resources associated with a nodelist
GETLENGTH Functions on page 167-74	Retrieves the number of items in the list
ISNULL Functions on page 167-110	Tests if the `NodeList` is `NULL`
ITEM Functions on page 167-113	Retrieves the item given the index in the list

DOMNotation Subprograms

Table 167–18 Summary of DOMNotation Subprograms; DBMS_XMLDOM

Method	Description
GETPUBLICID Functions on page 167-93	Retrieves the public Id of the notation
GETSYSTEMID Functions on page 167-98	Retrieves the system Id of the notation
ISNULL Functions on page 167-110	Tests if the Notation is `NULL`
MAKENODE Functions on page 167-124	Casts the notation to a node

DOMProcessingInstruction Subprograms

Table 167–19 Summary of DOMProcessingInstruction Subprograms; DBMS_XMLDOM

Method	Description
GETDATA Functions on page 167-65	Retrieves the data of the processing instruction
GETTARGET Function on page 167-87	Retrieves the target of the processing instruction
ISNULL Functions on page 167-110	Tests if the Processing Instruction is `NULL`
MAKENODE Functions on page 167-124	Casts the Processing Instruction to a node
SETDATA Procedures on page 167-141	Sets the data of the processing instruction

DOMText Subprograms

Table 167–20 Summary of DOMText Subprograms; DBMS_XMLDOM

Method	Description
ISNULL Functions on page 167-110	Tests if the text is `NULL`
MAKENODE Functions on page 167-124	Casts the text to a node
SPLITTEXT Function on page 167-151	Splits the contents of the text node into 2 text nodes

Summary of DBMS_XMLDOM Subprograms

Table 167–21 Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ADOPTNODE Function on page 167-39	Adopts a node from another document	DOMNode Subprograms on page 167-10
APPENDCHILD Function on page 167-40	Appends a new child to the node	DOMNode Subprograms on page 167-10
APPENDDATA Procedure on page 167-41	Appends the specified data to the node data	DOMCharacterData Subprograms on page 167-14
CLONENODE Function on page 167-42	Clones the node	DOMNode Subprograms on page 167-10
CREATEATTRIBUTE Functions on page 167-43	Creates an Attribute	DOMDocument Subprograms on page 167-16
CREATECDATASECTION Function on page 167-44	Creates a `CDataSection` node	DOMDocument Subprograms on page 167-16
CREATECOMMENT Function on page 167-45	Creates a Comment node	DOMDocument Subprograms on page 167-16
CREATEDOCUMENT Function on page 167-46	Creates a new Document	DOMDocument Subprograms on page 167-16
CREATEDOCUMENTFRAGMENT Function on page 167-47	Creates a new Document Fragment	DOMDocument Subprograms on page 167-16
CREATEELEMENT Functions on page 167-48	Creates a new Element	DOMDocument Subprograms on page 167-16
CREATEENTITYREFERENCE Function on page 167-49	Creates an Entity reference	DOMDocument Subprograms on page 167-16
CREATEPROCESSINGINSTRUCTION Function on page 167-50	Creates a Processing Instruction	DOMDocument Subprograms on page 167-16
CREATETEXTNODE Function on page 167-51	Creates a Text node	DOMDocument Subprograms on page 167-16
DELETEDATA Procedure on page 167-52	Deletes the data from the specified offSets	DOMCharacterData Subprograms on page 167-14
FINDENTITY Function on page 167-53	Finds the specified entity in the document type	DOMDocumentType Subprograms on page 167-19
FINDNOTATION Function on page 167-54	Finds the specified notation in the document type	DOMDocumentType Subprograms on page 167-19

Table 167–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
FREEDOCFRAG Procedure on page 167-55	Frees the document fragment	DOMDocument Subprograms on page 167-16 and DOMDocumentFragment Subprograms on page 167-18
FREEDOCUMENT Procedure on page 167-56	Frees the document	DOMDocument Subprograms on page 167-16
FREEELEMENT Procedure on page 167-57	Frees memory allocated to a DOMElement handle	DOMElement Subprograms on page 167-20
FREENODE Procedure on page 167-58	Frees all resources associated with the node	DOMNode Subprograms on page 167-10
FREENODELIST Procedure on page 167-59	Frees all resources associated with a nodelist	DOMNodeList Subprograms on page 167-25
GETATTRIBUTE Functions on page 167-60	Retrieves the attribute node by name	DOMElement Subprograms on page 167-20
GETATTRIBUTENODE Functions on page 167-61	Retrieves the attribute node by name	DOMElement Subprograms on page 167-20
GETATTRIBUTES Function on page 167-62	Retrieves the attributes of the node	DOMNode Subprograms on page 167-10
GETCHILDNODES Function on page 167-63	Retrieves the children of the node	DOMNode Subprograms on page 167-10
GETCHILDRENBYTAGNAME Functions on page 167-64	Retrieves children of the element by tag name	DOMCharacterData Subprograms on page 167-14
GETDATA Functions on page 167-65	Retrieves ▪ the data of the node ▪ the data of the processing instruction	▪ DOMCharacterData Subprograms on page 167-14 ▪ DOMProcessingInstruction Subprograms on page 167-27
GETDOCTYPE Function on page 167-66	Retrieves the DTD of the document	DOMDocument Subprograms on page 167-16
GETDOCUMENTELEMENT Function on page 167-67	Retrieves the root element of the document	DOMDocument Subprograms on page 167-16
GETELEMENTSBYTAGNAME Functions on page 167-68	Retrieves ▪ the elements in the DOMNODELIST by tag name ▪ elements in the subtree of a DOMNODELIST by tagname	▪ DOMDocument Subprograms on page 167-16 ▪ DOMElement Subprograms on page 167-20

Table 167–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETENTITIES Function on page 167-69	Retrieves the nodemap of entities in the Document type	DOMDocumentType Subprograms on page 167-19
GETEXPANDEDNAME Procedure and Functions on page 167-70	Retrieves ▪ the expanded name of the node ▪ the expanded name of the attribute ▪ the expanded name of the element	▪ DOMNode Subprograms on page 167-10 ▪ DOMAttr Subprograms on page 167-12 ▪ DOMElement Subprograms on page 167-20
GETFIRSTCHILD Function on page 167-71	Retrieves the first child of the node	DOMNode Subprograms on page 167-10
GETIMPLEMENTATION Function on page 167-72	Retrieves the DOM implementation	DOMDocument Subprograms on page 167-16
GETLASTCHILD Function on page 167-73	Retrieves the last child of the node	DOMNode Subprograms on page 167-10
GETLENGTH Functions on page 167-74	Retrieves ▪ the length of the data ▪ the number of items in the map ▪ the number of items in the list	▪ DOMCharacterData Subprograms on page 167-14 ▪ DOMNamedNodeMap ubprograms on page 167-24 ▪ DOMNodeList Subprograms on page 167-25
GETLOCALNAME Procedure and Functions on page 167-75	Retrieves ▪ the local part of the qualified name ▪ the local name of the attribute ▪ the local name of the element	▪ DOMNode Subprograms on page 167-10 ▪ DOMAttr Subprograms on page 167-12 ▪ DOMElement Subprograms on page 167-20
GETNAME Functions on page 167-76	Retrieves ▪ the name of the attribute ▪ the name of the Document type	▪ DOMAttr Subprograms on page 167-12 ▪ DOMDocumentType Subprograms on page 167-19
GETNAMEDITEM Function on page 167-77	Retrieves ▪ an item specified by name ▪ and namespace URI on page 167-24)	▪ DOMNamedNodeMap ubprograms on page 167-24 ▪ DOMNamedNodeMap ubprograms

Table 167–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETNAMESPACE Procedure and Functions on page 167-78	Retrieves ■ the node's namespace URI ■ the NS URI of the attribute ■ the NS URI of the element	■ DOMNode Subprograms on page 167-10 ■ DOMAttr Subprograms on page 167-12 ■ DOMElement Subprograms on page 167-20
GETNEXTSIBLING Function on page 167-79	Retrieves the next sibling of the node	DOMNode Subprograms on page 167-10
GETNODENAME Function on page 167-81	Retrieves the Name of the Node	DOMNode Subprograms on page 167-10
GETNODETYPE Function on page 167-80	Retrieves the Type of the node	DOMNode Subprograms on page 167-10
GETNODEVALUE Function on page 167-82	Retrieves the Value of the Node	DOMNode Subprograms on page 167-10
GETNODEVALUEASBINARYSTREAM Function & Procedure on page 167-83	Retrieves the Node Value as binary stream	DOMNode Subprograms on page 167-10
GETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 167-84	Retrieves the Node Value as character stream	DOMNode Subprograms on page 167-10
GETNOTATIONNAME Function on page 167-85	Retrieves the notation name of the entity	DOMEntity Subprograms on page 167-21
GETNOTATIONS Function on page 167-86	Retrieves the nodemap of the notations in the Document type	DOMDocumentType Subprograms on page 167-19
GETTARGET Function on page 167-87	Retrieves the target of the processing instruction	DOMProcessingInstruction Subprograms on page 167-27
GETOWNERDOCUMENT Function on page 167-88	Retrieves the owner document of the node	DOMNode Subprograms on page 167-10
GETOWNERELEMENT Function on page 167-89	Retrieves the Element node, parent of the attribute	DOMAttr Subprograms on page 167-12
GETPARENTNODE Function on page 167-90	Retrieves the parent of this node	DOMNode Subprograms on page 167-10
GETPREFIX Function on page 167-91	Retrieves the namespace prefix)	DOMNode Subprograms on page 167-10
GETPREVIOUSSIBLING Function on page 167-92	Retrieves the previous sibling of the node	DOMNode Subprograms on page 167-10
GETPUBLICID Functions on page 167-93	Retrieves ■ the public ID of the document type ■ the public Id of the entity ■ the public Id of the notation	■ DOMDocumentType Subprograms on page 167-19 ■ DOMEntity Subprograms on page 167-21 ■ DOMNotation Subprograms on page 167-26

Table 167–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
GETQUALIFIEDNAME Functions on page 167-94	Retrieves ▪ the Qualified Name of the attribute ▪ the qualified name of the element	▪ DOMAttr Subprograms on page 167-12 ▪ DOMElement Subprograms on page 167-20
GETSCHEMANODE Function on page 167-95	Retrieves the associated schema URI	DOMNode Subprograms on page 167-10
GETSPECIFIED Function on page 167-96	Tests if attribute was specified in the element.	DOMAttr Subprograms on page 167-12
GETSTANDALONE Function on page 167-97	Retrieves the standalone property of the document	DOMDocument Subprograms on page 167-16
GETSYSTEMID Functions on page 167-98	Retrieves ▪ the system ID of the document type ▪ the system Id of the entity ▪ the system Id of the notation	▪ DOMDocumentType Subprograms on page 167-19 ▪ DOMEntity Subprograms on page 167-21 ▪ DOMNotation Subprograms on page 167-26
GETTAGNAME Function on page 167-99	Retrieves the Tag name of the element	DOMElement Subprograms on page 167-20
GETVALUE Function on page 167-100	Retrieves the value of the attribute	DOMAttr Subprograms on page 167-12
GETVERSION Function on page 167-101	Retrieves the version of the document	DOMDocument Subprograms on page 167-16)
GETXMLTYPE Function on page 167-102	Retrieves the `XMLType` associated with the DOM Document	DOMDocument Subprograms on page 167-16
HASATTRIBUTES Function on page 167-104	Tests if the node has attributes	DOMNode Subprograms on page 167-10
HASATTRIBUTE Functions on page 167-103	Tests if an attribute exists	DOMElement Subprograms on page 167-20
HASCHILDNODES Function on page 167-105	Tests if the node has child nodes	DOMNode Subprograms on page 167-10
HASFEATURE Function on page 167-106	Tests if the `DOMImplementation` implements a feature	DOMImplementation Subprograms on page 167-23
IMPORTNODE Function on page 167-107	Imports a node from another document	DOMNode Subprograms on page 167-10
INSERTBEFORE Function on page 167-108	Inserts a child before the reference child	DOMNode Subprograms on page 167-10
INSERTDATA Procedure on page 167-109	Inserts the data in the node at the specified offSets	DOMCharacterData Subprograms on page 167-14

Table 167–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ISNULL Functions on page 167-110	Tests ■ if the node is NULL ■ if the Attribute node is NULL ■ if the CDataSection is NULL ■ if the CharacterData is NULL ■ if the comment is NULL ■ if the document is NULL ■ if the DocumentFragment is NULL ■ if the Document Type is NULL ■ if the Element is NULL ■ if the Entity is NULL ■ if the DOMEntityReference is NULL ■ if the DOMImplementation node is NULL ■ if the NamedNodeMap is NULL ■ if the NodeList is NULL ■ if the Notation is NULL ■ if the Processing Instruction is NULL ■ if the text is NULL	■ DOMNode Subprograms on page 167-10 ■ DOMAttr Subprograms on page 167-12 ■ DOMCDataSection Subprograms on page 167-13 ■ DOMCharacterData Subprograms on page 167-14 ■ DOMComment Subprograms on page 167-15 ■ DOMDocument Subprograms on page 167-16 ■ DOMDocumentFragment Subprograms on page 167-18 ■ DOMDocumentType Subprograms on page 167-19 ■ DOMElement Subprograms on page 167-20 ■ DOMEntity Subprograms on page 167-21 ■ DOMEntityReference Subprograms on page 167-22 ■ DOMImplementation Subprograms on page 167-23 ■ DOMNamedNodeMap Subprograms on page 167-24 ■ DOMNodeList Subprograms on page 167-25 ■ DOMNotation Subprograms on page 167-26 ■ DOMProcessingInstruction Subprograms on page 167-27 ■ DOMText Subprograms on page 167-28

Table 167–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
ITEM Functions on page 167-113	Retrieves ▪ the item given the index in the map ▪ the item given the index in the `NodeList`	▪ DOMNamedNodeMap Subprograms on page 167-24 ▪ DOMNodeList Subprograms on page 167-25
MAKEATTR Function on page 167-114	Casts the node to an Attribute	DOMNode Subprograms on page 167-10
MAKECDATASECTION Function on page 167-115	Casts the node to a CData Section	DOMNode Subprograms on page 167-10
MAKECHARACTERDATA Function on page 167-116	Casts the node to Character Data	DOMNode Subprograms on page 167-10
MAKECOMMENT Function on page 167-117	Casts the node to a Comment	DOMNode Subprograms on page 167-10
MAKEDOCUMENT Function on page 167-118	Casts the node to a DOM Document	DOMNode Subprograms on page 167-10
MAKEDOCUMENTFRAGMENT Function on page 167-119	Casts the node to a DOM Document Fragment	DOMNode Subprograms on page 167-10)
MAKEDOCUMENTTYPE Function on page 167-120	Casts the node to a DOM Document Type	DOMNode Subprograms on page 167-10
MAKEELEMENT Function on page 167-121	Casts the node to a DOM ElemenT	DOMNode Subprograms on page 167-10
MAKEENTITY Function on page 167-122	Casts the node to a DOM Entity	DOMNode Subprograms on page 167-10
MAKEENTITYREFERENCE Function on page 167-123	Casts the node to a DOM Entity Reference	DOMNode Subprograms on page 167-10

Table 167–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
MAKENODE Functions on page 167-124	Casts ■ the Attribute to a node ■ the `CDatasection` to a node ■ the CharacterData to a node ■ the Comment to a node ■ the document to a node ■ the Document Fragment to a node ■ the document type to a node ■ the Element to a node ■ the Entity to a node ■ ■ the `DOMEntityReference` to `NULL` ■ the notation to a node ■ the Processing Instruction to a node ■ the text to a node	■ DOMAttr Subprograms on page 167-12 ■ DOMCDataSection Subprograms on page 167-13 ■ DOMCharacterData Subprograms on page 167-14 ■ DOMComment Subprograms on page 167-15 ■ DOMDocument Subprograms on page 16 ■ DOMDocumentFragment Subprograms on page 167-18 ■ DOMDocumentType Subprograms on page 167-19 ■ DOMElement Subprograms on page 167-20 ■ DOMEntity Subprograms on page 167-21 ■ DOMEntityReference Subprograms on page 167-22 ■ DOMNotation Subprograms on page 167-26 ■ DOMProcessingInstruction Subprograms on page 167-27 ■ DOMText Subprograms on page 167-28
MAKENOTATION Function on page 167-127	Casts the node to a DOM Notation	DOMNode Subprograms on page 167-10
MAKEPROCESSINGINSTRUCTION Function on page 167-128	Casts the node to a DOM Processing Instruction	DOMNode Subprograms on page 167-10
MAKETEXT Function on page 167-129	Casts the node to a DOM Text	DOMNode Subprograms on page 167-10
NEWDOMDOCUMENT Functions on page 167-130	Creates a new document	DOMDocument Subprograms on page 167-16
NORMALIZE Procedure on page 167-131	Normalizes the text children of the element	DOMElement Subprograms on page 167-20

Table 167–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
REMOVEATTRIBUTE Procedures on page 167-132	Removes the attribute specified by the name	DOMElement Subprograms on page 167-20
REMOVEATTRIBUTENODE Function on page 167-133	Removes the attribute node in the element	DOMElement Subprograms on page 167-20
REMOVECHILD Function on page 167-134	Removes a specified child from a node	DOMNode Subprograms on page 167-10
REMOVENAMEDITEM Function on page 167-135	Removes the item specified by name	DOMNamedNodeMap Subprograms on page 167-24
REPLACECHILD Function on page 167-136	Replaces the old child with a new child	DOMNode Subprograms on page 167-10
REPLACEDATA Procedure on page 167-137	Changes a range of characters in the node	DOMCharacterData Subprograms on page 167-14
RESOLVENAMESPACEPREFIX Function on page 167-138	Resolve the prefix to a namespace URI	DOMElement Subprograms on page 167-20
SETATTRIBUTE Procedures on page 167-139	Sets the attribute specified by the name	DOMElement Subprograms on page 167-20
SETATTRIBUTENODE Functions on page 167-140	Sets the attribute node in the element	DOMElement Subprograms on page 167-20
SETDATA Procedures on page 167-141	Sets ▪ the data to the node ▪ the data of the processing instruction	▪ DOMCharacterData Subprograms on page 167-14 ▪ DOMProcessingInstruction Subprograms on page 167-27
SETDOCTYPE Procedure on page 167-142	Sets the DTD of the document.	DOMDocument Subprograms on page 167-16
SETNAMEDITEM Function on page 167-143	Sets the item in the map specified by the name	DOMNamedNodeMap Subprograms on page 167-24
SETNODEVALUE Procedure on page 167-144	Sets the Value of the node	DOMNode Subprograms on page 167-10
SETNODEVALUEASBINARYSTREAM Function & Procedure on page 167-145	Sets the Node Value as a binary stream	DOMNode Subprograms on page 167-10
SETNODEVALUEASCHARACTERSTREAM Function & Procedure on page 167-146	Sets the Node Value as a character stream	DOMNode Subprograms on page 167-10
SETPREFIX Procedure on page 167-147	Sets the namespace prefix	DOMNode Subprograms on page 167-10
SETSTANDALONE Procedure on page 167-148	Sets the standalone property of the document	DOMDocument Subprograms on page 167-16

Table 167–21 (Cont.) Summary of DBMS_XMLDOM Package Subprogram

Subprogram	Description	Group
SETVALUE Procedure on page 167-149	Sets the value of the attribute	DOMAttr Subprograms on page 167-12
SETVERSION Procedure on page 167-150	Sets the version of the document	DOMDocument Subprograms on page 167-16
SPLITTEXT Function on page 167-151	Splits the contents of the text node into 2 text nodes	DOMText Subprograms on page 167-28
SUBSTRINGDATA Function on page 167-152	Retrieves the substring of the data	DOMCharacterData Subprograms on page 167-14
USEBINARYSTREAM Function on page 167-153	Strabismus that the stream is valid for use	DOMNode Subprograms on page 167-10
WRITETOBUFFER Procedures on page 167-154	Writes ■ the contents of the node to a buffer ■ the document to a buffer ■ the contents of a document fragment into a buffer	■ DOMNode Subprograms on page 167-10 ■ DOMDocument Subprograms on page 167-16 ■ DOMDocumentFragment Subprograms on page 167-18
WRITETOCLOB Procedures on page 167-155	Writes ■ the contents of the node to a `CLOB` ■ the document to a `CLOB`	■ DOMNode Subprograms on page 167-10 ■ DOMDocument Subprograms on page 167-16
WRITETOFILE Procedures on page 167-156	Writes ■ the contents of the node to a file ■ the document to a file	■ DOMNode Subprograms on page 167-10 ■ DOMDocument Subprograms on page 167-16

ADOPTNODE Function

This function adopts a node from another document, and returns this new node.

> **See Also:** DOMNode Subprograms on page 167-10 for other subprograms in this group

Syntax

```
DBMS_XMLDOM.ADOPTNODE(
   doc            IN   DOMDocument,
   importedNode   IN   DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 167–22 ADOPTNODE Function Parameters

Parameter	Description
doc	Document that is adopting the node
importedNode	Node to adopt

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

APPENDCHILD Function

This function adds the node `newchild` to the end of the list of children of this node, and returns the newly added node. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.APPENDCHILD(
   n          IN    DOMNode,
   newchild   IN    DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 167–23 APPENDCHILD Function Parameters

Parameter	Description
`n`	`DOMNode`
`newchild`	The child to be appended to the list of children of node `n`

APPENDDATA Procedure

This procedure appends the string to the end of the character data of the node. Upon success, data provides access to the concatenation of data and the specified string argument.

See Also: DOMCharacterData Subprograms on page 167-14

Syntax

```
DBMS_XMLDOM.APPENDDATA(
   cd      IN    DOMCHARACTERDATA,
   arg     IN    VARCHAR2);
```

Parameters

Table 167–24 APPENDDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
arg	The data to append to the existing data

CLONENODE Function

This function returns a duplicate of this node, and serves as a generic copy constructor for nodes. The duplicate node has no parent, its parent node is NULL.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.CLONENODE(
   n       IN    DOMNODE,
   deep    IN    BOOLEAN)
 RETURN DOMNODE;
```

Parameters

Table 167–25 CLONENODE Function Parameters

Parameter	Description
n	DOMNODE
deep	Determines if children are to be cloned

Usage Notes

- Cloning an Element copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child Text node.
- Cloning an Attribute directly, as opposed to be cloned as part of an Element cloning operation, returns a specified attribute (specified is TRUE).
- Cloning any other type of node simply returns a copy of this node.

CREATEATTRIBUTE Functions

This function creates a DOMATTR node.

See Also: DOMDocument Subprograms on page 167-16

Syntax

Creates a DOMATTR with the specified name:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc      IN    DOMDOCUMENT,
   name     IN    VARCHAR2)
 RETURN DOMATTR;
```

Creates a DOMATTR with the specified name and namespace URI:

```
DBMS_XMLDOM.CREATEATTRIBUTE(
   doc      IN    DOMDOCUMENT,
   qname     IN    VARCHAR2,
   ns       IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 167–26 CREATEATTRIBUTE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
qname	New attribute qualified name
ns	Namespace

CREATECDATASECTION Function

This function creates a DOMCDATASECTION node.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.CREATECDATASECTION(
   doc      IN      DOMDOCUMENT,
   data     IN      VARCHAR2)
 RETURN DOMCDATASECTION;
```

Parameters

Table 167–27 CREATECDATASECTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMCDATASECTION node

CREATECOMMENT Function

This function creates a DOMCOMMENT node.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.CREATECOMMENT(
   doc      IN      DOMDOCUMENT,
   data     IN      VARCHAR2)
 RETURN DOMCOMMENT;
```

Parameters

Table 167–28 CREATECOMMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMComment node

CREATEDOCUMENT Function

This function creates a DOMDOCUMENT with specified namespace URI, root element name, DTD.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENT(
   namespaceURI      IN     VARCHAR2,
   qualifiedName     IN     VARCHAR2,
   doctype           IN     DOMTYPE := NULL)
 RETURN DOMDOCUMENT;
```

Parameters

Table 167–29 CREATEDOCUMENT Function Parameters

Parameter	Description
namespaceURI	Namespace URI
qualifiedName	Root element name
doctype	Document type

CREATEDOCUMENTFRAGMENT Function

This function creates a DOMDOCUMENTFRAGMENT.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.CREATEDOCUMENTFRAGMENT(
   doc       IN      DOMDOCUMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 167–30 CREATEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
doc	DOMDocument

CREATEELEMENT Functions

This function creates a DOMELEMENT.

See Also: DOMDocument Subprograms on page 167-16

Syntax

Creates a DOMElement with specified name:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc         IN      DOMDOCUMENT,
   tagName     IN      VARCHAR2)
 RETURN DOMELEMENT;
```

Creates a DOMElement with specified name and namespace URI:

```
DBMS_XMLDOM.CREATEELEMENT(
   doc         IN     DOMDOCUMENT,
   tagName     IN     VARCHAR2,
   ns          IN     VARCHAR2)
 RETURN DOMELEMENT;
```

Parameters

Table 167–31 CREATEELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagName	Tagname for new DOMELEMENT
ns	Namespace

CREATEENTITYREFERENCE Function

This function creates a DOMENTITYREFERENCE node.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.CREATEENTITYREFERENCE(
   doc         IN     DOMDOCUMENT,
   name        IN     VARCHAR2)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 167–32 CREATEENTITYREFERENCE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
name	New entity reference name

CREATEPROCESSINGINSTRUCTION Function

This function creates a DOMPROCESSINGINSTRUCTION node.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.CREATEPROCESSINGINSTRUCTION(
   doc        IN      DOMDocument,
   target     IN      VARCHAR2,
   data       IN      VARCHAR2)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 167–33 CREATEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
doc	DOMDOCUMENT
target	Target of the new processing instruction
data	Content data of the new processing instruction

CREATETEXTNODE Function

This function creates a DOMTEXT node.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.CREATETEXTNODE(
   doc      IN     DOMDocument,
   data     IN     VARCHAR2)
 RETURN DOMTEXT;
```

Parameters

Table 167–34 CREATETEXTNODE Function Parameters

Parameter	Description
doc	DOMDOCUMENT
data	Content of the DOMText node

DELETEDATA Procedure

This procedure removes a range of characters from the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 167-14

Syntax

```
DBMS_XMLDOM.DELETEDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
   cnt       IN     NUMBER);
```

Parameters

Table 167–35 DELETEDATA PROCEDURE Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset from which to delete the data
cnt	The number of characters (starting from offset) to delete

FINDENTITY Function

This function finds an entity in the specified DTD, and returns that entity if found.

See Also: DOMDocumentType Subprograms on page 167-19

Syntax

```
DBMS_XMLDOM.FINDENTITY(
   dt      IN     DOMDOCUMENTTYPE,
   name    IN     VARCHAR2,
   par     IN     BOOLEAN)
 RETURN  DOMENTITY;
```

Parameters

Table 167–36 FINDENTITY Function Parameters

Parameter	Description
dt	The DTD
name	Entity to find
par	Flag to indicate type of entity; TRUE for parameter entity and FALSE for normal entity

FINDNOTATION Function

This function finds the notation in the specified DTD, and returns it, if found.

See Also: DOMDocumentType Subprograms on page 167-19

Syntax

```
DBMS_XMLDOM.FINDNOTATION(
   dt         IN     DOMDocumentType,
   name       IN     VARCHAR2)
 RETURN DOMNOTATION;
```

Parameters

Table 167–37 FINDNOTATION Function Parameters

Parameter	Description
dt	The DTD
name	The notation to find

FREEDOCFRAG Procedure

This procedure frees the specified document fragment.

> **See Also:** DOMDocument Subprograms on page 167-16 and DOMDocumentFragment Subprograms on page 167-18

Syntax

```
DBMS_XMLDOM.FREEDOCFRAG(
   df     IN     DOMDOCUMENTFRAGMENT);
```

Parameters

Table 167–38 FREEDOCFRAG Procedure Parameters

Parameter	Description
df	DOM document fragment

FREEDOCUMENT Procedure

This procedure frees DOMDOCUMENT object.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.FREEDOCUMENT(
   doc      IN      DOMDOCUMENT);
```

Parameters

Table 167–39 FREEDOCUMENT Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT

FREEELEMENT Procedure

This procedure frees memory allocated to a DOMElement handle.

See Also: DOMElement Subprograms on page 167-20

Syntax

```
DBMS_XMLDOM.FREENODE(
   elem      IN     DOMELEMENT);
```

Parameters

Table 167–40 FREENODE Procedure Parameters

Parameter	Description
elem	Of type `DOMELEMENT`

FREENODE Procedure

This procedure frees all resources associated with a DOMNODE.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.FREENODE(
   n       IN      DOMNODE);
```

Parameters

Table 167–41 FREENODE Procedure Parameters

Parameter	Description
n	DOMNODE

FREENODELIST Procedure

This procedure frees all resources associated with a nodelist.

See Also: DOMNodeList Subprograms on page 167-25

Syntax

```
DBMS_XMLDOM.FREENODE(
   nl     IN     DOMNodeList);
```

Parameters

Table 167–42 FREENODE Procedure Parameters

Parameter	Description
nl	Of type `DOMNODELIST`

GETATTRIBUTE Functions

This function returns the value of an attribute of an DOMELEMENT by name.

See Also: DOMElement Subprograms on page 167-20

Syntax

Returns the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem       IN      DOMELEMENT,
   name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Returns the value of a DOMELEMENT's attribute by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTE(
   elem      IN     DOMELEMENT,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 167–43 GETATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

GETATTRIBUTENODE Functions

This function returns an attribute node from the DOMELEMENT by name. The function is overloaded. The specific forms of functionality are described along with the syntax declarations.

See Also: DOMElement Subprograms on page 167-20

Syntax

Returns an attribute node from the DOMELEMENT by name:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2)
 RETURN DOMATTR;
```

Returns an attribute node from the DOMELEMENT by name and namespace URI:

```
DBMS_XMLDOM.GETATTRIBUTENODE(
   elem      IN     DOMElement,
   name      IN     VARCHAR2,
   ns        IN     VARCHAR2)
RETURN DOMATTR;
```

Parameters

Table 167–44 GETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

GETATTRIBUTES Function

This function retrieves a NAMEDNODEMAP containing the attributes of this node (if it is an Element) or NULL otherwise.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETATTRIBUTES(
   n       IN       DOMNode)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 167–45 GETATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

GETCHILDNODES Function

This function retrieves a DOMNODELIST that contains all children of this node. If there are no children, this is a DOMNODELIST containing no nodes.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETCHILDNODES(
   n      IN    DOMNode)
 RETURN DOMNodeList;
```

Parameters

Table 167–46 GETCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

GETCHILDRENBYTAGNAME Functions

This function returns the children of the DOMELEMENT.

See Also: DOMElement Subprograms on page 167-20

Syntax

Returns children of the DOMELEMENT given the tag name:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem      IN      DOMElement,
   name      IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Returns children of the DOMELEMENT given the tag name and namespace:

```
DBMS_XMLDOM.GETCHILDRENBYTAGNAME(
   elem      IN      DOMElement,
   name      IN      VARCHAR2,
   ns        IN      VARCHAR2)
RETURN DOMNODELIST;
```

Parameters

Table 167–47 GETCHILDRENBYTAGNAME Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Tag name
ns	Namespace

GETDATA Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 167-14):

```
DBMS_XMLDOM.GETDATA(
   cd      IN    DOMCHARACTERDATA)
 RETURN VARCHAR2;
```

Returns the content data of the `DOMProcessingInstruction` (See Also: DOMProcessingInstruction Subprograms on page 167-27):

```
DBMS_XMLDOM.GETDATA(
   pi      IN    DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 167–48 GETDATA Function Parameters

Parameter	Description
`cd`	`DOMCHARACTERDATA`
`pi`	The `DOMPROCESSINGINSTRUCTION`

GETDOCTYPE Function

This function returns the DTD associated to the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.GETDOCTYPE(
   doc       IN     DOMDOCUMENT)
RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 167–49 GETDOCTYPE Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETDOCUMENTELEMENT Function

This function returns the root element of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.GETDOCUMENTELEMENT(
   doc       IN       DOMDOCUMENT)
 RETURN DOMELEMENT;
```

Parameters

Table 167–50 GETDOCUMENTELEMENT Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETELEMENTSBYTAGNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns a DOMNODELIST of all the elements with a specified tagname (See Also: DOMDocument Subprograms on page 167-16):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   doc          IN      DOMDOCUMENT,
   tagname      IN      VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name (See Also: DOMElement Subprograms on page 167-20):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem       IN     DOMELEMENT,
   name       IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Returns the element children of the DOMELEMENT given the tag name and namespace (See Also: DOMElement Subprograms on page 167-20):

```
DBMS_XMLDOM.GETELEMENTSBYTAGNAME(
   elem       IN     DOMELEMENT,
   name       IN     VARCHAR2,
   ns         IN     VARCHAR2)
 RETURN DOMNODELIST;
```

Parameters

Table 167–51 GETELEMENTSBYTAGNAME Function Parameters

Parameter	Description
doc	DOMDOCUMENT
tagname	Name of the tag to match on
elem	The DOMELEMENT
name	Tag name; using a wildcard(*) would match any tag
ns	Namespace

GETENTITIES Function

This function retrieves a DOMNAMEDNODEMAP containing the general entities, both external and internal, declared in the DTD.

See Also: DOMDocumentType Subprograms on page 167-19

Syntax

```
DBMS_XMLDOM.GETENTITIES(
   dt       IN     DOMDocumentType)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 167–52 GETENTITIES Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

GETEXPANDEDNAME Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described along with the syntax declarations.

Syntax

Retrieves the expanded name of the `Node` if is in an `Element` or `Attribute` type; otherwise, returns `NULL` (See Also: DOMNode Subprograms on page 167-10)

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   n       IN      DOMNODE
   data    OUT     VARCHAR);
```

Returns the expanded name of the `DOMAttr` (See Also: DOMAttr Subprograms on page 167-12):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   a       IN     DOMAttr)
 RETURN VARCHAR2;
```

Returns the expanded name of the `DOMElement` (See Also: DOMElement Subprograms on page 167-20):

```
DBMS_XMLDOM.GETEXPANDEDNAME(
   elem      IN    DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 167–53 GETEXPANDEDNAME Procedure and Function Parameters

Parameter	Description
`n`	`DOMNODE`
`data`	Returned expanded name of the `Node`
`a`	`DOMATTR`
`elem`	`DOMELEMENT`

GETFIRSTCHILD Function

This function retrieves the first child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETFIRSTCHILD(
   n      IN      DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 167–54 GETFIRSTCHILD Function Parameters

Parameter	Description
n	DOMNODE

GETIMPLEMENTATION Function

This function returns the DOMIMPLEMENTATION object that handles this DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.GETIMPLEMENTATION(
   doc      IN     DOMDOCUMENT)
 RETURN DOMIMPLEMENTATION;
```

Parameters

Table 167–55 GETIMPLEMENTATION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETLASTCHILD Function

This function retrieves the last child of this node. If there is no such node, this returns NULL.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETLASTCHILD(
   n      IN   DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 167–56 GETLASTCHILD Function Parameters

Parameter	Description
n	DOMNODE

GETLENGTH Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Gets the number of characters in the data. This may have the value zero, because CharacterData nodes may be empty (See Also: DOMCharacterData Subprograms on page 167-14):

```
DBMS_XMLDOM.GETLENGTH(
   cd      IN      DOMCHARACTERDATA)
 RETURN NUMBER;
```

Gets the number of nodes in this map. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNamedNodeMap Subprograms on page 167-24):

```
DBMS_XMLDOM.GETLENGTH(
   nnm       IN      DOMNAMEDNODEMAP)
 RETURN NUMBER;
```

Gets the number of nodes in the list. The range of valid child node indexes is `0` to `length-1`, inclusive (See Also: DOMNodeList Subprograms on page 167-25):

```
DBMS_XMLDOM.GETLENGTH(
   nl      IN     DOMNODELIST)
 RETURN NUMBER;
```

Parameters

Table 167–57 GETLENGTH Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
nnm	DOMNAMEDNODEMAP
nl	DOMNODELIST

GETLOCALNAME Procedure and Functions

This function is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the local part of the node's qualified name (See Also: DOMNode Subprograms on page 167-10):

```
DBMS_XMLDOM.GETLOCALNAME(
   n       IN     DOMNODE,
   data    OUT    VARCHAR2);
```

Returns the local name of the `DOMAttr` (See Also: DOMAttr Subprograms on page 167-12):

```
DBMS_XMLDOM.GETLOCALNAME(
   a       IN     DOMATTR)
 RETURN VARCHAR2;
```

Returns the local name of the `DOMElement` (See Also: DOMElement Subprograms on page 167-20)

```
DBMS_XMLDOM.GETLOCALNAME(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 167–58 GETLOCALNAME Procedure and Function Parameters

Parameter	Description
`n`	`DOMNode`
`data`	Returned local name.
`a`	`DOMAttr`.
`elem`	`DOMElement`.

GETNAME Functions

This function is overloaded. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Returns the name of this attribute (See Also: DOMAttr Subprograms on page 167-12):

```
DBMS_XMLDOM.GETNAME(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the name of DTD, or the name immediately following the `DOCTYPE` keyword (See Also: DOMDocumentType Subprograms on page 167-19):

```
DBMS_XMLDOM.GETNAME(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Parameters

Table 167–59 GETNAME Function Parameters

Parameter	Description
a	DOMATTR
dt	DOMDOCUMENTTYPE

GETNAMEDITEM Function

This function retrieves a node specified by name.

See Also: DOMNamedNodeMap Subprograms on page 167-24

Syntax

Retrieves a node specified by name:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2)
 RETURN DOMNODE;
```

Retrieves a node specified by name and namespace URI:

```
DBMS_XMLDOM.GETNAMEDITEM(
   nnm    IN  DOMNAMEDNODEMAP,
   name   IN  VARCHAR2,
   ns     IN  VARCHAR2)
 RETURN DOMNODE;
```

Parameters

Table 167–60 GETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
name	Name of the item to be retrieved
ns	Namespace

GETNAMESPACE Procedure and Functions

This subprogram is overloaded as a procedure and two functions. The specific forms of functionality are described alongside the syntax declarations.

Syntax

Retrieves the namespace URI associated with the node (See Also: DOMNode Subprograms on page 167-10):

```
DBMS_XMLDOM.GETNAMESPACE(
   n       IN     DOMNODE,
   data    OUT    VARCHAR2);
```

Retrieves the namespace of the DOMATTR (See Also: DOMAttr Subprograms on page 167-12):

```
DBMS_XMLDOM.GETNAMESPACE(
   a       IN     DOMATTR)
 RETURN VARCHAR2;
```

Retrieves the namespace of the DOMELEMENT (See Also: DOMElement Subprograms on page 167-20):

```
DBMS_XMLDOM.GETNAMESPACE(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 167–61 GETNAMESPACE Procedure and Function Parameters

Parameter	Description
n	DOMNODE
data	Returned namespace URI
a	DOMATTR
elem	DOMELEMENT

GETNEXTSIBLING Function

This function retrieves the node immediately following this node. If there is no such node, this returns `NULL`.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETNEXTSIBLING(
   n       IN     DOMNODE)
 RETURN DOMNode;
```

Parameters

Table 167–62 GETNEXTSIBLING Function Parameters

Parameter	Description
n	DOMNODE

GETNODETYPE Function

This function retrieves a code representing the type of the underlying object.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETNODETYPE(
   n        IN      DOMNODE)
 RETURN NUMBER;
```

Parameters

Table 167–63 GETNODETYPE Function Parameters

Parameter	Description
n	DOMNODE

GETNODENAME Function

This function gets the name of the node depending on its type.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETNODENAME(
   n        IN     DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 167–64 GETNODENAME Function Parameters

Parameter	Description
n	DOMNODE

GETNODEVALUE Function

This function gets the value of this node, depending on its type.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETNODEVALUE(
   n        IN     DOMNODE)
 RETURN VARCHAR2;*
```

Parameters

Table 167–65 GETNODEVALUE Function Parameters

Parameter	Description
n	DOMNODE

GETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 167-10

Syntax

This function returns an instance of the PL/SQL `XMLBinaryInputStream`. The node data type must be `RAW` or `BLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n      IN     DOMNODE)
 RETURN SYS.UTL_BINARYINPUTSTREAM;
```

Using this procedure, the application passes an implementation of `SYS.UTL_BINARYOUTPUTSTREAM` into which XDB writes the contents of the node. The data type of the node must be `RAW` or `CLOB` – if not an exception is raised.

```
DBMS_XMLDOM.GETNODEVALUEASBINARYSTREAM (
   n        in   DOMNODE,
   value    in   SYS.UTL_BINARYOUTPUTSTREAM);
```

Parameters

Table 167–66 GETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYOUTPUTSTREAM

GETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 167-10

Syntax

This function returns an instance of the PL/SQL `XMLCharacterInputStream`. If the node data is character it is converted to the current session character set. If the node data is not character data, it is first converted to character data.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n         IN     DOMNODE)
 RETURN SYS.UTL_CHARACTERINPUTSTREAM;
```

Using this procedure, the node data is converted, as necessary, to the session character set and then "pushed" into the `SYS.UTL_CHARACTEROUTPUTSTREAM`.

```
DBMS_XMLDOM.GETNODEVALUEASCHARACTERSTREAM  (
   n         IN   DOMNODE,
   value     IN   SYS.UTL_CHARACTEROUTPUTSTREAM);
```

Parameters

Table 167–67 GETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTEROUTPUTSTREAM

GETNOTATIONNAME Function

This function returns the notation name of the DOMENTITY.

See Also: DOMEntity Subprograms on page 167-21

Syntax

```
DBMS_XMLDOM.GETNOTATIONNAME(
   ent        IN     DOMENTITY)
 RETURN VARCHAR2;
```

Parameters

Table 167–68 GETNOTATIONNAME Function Parameters

Parameter	Description
ent	DOMENTITY

GETNOTATIONS Function

This function retrieves a DOMNAMEDNODEMAP containing the notations declared in the DTD.

See Also: DOMDocumentType Subprograms on page 167-19

Syntax

```
DBMS_XMLDOM.GETNOTATIONS(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN DOMNAMEDNODEMAP;
```

Parameters

Table 167–69 GETNOTATIONS Function Parameters

Parameter	Description
dt	DOMDOCUMENTTYPE

GETTARGET Function

This function returns the target of the DOMPROCESSINGINSTRUCTION.

See Also: DOMProcessingInstruction Subprograms on page 167-27

Syntax

```
DBMS_XMLDOM.GETTARGET(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN VARCHAR2;
```

Parameters

Table 167–70 GETTARGET Function Parameters

Parameter	Description
pi	DOMPROCESSINGINSTRUCTION

GETOWNERDOCUMENT Function

This function retrieves the Document object associated with this node. This is also the Document object used to create new nodes. When this node is a Document or a Document Type that is not used with any Document yet, this is NULL.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETOWNERDOCUMENT(
   n        IN     DOMNODE)
 RETURN DOMDOCUMENT;
```

Parameters

Table 167–71 GETOWNERDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE

GETOWNERELEMENT Function

This function retrieves the Element node to which the specified Attribute is attached.

See Also: DOMAttr Subprograms on page 167-12

Syntax

```
DBMS_XMLDOM.GETOWNERELEMENT(
   a        IN     DOMATTR)
 RETURN DOMElement;
```

Parameters

Table 167–72 GETOWNERELEMENT Function Parameters

Parameter	Description
a	Attribute

GETPARENTNODE Function

This function retrieves the parent of this node. All nodes, except `Attr`, `Document`, `DocumentFragment`, `Entity`, and `Notation` may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, this is `NULL`.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETPARENTNODE(
   n        IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 167–73 GETPARENTNODE Function Parameters

Parameter	Description
n	DOMNODE

GETPREFIX Function

This function retrieves the namespace prefix of the node.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETPREFIX(
   n        IN     DOMNODE)
 RETURN VARCHAR2;
```

Parameters

Table 167–74 GETPREFIX Function Parameters

Parameter	Description
n	DOMNODE

GETPREVIOUSSIBLING Function

This function retrieves the node immediately preceding this node. If there is no such node, this returns `NULL`.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETPREVIOUSSIBLING(
   n        IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 167–75 GETPREVIOUSSIBLING Function Parameters

Parameter	Description
n	DOMNODE

GETPUBLICID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the public identifier of the specified DTD (See Also: DOMDocumentType Subprograms on page 167-19):

```
DBMS_XMLDOM.GETPUBLICID(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the public identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 167-21):

```
DBMS_XMLDOM.GETPUBLICID(
   ent       IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the public identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 167-26):

```
DBMS_XMLDOM.GETPUBLICID(
   n         IN     DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 167–76 GETPUBLICID Function Parameters

Parameter	Description
dt	The DTD
ent	DOMENTITY
n	DOMNOTATION

GETQUALIFIEDNAME Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the qualified name of the DOMATTR (See Also: DOMAttr Subprograms on page 167-12):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   a         IN     DOMATTR)
 RETURN VARCHAR2;
```

Returns the qualified name of the DOMElement (See Also: DOMElement Subprograms on page 167-20):

```
DBMS_XMLDOM.GETQUALIFIEDNAME(
   elem      IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 167–77 GETQUALIFIEDNAME Functions Parameters

Parameter	Description
a	DOMATTR
elem	DOMELEMENT

GETSCHEMANODE Function

This function retrieves the schema URI associated with the node.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.GETSCHEMANODE(
   n        IN     DOMNODE)
 RETURN DOMNODE;
```

Parameters

Table 167–78 GETSCHEMANODE Function Parameters

Parameter	Description
n	DOMNODE

GETSPECIFIED Function

If this attribute was explicitly specified, a value in the original document, this is true; otherwise, it is false.

See Also: DOMAttr Subprograms on page 167-12

Syntax

```
DBMS_XMLDOM.GETSPECIFIED(
   a       IN     DOMATTR)
 RETURN BOOLEAN;
```

Parameters

Table 167–79 GETSPECIFIED Function Parameters

Parameter	Description
a	DOMATTR

GETSTANDALONE Function

This function returns the standalone property associated with the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.GETSTANDALONE(
   doc        IN      DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 167–80 GETSTANDALONE Function Parameters

Parameter	Description
doc	DOMDOCUMENT.

GETSYSTEMID Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the system id of the specified DTD (See Also: DOMDocumentType Subprograms on page 167-19):

```
DBMS_XMLDOM.GETSYSTEMID(
   dt       IN     DOMDOCUMENTTYPE)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMENTITY (See Also: DOMEntity Subprograms on page 167-21):

```
DBMS_XMLDOM.GETSYSTEMID(
   ent      IN     DOMENTITY)
 RETURN VARCHAR2;
```

Returns the system identifier of the DOMNOTATION (See Also: DOMNotation Subprograms on page 167-26):

```
DBMS_XMLDOM.GETSYSTEMID(
   n        IN     DOMNOTATION)
 RETURN VARCHAR2;
```

Parameters

Table 167–81 GETSYSTEMID Function Parameters

Parameter	Description
dt	The DTD.
ent	DOMEntity.
n	DOMNotation.

GETTAGNAME Function

This function returns the name of the DOMELEMENT.

See Also: DOMElement Subprograms on page 167-20

Syntax

```
DBMS_XMLDOM.GETTAGNAME(
   elem       IN     DOMELEMENT)
 RETURN VARCHAR2;
```

Parameters

Table 167–82 GETTAGNAME Function Parameters

Parameter	Description
elem	The DOMELEMENT

GETVALUE Function

This function retrieves the value of the attribute.

See Also: DOMAttr Subprograms on page 167-12

Syntax

```
DBMS_XMLDOM.GETVALUE(
   a        IN     DOMATTR)
 RETURN VARCHAR2;
```

Parameters

Table 167–83 GETVALUE Function Parameters

Parameter	Description
a	DOMATTR

GETVERSION Function

This function returns the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.GETVERSION(
   doc        IN     DOMDOCUMENT)
 RETURN VARCHAR2;
```

Parameters

Table 167–84 GETVERSION Function Parameters

Parameter	Description
doc	DOMDOCUMENT

GETXMLTYPE Function

This function returns the `XMLType` associated with the `DOMDOCUMENT`.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.GETXMLTYPE(
   doc        IN     DOMDOCUMENT)
 RETURN SYS.XMLTYPE;
```

Parameters

Table 167–85 GETXMLTYPE Function Parameters

Parameter	Description
`doc`	`DOMDOCUMENT`

HASATTRIBUTE Functions

Verifies whether an attribute has been defined for DOMELEMENT, or has a default value.

See Also: DOMElement Subprograms on page 167-20

Syntax

Verifies whether an attribute with the specified name has been defined for DOMElement:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem     IN  DOMELEMENT,
   name     IN  VARCHAR2)
 RETURN VARCHAR2;
```

Verifies whether an attribute with specified name and namespace URI has been defined for DOMELEMENT; namespace enabled:

```
DBMS_XMLDOM.HASATTRIBUTE(
   elem     IN  DOMELEMENT,
   name     IN  VARCHAR2,
   ns       IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 167–86 HASATTRIBUTE Function Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name; * matches any attribute
ns	Namespace

HASATTRIBUTES Function

This function returns whether this node has any attributes.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.HASATTRIBUTES(
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 167–87 HASATTRIBUTES Function Parameters

Parameter	Description
n	DOMNODE

HASCHILDNODES Function

This function determines whether this node has any children.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.HASCHILDNODES(
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 167–88 HASCHILDNODES Function Parameters

Parameter	Description
n	DOMNODE

HASFEATURE Function

This function tests if the DOMIMPLEMENTATION implements a specific feature.

See Also: DOMImplementation Subprograms on page 167-23

Syntax

```
DBMS_XMLDOM.HASFEATURE(
   di       IN     DOMIMPLEMENTATION,
   feature  IN     VARCHAR2,
   version  IN     VARCHAR2)
 RETURN BOOLEAN;
```

Parameters

Table 167–89 HASFEATURE Function Parameters

Parameter	Description
di	DOMIMPLEMENTATION
feature	The feature to check for
version	The version of the DOM to check in

IMPORTNODE Function

This function imports a node from an external document and returns this new node.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.IMPORTNODE(
   doc             IN  DOMDOCUMENT,
   importedNode    IN  DOMNODE,
   deep            IN  BOOLEAN)
  RETURN DOMNODE;
```

Parameters

Table 167–90 IMPORTNODE Function Parameters

Parameter	Description
`doc`	Document from which the node is imported
`importedNode`	Node to import
`deep`	Setting for recursive import. ■ If this value is `TRUE`, the entire subtree of the node will be imported with the node. ■ If this value is `FALSE`, only the node itself will be imported.

Usage Notes

Note that the ADOPTNODE Function removes the node from the source document while the IMPORTNODE Function clones the node in the source document.

INSERTBEFORE Function

This function inserts the node `newchild` before the existing child node `refchild`. If `refchild` is `NULL`, insert `newchild` at the end of the list of children.

If `newchild` is a `DOCUMENTFRAGMENT` object, all of its children are inserted, in the same order, before `refchild`. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.INSERTBEFORE(
   n          IN     DOMNODE,
   newchild   IN     DOMNODE,
   refchild   IN     DOMNODE)
  RETURN DOMNode;
```

Parameters

Table 167–91 INSERTBEFORE Function Parameters

Parameter	Description
`n`	`DOMNODE`
`newChild`	The child to be inserted in the `DOMNODE`
`refChild`	The reference node before which the `newchild` is to be inserted

INSERTDATA Procedure

This procedure inserts a string at the specified character offset.

See Also: DOMCharacterData Subprograms on page 167-14

Syntax

```
DBMS_XMLDOM.INSERTDATA(
   cd       IN     DOMCHARACTERDATA,
   offset   IN     NUMBER,
   arg      IN     VARCHAR2);
```

Parameters

Table 167–92 INSERTDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to insert the data
arg	The value to be inserted

ISNULL Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Checks if the specified DOMNODE is NULL. Returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNode Subprograms on page 167-10):

```
DBMS_XMLDOM.ISNULL(
  n         IN     DOMNODE)
 RETURN BOOLEAN;
```

Checks that the specified DOMATTR is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMAttr Subprograms on page 167-12):

```
DBMS_XMLDOM.ISNULL(
   a        IN     DOMATTR)
 RETURN BOOLEAN;
```

Checks that the specified DOMCDATASECTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCDataSection Subprograms on page 167-13):

```
DBMS_XMLDOM.ISNULL(
   cds      IN     DOMCDATASECTION)
 RETURN BOOLEAN;
```

Checks that the specified DOMCHARACTERDATA is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMCharacterData Subprograms on page 167-14):

```
DBMS_XMLDOM.ISNULL(
   cd       IN     DOMCHARACTERDATA)
 RETURN BOOLEAN;
```

Checks that the specified DOMCOMMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMComment Subprograms on page 167-15):

```
DBMS_XMLDOM.ISNULL(
   com       IN     DOMCOMMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocument Subprograms on page 167-16):

```
DBMS_XMLDOM.ISNULL(
   doc       IN     DOMDOCUMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTFRAGMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentFragment Subprograms on page 167-18):

```
DBMS_XMLDOM.ISNULL(
   df       IN     DOMDOCUMENTFRAGMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMDOCUMENTTYPE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMDocumentType Subprograms on page 167-19):

```
DBMS_XMLDOM.ISNULL(
   dt       IN     DOMDOCUMENTTYPE)
```

```
 RETURN BOOLEAN;
```

Checks that the specified DOMELEMENT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMElement Subprograms on page 167-20):

```
DBMS_XMLDOM.ISNULL(
   elem     IN     DOMELEMENT)
 RETURN BOOLEAN;
```

Checks that the specified DOMENTITY is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntity Subprograms on page 167-21):

```
DBMS_XMLDOM.ISNULL(
   ent       IN     DOMENTITY)
 RETURN BOOLEAN;
```

Checks that the specified DOMENTITYREFERENCE is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMEntityReference Subprograms on page 167-22):

```
DBMS_XMLDOM.ISNULL(
   EREF       IN     DOMENTITYREFERENCE)
 RETURN BOOLEAN;
```

Checks that the specified DOMIMPLEMENTATION is NULL; returns TRUE if it is NULL (See Also: DOMImplementation Subprograms on page 167-23):

```
DBMS_XMLDOM.ISNULL(
   di       IN     DOMIMPLEMENTATION)
 RETURN BOOLEAN;
```

Checks that the specified DOMNAMEDNODEMAP is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNamedNodeMap Subprograms on page 167-24):

```
DBMS_XMLDOM.ISNULL(
   nnm       IN     DOMNAMEDNODEMAP)
 RETURN BOOLEAN;
```

Checks that the specified DOMNODELIST is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNodeList Subprograms on page 167-25):

```
DBMS_XMLDOM.ISNULL(
   nl       IN     DOMNODELIST)
 RETURN BOOLEAN;
```

Checks that the specified DOMNOTATION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMNotation Subprograms on page 167-26):

```
DBMS_XMLDOM.ISNULL(
   n       IN     DOMNOTATION)
 RETURN BOOLEAN;
```

Checks that the specified DOMPROCESSINGINSTRUCTION is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMProcessingInstruction Subprograms on page 167-27):

```
DBMS_XMLDOM.ISNULL(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN BOOLEAN;
```

Checks that the specified DOMTEXT is NULL; returns TRUE if it is NULL, FALSE otherwise (See Also: DOMText Subprograms on page 167-28):

```
DBMS_XMLDOM.ISNULL(
```

```
  t       IN     DOMTEXT)
RETURN BOOLEAN;
```

Parameters

Table 167–93 ISNULL Function Parameters

Parameter	Description
n	DOMNODE to check
a	DOMATTR to check
cds	DOMCDATASECTION to check
cd	DOMCHARACTERDATA to check
com	DOMCOMMENT to check
doc	DOMDOCUMENT to check
dF	DOMDOCUMENTFRAGMENT to check
dt	DOMDOCUMENTTYPE to check
elem	DOMELEMENT to check
ent	DOMENTITY to check
eref	DOMENTITYREFERENCE to check
di	DOMIMPLEMENTATION to check
nnm	DOMNAMENODEMAP to check
nl	DOMNODELIST to check
n	DOMNOTATION to check
pi	DOMPROCESSINGINSTRUCTION to check
t	DOMTEXT to check

ITEM Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Returns the item in the map which corresponds to the `INDEX` parameter. If `INDEX` is greater than or equal to the number of nodes in this map, this returns `NULL` (See Also: DOMNamedNodeMap Subprograms on page 167-24):

```
DBMS_XMLDOM.ITEM(
   nnm       IN     DOMNAMEDNODEMAP,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Returns the item in the collection which corresponds to the `INDEX` parameter. If index is greater than or equal to the number of nodes in the list, this returns `NULL` (See Also: DOMNodeList Subprograms on page 167-25):

```
DBMS_XMLDOM.ITEM(
   nl        IN     DOMNODELIST,
   index     IN     NUMBER)
 RETURN DOMNODE;
```

Parameters

Table 167–94 ITEM Function Parameters

Parameter	Description
`nnm`	`DOMNAMEDNODEMAP`
`index`	The index in the node map at which the item is to be retrieved
`nl`	`DOMNODELIST`
`index`	The index in the `NodeList` used to retrieve the item

MAKEATTR Function

This function casts a specified DOMNODE to a DOMATTR, and returns the DOMATTR.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKEATTR(
   n        IN     DOMNODE)
 RETURN DOMATTR;
```

Parameters

Table 167–95 MAKEATTR Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECDATASECTION Function

This function casts a specified DOMNODE to a DOMCDATASECTION.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKECDATASECTION(
   n        IN     DOMNODE)
 RETURN DOMCDATASECTION;
```

Parameters

Table 167–96 MAKECDATASECTION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECHARACTERDATA Function

This function casts a specified DOMNODE to a DOMCHARACTERDATA, and returns the DOMCHARACTERDATA.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKECHARACTERDATA(
   n       IN     DOMNode)
 RETURN DOMCharacterData;
```

Parameters

Table 167–97 MAKECHARACTERDATA Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKECOMMENT Function

This function casts a specified DOMNODE to a DOMCOMMENT, and returns the DOMCOMMENT.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKECOMMENT(
   n        IN     DOMNODE)
 RETURN DOMCOMMENT;
```

Parameters

Table 167–98 MAKECOMMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENT, and returns the DOMDOCUMENT.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENT(
   n        IN     DOMNODE)
 RETURN DOMDocument;
```

Parameters

Table 167–99 MAKEDOCUMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENTFRAGMENT Function

This function casts a specified DOMNODE to a DOMDOCUMENTFRAGMENT, and returns the DOMDOCUMENTFRAGMENT.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTFRAGMENT(
   n        IN      DOMNODE)
 RETURN DOMDOCUMENTFRAGMENT;
```

Parameters

Table 167–100 MAKEDOCUMENTFRAGMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEDOCUMENTTYPE Function

This function casts a specified DOMNODE to a DOMDOCUMENTTYPE and returns the DOMDOCUMENTTYPE.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKEDOCUMENTTYPE(
   n        IN     DOMNODE)
 RETURN DOMDOCUMENTTYPE;
```

Parameters

Table 167–101 MAKEDOCUMENTTYPE Function Parameters

Parameter	Description
n	DOMNODE to cast.

MAKEELEMENT Function

This function casts a specified DOMNODE to a DOMELEMENT, and returns the DOMELEMENT.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKEELEMENT(
   n        IN      DOMNODE)
 RETURN DOMELEMENT;
```

Parameters

Table 167–102 MAKEELEMENT Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEENTITY Function

This function casts a specified DOMNODE to a DOMENTITY, and returns the DOMENTITY.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKEENTITY(
   n        IN     DOMNODE)
 RETURN DOMENTITY;
```

Parameters

Table 167–103 MAKEENTITY Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEENTITYREFERENCE Function

This function casts a specified DOMNODE to a DOMENTITYREFERENCE, and returns the DOMENTITYREFERENCE.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKEENTITYREFERENCE(
   n       IN     DOMNODE)
 RETURN DOMENTITYREFERENCE;
```

Parameters

Table 167–104 MAKEENTITYREFERENCE Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKENODE Functions

This function is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Casts specified DOMATTR to a DOMNODE, and returns the DOMNODE (See Also: DOMAttr Subprograms on page 167-12):

```
DBMS_XMLDOM.MAKENODE(
   a         IN     DOMATTR)
 RETURN DOMNODE;
```

Casts the DOMCDATASECTION to a DOMNODE, and returns that DOMNODE (See Also: DOMCDataSection Subprograms on page 167-13):

```
DBMS_XMLDOM.MAKENODE(
   cds       IN     DOMCDATASECTION)
 RETURN DOMNODE;
```

Casts the specified DOMCHARACTERDATA as a DOMNODE, and returns that DOMNODE (See Also: DOMCharacterData Subprograms on page 167-14):

```
DBMS_XMLDOM.MAKENODE(
   cd        IN     DOMCHARACTERDATA)
 RETURN DOMNODE;
```

Casts the specified DOMCOMMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMComment Subprograms on page 167-15):

```
DBMS_XMLDOM.MAKENODE(
   com       IN     DOMCOMMENT)
 RETURN DOMNODE;
```

Casts the DOMDOCUMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocument Subprograms on page 167-16):

```
DBMS_XMLDOM.MAKENODE(
   doc       IN     DOMDOCUMENT)
 RETURN DOMNODE;
```

Casts the specified DOMDOCUMENTFRAGMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentFragment Subprograms on page 167-18):

```
DBMS_XMLDOM.MAKENODE(
   df        IN     DOMDOCUMENTFRAGMENT)
 RETURN DOMNode;
```

Casts the specified DOMDOCUMENTTYPE to a DOMNODE, and returns that DOMNODE (See Also: DOMDocumentType Subprograms on page 167-19):

```
DBMS_XMLDOM.MAKENODE(
   dt        IN     DOMDOCUMENTTYPE)
 RETURN DOMNODE;
```

Casts the specified DOMELEMENT to a DOMNODE, and returns that DOMNODE (See Also: DOMElement Subprograms on page 167-20):

```
DBMS_XMLDOM.MAKENODE(
   elem        IN     DOMELEMENT)
```

```
 RETURN DOMNODE;
```

Casts specified DOMENTITY to a DOMNODE, and returns that DOMNODE (See Also: DOMEntity Subprograms on page 167-21):

```
DBMS_XMLDOM.MAKENODE(
   ent       IN     DOMENTITY)
 RETURN DOMNODE;
```

Casts the DOMENTITYREFERENCE to a DOMNODE, and returns that DOMNODE (See Also: DOMEntityReference Subprograms on page 167-22):

```
DBMS_XMLDOM.MAKENODE(
   eref       IN     DOMENTITYREFERENCE)
 RETURN DOMNODE;
```

Casts the DOMNOTATION to a DOMNODE, and returns that DOMNODE (See Also: DOMNotation Subprograms on page 167-26):

```
DBMS_XMLDOM.MAKENODE(
   n       IN     DOMNOTATION)
 RETURN DOMNODE;
```

Casts the DOMPROCESSINGINSTRUCTION to a DOMNODE, and returns the DOMNODE (See Also: DOMProcessingInstruction Subprograms on page 167-27):

```
DBMS_XMLDOM.MAKENODE(
   pi       IN     DOMPROCESSINGINSTRUCTION)
 RETURN DOMNODE;
```

Casts the DOMTEXT to a DOMNODE, and returns that DOMNODE (See Also: DOMText Subprograms on page 167-28):

```
DBMS_XMLDOM.MAKENODE(
   t       IN     DOMTEXT)
 RETURN DOMNODE;
```

Parameters

Table 167–105 MAKENODE Function Parameters

Parameter	Description
a	DOMATTR to cast
cds	DOMCDATASECTION to cast
cd	DOMCHARACTERDATA to cast
com	DOMCOMMENT to cast
doc	DOMDOCUMENT to cast
df	DOMDOCUMENTFRAGMENT to cast
dt	DOMDOCUMENTTYPE to cast
elem	DOMELEMENT to cast
ent	DOMENTITY to cast
eref	DOMENTITYREFERENCE to cast
n	DOMNOTATION to cast
pi	DOMPROCESSINGINSTRUCTION to cast

Table 167–105 (Cont.) MAKENODE Function Parameters

Parameter	Description
t	DOMTEXT to cast

MAKENOTATION Function

This function casts a specified DOMNODE to a DOMNOTATION, and returns the DOMNOTATION.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKENOTATION(
   n       IN     DOMNODE)
 RETURN DOMNOTATION;
```

Parameters

Table 167–106 MAKENOTATION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKEPROCESSINGINSTRUCTION Function

This function casts a specified DOMNODE to a DOMPROCESSINGINSTRUCTION, and returns the Domprocessinginstruction.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKEPROCESSINGINSTRUCTION(
   n        IN     DOMNODE)
 RETURN DOMPROCESSINGINSTRUCTION;
```

Parameters

Table 167–107 MAKEPROCESSINGINSTRUCTION Function Parameters

Parameter	Description
n	DOMNODE to cast

MAKETEXT Function

This function casts a specified DOMNODE to a DOMTEXT, and returns the DOMTEXT.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.MAKETEXT(
   n        IN     DOMNODE)
 RETURN DOMTEXT;
```

Parameters

Table 167–108 MAKETEXT Function Parameters

Parameter	Description
n	DOMNODE to cast

NEWDOMDOCUMENT Functions

This function returns a new DOMDOCUMENT instance.

See Also: DOMDocument Subprograms on page 167-16

Syntax

Returns a new DOMDOCUMENT instance:

```
DBMS_XMLDOM.NEWDOMDOCUMENT
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified XMLType object:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   xmldoc    IN SYS.XMLTYPE)
 RETURN DOMDOCUMENT;
```

Returns a new DOMDOCUMENT instance created from the specified CLOB:

```
DBMS_XMLDOM.NEWDOMDOCUMENT(
   cl       IN    CLOB)
 RETURN DOMDOCUMENT;
```

Parameters

Table 167–109 NEWDOMDOCUMENT Function Parameters

Parameter	Description
xmldoc	XMLType source for the DOMDOCUMENT
cl	CLOB source for the DOMDOCUMENT

NORMALIZE Procedure

This procedure normalizes the text children of the DOMELEMENT.

See Also: DOMElement Subprograms on page 167-20

Syntax

```
DBMS_XMLDOM.NORMALIZE(
   elem       IN     DOMELEMENT);
```

Parameters

Table 167–110 NORMALIZE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT

REMOVEATTRIBUTE Procedures

This procedure removes an attribute from the DOMELEMENT by name.

See Also: DOMElement Subprograms on page 167-20

Syntax

Removes the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem     IN    DOMELEMENT,
   name     IN    VARCHAR2);
```

Removes the value of a DOMELEMENT's attribute by name and namespace URI.

```
DBMS_XMLDOM.REMOVEATTRIBUTE(
   elem     IN    DOMELEMENT,
   name     IN    VARCHAR2,
   ns       IN    VARCHAR2);
```

Parameters

Table 167–111 REMOVEATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
ns	Namespace

REMOVEATTRIBUTENODE Function

This function removes the specified attribute node from the DOMELEMENT. The method returns the removed node.

See Also: DOMElement Subprograms on page 167-20

Syntax

```
DBMS_XMLDOM.REMOVEATTRIBUTENODE(
   elem       IN     DOMELEMENT,
   oldAttr    IN     DOMATTR)
  RETURN DOMAttr;
```

Parameters

Table 167–112 REMOVEATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT.
oldAttr	The old DOMATTR.

REMOVECHILD Function

This function removes the child node indicated by `oldchild` from the list of children, and returns it.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.REMOVECHILD(
   n          IN     DOMNode,
   oldchild   IN     DOMNode)
 RETURN DOMNODE;
```

Parameters

Table 167–113 REMOVECHILD Function Parameters

Parameter	Description
`n`	`DOMNODE`
`oldCHild`	The child of the node `n` to be removed

REMOVENAMEDITEM Function

This function removes from the map a node specified by name, and returns this node. When this map contains the attributes attached to an element, if the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

See Also: DOMNamedNodeMap Subprograms on page 167-24

Syntax

Removes a node specified by name:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
   name     IN     VARCHAR2)
 RETURN DOMNode;
```

Removes a node specified by name and namespace URI:

```
DBMS_XMLDOM.REMOVENAMEDITEM(
   nnm      IN     DOMNamedNodeMap,
   name     IN     VARCHAR2,
   ns       IN     VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 167–114 REMOVENAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNamedNodeMap
name	The name of the item to be removed from the map
ns	Namespace

REPLACECHILD Function

This function replaces the child node `oldchild` with `newchild` in the list of children, and returns the `oldchild` node. If `newchild` is a `DocumentFragment` object, `oldchild` is replaced by all of the `DocumentFragment` children, which are inserted in the same order. If the `newchild` is already in the tree, it is first removed.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.REPLACECHILD(
   n           IN     DOMNode,
   newchild    IN     DOMNode,
   oldchild    IN     DOMNode)
 RETURN DOMNode;
```

Parameters

Table 167–115 REPLACECHILD Function Parameters

Parameter	Description
`n`	`DOMNode`
`newchild`	The new child which is to replace the old child
`oldchild`	The child of the node n which is to be replaced

REPLACEDATA Procedure

This procedure changes a range of characters in the node. Upon success, data and length reflect the change.

See Also: DOMCharacterData Subprograms on page 167-14

Syntax

```
DBMS_XMLDOM.REPLACEDATA(
   cd        IN     DOMCHARACTERDATA,
   offset    IN     NUMBER,
   cnt       IN     NUMBER,
   arg       IN     VARCHAR2);
```

Parameters

Table 167–116 REPLACEDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The offset at which to replace
cnt	The number of characters to replace
arg	The value to replace with

RESOLVENAMESPACEPREFIX Function

This function resolves the specified namespace prefix, and returns the resolved namespace.

See Also: DOMElement Subprograms on page 167-20

Syntax

```
DBMS_XMLDOM.RESOLVENAMESPACEPREFIX(
   elem       IN     DOMELEMENT,
   prefix     IN     VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 167–117 RESOLVENAMESPACEPREFIX Function Parameters

Parameter	Description
`elem`	The `DOMELEMENT`
`prefix`	Namespace prefix

SETATTRIBUTE Procedures

Sets the value of a DOMELEMENT's attribute by name.

See Also: DOMElement Subprograms on page 167-20

Syntax

Sets the value of a DOMELEMENT's attribute by name:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem       IN  DOMELEMENT,
   name       IN  VARCHAR2,
   newvalue   IN  VARCHAR2);
```

Sets the value of a DOMElement's attribute by name and namespace URI:

```
DBMS_XMLDOM.SETATTRIBUTE(
   elem       IN  DOMELEMENT,
   name       IN  VARCHAR2,
   newvalue   IN  VARCHAR2,
   ns         IN  VARCHAR2);
```

Parameters

Table 167–118 SETATTRIBUTE Procedure Parameters

Parameter	Description
elem	The DOMELEMENT
name	Attribute name
newvalue	Attribute value
ns	Namespace

SETATTRIBUTENODE Functions

Adds a new attribute node to the DOMELEMENT.

See Also: DOMElement Subprograms on page 167-20

Syntax

Adds a new attribute node to the DOMELEMENT:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR)
 RETURN DOMATTR;
```

Adds a new attribute node to the DOMElement; namespace enabled:

```
DBMS_XMLDOM.SETATTRIBUTENODE(
   elem      IN  DOMELEMENT,
   newAttr   IN  DOMATTR,
   ns        IN  VARCHAR2)
 RETURN DOMATTR;
```

Parameters

Table 167–119 SETATTRIBUTENODE Function Parameters

Parameter	Description
elem	The DOMELEMENT
newAttr	The new DOMATTR
ns	The namespace

SETDATA Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Sets the character data of the node that implements this interface (See Also: DOMCharacterData Subprograms on page 167-14):

```
DBMS_XMLDOM.SETDATA(
   cd       IN     DOMCHARACTERDATA,
   data     IN     VARCHAR2);
```

Sets the content data of the DOMPROCESSINGINSTRUCTION (See Also: DOMProcessingInstruction Subprograms on page 167-14):

```
DBMS_XMLDOM.SETDATA(
   pi       IN     DOMPROCESSINGINSTRUCTION,
   data     IN     VARCHAR2);
```

Parameters

Table 167–120 SETDATA Procedure Parameters

Parameter	Description
cd	DOMCHARACTERDATA
data	The data to which the node is set
pi	DOMPROCESSINGINSTRUCTION
data	New processing instruction content data

SETDOCTYPE Procedure

Given a DOM document, this procedure creates a new DTD with the specified name, system id and public id and sets it in the document. This DTD can later be retrieved using the GETDOCTYPE Function.

Syntax

```
DBMS_XMLDOM.SETDOCTYPE(
  doc     IN   DOMDocument,
  name    IN   VARCHAR2,
  sysid   IN   VARCHAR2,
  pubid   IN   VARCHAR2);
```

Parameters

Table 167–121 SETDOCTYPE Procedure Parameters

Parameter	Description
doc	The document whose DTD has to be set
name	The name that the doctype needs to be initialized with
sysid	The system ID that the doctype needs to be initialized with
pubid	The public ID that the doctype needs to be initialized with

SETNAMEDITEM Function

This function adds a node using its NodeName attribute. If a node with that name is already present in this map, it is replaced by the new one. The old node is returned on replacement; if no replacement is made, NULL is returned.

As the NodeName attribute is used to derive the name under which the node must be stored, multiple nodes of certain types, those that have a "special" string value, cannot be stored because the names would clash. This is seen as preferable to allowing nodes to be aliased.

See Also: DOMNamedNodeMap Subprograms on page 167-24

Syntax

Adds a node using its NodeName attribute:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm      IN     DOMNAMEDNODEMAP,
   arg      IN     DOMNODE)
 RETURN DOMNode;
```

Adds a node using its NodeName attribute and namespace URI:

```
DBMS_XMLDOM.SETNAMEDITEM(
   nnm      IN     DOMNAMEDNODEMAP,
   arg       IN    DOMNODE,
   ns       IN     VARCHAR2)
 RETURN DOMNode;
```

Parameters

Table 167–122 SETNAMEDITEM Function Parameters

Parameter	Description
nnm	DOMNAMEDNODEMAP
arg	The Node to be added using its NodeName attribute
ns	Namespace

SETNODEVALUE Procedure

This procedure sets the value of this node, depending on its type. When it is defined to be NULL, setting it has no effect.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.SETNODEVALUE(
   n         IN     DOMNODE,
   nodeValue IN     VARCHAR2);
```

Parameters

Table 167–123 SETNODEVALUE Procedure Parameters

Parameter	Description
n	DOMNode
nodeValue	The value to which node is set

SETNODEVALUEASBINARYSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 167-10

Syntax

This function returns an instance of the PL/SQL `XMLBINARYOUTPUTSTREAM` into which the caller can write the node value. The data type of the node must be `RAW` or `BLOB` – if not, an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n      IN     DOMNODE)
 RETURN SYS.UTL_BINARYOUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of `sys.utl_BinaryInputStream` from which XDB reads data to populate the node. The data type of the node must be `RAW` or BLOB – if not an exception is raised.

```
DBMS_XMLDOM.SETNODEVALUEASBINARYSTREAM (
   n        in   DOMNODE,
   value    in   SYS.UTL_BINARYINPUTSTREAM);
```

Parameters

Table 167–124 SETNODEVALUEASBINARYSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	BINARYINPUTSTREAM

SETNODEVALUEASCHARACTERSTREAM Function & Procedure

The operation of these subprograms is described with each syntax implementation.

See Also: DOMNode Subprograms on page 167-10

Syntax

This function returns an instance of the PL/SQL XMLCHARACTEROUTPUTSTREAM type into which the caller can write the node value. The data type of the node can be any valid XDB data type. If the type is not character or CLOB, the character data written to the stream is converted to the node data type. If the data type of the node is character or CLOB, then the character data written to the stream is converted from PL/SQL session character set to the character set of the node.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n         IN     DOMNODE)
 RETURN SYS.UTL_CHARACTEROUTPUTSTREAM;
```

Using this procedure, the application passes in an implementation of SYS.UTL_CHARACTERINPUTSTREAM from which XDB reads to populate the node. The data type of the node may be any valid type supported by XDB. If a non-character data type, the character data read from the stream is converted to the data type of the node. If the data type of the node is either character or CLOB, then no conversion occurs and the character set of the node becomes the character set of the PL/SQL session.

```
DBMS_XMLDOM.SETNODEVALUEASCHARACTERSTREAM  (
   n         IN   DOMNODE,
   value     IN   SYS.UTL_CHARACTERINPUTSTREAM);
```

Parameters

Table 167–125 SETNODEVALUEASCHARACTERSTREAM Function & Procedure Parameters

Parameter	Description
n	DOMNODE
value	CHARACTERINPUTSTREAM

SETPREFIX Procedure

This procedure sets the namespace prefix for this node to the specified value.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.SETPREFIX(
   n       IN     DOMNODE,
   prefix  IN     VARCHAR2);
```

Parameters

Table 167–126 SETPREFIX Procedure Parameters

Parameter	Description
n	DOMNODE
prefix	The value for the namespace prefix of the node

SETSTANDALONE Procedure

This procedure sets the standalone property of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.SETSTANDALONE(
   doc          IN     DOMDOCUMENT,
   newvalue     IN     VARCHAR2);
```

Parameters

Table 167–127 SETSTANDALONE Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
newvalue	Value of the standalone property of the document

SETVALUE Procedure

This procedure sets the value of the attribute.

See Also: DOMAttr Subprograms on page 167-12

Syntax

```
DBMS_XMLDOM.SETVALUE(
   a       IN     DOMATTR,
   value   IN     VARCHAR2);
```

Parameters

Table 167–128 SETVALUE Procedure Parameters

Parameter	Description
a	DOMATTR
value	The value to which to set the attribute

SETVERSION Procedure

This procedure sets the version of the DOMDOCUMENT.

See Also: DOMDocument Subprograms on page 167-16

Syntax

```
DBMS_XMLDOM.SETVERSION(
   doc         IN     DOMDOCUMENT,
   version     IN     VARCHAR2);
```

Parameters

Table 167–129 SETVERSION Procedure Parameters

Parameter	Description
doc	DOMDOCUMENT
version	The version of the document

SPLITTEXT Function

This function breaks this DOMTEXT node into two DOMTEXT nodes at the specified offset.

See Also: DOMText Subprograms on page 167-28

Syntax

```
DBMS_XMLDOM.SPLITTEXT(
   t        IN     DOMTEXT,
   offset   IN     NUMBER)
 RETURN DOMText;
```

Parameters

Table 167–130 SPLITTEXT Function Parameters

Parameter	Description
t	DOMTEXT
offset	Offset at which to split

SUBSTRINGDATA Function

This function extracts a range of data from the node.

See Also: DOMCharacterData Subprograms on page 167-14

Syntax

```
DBMS_XMLDOM.SUBSTRINGDATA(
   cd         IN     DOMCHARACTERDATA,
   offset     IN     NUMBER,
   cnt        IN     NUMBER)
 RETURN VARCHAR2;
```

Parameters

Table 167–131 SUBSTRINGDATA Function Parameters

Parameter	Description
cd	DOMCHARACTERDATA
offset	The starting offset of the data from which to get the data
cnt	The number of characters (from the offset) of the data to get

USEBINARYSTREAM Function

This function returns TRUE if the data type of the node is RAW or BLOB so that the node value may be read or written using an UTL_BINARYINPUTSTREAM or UTL_BINARYOUTPUTSTREAM. If a value of FALSE is returned, the node value may only be accessed through an UTL_CHARACTERINPUTSTREAM or UTL_CHARACTEROUTPUTSTREAM.

See Also: DOMNode Subprograms on page 167-10

Syntax

```
DBMS_XMLDOM.USEBINARYSTREAM   (
   n        IN     DOMNODE)
 RETURN BOOLEAN;
```

Parameters

Table 167–132 USEBINARYSTREAM Function Parameters

Parameter	Description
n	DOMNODE

WRITETOBUFFER Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified buffer using the database character set (See Also: DOMNode Subprograms on page 167-10):

```
DBMS_XMLDOM.WRITETOBUFFER(
   n        IN      DOMNODE,
   buffer   IN OUT  VARCHAR2);
```

Writes XML document to a specified buffer using database character set (See Also: DOMDocument Subprograms on page 167-16):

```
DBMS_XMLDOM.WRITETOBUFFER(
   doc       IN      DOMDOCUMENT,
   buffer    IN OUT  VARCHAR2);
```

Writes the contents of the specified document fragment into a buffer using the database character set (See Also: DOMDocumentFragment Subprograms on page 167-18):

```
DBMS_XMLDOM.WRITETOBUFFER(
   df        IN      DOMDOCUMENTFRAGMENT,
   buffer    IN OUT  VARCHAR2);
```

Parameters

Table 167–133 WRITETOBUFFER Procedure Parameters

Parameter	Description
n	DOMNODE
buffer	Buffer to which to write
doc	DOMDOCUMENT
df	DOM document fragment

WRITETOCLOB Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified `CLOB` using the database character set (See Also: DOMNode Subprograms on page 167-10):

```
DBMS_XMLDOM.WRITETOCLOB(
   n       IN      DOMNODE,
   cl      IN OUT  CLOB);
```

Writes XML document to a specified `CLOB` using database character set (See Also: DOMDocument Subprograms on page 167-16):

```
DBMS_XMLDOM.WRITETOCLOB(
   doc     IN      DOMDOCUMENT,
   cl      IN OUT  CLOB);
```

Parameters

Table 167–134 WRITETOCLOB Procedure Parameters

Parameter	Description
`n`	`DOMNODE`
`cl`	`CLOB` to which to write
`doc`	`DOMDOCUMENT`

WRITETOFILE Procedures

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Syntax

Writes XML node to specified file using the database character set (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2);
```

Writes XML node to specified file using the specified character set, which is passed in as a separate parameter (See Also: DOMNode Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   n          IN      DOMNODE,
   fileName   IN      VARCHAR2,
   charset    IN      VARCHAR2);
```

Writes an XML document to a specified file using database character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc        IN   DOMDOCUMENT,
   filename   IN   VARCHAR2);
```

Writes an XML document to a specified file using specified character set (See Also: DOMDocument Subprograms):

```
DBMS_XMLDOM.WRITETOFILE(
   doc       IN   DOMDOCUMENT,
   fileName  IN   VARCHAR2,
   charset   IN   VARCHAR2);
```

Parameters

Table 167–135 WRITETOFILE Procedure Parameters

Parameter	Description
n	DOMNODE
fileName	File to which to write
charset	specified character set
doc	DOMDOCUMENT
charset	Character set

168

DBMS_XMLGEN

The DBMS_XMLGEN package converts the results of a SQL query to a canonical XML format. The package takes an arbitrary SQL query as input, converts it to XML format, and returns the result as a CLOB. This package is similar to the DBMS_XMLQUERY package, except that it is written in C and compiled into the kernel. This package can only be run on the database.

This chapter contains the following topic:

- Summary of DBMS_XMLGEN Subprograms

> **See Also:** *Oracle XML DB Developer's Guide*, for more information on XML support and on examples of using DBMS_XMLGEN

Summary of DBMS_XMLGEN Subprograms

Table 168–1 Summary of DBMS_XMLGEN Package Subprograms

Subprogram	Description
CLOSECONTEXT Procedure on page 168-3	Closes the context and releases all resources
CONVERT Functions on page 168-4	Converts the XML into the escaped or unescaped XML equivalent
GETNUMROWSPROCESSED Function on page 168-5	Gets the number of SQL rows that were processed in the last call to GETXML Functions
GETXML Functions on page 168-6	Gets the XML document
GETXMLTYPE Functions on page 168-7	Gets the XML document and returns it as `XMLType`
NEWCONTEXT Functions on page 168-8	Creates a new context handle
RESTARTQUERY Procedure on page 168-9	Restarts the query to start fetching from the beginning
SETCONVERTSPECIALCHARS Procedure on page 168-10	Sets whether special characters such as `$`, which are non-XML characters, should be converted or not to their escaped representation
SETMAXROWS Procedure on page 168-11	Sets the maximum number of rows to be fetched each time
SETNULLHANDLING Procedure on page 168-12	Sets `NULL` handling options
SETROWSETTAG Procedure on page 168-13	Sets the name of the element enclosing the entire result
SETROWTAG Procedure on page 168-14	Sets the name of the element enclosing each row of the result
SETSKIPROWS Procedure on page 168-15	Sets the number of rows to skip every time before generating the XML.
USEITEMTAGSFORCOLL Procedure on page 168-16	Forces the use of the collection column name appended with the tag `_ITEM` for collection elements
USENULLATTRIBUTEINDICATOR Procedure on page 168-17	Specified weather to use an XML attribute to indicate `NULL`ness, or to do it by omitting the inclusion of the particular entity in the XML document.

CLOSECONTEXT Procedure

This procedure closes a given context and releases all resources associated with it, including the SQL cursor and bind and define buffers. After this call, the handle cannot be used for a subsequent function call.

Syntax

```
DBMS_XMLGEN.CLOSECONTEXT (
   ctx  IN ctxHandle);
```

Parameters

Table 168–2 CLOSECONTEXT Procedure Parameters

Parameter	Description
ctx	The context handle to close.

CONVERT Functions

This function converts the XML data into the escaped or unescapes XML equivalent, and returns XML CLOB data in encoded or decoded format. There are several version of the function.

Syntax

Uses XMLDATA in string form (VARCHAR2):

```
DBMS_XMLGEN.CONVERT (
   xmlData IN VARCHAR2,
   flag    IN NUMBER := ENTITY_ENCODE)
RETURN VARCHAR2;
```

Uses XMLDATA in CLOB form:

```
DBMS_XMLGEN.CONVERT (
   xmlData IN CLOB,
   flag    IN NUMBER := ENTITY_ENCODE)
 RETURN CLOB;
```

Parameters

Table 168–3 CONVERT Function Parameters

Parameter	Description
xmlData	The XML CLOB data to be encoded or decoded.
flag	The flag setting; ENTITY_ENCODE (default) for encode, and ENTITY_DECODE for decode.

Usage Notes

This function escapes the XML data if the ENTITY_ENCODE is specified. For example, the escaped form of the character < is <. Unescaping is the reverse transformation.

GETNUMROWSPROCESSED Function

This function retrieves the number of SQL rows processed when generating the XML using the GETXML Functions call. This count does not include the number of rows skipped before generating the XML. Note that GETXML Functions always generates an XML document, even if there are no rows present.

Syntax

```
DBMS_XMLGEN.GETNUMROWSPROCESSED (
   ctx     IN    ctxHandle)
RETURN NUMBER;
```

Parameters

Table 168–4 GETNUMROWSPROCESSED Function Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call on page 168-8.

Usage Notes

This function is used to determine the terminating condition if calling GETXML Functions in a loop.

GETXML Functions

This function gets the XML document. The function is overloaded.

Syntax

Gets the XML document by fetching the maximum number of rows specified. It appends the XML document to the CLOB passed in. Use this version of GETXML Functions to avoid any extra CLOB copies and to reuse the same CLOB for subsequent calls. Because of the CLOB reuse, this GETXML Functionscall is potentially more efficient:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   tmpclob      IN OUT NCOPY CLOB,
   dtdOrSchema  IN number := NONE)
 RETURN BOOLEAN;
```

Generates the XML document and returns it as a temporary CLOB. The temporary CLOB obtained from this function must be freed using the DBMS_ LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   ctx          IN ctxHandle,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Converts the results from the SQL query string to XML format, and returns the XML as a temporary CLOB, which must be subsequently freed using the DBMS_ LOB.FREETEMPORARY call:

```
DBMS_XMLGEN.GETXML (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN CLOB;
```

Parameters

Table 168–5 GETXML Function Parameters

Parameter	Description
ctx	The context handle obtained from the newContext call.
tmpclob	The CLOB to which the XML document is appended.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only NONE is supported.

Usage Notes

When the rows indicated by the SETSKIPROWS Procedure call are skipped, the maximum number of rows as specified by the SETMAXROWS Procedure call (or the entire result if not specified) is fetched and converted to XML. Use the GETNUMROWSPROCESSED Function to check if any rows were retrieved.

GETXMLTYPE Functions

This function gets the XML document and returns it as an XMLTYPE. XMLTYPE operations can be performed on the results.

This function is overloaded.

Syntax

Generates the XML document and returns it as a sys.XMLType:

```
DBMS_XMLGEN.GETXMLTYPE (
   ctx           IN ctxhandle,
   dtdOrSchema   IN number := NONE)
 RETURN sys.XMLType;
```

Converts the results from the SQL query string to XML format, and returns the XML as a sys.XMLType:

```
DBMS_XMLGEN.GETXMLTYPE (
   sqlQuery     IN VARCHAR2,
   dtdOrSchema  IN number := NONE)
 RETURN sys.XMLType
```

Parameters

Table 168–6 GETXMLTYPE Function Parameters

Parameter	Description
ctx	The context handle obtained from the newContext call.
sqlQuery	The SQL query string.
dtdOrSchema	Generate a DTD or a schema? Only NONE is supported.

NEWCONTEXT Functions

This function generates and returns a new context handle. This context handle is used in GETXML Functions and other functions to get XML back from the result. There are several version of the function.

Syntax

Generates a new context handle from a query:

```
DBMS_XMLGEN.NEWCONTEXT (
      query     IN VARCHAR2)
 RETURN ctxHandle;
```

Generates a new context handle from a query string in the form of a PL/SQL ref cursor:

```
DBMS_XMLGEN.NEWCONTEXT (
   queryString  IN SYS_REFCURSOR)
 RETURN ctxHandle;
```

Parameters

Table 168–7 NEWCONTEXT Function Parameters

Parameter	Description
`query`	The query, in the form of a `VARCHAR`, the result of which must be converted to XML.
`queryString`	The query string in the form of a PL/SQL ref cursor, the result of which must be converted to XML.

RESTARTQUERY Procedure

This procedure restarts the query and generates the XML from the first row. It can be used to start executing the query again, without having to create a new context.

Syntax

```
DBMS_XMLGEN.RESTARTQUERY (
ctx  IN ctxHandle);
```

Parameters

Table 168–8 RESTARTQUERY Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the current query.

SETCONVERTSPECIALCHARS Procedure

This procedure sets whether or not special characters in the XML data must be converted into their escaped XML equivalent. For example, the < sign is converted to `<`. The default is to perform conversions. This function improves performance of XML processing when the input data cannot contain any special characters such as <, >, `"`, `'`, which must be escaped. It is expensive to scan the character data to replace the special characters, particularly if it involves a lot of data.

Syntax

```
DBMS_XMLGEN.SETCONVERTSPECIALCHARS (
ctx   IN ctxHandle,
conv  IN BOOLEAN);
```

Parameters

Table 168–9 SETCONVERTSPECIALCHARS Procedure Parameters

Parameter	Description
`ctx`	The context handle obtained from one of the NEWCONTEXT Functions call on page 168-8.
`conv`	`TRUE` indicates that conversion is needed.

SETMAXROWS Procedure

This procedure sets the maximum number of rows to fetch from the SQL query result for every invokation of the GETXML Functions call. It is used when generating paginated results. For example, when generating a page of XML or HTML data, restrict the number of rows converted to XML or HTML by setting the `maxrows` parameter.

Syntax

```
DBMS_XMLGEN.SETMAXROWS (
ctx      IN ctxHandle,
maxRows  IN NUMBER);
```

Parameters

Table 168–10 SETMAXROWS Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`maxRows`	The maximum number of rows to get for each call to GETXML Functions

SETNULLHANDLING Procedure

This procedure sets NULL handling options, handled through the flag parameter setting.

Syntax

```
DBMS_XMLGEN.SETNULLHANDLING(
ctx  IN ctx,
flag IN NUMBER);
```

Parameters

Table 168–11 SETNULLHANDLING Procedure Parameters

Parameter	Description
ctx	The context handle corresponding to the query executed.
flag	The NULL handling option set. ■ DROP_NULLS CONSTANT NUMBER:= 0; (Default) Leaves out the tag for NULL elements. ■ NULL_ATTR CONSTANT NUMBER:= 1; Sets xsi:nil="true". ■ EMPTY_TAG CONSTANT NUMBER:= 2; Sets, for example, <foo/>.

SETROWSETTAG Procedure

This procedure sets the name of the root element of the document. The default name is `ROWSET`.

Syntax

```
DBMS_XMLGEN.SETROWSETTAG (
ctx            IN ctxHandle,
rowSetTagName  IN VARCHAR2);
```

Parameters

Table 168–12 SETROWSETTAG Procedure Parameters

Parameter	Description
ctx	The context handle obtained from the NEWCONTEXT Functions call on page 168-8.
rowSetTagName	The name of the document element. Passing `NULL` indicates that you do not want the `ROWSET` element present.

Usage Notes

The user can set the `rowSetTag` to `NULL` to suppress the printing of this element. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output . This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

SETROWTAG Procedure

This procedure sets the name of the element separating all the rows. The default name is `ROW`.

Syntax

```
DBMS_XMLGEN.SETROWTAG (
ctx         IN ctxHandle,
rowTagName  IN VARCHAR2);
```

Parameters

Table 168–13 SETROWTAG Procedure Parameters

Parameter	Description
`ctx`	The context handle obtained from the NEWCONTEXT Functions call on page 168-8.
`rowTagName`	The name of the `ROW` element. Passing `NULL` indicates that you do not want the `ROW` element present.

Usage Notes

The user can set the name of the element to `NULL` to suppress the `ROW` element itself. However, an error is produced if both the row and the rowset are `NULL` and there is more than one column or row in the output. This is because the generated XML would not have a top-level enclosing tag, and so would be invalid.

SETSKIPROWS Procedure

This procedure skips a given number of rows before generating the XML output for every call to the GETXML Functions. It is used when generating paginated results for stateless Web pages using this utility. For example, when generating the first page of XML or HTML data, set `skiprows` to zero. For the next set, set the `skiprows` to the number of rows obtained in the first case. See GETNUMROWSPROCESSED Function on page 168-5.

Syntax

```
DBMS_XMLGEN.SETSKIPROWS (
ctx       IN ctxHandle,
skipRows  IN NUMBER);
```

Parameters

Table 168–14 SETSKIPROWS Procedure Parameters

Parameter	Description
`ctx`	The context handle corresponding to the query executed.
`skipRows`	The number of rows to skip for each call to `getXML`.

USEITEMTAGSFORCOLL Procedure

This procedure overrides the default name of the collection elements. The default name for collection elements is the type name itself.

Syntax

```
DBMS_XMLGEN.USEITEMTAGSFORCOLL (
   ctx  IN ctxHandle);
```

Parameters

Table 168–15 USEITEMTAGSFORCOLL Procedure Parameters

Parameter	Description
ctx	The context handle.

Usage Notes

Using this procedure, you can override the default to use the name of the column with the _ITEM tag appended to it. If there is a collection of NUMBER, the default tag name for the collection elements is NUMBER.

USENULLATTRIBUTEINDICATOR Procedure

This procedure specifies whether to use an XML attribute to indicate NULLness, or to do it by omitting the inclusion of the particular entity in the XML document. It is used as a shortcut for the SETNULLHANDLING Procedure .

Syntax

```
DBMS_XMLGEN.USENULLATTRIBUTEINDICATOR(
ctx       IN   ctxType,
attrind   IN   BOOLEAN := TRUE);
```

Parameters

Table 168–16 USENULLATTRIBUTEINDICATOR Procedure Parameters

Parameter	Description
ctx	Context handle.
attrind	Use attribute to indicate NULL?

169

DBMS_XMLINDEX

The DBMS_XMLINDEX package provides an interface to implement asychronous indexing.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about "XMLIndex"

This chapter contains the following topics:

- Using DBMS_XMLINDEX
  - Overview
- Summary of DBMS_XMLINDEX Subprograms

Using DBMS_XMLINDEX

- Overview

Overview

Asynchronous Index Maintenance

The basic XMLIndex is maintained on every DML operation. However, given the computing costs, in many cases the availability of stale result is adequate. In such situations, it is desirable to defer index updates to a convenient time, for example to a time when the load on the database is low. Thus a mechanism for asynchronous index maintenance is provided.

Summary of DBMS_XMLINDEX Subprograms

This table list the package subprograms in alphabetical order.

Table 169–1 DBMS_XMLINDEX Package Subprograms

Subprogram	Description
CREATEDATEINDEX Procedure on page 169-5	Creates a secondary index for date values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`
CREATENUMBERINDEX Procedure on page 169-6	Creates a secondary index for number values in the `VALUE` column of a `PATH TABLE` which is the storage table of an `XMLIndex`
DROPPARAMETER Procedure on page 169-7	Drops the `XMLIndex` parameter string that is associated with a given parameter identifier.
MODIFYPARAMETER Procedure on page 169-8	Modifies the `XMLIndex` parameter string that is associated with a given parameter name
REGISTERPARAMETER Procedure on page 169-9	Registers a parameter string and `XMLIndex` parameter string pair in XDB
SYNCINDEX Procedure on page 169-10	Synchronizes the index manually

CREATEDATEINDEX Procedure

This procedure creates a secondary index for date values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex. The second form of the procedure allows for the date_index_clause to be set to an empty string.

Syntax

```
DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2,
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2,
   date_index_clause  IN   VARCHAR2);

DBMS_XMLINDEX.CREATEDATEINDEX  (
   xml_index_schema   IN   VARCHAR2
   xml_index_name     IN   VARCHAR2,
   date_index_name    IN   VARCHAR2,
   xmltypename        IN   VARCHAR2);
```

Parameters

Table 169–2 CREATEDATEINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
date_index_name	Name of the secondary index to be created for date values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: DATETIME, TIME, DATE, GDAY, GMONTH, GYEAR, GYEARMONTH, GMONTHDAY.
date_index_clause	Storage clause to be applied to the date index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the date index

CREATENUMBERINDEX Procedure

This procedure creates a secondary index for number values in the VALUE column of a PATH TABLE which is the storage table of an XMLIndex.

Syntax

```
DBMS_XMLINDEX.CREATENUMBERINDEX (
   xml_index_schema   IN   VARCHAR2,
   xml_index_name     IN   VARCHAR2,
   num_index_name     IN   VARCHAR2,
   num_index_clause   IN   VARCHAR2,
   xmltypename        IN   VARCHAR2);
```

Parameters

Table 169–3 CREATENUMBERINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_index_name	Name of the XMLIndex
num_index_name	Name of the secondary index to be created for number values in the VALUE column of the PATH TABLE of XMLIndex named xml_index_name and owned by xml_index_schema
num_index_clause	Storage clause to be applied to the number index during its creation. This is a string argument appended to the CREATE INDEX statement for creating the number index.
xmltypename	The type to which values in the VALUE column of the path table are to be cast. Acceptable values are the following strings: FLOAT, DOUBLE, DECIMAL, INTEGER, NONPOSITIVEINTEGER, NEGATIVEINTEGER, LONG, INT, SHORT, BYTE, NONNEGATIVEINTEGER, UNSIGNEDLONG, UNSIGNEDINT, UNSIGNEDSHORT, UNSIGNEDBYTE, POSITIVEINTEGER.

DROPPARAMETER Procedure

This procedure drops the `XMLIndex` parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.DROPPARAMETER (
   name         IN      VARCHAR2);
```

Parameters

Table 169–4 DROPPARAMETER Procedure Parameters

Parameter	Description
`name`	Identifier for parameter string

Examples

```
DBMS_XMLINDEX.DROPPARAMETER (
   'myIndexParam');
```

MODIFYPARAMETER Procedure

This procedure modifies the XMLIndex parameter string that is associated with a given parameter identifier.

Syntax

```
DBMS_XMLINDEX.MODIFYPARAMETER (
   name        IN      VARCHAR2,
   parameter   IN      CLOB);
```

Parameters

Table 169–5 MODIFYPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

Examples

```
DBMS_XMLINDEX.MODIFYPARAMETER (
   'myIndexParam',
   'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx');
```

REGISTERPARAMETER Procedure

This procedure registers a parameter identifier and XMLIndex parameter string pair in XDB.

Syntax

```
DBMS_XMLINDEX.REGISTERPARAMETER (
   name        IN      VARCHAR2,
   parameter   IN      CLOB);
```

Parameters

Table 169–6 REGISTERPARAMETER Procedure Parameters

Parameter	Description
name	Identifier for parameter string
parameter	XMLIndex parameter clause that can appear in a CREATE INDEX or an ALTER INDEX statement

Examples

```
DBMS_XMLINDEX.REGISTERPARAMETER (
   'myIndexParam',
   'PATH TABLE po_ptab
    PATH ID INDEX po_pidx
    ORDER KEY INDEX po_oidx
    VALUE INDEX po_vidx
    PATHS(NAMESPACE MAPPING(xmlns:p="http://www.example.com/IPO"))
    GROUP MASTERGROUP XMLTABLE PO_TAB
    (''/p:PurchaseOrder''
        COLUMNS
           REFERENCE VARCHAR2(30) PATH ''p:Reference'',
           REQUESTOR VARCHAR2(30) PATH ''p:Requestor'' )
    GROUP ITEMGROUP XMLTABLE ITEMGROUP_TAB
    (''/p:PurchaseOrder/p:LineItems/p:LineItem''
        COLUMNS
           LINENUMBER NUMBER(38) PATH ''@p:ItemNumber'',
           QUANTITY NUMBER(38) PATH ''@p:Quantity'',
           DESCRIPTION VARCHAR2(256) PATH ''p:Description'' ));
```

SYNCINDEX Procedure

This function synchronizes an asynchronously maintained XMLIndex. It applies to the XMLIndex changes that are logged in the pending table, and brings the path table up-to-date with the base XMLTYPE column.

Syntax

```
DBMS_XMLINDEX.SYNCINDEX (
   xml_index_schema      IN VARCHAR2,
   xml_index_name        IN VARCHAR2,
   partition_name        IN VARCHAR2 DEFAULT NULL,
   reindex               IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 169–7 SYNCINDEX Procedure Parameters

Parameter	Description
xml_index_schema	Name of the owner of the XMLIndex
xml_schema_name	Name of the XMLIndex
partition_name	[Currently not supported]
reindex	Default is FALSE. If set to TRUE, this drops the secondary indexes and recreates them later so that they can be bulkloaded.

Examples

```
EXEC DBMS_XMLINDEX.SYNCINDEX('USER1', 'SS_TAB_XMLI', REINDEX=>TRUE);
```

170

DBMS_XMLPARSER

Using DBMS_XMLPARSER, you can access the contents and structure of XML documents. XML describes a class of data XML document objects. It partially describes the behavior of computer programs which process them. By construction, XML documents are conforming SGML documents.

XML documents are made up of storage units called entities, which contain either parsed or unparsed data. Parsed data is made up of characters, some of which form character data, and some of which form markup. Markup encodes a description of the document's storage layout and logical structure. XML provides a mechanism to impose constraints on the storage layout and logical structure.

A software module called an XML processor is used to read XML documents and provide access to their content and structure. It is assumed that an XML processor is doing its work on behalf of another module, called the application. This PL/SQL implementation of the XML processor (or parser) follows the W3C XML specification REC-xml-19980210 and includes the required behavior of an XML processor in terms of how it must read XML data and the information it must provide to the application.

The default behavior for this PL/SQL XML parser is to build a parse tree that can be accessed by DOM APIs, validate it if a DTD is found (otherwise, it is non-validating), and record errors if an error log is specified. If parsing fails, an application error is raised.

This chapter contains the following topics:

- Summary of DBMS_XMLPARSER Subprograms

See Also: *Oracle XML DB Developer's Guide*

Summary of DBMS_XMLPARSER Subprograms

Table 170–1 DBMS_XMLPARSER Package Subprograms

Method	Description
FREEPARSER on page 170-3	Frees a parser object.
GETDOCTYPE on page 170-4	Gets parsed DTD.
GETDOCUMENT on page 170-5	Gets DOM document.
GETRELEASEVERSION on page 170-5	Returns the release version of Oracle XML Parser for PL/SQL.
GETVALIDATIONMODE on page 170-7	Returns validation mode.
NEWPARSER on page 170-8	Returns a new parser instance
PARSE on page 170-9	Parses XML stored in the given url/file.
PARSEBUFFER on page 170-10	Parses XML stored in the given buffer
PARSECLOB on page 170-10	Parses XML stored in the given clob
PARSEDTD on page 170-12	Parses DTD stored in the given url/file
PARSEDTDBUFFER on page 170-13	Parses DTD stored in the given buffer
PARSEDTDCLOB on page 170-14	Parses DTD stored in the given clob
SETBASEDIR on page 170-15	Sets base directory used to resolve relative URLs.
SETDOCTYPE on page 170-16	Sets DTD.
SETERRORLOG on page 170-17	Sets errors to be sent to the specified file
SETPRESERVEWHITESPACE on page 170-18	Sets white space preserve mode
SETVALIDATIONMODE on page 170-19	Sets validation mode.
SHOWWARNINGS on page 170-20	Turns warnings on or off.

FREEPARSER

Frees a parser object.

Syntax

```
PROCEDURE freeParser(
    p Parser);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETDOCTYPE

Returns the parsed DTD; this function must be called only after a DTD is parsed.

Syntax

```
FUNCTION getDoctype(
p Parser)
RETURN DOMDocumentType;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETDOCUMENT

Returns the document node of a DOM tree document built by the parser; this function must be called only after a document is parsed.

Syntax

```
FUNCTION GETDOCUMENT(
p Parser)
RETURN DOMDocument;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

GETRELEASEVERSION

Returns the release version of the Oracle XML parser for PL/SQL.

Syntax

```
FUNCTION getReleaseVersion
RETURN VARCHAR2;
```

GETVALIDATIONMODE

Retrieves validation mode; TRUE for validating, FALSE otherwise.

Syntax

```
FUNCTION GETVALIDATIONMODE(
p Parser)
RETURN BOOLEAN;
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.

NEWPARSER

Returns a new parser instance. This function must be called before the default behavior of Parser can be changed and if other parse methods need to be used.

Syntax

```
FUNCTION newParser
RETURN Parser;
```

PARSE

Parses XML stored in the given URL or file. An application error is raised if parsing fails. There are several versions of this method.

Syntax	Description

`FUNCTION parse(`
`  url VARCHAR2)`
`RETURN DOMDocument;`
	Returns the built DOM Document.
	This is meant to be used when the default parser behavior is acceptable and just a url/file needs to be parsed.

`PROCEDURE parse(`
`  p  Parser,`
`  url  VARCHAR2);`
	Any changes to the default parser behavior should be effected before calling this procedure.

Parameter	IN / OUT	Description
`url`	`(IN)`	Complete path of the url/file to be parsed.
`p`	`(IN)`	Parser instance.

PARSEBUFFER

Parses XML stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEBUFFER(
p   Parser,
doc VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

PARSECLOB

Parses XML stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSECLOB(
p   Parser,
doc CLOB);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
doc	(IN)	XML document buffer to parse.

PARSEDTD

Parses the DTD stored in the given URL or file. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTD(
p     Parser,
url   VARCHAR2,
root  VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
url	(IN)	Complete path of the URL or file to be parsed.
root	(IN)	Name of the root element.

PARSEDTDBUFFER

Parses the DTD stored in the given buffer. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDBUFFER(
p    Parser,
dtd  VARCHAR2,
root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD buffer to parse.
root	(IN)	Name of the root element.

PARSEDTDCLOB

Parses the DTD stored in the given clob. Any changes to the default parser behavior should be effected before calling this procedure. An application error is raised if parsing fails.

Syntax

```
PROCEDURE PARSEDTDCLOB(
p    Parser,
dtd  CLOB,
root VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD Clob to parse.
root	(IN)	Name of the root element.

SETBASEDIR

Sets base directory used to resolve relative URLs. An application error is raised if parsing fails.

Syntax

```
PROCEDURE setBaseDir(
p   Parser,
dir VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dir	(IN)	Directory used as a base directory.

SETDOCTYPE

Sets a DTD to be used by the parser for validation. This call should be made before the document is parsed.

Syntax

```
PROCEDURE setDoctype(
p   Parser,
dtd DOMDocumentType);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
dtd	(IN)	DTD to set.

SETERRORLOG

Sets errors to be sent to the specified file.

Syntax

```
PROCEDURE setErrorLog(
p        Parser,
fileName VARCHAR2);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
fileName	(IN)	Complete path of the file to use as the error log.

SETPRESERVEWHITESPACE

Sets whitespace preserving mode.

Syntax

```
PROCEDURE setPreserveWhitespace(
p   Parser,
yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - preserve, FALSE - don't preserve.

SETVALIDATIONMODE

Sets validation mode.

Syntax

```
PROCEDURE setValidationMode(
p   Parser,
yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - validate, FALSE - don't validate.

SHOWWARNINGS

Turns warnings on or off.

Syntax

```
PROCEDURE showWarnings(
p   Parser,
yes BOOLEAN);
```

Parameter	IN / OUT	Description
p	(IN)	Parser instance.
yes	(IN)	Mode to set: TRUE - show warnings, FALSE - don't show warnings.

171

DBMS_XMLQUERY

DBMS_XMLQUERY provides database-to-XMLType functionality. Whenever possible, use DBMS_XMLGEN, a built-in package in C, instead of DBMS_XMLQUERY.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- Using DBMS_XMLQUERY
  - Constants
  - Types
- Summary of DBMS_XMLQUERY Subprograms

Using DBMS_XMLQUERY

- Constants
- Types

Constants

Table 171–1 Constants of DBMS_XMLQUERY

Constant	Description
DB_ENCODING	Used to signal that the DB character encoding is to be used.
DEFAULT_ ROWSETTAG	The tag name for the element enclosing the XML generated from the result set (that is, for most cases the root node tag name) -- ROWSET.
DEFAULT_ERRORTAG	The default tag to enclose raised errors -- ERROR.
DEFAULT_ ROWIDATTR	The default name for the cardinality attribute of XML elements corresponding to db.records -- NUM
DEFAULT_ROWTAG	The default tag name for the element corresponding to db. records -- ROW
DEFAULT_DATE_ FORMAT	Default date mask --'MM/dd/yyyy HH:mm:ss'
ALL_ROWS	Indicates that all rows are needed in the output.
NONE	Used to specifies that the output should not contain any XML metadata (for example, no DTD).
DTD	Used to specify that the generation of the DTD is desired.
SCHEMA	Used to specify that the generation of the XML Schema is desired.
LOWER_CASE	Use lower case tag names.
UPPER_CASE	Use upper case tag names.

Types

Table 171–2 Types of DBMS_XMLQUERY

Type	Description
`ctxType`	The type of the query context handle. This is the return type of NEWCONTEXT

Summary of DBMS_XMLQUERY Subprograms

Table 171–3 DBMS_XMLQUERY Package Subprograms

Method	Description
CLOSECONTEXT on page 171-7	Closes or deallocates a particular query context.
GETDTD on page 171-8	Generates the DTD.
GETEXCEPTIONCONTENT on page 171-9	Returns the thrown exception's error code and error message.
GETNUMROWSPROCESSED on page 171-10	Returns the number of rows processed for the query.
GETVERSION on page 171-11	Prints the version of the XSU in use.
GETXML on page 171-12	Generates the XML document.
NEWCONTEXT on page 171-13	Creates a query context and it returns the context handle.
PROPAGATEORIGINALEXCEPTION on page 171-14	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.
REMOVEXSLTPARAM on page 171-15	Removes a particular top-level stylesheet parameter.
SETBINDVALUE on page 171-16	Sets a value for a particular bind name.
SETCOLLIDATTRNAME on page 171-17	Sets the name of the id attribute of the collection element's separator tag.
SETDATAHEADER on page 171-17	Sets the XML data header.
SETDATEFORMAT on page 171-19	Sets the format of the generated dates in the XML document.
SETENCODINGTAG on page 171-20	Sets the encoding processing instruction in the XML document.
SETERRORTAG on page 171-21	Sets the tag to be used to enclose the XML error documents.
SETMAXROWS on page 171-22	Sets the maximum number of rows to be converted to XML.
SETMETAHEADER on page 171-23	Sets the XML meta header.
SETRAISEEXCEPTION on page 171-24	Tells the XSU to throw the raised exceptions.
SETRAISENOROWSEXCEPTION on page 171-25	Tells the XSU to throw or not to throw an `OracleXMLNoRowsException` in the case when for one reason or another, the XML document generated is empty.
SETROWIDATTRNAME on page 171-26	Sets the name of the id attribute of the row enclosing tag.
SETROWIDATTRVALUE on page 171-27	Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag.
SETROWSETTAG on page 171-28	Sets the tag to be used to enclose the XML dataset.
SETROWTAG on page 171-29	Sets the tag to be used to enclose the XML element.
SETSKIPROWS on page 171-30	Sets the number of rows to skip.

Table 171–3 (Cont.) DBMS_XMLQUERY Package Subprograms

Method	Description
SETSQLTOXMLNAMEESCAPING on page 171-31	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETSTYLESHEETHEADER on page 171-32	Sets the stylesheet header.
SETTAGCASE on page 171-33	Specified the case of the generated XML tags.
SETXSLT on page 171-34	Registers a stylesheet to be applied to generated XML.
SETXSLTPARAM on page 171-35	Sets the value of a top-level stylesheet parameter.
USENULLATTRIBUTEINDICATOR on page 171-36	Specifies weather to use an XML attribute to indicate `NULL`ness.
USETYPEFORCOLLELEMTAG on page 171-37	Tells the XSU to use the collection element's type name as the collection element tag name.

CLOSECONTEXT

Closes or deallocates a particular query context

Syntax

```
PROCEDURE CLOSECONTEXT(
ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

GETDTD

Generates and returns the DTD based on the SQL query used to initialize the context. The options are described in the following table.

Syntax	Description

`FUNCTION GETDTD(`
`ctxHdl IN ctxType,`
`withVer IN BOOLEAN := false)`
`RETURN CLOB;`
	Function that generates the DTD based on the SQL query used to initialize the context.

`PROCEDURE GETDTD(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB,`
`withVer IN BOOLEAN := false);`
	Procedure that generates the DTD based on the SQL query used to initialize the context; specifies the output `CLOB` for XML document result.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`withVer`	`(IN)`	Generate the version information? `TRUE` for yes .
`xDoc`	`(IN)`	`CLOB` into which to write the generated XML document.

GETEXCEPTIONCONTENT

Returns the thrown exception's SQL error code and error message through the procedure's `OUT` parameters. This procedure is a work around the JVM functionality that obscures the original exception by its own exception, rendering PL/SQL unable to access the original exception content.

Syntax

```
PROCEDURE GETEXCEPTIONCONTENT(
ctxHdl IN ctxType,
errNo OUT NUMBER,
errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`errNo`	`(OUT)`	Error number.
`errMsg`	`(OUT)`	Error message.

GETNUMROWSPROCESSED

Return the number of rows processed for the query.

Syntax

```
FUNCTION GETNUMROWSPROCESSED(
ctxHdl IN ctxType)
RETURN NUMBER;
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

GETVERSION

Prints the version of the XSU in use.

Syntax

```
PROCEDURE GETVERSION();
```

GETXML

Creates the new context, executes the query, gets the XML back and closes the context. This is a convenience function. The context doesn't have to be explicitly opened or closed. The options are described in the following table.

Syntax	Description

`FUNCTION GETXML(`
`sqlQuery IN VARCHAR2,`
`metaType IN NUMBER := NONE)`
`RETURN CLOB;`
	This function uses a SQL query in string form.

`FUNCTION GETXML(`
`sqlQuery IN CLOB,`
`metaType IN NUMBER := NONE)`
`RETURN CLOB;`
	This function uses a SQL query in `CLOB` form.

`FUNCTION GETXML(`
`ctxHdl IN ctxType,`
`metaType IN NUMBER := NONE)`
`RETURN CLOB;`
	This function generates the XML document based on a SQL query used to initialize the context.

`PROCEDURE GETXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB,`
`metaType IN NUMBER := NONE);`
	This procedure generates the XML document based on the SQL query used to initialize the context.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`metaType`	`(IN)`	XML metadata type (`NONE`, `DTD`, or `SCHEMA`).
`sqlQuery`	`(IN)`	SQL query.
`xDoc`	`(IN)`	`CLOB` into which to write the generated XML document.

NEWCONTEXT

Creates a query context and it returns the context handle. The options are described in the following table.

Syntax	Description

`FUNCTION NEWCONTEXT(`
`  sqlQuery IN VARCHAR2)`
`RETURN ctxType;`
	Creates a query context from a string.

`FUNCTION NEWCONTEXT(`
`  sqlQuery IN CLOB)`
`RETURN ctxType;`
	Creates a query context from a `CLOB`.

Parameter	IN / OUT	Description
`sqlQuery`	`(IN)`	SQL query, the results of which to convert to XML.

PROPAGATEORIGINALEXCEPTION

Specifies whether to throw every original exception raised or to wrap it in an `OracleXMLSQLException`.

Syntax

```
PROCEDURE PROPAGATEORIGINALEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	`TRUE` if want to propagate original exception, `FALSE` to wrap in `OracleXMLException`.

REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE REMOVEXSLTPARAM(
ctxHdl IN ctxType,
name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.

SETBINDVALUE

Sets a value for a particular bind name.

Syntax

```
PROCEDURE SETBINDVALUE(
ctxHdl IN ctxType,
bindName IN VARCHAR2,
bindValue IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
bindName	(IN)	Bind name.
bindValue	(IN)	Bind value.

SETCOLLIDATTRNAME

Sets the name of the id attribute of the collection element's separator tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETCOLLIDATTRNAME(
ctxHdl IN ctxType,
attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`attrName`	`(IN)`	Attribute name.

SETDATAHEADER

Sets the XML data header. The data header is an XML entity that is appended at the beginning of the query-generated XML entity, the `rowset`. The two entities are enclosed by the `docTag` argument. The last data header specified is used. Passing in `NULL` for the `header` parameter unsets the data header.

Syntax

```
PROCEDURE SETDATAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null,
tag IN VARCHAR2 := null);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`header`	`(IN)`	Header.
`tag`	`(IN)`	Tag used to enclose the data header and the rowset.

SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format pattern, the date mask, should conform to the requirements of the `java.text.SimpleDateFormat` class. Setting the mask to `NULL` or an empty string sets the default mask -- `DEFAULT_DATE_FORMAT`.

Syntax

```
PROCEDURE SETDATEFORMAT(
ctxHdl IN ctxType,
mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`mask`	`(IN)`	The date mask.

SETENCODINGTAG

Sets the encoding processing instruction in the XML document.

Syntax

```
PROCEDURE SETENCODINGTAG(
ctxHdl IN ctxType,
enc IN VARCHAR2 := DB_ENCODING);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
enc	(IN)	The encoding to use.

SETERRORTAG

Sets the tag to be used to enclose the XML error documents.

Syntax

```
PROCEDURE SETERRORTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETMAXROWS

Sets the maximum number of rows to be converted to XML. By default, there is no set maximum.

Syntax

```
PROCEDURE SETMAXROWS (
ctxHdl IN ctxType,
rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to generate.

SETMETAHEADER

Sets the XML meta header. When set, the header is inserted at the beginning of the metadata part (DTD or XMLSchema) of each XML document generated by this object. The last meta header specified is used. Passing in `NULL` for the `header` parameter unsets the meta header.

Syntax

```
PROCEDURE SETMETAHEADER(
ctxHdl IN ctxType,
header IN CLOB := null);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`Header`	`(IN)`	Header.

SETRAISEEXCEPTION

Specifies whether to throw raised exceptions. If this call isn't made or if `FALSE` is passed to the `flag` argument, the XSU catches the SQL exceptions and generates an XML document from the exception message.

Syntax

```
PROCEDURE SETRAISEEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN:=true);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Throw raised exceptions? `TRUE` for yes, otherwise `FALSE`.

SETRAISENOROWSEXCEPTION

Specifies whether to throw an `OracleXMLNoRowsException` when the generated XML document is empty. By default, the exception is not thrown.

Syntax

```
PROCEDURE SETRAISENOROWSEXCEPTION(
ctxHdl IN ctxType,
flag IN BOOLEAN:=false);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Throws an `OracleXMLNoRowsException` if set to `TRUE`.

SETROWIDATTRNAME

Sets the name of the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the tag causes the row id attribute to be omitted.

Syntax

```
PROCEDURE SETROWIDATTRNAME(
ctxHdl IN ctxType,
attrName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`attrName`	`(IN)`	Attribute name.

SETROWIDATTRVALUE

Specifies the scalar column whose value is to be assigned to the id attribute of the row enclosing tag. Passing `NULL` or an empty string for the `colName` assigns the row count value (0, 1, 2 and so on) to the row id attribute.

Syntax

```
PROCEDURE SETROWIDATTRVALUE(
ctxHdl IN ctxType,
colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`colName`	`(IN)`	Column whose value is to be assigned to the row id attribute.

SETROWSETTAG

Sets the tag to be used to enclose the XML dataset.

Syntax

```
PROCEDURE SETROWSETTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETROWTAG

Sets the tag to be used to enclose the XML element corresponding to a `db.record`.

Syntax

```
PROCEDURE SETROWTAG(
ctxHdl IN ctxType,
tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`tag`	`(IN)`	Tag name.

SETSKIPROWS

Sets the number of rows to skip. By default, 0 rows are skipped.

Syntax

```
PROCEDURE SETSKIPROWS(
ctxHdl IN ctxType,
rows IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
rows	(IN)	Maximum number of rows to skip.

SETSQLTOXMLNAMEESCAPING

This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE SETSQLTOXMLNAMEESCAPING(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping? TRUE for yes, otherwise FALSE.

SETSTYLESHEETHEADER

Sets the stylesheet header (the stylesheet processing instructions) in the generated XML document. Passing `NULL` for the `uri` argument will unset the stylesheet header and the stylesheet type.

Syntax

```
PROCEDURE SETSTYLESHEETHEADER(
ctxHdl IN ctxType,
uri IN VARCHAR2,
type IN VARCHAR2 := 'text/xsl');
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`uri`	`(IN)`	Stylesheet URI.
`type`	`(IN)`	Stylesheet type; defaults to "`text/xsl`".

SETTAGCASE

Specifies the case of the generated XML tags.

Syntax

```
PROCEDURE SETTAGCASE(
ctxHdl IN ctxType,
tCase IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tCase	(IN)	The tag's case: ■ 0 for as are ■ 1 for lower case ■ 2 for upper case

SETXSLT

Registers a stylesheet to be applied to generated XML. If a stylesheet was already registered, it is replaced by the new one. The options are described in the following table. Passing `NULL` for the `uri` argument or an empty string for the `stylesheet` argument will unset the stylesheet header and type.

Syntax	Description
`PROCEDURE SETXSLT( ctxHdl IN ctxType, uri IN VARCHAR2, ref IN VARCHAR2 := null);`	To un-register the stylesheet pass in a null for the uri.
`PROCEDURE SETXSLT( ctxHdl IN ctxType, stylesheet CLOB, ref IN VARCHAR2 := null);`	To un-register the stylesheet pass in a null or an empty string for the stylesheet.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`uri`	`(IN)`	Stylesheet URI.
`stylesheet`	`(IN)`	Stylesheet.
`ref`	`(IN)`	URL to include, imported and external entities.

SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter value is expected to be a valid XPath expression; the string literal values would therefore have to be quoted explicitly. If no stylesheet is registered, this method is not operational.

Syntax

```
PROCEDURE SETXSLTPARAM(
ctxHdl IN ctxType,
name IN VARCHAR2,
value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Name of the top level stylesheet parameter.
value	(IN)	Value to be assigned to the stylesheet parameter.

USENULLATTRIBUTEINDICATOR

Specifies whether to use an XML attribute to indicate NULLness, or to do this by omitting the particular entity in the XML document.

Syntax

```
PROCEDURE SETNULLATTRIBUTEINDICATOR(
ctxHdl IN ctxType,
flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Sets attribute to NULL if TRUE, omits from XML document if FALSE.

USETYPEFORCOLLELEMTAG

Specifies whether to use the collection element's type name as its element tag name. By default, the tag name for elements of a collection is the collection's tag name followed by `_item`.

Syntax

```
PROCEDURE USETYPEFORCOLLELEMTAG(
ctxHdl IN ctxType,
flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Turn on use of the type name?

172

DBMS_XMLSAVE

DBMS_XMLSAVE provides XML to database-type functionality.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- Using DBMS_XMLSAVE
  - Constants
  - Types
- Summary of DBMS_XMLSAVE Subprograms

Using DBMS_XMLSAVE

- Constants
- Types

Constants

Table 172–1 Constants of DBMS_XMLSAVE

Constant	Description
DEFAULT_ROWTAG	The default tag name for the element corresponding to database records -- ROW
DEFAULT_DATE_ FORMAT	Default date mask:'MM/dd/yyyy HH:mm:ss'
MATCH_CASE	Used to specify that when mapping XML elements to database entities; the XSU should be case sensitive.
IGNORE_CASE	Used to specify that when mapping XML elements to database. entities the XSU should be case insensitive.

Types

Table 172–2 Types of DBMS_XMLSAVE

Type	Description
`ctxType`	The type of the query context handle. The type of the query context handle. This the return type of NEWCONTEXT.

Summary of DBMS_XMLSAVE Subprograms

Table 172–3 DBMS_XMLSAVE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST on page 172-6	Clears the key column list.
CLEARUPDATECOLUMNLIST on page 172-7	Clears the update column list.
CLOSECONTEXT on page 172-8	It closes/deallocates a particular save context.
DELETEXML on page 172-9	Deletes records specified by data from the XML document, from the table specified at the context creation time.
GETEXCEPTIONCONTENT on page 172-10	Returns the thrown exception's error code and error message.
INSERTXML on page 172-11	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT on page 172-12	Creates a save context, and returns the context handle.
PROPAGATEORIGINALEXCEPTION on page 172-13	Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.
REMOVEXSLTPARAM on page 172-14	Removes the value of a top-level stylesheet parameter
SETBATCHSIZE on page 172-15	Changes the batch size used during DML operations.
SETCOMMITBATCH on page 172-17	Sets the commit batch size.
SETDATEFORMAT on page 172-17	Sets the format of the generated dates in the XML document.
SETIGNORECASE on page 172-18	The XSU does mapping of XML elements to database.
SETKEYCOLUMN on page 172-19	This methods adds a column to the key column list.
SETPRESERVEWHITESPACE on page 172-20	Tells the XSU whether to preserve whitespace or not.
SETROWTAG on page 172-21	Names the tag used in the XML document to enclose the XML elements corresponding to database.
SETSQLTOXMLNAMEESCAPING on page 172-22	This turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.
SETUPDATECOLUMN on page 172-23	Adds a column to the update column list.
SETXSLT on page 172-24	Registers a XSL transform to be applied to the XML to be saved.
SETXSLTPARAM on page 172-25	Sets the value of a top-level stylesheet parameter.
UPDATEXML on page 172-26	Updates the table given the XML document.

CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLEARUPDATECOLUMNLIST

Clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted. The options are described in the following table.

Syntax	Description

`FUNCTION deleteXML(`
`ctxHdl IN ctxPType,`
`xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Uses a `VARCHAR2` type for the `xDoc` parameter.

`FUNCTION deleteXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB)`
`RETURN NUMBER;`
	Uses a `CLOB` type for the `xDoc` parameter.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

GETEXCEPTIONCONTENT

Through its arguments, this method returns the thrown exception's error code and error message, SQL error code. This is to get around the fact that the JVM throws an exception on top of whatever exception was raised; thus, rendering PL/SQL unable to access the original exception.

Syntax

```
PROCEDURE getExceptionContent(
   ctxHdl IN ctxType,
   errNo OUT NUMBER,
   errMsg OUT VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
errNo	(IN)	Error number.
errMsg	(IN)	Error message.

INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted. The options are described in the following table.

Syntax	Description
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `VARCHAR2`.
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `CLOB`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

```
FUNCTION newContext(
   targetTable IN VARCHAR2)
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

PROPAGATEORIGINALEXCEPTION

Tells the XSU that if an exception is raised, and is being thrown, the XSU should throw the very exception raised; rather then, wrapping it with an `OracleXMLSQLException`.

Syntax

```
PROCEDURE propagateOriginalException(
   ctxHdl IN ctxType,
   flag IN BOOLEAN);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`flag`	`(IN)`	Propagate the original exception? 0=`FALSE`, 1=`TRUE`.

REMOVEXSLTPARAM

Removes the value of a top-level stylesheet parameter.

Syntax

```
PROCEDURE removeXSLTParam(
   ctxHdl IN ctxType,
   name IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.

SETBATCHSIZE

Changes the batch size used during DML operations. When performing inserts, updates or deletes, it is better to batch the operations so that they get executed in one shot rather than as separate statements. The flip side is that more memory is needed to buffer all the bind values. Note that when batching is used, a commit occurs only after a batch is executed. So if one of the statement inside a batch fails, the whole batch is rolled back. This is a small price to pay considering the performance gain; nevertheless, if this behavior is unacceptable, then set the batch size to 1.

Syntax

```
PROCEDURE setBatchSize(
   ctxHdl IN ctxType,
   batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
batchSize	(IN)	Batch size.

SETCOMMITBATCH

Sets the commit batch size. The commit batch size refers to the number or records inserted after which a commit should follow. If `batchSize` is less than `1` or the session is in "auto-commit" mode, using the XSU does not make any explicit commits. By default, `commitBatch` is `0`.

Syntax

```
PROCEDURE setCommitBatch(
   ctxHdl IN ctxType,
   batchSize IN NUMBER);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`batchSize`	`(IN)`	Commit batch size.

SETDATEFORMAT

Sets the format of the generated dates in the XML document. The syntax of the date format patern, the date mask, should conform to the requirements of the class `java.text.SimpleDateFormat`. Setting the mask to `<code>null</code>` or an empty string unsets the date mask.

Syntax

```
PROCEDURE setDateFormat(
   ctxHdl IN ctxType,
   mask IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`mask`	`(IN)`	Syntax of the date format pattern..

SETIGNORECASE

The XSU does mapping of XML elements to db columns/attributes based on the element names (XML tags). This function tells the XSU to do this match case insensitive.

Syntax

```
PROCEDURE setIgnoreCase(
   ctxHdl IN ctxType,
   flag IN NUMBER);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Ignore tag case in the XML doc? 0=FALSE, 1=TRUE.

SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations.

Syntax

```
PROCEDURE setKeyColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

SETPRESERVEWHITESPACE

Tells the XSU whether or not to preserve whitespace.

Syntax

```
PROCEDURE setPreserveWhitespace(
   ctxHdl IN ctxType,
   flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Should XSU preserve whitespace?

SETROWTAG

Names the tag used in the XML document to enclose the XML elements corresponding to db. records.

Syntax

```
PROCEDURE setRowTag(
   ctxHdl IN ctxType,
   tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETSQLTOXMLNAMEESCAPING

Turns on or off escaping of XML tags in the case that the SQL object name, which is mapped to a XML identifier, is not a valid XML identifier.

Syntax

```
PROCEDURE setSQLToXMLNameEscaping(
   ctxHdl IN ctxType,
   flag IN BOOLEAN := true);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
flag	(IN)	Turn on escaping?

SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the ROW element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Syntax

```
PROCEDURE setUpdateColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the update column list.

SETXSLT

Registers an XSL transform to be applied to the XML to be saved. If a stylesheet was already registered, it gets replaced by the new one. To un-register the stylesheet, pass in null for the URI. The options are described in the following table.

Syntax	Description
`PROCEDURE setXSLT( ctxHdl IN ctxType, uri IN VARCHAR2, ref IN VARCHAR2 := null);`	Passes in the stylesheet through a URI.
`PROCEDURE setXSLT( ctxHdl IN ctxType, stylesheet IN CLOB, ref IN VARCHAR2 := null);`	Passes in the stylesheet through a `CLOB`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`uri`	`(IN)`	URI to the stylesheet to register.
`ref`	`(IN)`	URL for include, import, and external entities.
`stylesheet`	`(IN)`	`CLOB` containing the stylesheet to register .

SETXSLTPARAM

Sets the value of a top-level stylesheet parameter. The parameter is expected to be a valid XPath expression; literal values would therefore have to be explicitly quoted.

Syntax

```
PROCEDURE setXSLTParam(
   ctxHdl IN ctxType,
   name IN VARCHAR2,
   value IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
name	(IN)	Parameter name.
value	(IN)	Parameter value as an XPath expression

UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description
`FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `VARCHAR2`.
`FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `CLOB`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

173

DBMS_XMLSCHEMA

DBMS_XMLSCHEMA package provides procedures to manage XML schemas. It is created by script dbmsxsch.sql during Oracle database installation.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following topics:

- Using DBMS_XMLSCHEMA
  - Overview
  - Constants
  - Views
  - Operational Notes
- Summary of DBMS_XMLSCHEMA Subprograms

Using DBMS_XMLSCHEMA

This section contains topics which relate to using the `DBMS_XMLSCHEMA` package.

- Overview
- Constants
- Views
- Operational Notes

Overview

This package provides subprograms to

- Register an XML schema
- Delete a previously registered XML schema
- Re-compile a previously registered XML schema
- Generate an XML schema
- Evolves an XML schema

Constants

The DBMS_XMLSCHEMA package uses the constants shown in following tables.

- DBMS_XMLSCHEMA Constants - Delete Option
- DBMS_XMLSCHEMA Constants - Enable Hierarchy
- DBMS_XMLSCHEMA Constants - Register CSID

Table 173–1 DBMS_XMLSCHEMA Constants - Delete Option

Constant	Type	Value	Description
DELETE_RESTRICT	NUMBER	1	Deletion of an XML schema fails if there are any tables or XML schemas that depend on it
DELETE_INVALIDATE	NUMBER	2	Deletion of an XML schema does not fail if there are tables or XML schemas that depend on it. All dependent tables and schemas are invalidated.
DELETE_CASCADE	NUMBER	3	Deletion of an XML schema also drops all SQL types and default tables associated with it. SQL types are dropped only if gentypes argument was set to TRUE during registration of the XML schema. However, deletion of the XML schema fails if there are any instance documents conforming to the schema or any dependent XML schemas.
DELETE_CASCADE_FORCE	NUMBER	4	This option is similar to DELETE_CASCADE except that it does not check for any stored instance documents conforming to the schema or any dependent XML schemas. Also, it ignores any errors.

Table 173–2 DBMS_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_NONE	PLS_INTEGER	1	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will not be called on any tables created while registering that schema
ENABLE_HIERARCHY_CONTENTS	PLS_INTEGER	2	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS

Table 173–2 (Cont.) DBMS_XMLSCHEMA Constants - Enable Hierarchy

Constant	Type	Value	Description
ENABLE_HIERARCHY_ RESMETADATA	PLS_INTEGER	3	The ENABLE_HIERARCHY procedure of the DBMS_XDBZ package will be called on all tables created during schema registration with hierarchy_ type as DBMS_XDBZ.ENABLE_ RESMETADATA. Users should pass in DBMS_ XMLSCHEMA.ENABLE_ RESMETADATA for schemas they intend to use as resource metadata tables.

Table 173–3 DBMS_XMLSCHEMA Constants - Register CSID

Constant	Type	Value	Description
REGISTER_NODOCID	NUMBER	1	If a schema is registered for metadata use (using the value ENABLE_HIER_ RESMETADATA for parameter enablehierarchy during registration), a column named DOCID is added to all tables created during schema registration. This constant can be used in the options argument of REGISTERSCHEMA to prevent the creation of this column if the user wishes to optimize on storage
REGISTER_CSID_NULL	NUMBER	-1	If user wishes to not specify the character set of the input schema document when invoking REGISTERSCHEMA, this value can be used for the csid parameter

Views

The DBMS_XMLSCHEMA package uses the views shown in Table 173–4. The columns of these views are described in detail in the *Oracle Database Reference.*

Table 173–4 Summary of Views used by DBMS_XMLSCHEMA

Schema	Description
USER_XML_SCHEMAS	All registered XML Schemas owned by the user
ALL_XML_SCHEMAS	All registered XML Schemas usable by the current user
DBA_XML_SCHEMAS	All registered XML Schemas in the database
DBA_XML_TABLES	All XMLType tables in the system
USER_XML_TABLES	All XMLType tables owned by the current user
ALL_XML_TABLES	All XMLType tables usable by the current user
DBA_XML_TAB_COLS	All XMLType table columns in the system
USER_XML_TAB_COLS	All XMLType table columns in tables owned by the current user
ALL_XML_TAB_COLS	All XMLType table columns in tables usable by the current user
DBA_XML_VIEWS	All XMLType views in the system
USER_XML_VIEWS	All XMlType views owned by the current user
ALL_XML_VIEWS	All XMLType views usable by the current user
DBA_XML_VIEW_COLS	All XMLType view columns in the system
USER_XML_VIEW_COLS	All XMLType view columns in views owned by the current user
ALL_XML_VIEW_COLS	All XMLType view columns in views usable by the current user

Operational Notes

Guidelines for Using In-Place XML Schema Evolution

Before you perform an in-place XML-schema evolution, you should follow these preparatory steps:

1. Back up all existing data (instance documents) for the XML schema that will be evolved.
2. Perform a dry run using trace only, that is, without actually evolving the XML schema or updating any instance documents, to produce a trace of the update operations that would be performed during evolution. To do this, set the flag parameter value to only `INPLACE_TRACE`. Do not also use `INPLACE_EVOLVE`. After performing the dry run, examine the trace file, verifying that the listed DDL operations are in fact those that you intend.

Summary of DBMS_XMLSCHEMA Subprograms

Table 173–5 DBMS_XMLSCHEMA Package Subprograms

Method	Description
COMPILESCHEMA Procedure on page 173-9	Used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state.
COPYEVOLVE Procedure on page 173-10	Evolves registered schemas so that existing XML instances remain valid
DELETESCHEMA Procedure on page 173-12	Removes the schema from the database
GENERATESCHEMA Function on page 173-13	Generates an XML schema from an oracle type name
GENERATESCHEMAS Function on page 173-14	Generates several XML schemas from an oracle type name
INPLACEEVOLVE Procedure on page 173-15	Evolves registered schemas by propagating schema changes to object types and tables
PURGESCHEMA Procedure on page 173-17	Removes the XML schema
REGISTERSCHEMA Procedures on page 173-18	Registers the specified schema for use by Oracle. This schema can then be used to store documents conforming to this.
REGISTERURI Procedure on page 173-22	Registers an XML schema specified by a URI name

COMPILESCHEMA Procedure

This procedure can be used to re-compile an already registered XML schema. This is useful for bringing a schema in an invalid state to a valid state. Can result in a `ORA-31001` exception: invalid resource handle or path name.

Syntax

```
DBMS_XMLSCHEMA.COMPILESCHEMA(
   schemaurl IN VARCHAR2);
```

Parameters

Table 173–6 COMPILESCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL identifying the schema

COPYEVOLVE Procedure

This procedure evolves registered schemas so that existing XML instances remain valid.

This procedure is accomplished in according to the following basic scenario (alternative actions are controlled by the procedure's parameters):

- copies data in schema based `XMLType` tables to temporary table storage
- drops old tables
- deletes old schemas
- registers new schemas
- creates new `XMLType` tables
- Populates new tables with data in temporary storage; auxiliary structures (constraints, triggers, indexes, and others) are not preserved
- drops temporary tables

See Also:

- "Schema Evolution" chapter of the *Oracle XML DB Developer's Guide* for examples on how to evolve existing schemas
- *Oracle Database Error Messages* for information on exceptions specific to schema evolution, ORA-30142 through ORA-30946.

Syntax

```
DBMS_XMLSCHEMA.COPYEVOLVE(
   schemaurls       IN  XDB$STRUBG_LIST_T,
   newschemas       IN  XMLSequenceType,
   transforms       IN  XMLSequenceType :=NULL,
   preserveolddocs  IN  BOOLEAN :=FALSE,
   maptablename     IN  VARCHAR2 :=NULL,
   generatetables   IN  BOOLEAN :=TRUE,
   force            IN  BOOLEAN :=FALSE,
   schemaowners     IN  XDB$STRING_LIST_T :=NULL
   parallelDegree   IN  PLS_INTEGER := 0,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 173–7 COPYEVOLVE Procedure Parameters

Parameter	Description
`schemaurls`	`VARRAY` of URLs of all schemas to be evolved. Should include the dependent schemas. Unless the `FORCE` parameter is `TRUE`, URLs should be in the order of dependency.
`newschemas`	`VARRAY` of new schema documents. Should be specified in same order as the corresponding URLs.
`transforms`	`VARRAY` of transforming XSL documents to be applied to schema-based documents. Should be specified in same order as the corresponding URLs. Optional if no transformations are required.

Table 173–7 (Cont.) COPYEVOLVE Procedure Parameters

Parameter	Description
preserveolddocs	Default is FALSE, and temporary tables with old data are dropped. If TRUE, these table are still available after schema evolution is complete.
maptabname	Specifies the name of the table mapping permanent to temporary tables during the evolution process. Valid columns are: ■ SCHEMA_URL - VARCHAR2(700) - URL of schema to which this table conforms ■ SCHEMA_OWNER -VARCHAR2(30) - Owner of the schema ■ ELEMENT_NAME - VARCHAR2(256)- Element to which this table conforms ■ TAB_NAME - VARCHAR2(65) - Qualified table name: *<owner_name>.<table_name>* ■ COL_NAME - VARCHAR2(4000) - Name of the column (NULL for XMLType tables) ■ TEMP_TABNAME - VARCHAR2(30) - Name of temporary tables which holds data for this table.
generatetables	Default is TRUE, and new tables will be generated. If FALSE: ■ new tables will not be generated after registration of new schemas ■ preserveolddocs must be TRUE ■ maptablename must be non-NULL
force	Default is FALSE. If TRUE, ignores errors generated during schema evolution. Used when there are circular dependencies among schemas to ensure that all schemas are stored despite possible errors in registration.
schemaowners	VARRAY of names of schema owners. Should be specified in same order as the corresponding URLs. Default is NULL, assuming that all schemas are owned by the current user.
paralleldegree	Specifies the degree of parallelism to be used in a PARALLEL hint during the data copy stage of the evolution. If this is 0 (default), the PARALLEL hint will not be given in the data copy statements.
options	Currently, the only supported option is COPYEVOLVE_BINARY_XML which lets you register the new schemas for binary XML and create the new tables/columns with binary XML as the storage type.

Usage Notes

You should back up all schemas and documents prior to invocation because COPYEVOLVE Procedure deletes all conforming documents prior to implementing the schema evolution.

DELETESCHEMA Procedure

This procedure deletes the XML Schema specified by the URL.

Syntax

```
DBMS_XMLSCHEMA.DELETESCHEMA(
   schemaurl      IN  VARCHAR2,
   delete_option  IN  PLS_INTEGER := DELETE_RESTRICT);
```

> **See Also:** "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Parameters

Table 173–8 DELETESCHEMA Procedure Parameters

Parameter	Description
`schemaurl`	URL identifying the schema to be deleted
`delete_option`	Delete options: ■ `DELETE_RESTRICT` - Schema deletion fails if there are any tables or schemas that depend on this schema ■ `DELETE_INVALIDATE` - Schema deletion does not fail if there are any dependencies. Instead, it simply invalidates all dependent objects. ■ `DELETE_CASCADE` - Schema deletion will also drop all default SQL types and default tables. However the deletion fails if there are any stored instances conforming to this schema. ■ `DELETE_CASCADE_FORCE` - Similar to `DELETE_CASCADE` except that it does not check for any stored instances conforming to this schema. Also, it ignores any errors.

Exceptions

Table 173–9 DELETESCHEMA Procedure Exceptions

Exception	Description
`ORA-31001`	Invalid resource handle or path name

GENERATESCHEMA Function

This function generates XML schema(s) from an Oracle type name. It inlines all in one schema (`XMLType`).

> **See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMA(
   schemaname    IN  VARCHAR2,
   typename      IN  VARCHAR2,
   elementname   IN  VARCHAR2 := NULL,
   recurse       IN  BOOLEAN  := TRUE,
   annotate      IN  BOOLEAN  := TRUE,
   embedcoll     IN  BOOLEAN  := TRUE)
RETURN SYS.XMLTYPE;
```

Parameters

Table 173–10 GENERATESCHEMA Function Parameters

Parameter	Description
`schemaname`	Name of the database schema containing the type
`typename`	Name of the Oracle type
`elementname`	The name of the top level element in the XML Schema. Defaults to `typename`.
`recurse`	Whether or not to also generate schema for all types referred to by the type specified
`annotate`	Whether or not to put the SQL annotations in the XML Schema
`embedcoll`	Determines whether the collections should be embedded in the type which refers to them, or create a `complextype`. Cannot be `FALSE` if annotations are turned on

Exceptions

Table 173–11 GENERATESCHEMA Function Exceptions

Exception	Description
`ORA-31001`	Invalid resource handle or path name

GENERATESCHEMAS Function

This function generates XML schema(s) from an Oracle type name. It returns a collection of XMLTypes, one XML Schema document for each database schema.

> **See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.GENERATESCHEMAS(
   schemaname   IN  VARCHAR2,
   typename     IN  VARCHAR2,
   elementname  IN  VARCHAR2 := NULL,
   schemaurl    IN  VARCHAR2 := NULL,
   annotate     IN  BOOLEAN := TRUE,
   embedcoll    IN  BOOLEAN := TRUE )
 RETURN SYS.XMLTYPE;
```

Parameters

Table 173–12 GENERATESCHEMAS Function Parameters

Parameter	Description
schemaname	Name of the database schema containing the type
typename	Name of the Oracle type
elementname	The name of the top level element in the XML Schema defaults to typeName
schemaurl	Specifies base URL where schemas will be stored, needed by top level schema for import statement
annotate	Whether or not to put the SQL annotations in the XML Schema
embedcoll	Determines whether the collections be embedded in the type which refers to them, or create a complextype. Cannot be FALSE if annotations are turned on

Exceptions

Table 173–13 GENERATESCHEMAS Function Exceptions

Exception	Description
ORA-31001	Invalid resource handle or path name

INPLACEEVOLVE Procedure

This procedure evolves registered schemas by propagating schema changes to object types and tables.

Syntax

```
DBMS_XMLSCHEMA.INPLACEEVOLVE(
   schemaURL     IN   VARCHAR2,
   diffXML       IN   XMLType,
   flags         IN   NUMBER);
```

Parameters

Table 173–14 INPLACEEVOLVE Procedure Parameters

Parameter	Description
schemaurl	URL of the schema to evolve
diffXML	Changes to be applied to the schema. This is an XML document conforming to the XDIFF schema and specifies what changes need to be applied and the locations in the schema document where the changes are to be applied.
flags	The following bits may be set in this parameter to control the behavior of this procedure: ■ INPLACE_EVOLVE (value 1, meaning that bit 1 is on) – Perform in-place XML schema evolution: construct a new XML schema and validate it (against the XML schema for XML schemas); construct the DDL statements needed to evolve the instance-document disk structures, execute the DDL statements, and replace the old XML schema with the new. ■ INPLACE_TRACE (value 2, meaning that bit 2 is on) – Perform all steps necessary for in-place evolution, except executing the DDL statements and overwriting the old XML schema with the new, then write both the DDL statements and the new XML schema to a trace file. That is, each of the bits constructs the new XML schema, validates it, and determines the steps needed to evolve the disk structures underlying the instance documents. In addition: ■ Bit INPLACE_EVOLVE carries out those evolution steps and replaces the old XML schema with the new. ■ Bit INPLACE_TRACE saves the evolution steps and the new XML schema in a trace file (it does not carry out the evolution steps)

Exceptions

The procedure raises exceptions in the following cases:

- An error will be raised for invalid XPATH expressions and for XDIFF documents that do not conform to the xdiff schema.
- Path expressions that are syntactically correct but result in an invalid node in the schema document will result in an error.
- If the schema change makes the schema an ill-formed XML document or an invalid XML schema, this will raise an error.

- Any errors resulting from `CREATE TYPE`, `ALTER TYPE` and like commands will generate error messages.

Usage Notes

- Users are required to backup all their data before attempting in-place evolution, as there is no rollback with this operation.
- A user must register their new XML schema with the database using the REGISTERSCHEMA Procedures and the REGISTERURI Procedure at a schema URL that is different from that of the one to be evolved. If the new schema registers successfully and is usable, only then should the user attempt to evolve the existing schema to the new schema by means of this subprogram. If the registration of the new schema is successful, then the user must delete this schema (and all its dependent objects) before attempting to evolve the schema at the old schema URL.

PURGESCHEMA Procedure

This procedure removes the XML schema.

> **See Also:** "XMLSCHEMA Storage and Query: Advanced" chapter of the *Oracle XML DB Developer's Guide*

Syntax

```
DBMS_XMLSCHEMA.PURGESCHEMA(
   schemaid   IN  RAW);
```

Parameters

Table 173–15 PURGESCHEMA Procedure Parameters

Parameter	Description
`schemaid`	ID of the schema to be purged

Usage Notes

- The schema should have been originally registered for binary encoding and should have been deleted in the `HIDE` mode.
- Once a schema has been deleted in `HIDE` mode, it continues to exist in the XML DB dictionary and is used for decoding already encoded documents. The user invokes this interface when there are no stored instances encoded with this schema.
- Once the schema is purged, any space used by that schema will be reclaimed and documents encoded using the schema will raise an error if an attempt is made to decode them.
- The Schema ID can be obtained from the catalog views.

REGISTERSCHEMA Procedures

This procedure registers the specified schema for use by the database. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definition.

> **See Also:** "XMLSCHEMA Storage and Query: Basic" chapter of the *Oracle XML DB Developer's Guide*

Syntax

Registers a schema specified as a VARCHAR2:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
    schemaurl        IN  VARCHAR2,
    schemadoc        IN  VARCHAR2,
    local            IN  BOOLEAN := TRUE,
    gentypes         IN  BOOLEAN := TRUE,
    genbean          IN  BOOLEAN := FALSE,
    gentables        IN  BOOLEAN := TRUE,
    force            IN  BOOLEAN := FALSE,
    owner            IN  VARCHAR2 := NULL,
    enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
    options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BFILE and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BFILE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := TRUE,
   gentables        IN  BOOLEAN := TRUE,
   force            IN  BOOLEAN := TRUE,
   owner            IN  VARCHAR2 := '',
   csid             IN  NUMBER,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a BLOB. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
```

```
   schemadoc        IN  BLOB,
   local            IN  BOOLEAN := TRUE,
   genTypes         IN  BOOLEAN := TRUE,
   genBean          IN  BOOLEAN := FASLE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB` and identifies the character set id of the schema document:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  BLOB,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := TRUE,
   gentables        IN  BOOLEAN := TRUE,
   force            IN  BOOLEAN := TRUE,
   owner            IN  VARCHAR2 := '',
   csid             IN  NUMBER,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `CLOB`

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  CLOB,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as an `XMLTYPE`.

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  SYS.XMLTYPE,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
   options          IN  PLS_INTEGER := 0);
```

Registers the schema specified as a `BLOB`. The contents of the schema document must be in the database character set:

```
DBMS_XMLSCHEMA.REGISTERSCHEMA(
   schemaurl        IN  VARCHAR2,
   schemadoc        IN  SYS.URIType,
   local            IN  BOOLEAN := TRUE,
   gentypes         IN  BOOLEAN := TRUE,
   genbean          IN  BOOLEAN := FALSE,
   force            IN  BOOLEAN := FALSE,
   owner            IN  VARCHAR2 := NULL,
   enablehierarchy  IN  PLS_INTEGER := DBMS_XMLSCHEMA.ENABLE_CONTENTS,
```

```
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 173–16 REGSITERSCHEMA Procedure Parameters

Parameter	Description
schemaurl	URL that uniquely identifies the schema document. This value is used to derive the path name of the schema document within the database hierarchy. Can be used inside schemalocation attribute of XML Schema import element.
schemadoc	A valid XML schema document
local	Is this a local or global schema? ■ By default, all schemas are registered as local schemas, under /sys/schemas/<username>/... ■ If a schema is registered as global, it is added under /sys/schemas/PUBLIC/... You need write privileges on the directory to be able to register a schema as global.
gentypes	Determines whether the schema compiler generates object types. By default, TRUE. If you use binary XML, you must be set gentypes to FALSE.
genbean	Determines whether the schema compiler generates Java beans. By default, FALSE. Oracle recommends that this parameter always be set to FALSE.
gentables	Determines whether the schema compiler generates default tables. By default, TRUE
force	If this parameter is set to TRUE, the schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is FALSE.
owner	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.
csid	Identifies the character set of the input schema document. If this value is 0, the schema document's encoding is determined by the current rule for "text/xml" MIME type.
enablehierarchy	■ ENABLE_HIERARCHY_NONE - enable hierarchy will not be called on any tables created while registering that schema ■ ENABLE_HIERARCHY_CONTENTS - enable hierarchy will be called for all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_CONTENTS. This is the default. ■ ENABLE_HIERARCHY_RESMETADATA - enable hierarchy will be called on all tables created during schema registration with hierarchy_type as DBMS_XDBZ.ENABLE_RESMETADATA. Users should pass in DBMS_XMLSCHEMA.ENABLE_RESMETADATA for schemas they intend to use as resource metadata tables.

Table 173–16 (Cont.) REGSITERSCHEMA Procedure Parameters

Parameter	Description
`options`	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a `BITOR` of the desired bits. Possible bits: ■ `REGISTER_NODOCID` - this will suppress the creation of the `DOCID` column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the `DOCID` column) ■ `REGISTER_BINARYXML` - Register the schema for Binary XML ■ `REGISTER_NT_AS_IOT` - Store nested tables created during schema registration as index organized tables. The default is to store nested tables as heap tables

REGISTERURI Procedure

This procedure registers an XML Schema specified by a URI name.

Syntax

```
DBMS_XMLSCHEMA.REGISTERURI(
   schemaurl      IN  VARCHAR2,
   schemadocuri   IN  VARCHAR2,
   local          IN  BOOLEAN := TRUE,
   gentypes       IN  BOOLEAN := TRUE,
   genbean        IN  BOOLEAN := FALSE,
   gentables      IN  BOOLEAN := TRUE,
   force          IN  BOOLEAN := FALSE,
   owner          IN  VARCHAR2 := NULL,
   options          IN  PLS_INTEGER := 0);
```

Parameters

Table 173–17 REGISTERURI Procedure Parameters

Parameter	Description
`schemaurl`	Uniquely identifies the schema document. Can be used inside `schemaLocation` attribute of XML Schema import element.
`schemadocuri`	Pathname (URI) corresponding to the physical location of the schema document. The URI path could be based on HTTP, FTP, DB or Oracle XML DB protocols. This function constructs a `URIType` instance using the `urifactory`, and invokes the REGISTERSCHEMA Procedures.
`local`	Determines whether this is a local or global schema. By default, all schemas are registered as local schemas, under `/sys/schemas/ <username>/...` If a schema is registered as global, it is added under `/sys/schemas/PUBLIC/...` The user needs write privileges on the directory to register a global schema.
`gentypes`	Determines whether the compiler generate object types. By default, `TRUE`.
`genbean`	Determines whether the compiler generate Java beans. By default, `FALSE`.
`gentables`	Determines whether the compiler generate default tables. `TRUE` by default.
`force`	`TRUE`: schema registration will not raise errors. Instead, it creates an invalid XML schema object in case of any errors. By default, the value of this parameter is `FALSE`.
`owner`	This parameter specifies the name of the database user owning the XML schema object. By default, the user registering the schema owns the XML schema object. This parameter can be used to register a XML schema to be owned by a different database user.

Table 173–17 (Cont.) REGISTERURI Procedure Parameters

Parameter	Description
`options`	Additional options to specify how the schema should be registered. The various options are represented as bits of an integer and the options parameter should be constructed by doing a `BITOR` of the desired bits. Possible bits: ■ `REGISTER_NODOCID` - this will suppress the creation of the `DOCID` column for out of line tables. This is a storage optimization which might be desirable when we do not need to join back to the document table (for example if we do not care about rewriting certain queries that could be rewritten by making use of the `DOCID` column)

174

DBMS_XMLSTORE

DBMS_XMLSTORE provides the ability to store XML data in relational tables.

See Also: *Oracle XML DB Developer's Guide*

This chapter contains the following sections:

- Using DBMS_XMLSTORE
  - Types
- Summary of DBMS_XMLSTORE Subprograms

Using DBMS_XMLSTORE

- Types

Types

Table 174–1 Types of DBMS_XMLSTORE

Type	Description
`ctxType`	The type of the query context handle. This is the return type of NEWCONTEXT.

Summary of DBMS_XMLSTORE Subprograms

Table 174–2 DBMS_XMLSTORE Package Subprograms

Method	Description
CLEARKEYCOLUMNLIST on page 174-5	Clears the key column list.
CLEARUPDATECOLUMNLIST on page 174-6	Clears the update column list.
CLOSECONTEXT on page 174-7	It closes/deallocates a particular save context.
DELETEXML on page 174-8	Deletes records specified by data from the XML document, from the table specified at the context creation time.
INSERTXML on page 174-9	Inserts the XML document into the table specified at the context creation time.
NEWCONTEXT on page 174-10	Creates a save context, and returns the context handle.
SETKEYCOLUMN on page 174-11	This method adds a column to the key column list.
SETROWTAG on page 174-12	Names the tag used in the XML document., to enclose the XML elements corresponding to the database.
SETUPDATECOLUMN on page 174-13	Adds a column to the "update column list".
UPDATEXML on page 174-14	Updates the table given the XML document.

CLEARKEYCOLUMNLIST

Clears the key column list.

Syntax

```
PROCEDURE clearKeyColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLEARUPDATECOLUMNLIST

Clears the update column list.

Syntax

```
PROCEDURE clearUpdateColumnList(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

CLOSECONTEXT

Closes/deallocates a particular save context.

Syntax

```
PROCEDURE closeContext(
   ctxHdl IN ctxType);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.

DELETEXML

Deletes records specified by data from the XML document from the table specified at the context creation time, and returns the number of rows deleted.

Syntax	Description

`FUNCTION deleteXML(`
`ctxHdl IN ctxPType,`
`xDoc IN VARCHAR2)`
`RETURN NUMBER;`
	Uses a `VARCHAR2` type for the `xDoc` parameter.

`FUNCTION deleteXML(`
`ctxHdl IN ctxType,`
`xDoc IN CLOB)`
`RETURN NUMBER;`
	Uses a `CLOB` type for the `xDoc` parameter.

`FUNCTION deleteXML(`
`ctxHdl IN ctxType,`
`xDoc IN XMLType)`
`RETURN NUMBER;`
	Uses an `XMLType` type for the `xDoc` parameter.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

INSERTXML

Inserts the XML document into the table specified at the context creation time, and returns the number of rows inserted.

Note that if a user passes an XML file for insertXML to DBMS_XMLSTORE which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless SETUPDATECOLUMN is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax	Description
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;`	Passes in the xDoc parameter as a VARCHAR2.
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;`	Passes in the xDoc parameter as a CLOB.
`FUNCTION insertXML( ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;`	Passes in the xDoc parameter as an XMLType.

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
xDoc	(IN)	String containing the XML document.

NEWCONTEXT

Creates a save context, and returns the context handle.

Syntax

```
FUNCTION newContext(
   targetTable IN VARCHAR2)
RETURN ctxType;
```

Parameter	IN / OUT	Description
targetTable	(IN)	The target table into which to load the XML document.

SETKEYCOLUMN

This method adds a column to the "key column list". The value for the column cannot be NULL. In case of update or delete, the columns in the key column list make up the WHERE clause of the statement. The key columns list must be specified before updates can complete; this is optional for delete operations

Syntax

```
PROCEDURE setKeyColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
colName	(IN)	Column to be added to the key column list; cannot be NULL.

SETROWTAG

Names the tag used in the XML document, to enclose the XML elements corresponding to databse records.

Syntax

```
PROCEDURE setRowTag(
   ctxHdl IN ctxType,
   tag IN VARCHAR2);
```

Parameter	IN / OUT	Description
ctxHdl	(IN)	Context handle.
tag	(IN)	Tag name.

SETUPDATECOLUMN

Adds a column to the update column list. In case of insert, the default is to insert values to all the columns in the table; on the other hand, in case of updates, the default is to only update the columns corresponding to the tags present in the `ROW` element of the XML document. When the update column list is specified, the columns making up this list alone will get updated or inserted into.

Note that if a user passes an XML file for INSERTXML to `DBMS_XMLSTORE` which contains extra elements (ones that do not match up to any columns in the table), Oracle will try to insert into those columns unless setUpdateColumn is used. The use of setUpdateColumn is optional only if the elements in the XML file match up to the columns in the table.

Syntax

```
PROCEDURE setUpdateColumn(
   ctxHdl IN ctxType,
   colName IN VARCHAR2);
```

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`colName`	`(IN)`	Column to be added to the update column list.

UPDATEXML

Updates the table specified at the context creation time with data from the XML document, and returns the number of rows updated. The options are described in the following table.

Syntax	Description
`FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN VARCHAR2) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `VARCHAR2`.
`FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN CLOB) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `CLOB`.
`FUNCTION updateXML( ctxHdl IN ctxType, xDoc IN XMLType) RETURN NUMBER;`	Passes in the `xDoc` parameter as a `XMLType`.

Parameter	IN / OUT	Description
`ctxHdl`	`(IN)`	Context handle.
`xDoc`	`(IN)`	String containing the XML document.

175

DBMS_XMLTRANSLATIONS

The DBMS_XMLTRANSLATIONS package provides an interface to perform translations so that strings can be searched or displayed in various languages.

> **See Also:** For more information, see the *Oracle XML DB Developer's Guide*

This chapter contains the following sections:

- Summary of DBMS_XMLTRANSLATIONS Subprograms

Summary of DBMS_XMLTRANSLATIONS Subprograms

Table 175–1 DBMS_XMLSTORE Package Subprograms

Method	Description
DISABLETRANSLATION Procedure on page 175-3	Disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values
ENABLETRANSLATION Procedure on page 175-4	Enables translations in the current session
EXTRACTXLIFF Function & Procedure on page 175-5	Extracts the translations in `XLIFF` format from either an `XMLTYPE` or a resource in the XDB Repository
GETBASEDOCUMENT Function on page 175-8	Returns the base document with all the translations
MERGEXLIFF Functions on page 175-9	Merges the translations in `XLIFF` format into either an `XMLTYPE` or a resource in the XDB Repository
SETSOURCELANG Function on page 175-12	Sets the source language to a particular language at the specified XPATH
TRANSLATEXML Function on page 175-14	Returns the document in the specified language
UPDATETRANSLATION Function on page 175-3	Updates the translation in a particular language at the specified `XPATH`

DISABLETRANSLATION Procedure

This procedure disables translations in the current session so that query or retrieval will take place on the base document ignoring session language values.

Syntax

```
DBMS_XMLTRANSLATIONS.DISABLETRANSLATION;
```

ENABLETRANSLATION Procedure

This procedure enables translations in the current session. This is the default behavior.

Syntax

```
DBMS_XMLTRANSLATIONS.ENABLETRANSLATION;
```

EXTRACTXLIFF Function & Procedure

This function and procedure extracts the translations in XLIFF format from either an XMLTYPE or a resource in the XDB Repository.

Syntax

```
DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.EXTRACTXLIFF(
   abspath   IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;
```

Parameters

Table 175–2 EXTRACTXLIFF Function Parameters

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be extracted
xpath	XPATH at which specifies the location of the element that needs to be translated. If no XPATH is specified, the entire document is processed.
namespace	Namespace
abspath	Absolute path of the resource from which the XLIFF is to be extracted

Return Values

The translations in the XLIFF format

Examples

Extracting the Translation from an XMLTYPE

Let doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <title xml:lang="es">
        Security Class Example - ES
```

```
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

Let the xpath = `'/securityClass/title'`. The output of `EXTRACTXLIFF` will be as follows:

```
<xliff version='1.1'>
  <file original='' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

Extracting the Translation from a Resource

Let the resource `'/public/security.xml'` =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="es">
        Security Class Example - ES
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
        <title>
            iStore Purchase Order Approver
        </title>
        <privilegeRef name="is:privilege1"/>
        <privilegeRef name="oa:submitPO"/>
        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en">
            secondary privilege
        </title>
        <title xml:lang="fr" xdb:srclang="true">
            secondary privilege - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
```

```
    </privilege>
    </privlist>
</securityClass>
```

And let XPATH = '', then the extracted XLIFF is

```
<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example - FR</target>
          <target xml:lang='es'>Security Class Example - ES</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
  <file original='/public/security.xml' source-language='fr' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/privilege[@name="privilege2"/title'>
        <source>secondary privilege - FR</source>
        <alt-trans>
          <target xml:lang='en'>secondary privilege</target>
        </alt-trans>
      </trans-unit>
    </body>
  </file>
</xliff>
```

GETBASEDOCUMENT Function

This function returns the base document with all the translations.

Syntax

```
DBMS_XMLTRANSLATIONS.GETBASEDOCUMENT(
   doc    IN  XMLTYPE)
 RETURN XMLTYPE;
```

Parameters

Table 175–3 GETBASEDOCUMENT Function Parameters

Parameter	Description
doc	Input XMLTYPE

Return Values

The XMLTYPE which contains the base document with all the translations

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

For the above document, this subprogram will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

MERGEXLIFF Functions

This function merges the translations in XLIFF format into either an XMLTYPE or a resource in the XDB Repository.

Syntax

```
DBMS_XMLTRANSLATIONS.MERGEXLIFF(
   doc       IN  XMLTYPE,
   xliff     IN  XMLTYPE)
 RETURN XMLTYPE;

DBMS_XMLTRANSLATIONS.MERGEXLIFF(
   xliff     IN  XMLTYPE);
```

Parameters

Table 175–4 MERGEXLIFF Function & Procedure Parameters

Parameter	Description
doc	XMLTYPE from which the XLIFF is to be merged
xliff	Translations in the XLIFF format

Return Values

The result of merging 'xliff' into 'doc' at 'xpath'

Examples

Merge Translations into an XMLTYPE

Consider the following input XMLTYPE:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="es">
        Security Class Example - ES
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
        <title>
            iStore Purchase Order Approver
        </title>
        <privilegeRef name="is:privilege1"/>
        <privilegeRef name="oa:submitPO"/>
```

```
        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en">
            secondary privilege
        </title>
        <title xml:lang="fr" xdb:srclang="true">
            secondary privilege - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
    </privilege>
    </privlist>
</securityClass>
```

Let the input XLIFF be as follows:

```
<xliff version='1.1'>
  <file original='/public/security.xml' source-language='en' datatype='xml'>
    <body>
      <trans-unit id='/securityClass/title'>
        <source>Security Class Example Modified</source>
        <alt-trans>
          <target xml:lang='fr'>Security Class Example Mod - FR</target>
          <target xml:lang='es'>Security Class Example Mod - ES</target>
        </alt-trans>
      </trans-unit>
      <trans-unit id='/securityClass/privilege[@name="privilege2"/title'>
        <source>secondary privilege modified</source>
        <alt-trans>
          <target xml:lang='fr'>secondary privilege mod - FR</target>
        </alt-trans>
      </trans-unit>
    </body>
</xliff>
```

The output of merge will be as follows:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example Modified
    </title>
    <title xml:lang="es">
        Security Class Example Mod - ES
    </title>
    <title xml:lang="fr">
        Security Class Example Mod - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
    <privlist>
    <privilege name="privilege1"/>
    <aggregatePrivilege name="iStorePOApprover">
        <title>
            iStore Purchase Order Approver
        </title>
```

```
        <privilegeRef name="is:privilege1"/>
        <privilegeRef name="oa:submitPO"/>
        <privilegeRef name="oa:privilege3"/>
    </aggregatePrivilege>
    <privilege name="privilege2">
        <title xml:lang="en" xdb:srclang="true">
            secondary privilege modified
        </title>
        <title xml:lang="fr">
            secondary privilege mod - FR
        </title>
        <columnRef schema="APPS" table="PurchaseOrder" column="POId"/>
        <columnRef schema="APPS" table="PurchaseOrder" column="Amount"/>
    </privilege>
    </privlist>
</securityClass>
```

Merge XLIFF Translations into a Resource

If the input document in the above example were to be stored in the repository at `'/public/security.xml'`, then merging the above `XLIFF` will have the same effect.

SETSOURCELANG Function

This function sets the source language to a particular language at the specified XPATH.

Syntax

```
DBMS_XMLTRANSLATIONS.SETSOURCELANG (
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   lang      IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;
```

Parameters

Table 175–5 SETSOURCELANG Function Parameters

Parameter	Description
doc	XMLTYPE for which the source language is to be set
xpath	XPATH at which the source language is to be set
lang	Source language
namespace	Namespace

Return Values

The updated document

Examples

For example, if doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

the statement

```
setSourceLang ( doc, '/securityClass/title', 'fr' )
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
```

```
    <name>
        securityClassExample
    </name>
    <title xml:lang="en">
        Security Class Example
    </title>
    <title xml:lang="fr" xdb:srclang="true">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML Function

This function returns the document in the specified language.

Syntax

```
DBMS_XMLTRANSLATIONS.TRANSLATEXML(
   doc    IN  XMLTYPE,
   lang   IN  VARCHAR2)
 RETURN XMLTYPE;
```

Parameters

Table 175–6 TRANSLATEXML Function Parameters

Parameter	Description
doc	Input XMLTYPE
lang	Language

Return Values

The XMLTYPE which contains the document in the specified language

Examples

For example, for doc =

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

TRANSLATEXML (doc, 'fr') will return:

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="fr">
        Security Class Example - FR
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

UPDATETRANSLATION Function

This function updates the translation in a particular language at the specified XPATH.

Syntax

```
DBMS_XMLTRANSLATIONS.UPDATETRANSLATION(
   doc       IN  XMLTYPE,
   xpath     IN  VARCHAR2,
   lang      IN  VARCHAR2,
   value     IN  VARCHAR2,
   namespace IN  VARCHAR2 := NULL)
 RETURN XMLTYPE;
```

Parameters

Table 175–7 UPDATETRANSLATION Function Parameters

Parameter	Description
doc	XMLTYPE for which the translation is to be updated
xpath	XPATH at which the translation is to be updated
lang	Language for which the translation is to be updated
value	New translation
namespace	Namespace

Return Values

The updated document

Examples

For example,

```
updateTranslation ( doc, '/securityClass/title/text()', 'fr', 'Oracle' );
```

produces

```
<securityClass xmlns="http://xmlns.oracle.com/xdb/security.xsd"
               xmlns:is="xmlns.oracle.com/iStore"
               xmlns:oa="xmlns.oracle.com/OracleApps"
               targetNamespace="xmlns.oracle.com/example">
    <name>
        securityClassExample
    </name>
    <title xml:lang="en" xdb:srclang="true">
        Security Class Example
    </title>
    <title xml:lang="fr">
        Oracle
    </title>
    <inherits-from>is:iStorePurchaseOrder</inherits-from>
</securityClass>
```

DBMS_XPLAN

The DBMS_XPLAN package provides an easy way to display the output of the EXPLAIN PLAN command in several, predefined formats. You can also use the DBMS_XPLAN package to display the plan of a statement stored in the Automatic Workload Repository (AWR) or stored in a SQL tuning set. It further provides a way to display the SQL execution plan and SQL execution runtime statistics for cached SQL cursors based on the information stored in the V$SQL_PLAN and V$SQL_PLAN_STATISTICS_ALL fixed views. Finally, it displays plans from a SQL plan baseline.

See Also:

- For more information on the EXPLAIN PLAN command, the AWR, and SQL tuning set, see *Oracle Database Performance Tuning Guide*.
- For more information on the V$SQL_PLAN and V$SQL_PLAN_STATISTICS fixed views, see *Oracle Database Reference.*

This chapter contains the following topics:

- Using DBMS_XPLAN
  - Overview
  - Security Model
  - Examples
- Summary of DBMS_XPLAN Subprograms

Using DBMS_XPLAN

- Overview
- Security Model
- Examples

Overview

The DBMS_XPLAN package supplies five table functions:

- DISPLAY - to format and display the contents of a plan table.
- DISPLAY_AWR - to format and display the contents of the execution plan of a stored SQL statement in the AWR.
- DISPLAY_CURSOR - to format and display the contents of the execution plan of any loaded cursor.
- DISPLAY_SQL_PLAN_BASELINE - to display one or more execution plans for the SQL statement identified by SQL handle
- DISPLAY_SQLSET - to format and display the contents of the execution plan of statements stored in a SQL tuning set.

Security Model

This package runs with the privileges of the calling user, not the package owner (SYS). The table function DISPLAY_CURSOR requires to have select privileges on the following fixed views: VSQL_PLAN, VSESSION and V$SQL_PLAN_STATISTICS_ALL.

Using the DISPLAY_AWR Function requires the user to have SELECT privileges on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE.

Using the DISPLAY_SQLSET Functionrequires the user to have the SELECT privilege on ALL_SQLSET_STATEMENTS and ALL_SQLSET_PLANS.

Using DISPLAY_SQL_PLAN_BASELINE Function the user requires the user to have the SELECT privilege on DBA_SQL_PLAN_BASELINES.

All these privileges are automatically granted as part of the SELECT_CATALOG role.

Examples

Displaying a Plan Table Using DBMS_XPLAN.DISPLAY

Execute an explain plan command on a SELECT statement:

```
EXPLAIN PLAN FOR
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename='benoit';
```

Display the plan using the DBMS_XPLAN.DISPLAY table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
```

This query produces the following output:

```
Plan hash value: 3693697075
--------------------------------------------------------------------------------
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
--------------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  1 |  HASH JOIN         |      |     1 |    57 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    37 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    80 |     3  (34)| 00:00:01 |
--------------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."ENAME"='benoit')

15 rows selected.
```

Displaying a Cursor Execution Plan Using DBMS_XPLAN.DISPLAY_CURSOR

By default, the table function DISPLAY_CURSOR formats the execution plan for the last SQL statement executed by the session. For example:

```
SELECT ename  FROM  emp e, dept d
   WHERE   e.deptno = d.deptno
   AND   e.empno=7369;

ENAME
----------
SMITH
```

To display the execution plan of the last executed statement for that session:

```
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR);
```

This query produces the following output:

```
Plan hash value: 3693697075, SQL hash value: 2096952573, child number: 0
-------------------------------------------------------------------
SELECT ename FROM emp e, dept d WHERE e.deptno = d.deptno
AND e.empno=7369

--------------------------------------------------------------------------------
```

```
| Id  | Operation          | Name | Rows  | Bytes | Cost (%CPU)| Time     |
---------------------------------------------------------------------------
|   0 | SELECT STATEMENT   |      |       |       |            |          |
|*  1 |  HASH JOIN         |      |     1 |    16 |     6  (34)| 00:00:01 |
|*  2 |   TABLE ACCESS FULL| EMP  |     1 |    13 |     3  (34)| 00:00:01 |
|   3 |   TABLE ACCESS FULL| DEPT |     4 |    12 |     3  (34)| 00:00:01 |
---------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   1 - access("E"."DEPTNO"="D"."DEPTNO")
   2 - filter("E"."EMPNO"=7369)

21 rows selected.
```

You can also use the table function `DISPLAY_CURSOR` to display the execution plan for any loaded cursor stored in the cursor cache. In that case, you must supply a reference to the child cursor to the table function. This includes the SQL ID of the statement and optionally the child number.

Run a query with a distinctive comment:

```
SELECT /* TOTO */ ename, dname
FROM dept d join emp e USING (deptno);
```

Get `sql_id` and `child_number` for the preceding statement:

```
SELECT sql_id, child_number
FROM v$sql
WHERE sql_text LIKE '%TOTO%';

SQL_ID         CHILD_NUMBER
----------     ------------------------------
gwp663cqh5qbf   0
```

Display the execution plan for the cursor:

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_CURSOR(('gwp663cqh5qbf',0));

Plan hash value: 3693697075, SQL ID: gwp663cqh5qbf, child number: 0
-------------------------------------------------------
SELECT /* TOTO */ ename, dname
FROM dept d JOIN emp e USING (deptno);

-----------------------------------------------------------------------------
| Id  | Operation           | Name | Rows  | Bytes | Cost (%CPU)| Time     |
-----------------------------------------------------------------------------
|   0 | SELECT STATEMENT    |      |       |       |     7 (100)|          |
|   1 |  SORT GROUP BY      |      |     4 |    64 |     7  (43)| 00:00:01 |
|*  2 |   HASH JOIN         |      |    14 |   224 |     6  (34)| 00:00:01 |
|   3 |    TABLE ACCESS FULL| DEPT |     4 |    44 |     3  (34)| 00:00:01 |
|   4 |    TABLE ACCESS FULL| EMP  |    14 |    70 |     3  (34)| 00:00:01 |
-----------------------------------------------------------------------------

Predicate Information (identified by operation id):
---------------------------------------------------
   2 - access("E"."DEPTNO"="D"."DEPTNO")
```

Instead of issuing two queries, one to the get the sql_id and child_number pair and one to display the plan, you can combine these in a single query:

Display the execution plan of all cursors matching the string 'TOTO':

```
SELECT t.*
FROM v$sql s, table(DBMS_XPLAN.DISPLAY_CURSOR(s.sql_id, s.child_number)) t WHERE
sql_text LIKE '%TOTO%';
```

Displaying a Plan Table with Parallel Information

By default, only relevant information is reported by the display and `display_cursor` table functions. In Displaying a Plan Table Using DBMS_XPLAN.DISPLAY on page 176-5, the query does not execute in parallel. Hence, information related to the parallelization of the plan is not reported. As shown in the following example, parallel information is reported only if the query executes in parallel.

```
ALTER TABLE emp PARALLEL;
EXPLAIN PLAN for
SELECT * FROM emp e, dept d
   WHERE e.deptno = d.deptno
   AND e.ename    ='hermann'
   ORDER BY e.empno;
```

Display the plan using the `DBMS_XPLAN.DISPLAY` table function

```
SET LINESIZE 130
SET PAGESIZE 0
SELECT * FROM table(DBMS_XPLAN.DISPLAY);
Plan hash value: 3693697345
```

```
-------------------------------------------------------------------------------------------------------------
| Id | Operation          | Name    | Rows | Bytes | Cost (%CPU)| Time     | TQ    |INOUT |PQ Distrib   |

| 14 | TABLE ACCESS FULL  | DEPT    | 4    | 120   | 3 (34)     | 00:00:01 |       |      |             |
-------------------------------------------------------------------------------------------------------------
Predicate Information (identified by operation id):
---------------------------------------------------
6 - access("E"."DEPTNO"="D"."DEPTNO")
10 - filter("E"."ENAME"='hermann')
---------------------------------------------------
```

When the query is parallel, information related to parallelism is reported: table queue number (`TQ` column), table queue type (`INOUT`) and table queue distribution method (`PQ Distrib`).

By default, if several plans in the plan table match the `statement_id` parameter passed to the display table function (default value is `NULL`), only the plan corresponding to the last `EXPLAIN PLAN` command is displayed. Hence, there is no need to purge the plan table after each `EXPLAIN PLAN`. However, you should purge the plan table regularly to ensure good performance in the execution of the `DISPLAY` table function. If no plan table is created, Oracle uses a global temporary table to store any plan information for individual users and preserves its content throughout the

lifespan of a session. Note that you cannot truncate the content of a global temporary table.

For ease of use, you can define a view on top of the display table function and then use that view to display the output of the `EXPLAIN PLAN` command:

Using a View to Display Last Explain Plan

```
# define plan view
CREATE VIEW PLAN AS SELECT * FROM TABLE(DBMS_XPLAN.DISPLAY);

# display the output of the last explain plan command
SELECT * FROM PLAN;
```

Summary of DBMS_XPLAN Subprograms

Table 176–1 DBMS_XPLAN Package Subprograms

Subprogram	Description
DISPLAY Function on page 176-10	Displays the contents of the plan table
DISPLAY_AWR Function on page 176-13	Displays the contents of an execution plan stored in the AWR
DISPLAY_CURSOR Function on page 176-16	Displays the execution plan of any cursor in the cursor cache
DISPLAY_PLAN Function on page 176-19	Displays the contents of the plan table in a variety of formats with `CLOB` output type
DISPLAY_SQL_PLAN_BASELINE Function on page 176-22	Displays one or more execution plans for the specified SQL handle of a SQL plan baseline
DISPLAY_SQLSET Function on page 176-24	Displays the execution plan of a given statement stored in a SQL tuning set

DISPLAY Function

This table function displays the contents of the plan table.

In addition, you can use this table function to display any plan (with or without statistics) stored in a table as long as the columns of this table are named the same as columns of the plan table (or V$SQL_PLAN_STATISTICS_ALL if statistics are included). You can apply a predicate on the specified table to select rows of the plan to display.

Syntax

```
DBMS_XPLAN.DISPLAY(
   table_name    IN  VARCHAR2  DEFAULT 'PLAN_TABLE',
   statement_id  IN  VARCHAR2  DEFAULT  NULL,
   format        IN  VARCHAR2  DEFAULT  'TYPICAL',
   filter_preds  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 176–2 DISPLAY Function Parameters

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.
statement_id	Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause.If no statement_id is specified, the function shows you the plan of the most recent explained statement.

Table 176–2 (Cont.) DISPLAY Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '–' to exclude the specified information. For example, '–PROJECTION' excludes projection information. If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).

Table 176–2 (Cont.) DISPLAY Function Parameters

Parameter	Description
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=>'plan_id = 10' Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see **WARNING** under Usage Notes)

Usage Notes

Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

WARNING: Application developers should expose the filter_preds parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, filter_preds can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

Examples

To display the result of the last EXPLAIN PLAN command stored in the plan table:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY);
```

To display from other than the default plan table, "my_plan_table":

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('my_plan_table'));
```

To display the minimum plan information:

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', null, 'basic'));
```

To display the plan for a statement identified by 'foo', such as statement_id='foo':

```
SELECT * FROM table (DBMS_XPLAN.DISPLAY('plan_table', 'foo'));
```

DISPLAY_AWR Function

This table function displays the contents of an execution plan stored in the AWR.

Syntax

```
DBMS_XPLAN.DISPLAY_AWR(
   sql_id            IN      VARCHAR2,
   plan_hash_value   IN      NUMBER DEFAULT NULL,
   db_id             IN      NUMBER DEFAULT NULL,
   format            IN      VARCHAR2 DEFAULT TYPICAL);
```

Parameters

Table 176–3 DISPLAY_AWR Table Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement. You can retrieve the appropriate value for the SQL statement of interest by querying the column SQL_ID in DBA_HIST_SQLTEXT.
plan_hash_value	Specifies the PLAN_HASH_VALUE of a SQL statement. This parameter is optional. If omitted, the table function returns all stored execution plans for a given SQL_ID.
db_id	Specifies the database_id for which the plan of the SQL statement, identified by SQL_ID should be displayed. If not supplied, the database_id of the local database is used, as shown in V$DATABASE.
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed).

Table 176–3 (Cont.) DISPLAY_AWR Table Function Parameters

Parameter	Description
	For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_AWR functionality, the calling user must have SELECT privilege on DBA_HIST_SQL_PLAN, DBA_HIST_SQLTEXT, and V$DATABASE, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:
  - Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
  - Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
  - Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
  - Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the different execution plans associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table(DBMS_XPLAN.DISPLAY_AWR('atfwcg8anrykp'));
```

To display all execution plans of all stored SQL statements containing the string 'TOTO':

```
SELECT tf.* FROM DBA_HIST_SQLTEXT ht, table
    (DBMS_XPLAN.DISPLAY_AWR(ht.sql_id,null, null,  'ALL' )) tf
 WHERE ht.sql_text like '%TOTO%';
```

DISPLAY_CURSOR Function

This table function displays the explain plan of any cursor loaded in the cursor cache. In addition to the explain plan, various plan statistics (such as. I/O, memory and timing) can be reported (based on the V$SQL_PLAN_STATISTICS_ALL VIEWS).

Syntax

```
DBMS_XPLAN.DISPLAY_CURSOR(
   sql_id        IN  VARCHAR2  DEFAULT  NULL,
   child_number  IN  NUMBER    DEFAULT  NULL,
   format        IN  VARCHAR2  DEFAULT  'TYPICAL');
```

Parameters

Table 176–4 DISPLAY_CURSOR Function Parameters

Parameter	Description
sql_id	Specifies the SQL_ID of the SQL statement in the cursor cache. You can retrieve the appropriate value by querying the column SQL_ID in V$SQL or V$SQLAREA. Alternatively, you could choose the column PREV_SQL_ID for a specific session out of V$SESSION. This parameter defaults to NULL in which case the plan of the last cursor executed by the session is displayed.
child_number	Child number of the cursor to display. If not supplied, the execution plan of all cursors matching the supplied sql_id parameter are displayed. The child_number can be specified only if sql_id is specified.
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE).

Table 176–4 (Cont.) DISPLAY_CURSOR Function Parameters

Parameter	Description
	Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan ■ IOSTATS - assuming that basic plan statistics are collected when SQL statements are executed (either by using the gather_plan_statistics hint or by setting the parameter statistics_level to ALL), this format shows IO statistics for ALL (or only for the LAST as shown below) executions of the cursor. ■ MEMSTATS - Assuming that PGA memory management is enabled (that is, pga_aggregate_target parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ■ ALLSTATS - A shortcut for 'IOSTATS MEMSTATS' ■ LAST - By default, plan statistics are shown for all executions of the cursor. The keyword LAST can be specified to see only the statistics for the last execution. The following two formats are deprecated but supported for backward compatibility: ■ RUNSTATS_TOT - Same as IOSTATS, that is, displays IO statistics for all executions of the specified cursor. ■ RUNSTATS_LAST - Same as IOSTATS LAST, that is, displays the runtime statistics for the last execution of the cursor Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information.

Usage Notes

- To use the DISPLAY_CURSOR functionality, the calling user must have SELECT privilege on the fixed views V$SQL_PLAN_STATISTICS_ALL, V$SQL and V$SQL_PLAN, otherwise it shows an appropriate error message.
- Here are some ways you might use variations on the format parameter:

- Use 'ALL -PROJECTION -NOTE' to display everything except the projection and note sections.
- Use 'TYPICAL PROJECTION' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply 'PROJECTION' is equivalent.
- Use '-BYTES -COST -PREDICATE' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use 'BASIC ROWS' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan of the last SQL statement executed by the current session:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR);
```

To display the execution plan of all children associated with the SQL ID 'atfwcg8anrykp':

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp'));
```

To display runtime statistics for the cursor included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_CURSOR('atfwcg8anrykp', NULL, 'ALLSTATS LAST');
```

DISPLAY_PLAN Function

This table function displays the contents of the plan table in a variety of formats with CLOB output type.

Syntax

```
DBMS_XPLAN.DISPLAY_PLAN (
   table_name       IN    VARCHAR2   DEFAULT 'PLAN_TABLE',
   statement_id     IN    VARCHAR2   DEFAULT NULL,
   format           IN    VARCHAR2   DEFAULT 'TYPICAL',
   filter_preds     IN    VARCHAR2   DEFAULT NULL,
   type             IN    VARCHAR2   DEFAULT 'TEXT')
  RETURN CLOB;
```

Parameters

Table 176–5 DISPLAY_PLAN Function Parameters

Parameter	Description
table_name	Specifies the table name where the plan is stored. This parameter defaults to PLAN_TABLE, which is the default plan table for the EXPLAIN PLAN command. If NULL is specified it also defaults to PLAN_TABLE.
statement_id	Specifies the statement_id of the plan to be displayed. This parameter defaults to NULL, which is the default when the EXPLAIN PLAN command is executed without a set statement_id clause.If no statement_id is specified, the function shows you the plan of the most recent explained statement.
filter_preds	SQL filter predicate(s) to restrict the set of rows selected from the table where the plan is stored. When value is NULL (the default), the plan displayed corresponds to the last executed explain plan. For example: filter_preds=>'plan_id = 10' Can reference any column of the table where the plan is stored and can contain any SQL construct (for example, sub-query, function calls (see **WARNING** under Usage Notes)

Table 176–5 (Cont.) DISPLAY_PLAN Function Parameters

Parameter	Description
format	Controls the level of details for the plan. It accepts four values: ■ BASIC: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ TYPICAL: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only PROJECTION, ALIAS and REMOTE SQL information (see below). ■ SERIAL: Like TYPICAL except that the parallel information is not displayed, even if the plan executes in parallel. ■ ALL: Maximum user level. Includes information displayed with the TYPICAL level with additional information (PROJECTION, ALIAS and information about REMOTE SQL if the operation is distributed). For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as PARTITION) or logical additions to the base plan table output (such as PREDICATE). Format keywords must be separated by either a comma or a space: ■ ROWS - if relevant, shows the number of rows estimated by the optimizer ■ BYTES - if relevant, shows the number of bytes estimated by the optimizer ■ COST - if relevant, shows optimizer cost information ■ PARTITION - if relevant, shows partition pruning information ■ PARALLEL - if relevant, shows PX information (distribution method and table queue information) ■ PREDICATE - if relevant, shows the predicate section ■ PROJECTION -if relevant, shows the projection section ■ ALIAS - if relevant, shows the "Query Block Name / Object Alias" section ■ REMOTE - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ NOTE - if relevant, shows the note section of the explain plan Format keywords can be prefixed by the sign '-' to exclude the specified information. For example, '-PROJECTION' excludes projection information. If the target plan table (see table_name parameter) also stores plan statistics columns (for example, it is a table used to capture the content of the fixed view V$SQL_PLAN_STATISTICS_ALL), additional format keywords can be used to specify which class of statistics to display when using the DISPLAY Function. These additional format keywords are IOSTATS, MEMSTATS, ALLSTATS and LAST (see the DISPLAY_CURSOR Function or the DISPLAY_SQLSET Function for a full description of these four keywords).
type	Output type, one of: 'TEXT', 'ACTIVE', 'HTML', or 'XML' (see Usage Notes regarding type ACTIVE). '

Return Values

Returns the requested report as `CLOB`

Usage Notes

Active reports have a rich, interactive user interface akin to that found in Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

WARNING: Application developers should expose the `filter_preds` parameter to end-users only after careful consideration because this could expose the application to SQL injection. Indeed, `filter_preds` can potentially reference any table or execute any server function for which the database user invoking the table function has privileges.

DISPLAY_SQL_PLAN_BASELINE Function

This table function displays one or more execution plans for the specified SQL handle of a SQL plan baseline.

Syntax

```
DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE (
   sql_handle      IN VARCHAR2 := NULL,
   plan_name       IN VARCHAR2 := NULL,
   format          IN VARCHAR2 := 'TYPICAL')
 RETURN dbms_xplan_type_table;
```

Parameters

Table 176–6 DISPLAY_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
`sql_handle`	SQL statement handle. It identifies a SQL statement whose plan(s) are to be displayed.
`plan_name`	Plan name. It identifies a specific plan. Default NULL means all plans associated with identified SQL statement are explained and displayed.
`format`	Format string determines what information stored in the plan displayed. One of three format values ('BASIC', 'TYPICAL', 'ALL') can be used, each representing a common use case.

Return Values

A PL/SQL type table

Usage Notes

This procedure uses plan information stored in the plan baseline to explain and display the plans.It is possible that the plan_id stored in the SQL management base may not match with the `plan_id` of the generated plan. A mismatch between stored `plan_id` and generated `plan_id` means that it is a non-reproducible plan. Such a plan is deemed invalid and is bypassed by the optimizer during SQL compilation.

Examples

Display all plans of a SQL statement identified by the SQL handle 'SYS_SQL_ b1d49f6074ab95af' using TYPICAL format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
  FROM TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(
                'SYS_SQL_b1d49f6074ab95af')) t;
```

Display all plans of one or more SQL statements containing the string 'HR2' using BASIC format

```
SET LINESIZE 150
SET PAGESIZE 2000
SELECT t.*
   FROM (SELECT DISTINCT sql_handle FROM dba_sql_plan_baselines
```

```
 WHERE sql_text like '%HR2%') pb,
TABLE(DBMS_XPLAN.DISPLAY_SQL_PLAN_BASELINE(pb.sql_handle, NULL,
                                           'BASIC')) t;
```

DISPLAY_SQLSET Function

This table function displays the execution plan of a given statement stored in a SQL tuning set.

Syntax

```
DBMS_XPLAN.DISPLAY_SQLSET(
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   plan_hash_value  IN NUMBER := NULL,
   format           IN  VARCHAR2  := 'TYPICAL',
   sqlset_owner     IN  VARCHAR2  := NULL)
  RETURN DBMS_XPLAN_TYPE_TABLE PIPELINED;
```

Parameters

Table 176–7 DISPLAY_SQLSET Function Parameters

Parameter	Description
`sqlset_name`	Name of the SQL Tuning Set
`sql_id`	Specifies the sql_id value for a SQL statement having its plan stored in the SQL tuning set. You can find all stored SQL statements by querying table function `DBMS_SQLTUNE.SELECT_SQLSET`
`plan_hash_value`	Optional parameter. Identifies a specific stored execution plan for a SQL statement. If suppressed, all stored execution plans are shown.
`format`	Controls the level of details for the plan. It accepts four values: ■ `BASIC`: Displays the minimum information in the plan—the operation ID, the operation name and its option. ■ `TYPICAL`: This is the default. Displays the most relevant information in the plan (operation id, name and option, #rows, #bytes and optimizer cost). Pruning, parallel and predicate information are only displayed when applicable. Excludes only `PROJECTION`, `ALIAS` and `REMOTE SQL` information (see below). ■ `SERIAL`: Like `TYPICAL` except that the parallel information is not displayed, even if the plan executes in parallel. ■ `ALL`: Maximum user level. Includes information displayed with the `TYPICAL` level with additional information (`PROJECTION`, `ALIAS` and information about `REMOTE SQL` if the operation is distributed).

Table 176–7 (Cont.) DISPLAY_SQLSET Function Parameters

Parameter	Description
	For finer control on the display output, the following keywords can be added to the above three standard format options to customize their default behavior. Each keyword either represents a logical group of plan table columns (such as `PARTITION`) or logical additions to the base plan table output (such as `PREDICATE`). Format keywords must be separated by either a comma or a space: ■ `ROWS` - if relevant, shows the number of rows estimated by the optimizer ■ `BYTES` - if relevant, shows the number of bytes estimated by the optimizer ■ `COST` - if relevant, shows optimizer cost information ■ `PARTITION` - if relevant, shows partition pruning information ■ `PARALLEL` - if relevant, shows PX information (distribution method and table queue information) ■ `PREDICATE` - if relevant, shows the predicate section ■ `PROJECTION` -if relevant, shows the projection section ■ `ALIAS` - if relevant, shows the "Query Block Name / Object Alias" section ■ `REMOTE` - if relevant, shows the information for distributed query (for example, remote from serial distribution and remote SQL) ■ `NOTE` - if relevant, shows the note section of the explain plan ■ `IOSTATS` - assuming that basic plan statistics are collected when SQL statements are executed (either by using the `gather_plan_statistics` hint or by setting the parameter statistics_level to ALL), this format shows IO statistics for `ALL` (or only for the `LAST` as shown below) executions of the cursor. ■ `MEMSTATS` - Assuming that PGA memory management is enabled (that is, `pga_aggregate_target` parameter is set to a non 0 value), this format allows to display memory management statistics (for example, execution mode of the operator, how much memory was used, number of bytes spilled to disk, and so on). These statistics only apply to memory intensive operations like hash-joins, sort or some bitmap operators. ■ `ALLSTATS` - A shortcut for `'IOSTATS MEMSTATS'` ■ `LAST` - By default, plan statistics are shown for all executions of the cursor. The keyword `LAST` can be specified to see only the statistics for the last execution. The following two formats are deprecated but supported for backward compatibility: ■ `RUNSTATS_TOT` - Same as `IOSTATS`, that is, displays IO statistics for all executions of the specified cursor. ■ `RUNSTATS_LAST` - Same as `IOSTATS LAST`, that is, displays the runtime statistics for the last execution of the cursor Format keywords can be prefixed by the sign '`-`' to exclude the specified information. For example, '`-PROJECTION`' excludes projection information.
`sqlset_owner`	The owner of the SQL tuning set. The default is the current user.

Usage Notes

Here are some ways you might use variations on the `format` parameter:

- Use '`ALL -PROJECTION -NOTE`' to display everything except the projection and note sections.
- Use '`TYPICAL PROJECTION`' to display using the typical format with the additional projection section (which is normally excluded under the typical format). Since typical is default, using simply '`PROJECTION`' is equivalent.
- Use '`-BYTES -COST -PREDICATE`' to display using the typical format but excluding optimizer cost and byte estimates as well as the predicate section.
- Use '`BASIC ROWS`' to display basic information with the additional number of rows estimated by the optimizer.

Examples

To display the execution plan for the SQL statement associated with SQL ID '`gwp663cqh5qbf`' and `PLAN HASH 3693697075` in the SQL Tuning Set called '`OLTP_optimization_0405`":

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
       'OLTP_optimization_0405','gwp663cqh5qbf', 3693697075));
```

To display all execution plans of the SQL ID '`atfwcg8anrykp`' stored in the SQL tuning set:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
      'OLTP_optimization_0405','gwp663cqh5qbf'));
```

To display runtime statistics for the SQL statement included in the preceding statement:

```
SELECT * FROM table (
   DBMS_XPLAN.DISPLAY_SQLSET(
      'OLTP_optimization_0405', 'gwp663cqh5qbf', NULL, 'ALLSTATS LAST');
```

177

DBMS_XSLPROCESSOR

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

This chapter contains the following topics:

- Using DBMS_XSLPROCESSOR
  - Overview
- Summary of DBMS_XSLPROCESSOR Subprograms

See Also:

- *Oracle XML DB Developer's Guide*

Using DBMS_XSLPROCESSOR

This section contains topics which relate to using the `DBMS_XSLPROCESSOR` package.

- Overview on page 177-3

Overview

The DBMS_XSLPROCESSOR package provides an interface to manage the contents and structure of XML documents.

Standards

This PL/SQL implementation of the XSL processor follows the W3C XSLT working draft rev WD-xslt-19990813 and includes the required behavior of an XSL processor in terms of how it must read XSLT stylesheets and the transformation it must effect.

Concepts

The Extensible Stylesheet Language Transformation (XSLT) describes rules for transforming a source tree into a result tree. A transformation expressed in XSLT is called a stylesheet. The transformation specified is achieved by associating patterns with templates defined in the stylesheet. A template is instantiated to create part of the result tree.

Implementation

The following is the default behavior for this PL/SQL XSL Processor:

- A result tree which can be accessed by DOM programmatic interface
- Errors are not recorded unless an error log is specified; however, an application error will be raised if parsing fails

Summary of DBMS_XSLPROCESSOR Subprograms

Table 177–1 DBMS_XSLPROCESSOR Package Subprograms

Method	Description
CLOB2FILE Procedure on page 177-5	Writes content of a `CLOB` into a file
FREEPROCESSOR Procedure on page 177-6	Frees a processor object
FREESTYLESHEET Procedure on page 177-7	Frees a stylesheet object
NEWPROCESSOR Function on page 177-7	Returns a new processor instance
NEWSTYLESHEET Functions on page 177-9	Creates a new stylesheet from input and reference URLs
PROCESSXSL Functions and Procedures on page 177-10	Transforms an input XML document
READ2CLOB Function on page 177-12	Reads content of the file into a `CLOB`
REMOVEPARAM Procedure on page 177-13	Removes a top-level stylesheet parameter
RESETPARAMS Procedure on page 177-14	Resets the top-level stylesheet parameters
SELECTNODES Function on page 177-15	Selects nodes from a DOM tree that match a pattern
SELECTSINGLENODE Function on page 177-16	Selects the first node from the tree that matches a pattern
SETERRORLOG Procedure on page 177-17	Sets errors to be sent to the specified file
SETPARAM Procedure on page 177-18	Sets a top-level parameter in the stylesheet
SHOWWARNINGS Procedure on page 177-19	Turns warnings on or off
TRANSFORMNODE Function on page 177-20	Transforms a node in a DOM tree using a stylesheet
VALUEOF Function and Procedure on page 177-21	Gets the value of the first node that matches a pattern

CLOB2FILE Procedure

This procedure writes content of a CLOB into a file.

Syntax

```
DBMS_XSLPROCESSOR.CLOB2FILE(
  cl          IN  CLOB;
  flocation   IN  VARCHAR2,
  fname       IN  VARCHAR2,
  csid        IN  NUMBER:=0);
```

Parameters

Table 177–2 CLOB2FILE Procedure Parameters

Parameter	Description
CLOB	File directory
flocation	File directory
fname	File name
csid	Character set id of the file ■ Must be a valid Oracle id; otherwise returns an error ■ If 0, content of the output file will be in the database character set

FREEPROCESSOR Procedure

This procedure Frees a `Processor` object.

Syntax

```
DBMS_XSLPROCESSOR.FREEPROCESSOR(
  p  IN  Processor);
```

Parameters

Table 177–3 FREEPROCESSOR Procedure Parameters

Parameter	Description
p	Processor

FREESTYLESHEET Procedure

This procedure frees a `Stylesheet` object.

Syntax

```
DBMS_XSLPROCESSOR.FREESTYLESHEET(
  ss  IN  Stylesheet);
```

Parameters

Table 177–4 FREESTYLESHEET Procedure Parameters

Parameter	Description
`ss`	Stylesheet

NEWPROCESSOR Function

This function returns a new `Processor` instance. The function must be called before the default behavior of `Processor` can be changed and if other processor methods need to be used.

Syntax

```
DBMS_XSLPROCESSOR.NEWPROCESSOR
 RETURN Processor;
```

NEWSTYLESHEET Functions

This function creates and returns a new `Stylesheet` instance. The options are described in the following table.

Syntax

Creates and returns a new stylesheet instance using the given `DOMDOCUMENT` and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   xmldoc  IN   DOMDOCUMENT,
   ref     IN   VARCHAR2)
 RETURN Stylesheet;
```

Creates and returns a new `Stylesheet` instance using the given input and reference URLs:

```
DBMS_XSLPROCESSOR.NEWSTYLESHEET(
   inp    IN   VARCHAR2,
   ref    IN   VARCHAR2)
 RETURN Stylesheet;
```

Parameters

Table 177–5 NEWSTYLESHEET Function Parameters

Parameter	Description
`xmldoc`	`DOMDocument` to use for construction
`inp`	Input URL to use for construction
`ref`	Reference URL

PROCESSXSL Functions and Procedures

This function transforms input XMLDocument. Any changes to the default processor behavior should be effected before calling this procedure. An application error is raised if processing fails.

Syntax

Transforms input XMLDocument using given DOMDocument and stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p      IN   Processor,
   ss     IN   Stylesheet,
   xmldoc IN   DOMDOCUMENT),
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as URL and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN   Stylesheet,
   url   IN   VARCHAR2,
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given document as CLOB and the Stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p     IN   Processor,
   ss    IN  Stylesheet,
   clb   IN  CLOB)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to the specified file:

```
DBMS_XSLPROCESSOR.DBMS_XSLPROCESSOR.(
   p           IN    Processor,
   ss          IN    Stylesheet,
   xmldoc      IN    DOMDOCUMENT,
   dir         IN    VARCHAR2,
   fileName    IN    VARCHAR2);
```

Transforms input XMLDocument using given URL and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN    Processor,
   ss         IN    Stylesheet,
   url        IN    VARCHAR2,
   dir        IN    VARCHAR2,
   fileName   IN    VARCHAR2);
```

Transforms input XMLDocument using given DOMDOCUMENT and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN      Processor,
```

```
   ss         IN      Stylesheet,
   xmldoc     IN      DOMDOCUMENT,
   cl         IN OUT  CLOB);
```

Transforms input XMLDocument using given DOMDOCUMENTFRAGMENT and the stylesheet, and returns the resultant document fragment:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p         IN    Processor,
   ss        IN    Stylesheet,
   xmldf     IN    DOMDOCUMENTFRAGMENT)
 RETURN DOMDOCUMENTFRAGMENT;
```

Transforms input XMLDocumentFragment using given DOMDocumentFragment and the stylesheet, and writes the output to the specified file in a specified directory:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p         IN    Processor,
   ss        IN    Stylesheet,
   xmldf     IN    DOMDOCUMENTFRAGMENT,
   dir       IN    VARCHAR2,
   filename  IN    VARCHAR2);
```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a buffer:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN       Processor,
   ss         IN       Stylesheet,
   xmldf      IN       DOMDOCUMENTFRAGMENT,
   buf        IN OUT   VARCHAR2);
```

Transforms input XMLDocumentFragment using given DOMDOCUMENTFRAGMENT and the stylesheet, and writes the output to a CLOB:

```
DBMS_XSLPROCESSOR.PROCESSXSL(
   p          IN      Processor,
   ss         IN      Stylesheet,
   xmldf      IN      DOMDOCUMENTFRAGMENT,
   cl         IN OUT  CLOB);
```

Parameters

Table 177–6 PROCESSXSL Function and Procedure Parameters

Parameter	Description
p	Processor instance
ss	Stylesheet instance
xmldoc	XML document being transformed
url	URL for the information being transformed
clb	CLOB containing information to be transformed
dir	Directory where processing output file is saved
filename	Processing output file
cl	CLOB to which the processing output is saved
xmldf	XMLDocumentFragment being transformed

READ2CLOB Function

This function reads content of a file into a CLOB.

Syntax

```
DBMS_XSLPROCESSOR.READ2CLOB(
   flocation     IN   VARCHAR2,
   fname         IN   VARCHAR2,
   csid          IN   NUMBER:=0)
 RETURN CLOB;
```

Parameters

Table 177–7 READ2CLOB Function Parameters

Parameter	Description
flocation	File directory
fname	File name
csid	Character set id of the file ■ Must be a valid Oracle id; otherwise returns an error ■ If 0, input file is assumed to be in the database character set

REMOVEPARAM Procedure

This procedure removes a top level stylesheet parameter.

Syntax

```
DBMS_XSLPROCESSOR.REMOVEPARAM(
   ss     IN  Stylesheet,
   name   IN  VARCHAR2);
```

Parameters

Table 177–8 REMOVEPARAM Procedure Parameters

Parameter	Description
ss	`Stylesheet` instance
name	Name of the parameter

RESETPARAMS Procedure

This procedure resets the top-level stylesheet parameters.

Syntax

```
DBMS_XSLPROCESSOR.RESETPARAMS(
   ss  IN   Stylesheet);
```

Parameters

Table 177–9 RESETPARAMS Procedure Parameters

Parameter	Description
ss	Stylesheet instance

SELECTNODES Function

This function selects nodes which match the suplied path expression from a DOM tree, and returns the result of the selection.

Syntax

```
DBMS_XSLPROCESSOR.SELECTNODES(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODELIST;
```

Parameters

Table 177–10 SELECTNODES Function Parameters

Parameter	Description
`n`	Root `DOMNode` of the tree
`pattern`	Pattern to use
`namespace`	Namespace declared

SELECTSINGLENODE Function

This function selects the first node from the tree that match the suplied path expression, and returns that node.

Syntax

```
DBMS_XSLPROCESSOR.SELECTSINGLENODE(
   n           IN   DBMS_XMLDOM.DOMNODE,
   pattern     IN   VARCHAR2,
   namespace   IN VARCHAR2 := NULL)
 RETURN DBMS_XMLDOM.DOMNODE;
```

Parameters

Table 177–11 SELECTSINGLENODE Function Parameters

Parameter	Description
`n`	Root `DOMNode` of the tree
`pattern`	Pattern to use
`namespace`	Namespace declared

SETERRORLOG Procedure

This procedure sets errors to be sent to the specified file.

> **Note:** This subprogram has been deprecated, and is included only for reasons of backward compatibility.

Syntax

```
DBMS_XSLPROCESSOR.SETERRORLOG(
   p         IN   Processor,
   fileName  IN   VARCHAR2);
```

Parameters

Table 177–12 SETERRORLOG Procedure Parameters

Parameter	Description
`p`	`Processor` instance
`fileName`	Complete path of the file to use as the error log

SETPARAM Procedure

This procedure sets a top level parameter in the stylesheet. The parameter value must be a valid `XPath` expression. Literal string values must be quoted.

Syntax

```
DBMS_XSLPROCESSOR.SETPARAM(
   ss      IN   Stylesheet,
   name    IN   VARCHAR2,
   value   IN   VARCHAR2);
```

Parameters

Table 177–13 SETPARAM Procedure Parameters

Parameter	Description
`ss`	`Stylesheet` instance
`name`	Name of the parameter
`value`	Value of the parameter

SHOWWARNINGS Procedure

This procedure turns warnings on (TRUE) or off (FALSE).

Syntax

```
DBMS_XSLPROCESSOR.SHOWWARNINGS(
   p     IN   Processor,
   yes   IN   BOOLEAN);
```

Parameters

Table 177–14 SHOWWARNINGS Procedure Parameters

Parameter	Description
p	Processor instance
yes	Mode to set: TRUE to show warnings, FALSE otherwise

TRANSFORMNODE Function

This function transforms a node in a DOM tree using the given stylesheet, and returns the result of the transformation as a `DOMDocumentFragment`.

Syntax

```
DBMS_XSLPROCESSOR.TRANSFORMNODE(
   n    IN  DOMNODE,
   ss   IN  Stylesheet)
 RETURN DOMDocumentFragment;
```

Parameters

Table 177–15 TRANSFORMNODE Function Parameters

Parameter	Description
`n`	`DOMNode` to transform
`ss`	Stylesheet to use

VALUEOF Function and Procedure

This subprogram retrieves the value of the first node from the tree that matches the given pattern. You can use either a function or a procedure.

Syntax

```
DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  namespace   IN    VARCHAR2 := NULL)
 RETURN VARCHAR2;

DBMS_XSLPROCESSOR.VALUEOF(
  n           IN    DBMS_XMLDOM.DOMNODE,
  pattern     IN    VARCHAR2,
  val         OUT   VARCHAR2,
  namespace   IN    VARCHAR2 := NULL);
```

Parameters

Table 177–16 VALUEOF Function and Procedure Parameters

Parameter	Description
n	Node whose value is being retrieved
pattern	Pattern to use
val	Retrieved value
namespace	Namespace to use

178

DEBUG_EXTPROC

The DEBUG_EXTPROC package enables you to start up the extproc agent within a session. This utility package can help you debug external procedures.

This chapter contains the following topics:

- Using DEBUG_EXTPROC
  - Security Model
  - Operational Notes
  - Rules and Limits
- Summary of DEBUG_EXTPROC Subprograms

Using DEBUG_EXTPROC

- Security Model
- Operational Notes
- Rules and Limits

Security Model

Your Oracle account must have `EXECUTE` privileges on the package and `CREATE LIBRARY` privileges.

Operational Notes

To install the package, run the script DBGEXTP.SQL.

- Install/load this package in the Oracle USER where you want to debug the 'extproc' process.
- Ensure that you have execute privileges on package DEBUG_EXTPROC

```
SELECT SUBSTR(OBJECT_NAME, 1, 20)
FROM USER_OBJECTS
WHERE OBJECT_NAME = 'DEBUG_EXTPROC';
```

- You can install this package as any other user, as long as you have EXECUTE privileges on the package.

> **Note:** These notes assumes that you built your shared library with debug symbols to aid in the debugging process. Please check the C compiler manual pages for the appropriate C compiler switches to build the shared library with debug symbols.

Having installed the package, proceed accordingly:

- Start a new Oracle session through SQL*Plus or OCI program by connecting to ORACLE.
- Execute procedure DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT to startup the extproc agent in this session; for example, execute DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT; Do not exit this session, because that terminates the extproc agent.
- Determine the PID of the extproc agent that was started up for this session.
- Using a debugger (for example, gdb, dbx, or the native system debugger), load the extproc executable and attach to the running process.
- Set a breakpoint on function 'pextproc' and let the debugger continue with its execution.
- Now execute your external procedure in the same session where you first executed DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT
- Your debugger should now break in function 'pextproc'. At this point in time, the shared library referenced by your PL/SQL external function would have been loaded and the function resolved. Now set a breakpoint in your C function and let the debugger continue its execution.

Because PL/SQL loads the shared library at runtime, the debugger you use may or may not automatically be able to track the new symbols from the shared library. You may have to issue some debugger command to load the symbols (for example, 'share' in gdb)

- The debugger should now break in your C function. Its assumed that you had built the shared library with debugging symbols.
- Now proceed with your debugging.

Rules and Limits

Note: DEBUG_EXTPROC works only on platforms with debuggers that can attach to a running process.

Summary of DEBUG_EXTPROC Subprograms

Table 178–1 DEBUG_EXTPROC Package Subprograms

Subprogram	Description
STARTUP_EXTPROC_AGENT Procedure on page 178-7	Starts up the extproc agent process in the session

STARTUP_EXTPROC_AGENT Procedure

This procedure starts up the extproc agent process in the session.This enables you to get the PID of the executing process. This PID is needed to be able to attach to the running process using a debugger.

Syntax

```
DEBUG_EXTPROC.STARTUP_EXTPROC_AGENT;
```

179

HTF

The HTF (hypertext functions) and HTP (hypertext procedures) packages generate HTML tags. For example, the HTF.ANCHOR function generates the HTML anchor tag, <A>.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- Using HTF
  - Operational Notes
  - Rules and Limits
  - Examples
- Summary of Tags
- Summary of HTF Subprograms

Using HTF

- Operational Notes
- Rules and Limits
- Examples

Operational Notes

For every HTF function that generates one or more HTML tags, there is a corresponding HTP procedure with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTF.`PRINT` function. It then prints its parameters to the generated Web page.

Rules and Limits

If you use values of the LONG data type in functions such as `HTF.PRINT`, `HTF.PRN`, `HTF.PA` or `OWA_UTIL.CELLSPRINT`, only the first 32 K of the `LONG` data is used. The `LONG` data is bound to a `VARCHAR2` data type in the function.

Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
   HTP.P (HTF.HTMLOPEN); -- generates <HTML>
   HTP.P (HTF.HEADOPEN); -- generates <HEAD>
   HTP.P (HTF.TITLE('Hello')); -- generates <TITLE>Hello</TITLE>
   HTP.P (HTF.HEADCLOSE); -- generates </HEAD>
   HTP.P (HTF.BODYOPEN); -- generates <BODY>
   HTP.P (HTF.HEADER(1, 'Hello')); -- generates <H1>Hello</H1>
   HTP.P (HTF.BODYCLOSE); -- generates </BODY>
   HTP.P (HTF.HTMLCLOSE); -- generates </HTML>
END;
```

Summary of Tags

HTML, HEAD, and BODY Tags

HTMLOPEN Function, HTMLCLOSE Function - generate <HTML> and </HTML>

HEADOPEN Function, HEADCLOSE Function - generate <HEAD> and </HEAD>

BODYOPEN Function, BODYCLOSE Function - generate <BODY> and </BODY>

Comment Tag

COMMENT Function - generates <!-- and -->

http://www.w3.org.BASE Function - generates <BASE>

LINKREL Function - generates <LINK> with the REL attribute

LINKREV Function - generates <LINK> with the REV attribute

TITLE Function - generates <TITLE>

META Function - generates <META>

SCRIPT Function - generates <SCRIPT>

STYLE Function - generates <STYLE>

ISINDEX Function - generates <ISINDEX>

Applet Tags

APPLETOPEN Function, APPLETCLOSE Function - generate <APPLET> and </APPLET>

PARAM Function - generates <PARAM>

List Tags

OLISTOPEN Function, OLISTCLOSE Function - generate <OL> and </OL>

ULISTOPEN Function, ULISTCLOSE Function - generate <UL> and </UL>

DLISTOPEN Function, DLISTCLOSE Function- generate <DL> and </DL>

DLISTTERM Function - generates <DT>

DLISTDEF Function - generates <DD>

DIRLISTOPEN Function, DIRLISTCLOSE Function - generate <DIR> and </DIR>

LISTHEADER Function - generates <LH>

LISTINGOPEN Function, LISTINGCLOSE Function - generate <LISTING> and </LISTING>

MENULISTOPEN Function - generate <MENU> and </MENU>

LISTITEM Function - generates <LI>

Form Tags

FORMOPEN Function, FORMCLOSE Function - generate <FORM> and </FORM>

FORMCHECKBOX Function - generates <INPUT TYPE="CHECKBOX">

FORMHIDDEN Function - generates <INPUT TYPE="HIDDEN">

FORMIMAGE Function - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Function - generates <INPUT TYPE="PASSWORD">

FORMRADIO Function - generates <INPUT TYPE="RADIO">

FORMSELECTOPEN Function, FORMSELECTCLOSE Function - generate <SELECT> and </SELECT>

FORMSELECTOPTION Function - generates <OPTION>

FORMTEXT Function - generates <INPUT TYPE="TEXT">

FORMTEXTAREA Function - generate <TEXTAREA>

FORMTEXTAREAOPEN Function, FORMTEXTAREACLOSE Function - generate <TEXTAREA> and </TEXTAREA>

FORMRESET Function - generates <INPUT TYPE="RESET">

FORMSUBMIT Function - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Function, TABLECLOSE Function - generate <TABLE> and </TABLE>

TABLECAPTION Function - generates <CAPTION>

TABLEROWOPEN Function, TABLEROWCLOSE Function - generate <TR> and </TR>

TABLEHEADER Function - generates <TH>

TABLEDATA Function - generates <TD>

IMG, HR, and A Tags

HR Function, LINE Function - generate <HR>

IMG Function, IMG2 Function - generate <IMG>

ANCHOR Function, ANCHOR2 Function - generate <A>

MAPOPEN Function, MAPCLOSE Function - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Function - generates heading tags (<H1> to <H6>)

PARA Function, PARAGRAPH Function - generate <P>

PRN Functions, PRINT Functions - generate any text that is passed in

PRN Functions, S Function - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Function, PRECLOSE Function - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Function, BLOCKQUOTECLOSE Function - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Function - generates <DIV>

NL Function, BR Function - generate

NOBR Function - generates <NOBR>

WBR Function - generates <WBR>

PLAINTEXT Function - generates <PLAINTEXT>

ADDRESS Function - generates <ADDRESS>

MAILTO Function - generates <A> with the MAILTO attribute

AREA Function - generates <AREA>

BGSOUND Function - generates <BGSOUND>

Character Formatting Tags

BASEFONT Function - generates <BASEFONT>

BIG Function - generates <BIG>

BOLD Function - generates <B>

CENTER Function - generates <CENTER> and </CENTER>

CENTEROPEN Function, CENTERCLOSE Function - generate <CENTER> and </CENTER>

CITE Function - generates <CITE>

CODE Function - generates <CODE>

DFN Function - generates <DFN>

EM Function, EMPHASIS Function - generate <EM>

FONTOPEN Function, FONTCLOSE Function - generate <FONT> and </FONT>

ITALIC Function - generates <I>

KBD Function, KEYBOARD Function - generate <KBD> and </KBD>

S Function - generates <S>

SAMPLE Function - generates <SAMP>

SMALL Function - generates <SMALL>

STRIKE Function - generates <STRIKE>

STRONG Function - generates <STRONG>

SUB Function - generates <SUB>

SUP Function - generates <SUP>

TELETYPE Function - generates <TT>

UNDERLINE Function - generates <U>

VARIABLE Function - generates <VAR>

Frame Tags

FRAME Function - generates <FRAME>

FRAMESETOPEN Function, FRAMESETCLOSE Function - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Function, NOFRAMESCLOSE Function - generate <NOFRAMES> and </NOFRAMES>

Summary of HTF Subprograms

Table 179–1 HTF Package Subprograms

Subprogram	Description
ADDRESS Function on page 179-15	Generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Function on page 179-16	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Function on page 179-17	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
APPLETCLOSE Function on page 179-18	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Function on page 179-19	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Function on page 179-20	Generates the <AREA> tag, which defines a client-side image map
BASE Function on page 179-21	Generates the <BASE> tag which records the URL of the document
BASEFONT Function on page 179-22	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Function on page 179-23	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Function on page 179-24	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Function on page 179-25	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Function on page 179-26	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Function on page 179-27	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Function on page 179-28	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Function on page 179-29	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Function on page 179-30	Generates the tag which begins a new line of text
CENTER Function on page 179-31	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Function on page 179-32	Generates the </CENTER> tag which marks the end of a section of text to center
CENTEROPEN Function on page 179-33	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Function on page 179-34	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Function on page 179-35	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically

Table 179–1 (Cont.) HTF Package Subprograms

Subprogram	Description
COMMENT Function on page 179-36	Generates the comment tags <!-- ctext -->
DFN Function on page 179-37	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Function on page 179-38	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Function on page 179-39	Generates the <DIR> which starts a directory list section
DIV Function on page 179-40	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Function on page 179-41	Generates the </DL> tag which ends a definition list
DLISTDEF Function on page 179-42	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Function on page 179-43	Generates the <DL> tag which starts a definition list
DLISTTERM Function on page 179-44	Generates the <DT> tag which defines a term in a definition list <DL>
EM Function on page 179-45	Generates the <EM> and </EM> tags, which define text to be emphasized
EMPHASIS Function on page 179-46	Generates the <EM> and </EM> tags, which define text to be emphasized
ESCAPE_SC Function on page 179-47	Replaces characters that have special meaning in HTML with their escape sequences
ESCAPE_URL Function on page 179-48	Replaces characters that have special meaning in HTML and HTTP with their escape sequences
FONTCLOSE Function on page 179-50	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Function on page 179-50	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
FORMAT_CELL Function on page 179-51	formats column values inside an HTML table using the TABLEDATA Function
FORMCHECKBOX Function on page 179-52	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Function on page 179-53	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMFILE Function on page 179-54	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Function on page 179-55	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element
FORMIMAGE Function on page 179-56	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMOPEN Function on page 179-57	Generates the <FORM> tag which marks the beginning of a form section in an HTML document

Table 179–1 (Cont.) HTF Package Subprograms

Subprogram	Description
FORMPASSWORD Function on page 179-58	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Function on page 179-59	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Function on page 179-60	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Function on page 179-61	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Function on page 179-62	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELECTOPTION Function on page 179-63	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Function on page 179-64	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Function on page 179-65	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Function on page 179-66	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Function on page 179-67	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Function on page 179-68	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Function on page 179-69	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Function on page 179-70	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Function on page 179-71	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Function on page 179-72	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Function on page 179-73	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Function on page 179-74	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Function on page 179-75	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Function on page 179-76	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Function on page 179-77	Generates the <HR> tag, which generates a line in the HTML document
HTMLCLOSE Function on page 179-79	Generates the </HTML> tag which marks the end of an HTML document

Table 179–1 (Cont.) HTF Package Subprograms

Subprogram	Description
HTMLOPEN Function on page 179-79	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Function on page 179-80	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Function on page 179-81	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Function on page 179-82	Creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program
ITALIC Function on page 179-83	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Function on page 179-84	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Function on page 179-85	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Function on page 179-86	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Function on page 179-87	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Function on page 179-88	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Function on page 179-89	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Function on page 179-90	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Function on page 179-91	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Function on page 179-92	Generates the <LI> tag, which indicates a list item
MAILTO Function on page 179-93	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Function on page 179-94	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Function on page 179-95	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Function on page 179-96	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Function on page 179-97	Generates the <MENU> tag which create a list that presents one line for each item
META Function on page 179-98	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers

Table 179–1 (Cont.) HTF Package Subprograms

Subprogram	Description
NL Function on page 179-86	Generates the tag which begins a new line of text
NOBR Function on page 179-100	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Function on page 179-101	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Function on page 179-102	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Function on page 179-103	Generates the </OL> tag which defines the end of an ordered list
OLISTOPEN Function on page 179-104	Generates the <OL> tag which marks the beginning of an ordered list
PARA Function on page 179-105	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Function on page 179-106	Adds attributes to the <P> tag
PARAM Function on page 179-107	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Function on page 179-108	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Function on page 179-109	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Function on page 179-110	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Functions on page 179-111	Generates the specified parameter as a string terminated with the \n newline character
PRN Functions on page 179-112	Generates the specified parameter as a string
S Function on page 179-113	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Function on page 179-114	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Function on page 179-115	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Function on page 179-116	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font
STRIKE Function on page 179-117	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Function on page 179-118	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Function on page 179-119	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page

Table 179–1 (Cont.) HTF Package Subprograms

Subprogram	Description
SUB Function on page 179-120	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Function on page 179-121	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Function on page 179-122	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Function on page 179-123	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Function on page 179-124	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Function on page 179-125	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Function on page 179-126	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Function on page 179-127	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Function on page 179-128	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Function on page 179-129	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Function on page 179-130	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Function on page 179-131	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Function on page 179-132	Generates the <UL> tag which marks the beginning of an unordered list
UNDERLINE Function on page 179-133	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Function on page 179-134	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Function on page 179-135	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

ADDRESS Function

This function generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTF.ADDRESS (
   cvalue          IN       VARCHAR2
   cnowrap         IN       VARCHAR2   DEFAULT NULL
   cclear          IN       VARCHAR2   DEFAULT NULL
   cattributes     IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 179–2 ADDRESS Function Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

ANCHOR Function

This function and the ANCHOR2 Function functions generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR2 Function provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 179–3 ANCHOR Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

ANCHOR2 Function

This function and the ANCHOR Function generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this functions provides a target and therefore can be used for a frame.

Syntax

```
HTF.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 179–4 ANCHOR2 Function Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

APPLETCLOSE Function

This function closes the applet invocation with the `</APPLET>` tag. You must first invoke the a Java applet using APPLETOPEN Function on page 179-19

Syntax

```
HTF.APPLETCLOSE
 RETURN VARCHAR2;
```

APPLETOPEN Function

This function generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Function on page 179-18 which generates the </APPLET> tag.

Syntax

```
HTF.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–5 APPLETOPEN Function Parameters

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTF.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Function function on page 179-107.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.

AREA Function

This function generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTF.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–6 AREA Function Parameters

Parameter	Description
ccords	The the value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

BASE Function

This function generates the <BASE> tag which records the URL of the document.

Syntax

```
HTF.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–7 BASE Function Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

BASEFONT Function

This function generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTF.BASEFONT (
   nsize    IN    INTEGER)
  RETURN VARCHAR2;
```

Parameters

Table 179–8 BASEFONT Function Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This function generates

```
<BASEFONT SIZE="nsize">
```

BGSOUND Function

This function generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTF.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–9 BGSOUND Function Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

BIG Function

This function generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTF.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–10 BIG Function Parameters

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BIG cattributes>ctext</BIG>
```

BLOCKQUOTECLOSE Function

This function generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Function.

Syntax

```
HTF.BLOCKQUOTECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BLOCKQUOTE>
```

BLOCKQUOTEOPEN Function

This function generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Function.

Syntax

```
HTF.BLOCKQUOTEOPEN (
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–11 BLOCKQUOTEOPEN Function Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

BODYCLOSE Function

This function generates the </BODY> tag which marks the end of a body section of an HTML document.You mark the beginning of a body section by means of the BODYOPEN Function.

Syntax

```
HTF.BODYCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</BODY>
```

BODYOPEN Function

This function generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Function.

Syntax

```
HTF.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–12 BODYOPEN Function Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTF.BODYOPEN('/img/background.gif')
  RETURN VARCHAR2;
```

generates:

```
<BODY background="/img/background.gif">
```

BOLD Function

This function generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTF.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–13 BOLD Function Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<B cattributes>ctext</B>
```

BR Function

This function generates the <BR> tag which begins a new line of text. It performs the same operation as the NL Function.

Syntax

```
HTF.BR(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–14 BR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

CENTER Function

This function generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTF.CENTER (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 179–15 CENTER Parameters

Parameter	Description
ctext	The text that goes between the tags.

Examples

This function generates

```
<CENTER>ctext</CENTER>
```

CENTERCLOSE Function

This function generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a of a section of text to center by means of the CENTEROPEN Function.

Syntax

```
HTF.CENTERCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</CENTER>
```

CENTEROPEN Function

This function generates the <CENTER> tag which mark the beginning of a section of text to center.You mark the beginning of a of a section of text to center by means of the CENTERCLOSE Function.

Syntax

```
HTF.CENTEROPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<CENTER>
```

CITE Function

This function generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTF.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–16 CITE Function Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CITE cattributes>ctext</CITE>
```

CODE Function

This function generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTF.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–17 CODE Function Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This function generates

```
<CODE cattributes>ctext</CODE>
```

COMMENT Function

This function generates the comment tags.

Syntax

```
HTF.COMMENT (
   ctext           IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 179–18 COMMENT Function Parameters

Parameter	Description
ctext	The comment.

Examples

This function generates

```
<!-- ctext -->
```

DFN Function

This function generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTF.DFN (
   ctext          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 179–19 DFN Function Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This function generates

```
<DFN>ctext</DFN>
```

DIRLISTCLOSE Function

This function generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Function.

Syntax

```
HTF.DIRLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
</DIR>
```

DIRLISTOPEN Function

This function generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Function.

Syntax

```
HTF.DIRLISTOPEN
  RETURN VARCHAR2;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Function so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This function generates

```
<DIR>
```

DIV Function

This function generates the <DIV> tag which creates document divisions.

Syntax

```
HTF.DIV (
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–20 DIV Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DIV ALIGN="calign" cattributes>
```

DLISTCLOSE Function

This function generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Function.

Syntax

```
HTF.DLISTCLOSE
  RETURN VARCHAR2;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
</DL>
```

DLISTDEF Function

This function generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTF.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–21 DLISTDEF Function Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DD CLEAR="cclear" cattributes>ctext
```

DLISTOPEN Function

This function generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Function.

Syntax

```
HTF.DLISTOPEN (
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–22 DLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Function and definitions are inserted using the DLISTDEF Function.

Examples

This function generates

```
<DL CLEAR="cclear" cattributes>
```

DLISTTERM Function

This function generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTF.DLISTTERM (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–23 DLISTTERM Function Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<DT CLEAR="cclear" cattributes>ctext
```

EM Function

This function generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EMPHASIS Function.

Syntax

```
HTF.EM(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–24 EM Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

EMPHASIS Function

This function generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EM Function.

Syntax

```
HTF.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–25 EMPHASIS Function Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<EM cattributes>ctext</EM>
```

ESCAPE_SC Function

This function replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- & to &
- " to &quot:
- < to <
- > to >

This function performs the same operation as HTP. PRINTS Procedure and HTP. PS Procedure.

Syntax

```
HTF.ESCAPE_SC(
     ctext          IN       VARCHAR2);
```

Parameters

Table 179–26 ESCAPE_SC Procedure Parameters

Parameter	Description
ctext	The text string to convert.

ESCAPE_URL Function

This function replaces characters that have special meaning in HTML and HTTP with their escape sequences. The following characters are converted:

- `&` to `&`
- `"` to `&quot:`
- `<` to `<`
- `>` to `>`
- `%` to `&25`

Syntax

```
HTF.ESCAPE_URL(
     p_url          IN       VARCHAR2);
```

Parameters

Table 179–27 ESCAPE_URL Procedure Parameters

Parameter	Description
`p_url`	The string to convert.

FONTCLOSE Function

This function generates the</FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Function.

Syntax

```
HTF.FONTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

</FONT>

FONTOPEN Function

This function generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Function.

Syntax

```
HTF.FONTOPEN(
   ccolor          IN       VARCHAR2   DEFAULT NULL,
   cface           IN       VARCHAR2   DEFAULT NULL,
   csize           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–28 FONTOPEN Function Parameters

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

FORMAT_CELL Function

This function formats column values inside an HTML table using the TABLEDATA Function. It allows for better control over the HTML tables.

Syntax

```
HTF.FORMAT_CELL(
   columnValue          IN       VARCHAR2
   format_numbers       IN       VARCHAR2   DEFAULT NULL
 RETURN VARCHAR2;
```

Parameters

Table 179–29 FORMAT_CELL Function Parameters

Parameter	Description
`columnValue`	The value that needs to be formatted in an HTML table.
`format_numbers`	The format that numeric data is displayed in. If the value of this parameter is not `NULL`, the number fields are right-justified and rounded to two decimal places.

Examples

This function generates

```
<TD >columnValue</TD>
```

FORMCHECKBOX Function

This function generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTF.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–30 FORMCHECKBOX Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMCLOSE Function

This function generates the </FORM> tag which marks the end of a form section in an HTML document.You mark the beginning of the form section by means of the FORMOPEN Function.

Syntax

```
HTF.FORMCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FORM>
```

FORMFILE Function

This function generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTF.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–31 FORMFILE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

FORMHIDDEN Function

This function generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTF.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–32 FORMHIDDEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

FORMIMAGE Function

This function generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTF.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–33 FORMIMAGE Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

FORMOPEN Function

This function generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Function.

Syntax

```
HTF.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–34 FORMOPEN Function Parameters

Parameter	Description
curl	The URL of the Web Request Broker or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```

FORMPASSWORD Function

This function generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTF.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–35 FORMPASSWORD Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

FORMRADIO Function

This function generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTF.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–36 FORMRADIO Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMRESET Function

This function generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTF.FORMRESET(
   cvalue         IN       VARCHAR2   DEFAULT 'Reset',
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–37 FORMRESET Function Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

FORMSELECTCLOSE Function

This function generates the `</SELECT>` tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Function.

FORMSELECTOPEN Function

This function generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Function.The values are inserted using FORMSELECTOPTION Function.

Syntax

```
HTF.FORMSELECTOPEN(
   cname          IN       VARCHAR2,
   cprompt        IN       VARCHAR2   DEFAULT NULL,
   nsize          IN       INTEGER    DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–38 FORMSELECTOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTF.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTF.FORMSELECTOPTION('Messier');
HTF.FORMSELECTOPTION('Howe');
HTF.FORMSELECTOPTION('Gretzky');.
HTF.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

FORMSELECTOPTION Function

This function generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTF.FORMSELECTOPTION(
   cvalue         IN       VARCHAR2,
   cselected      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–39 FORMSELECTOPTION Function Parameters

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Function.

FORMSUBMIT Function

This function generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTF.FORMSUBMIT(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT 'Submit',
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–40 FORMSUBMIT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

FORMTEXT Function

This function generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

Syntax

```
HTF.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–41 FORMTEXT Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

FORMTEXTAREA Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Function which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–42 FORMTEXTAREA Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```

FORMTEXTAREA2 Function

This function generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.The same operation is performed by the FORMTEXTAREA Function except that in that case you cannot specify a wrap style.

Syntax

```
HTF.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–43 FORMTEXTAREA2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

FORMTEXTAREACLOSE Function

This function generates the </TEXTAREA> tag which ends a text area form element. You open a text area element by means of eitherFORMTEXTAREAOPEN Function or FORMTEXTAREAOPEN2 Function.

Syntax

```
HTF.FORMTEXTAREACLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TEXTAREA>
```

FORMTEXTAREAOPEN Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Function which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–44 FORMTEXTAREAOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

FORMTEXTAREAOPEN2 Function

This function generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Function except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Function.

Syntax

```
HTF.FORMTEXTAREAOPEN2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–45 FORMTEXTAREAOPEN2 Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

FRAME Function

This function generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTF.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–46 FRAME Function Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

FRAMESETCLOSE Function

This function generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Function.

Syntax

```
HTF.FRAMESETCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</FRAMESET>
```

FRAMESETOPEN Function

This function generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Function.

Syntax

```
HTF.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–47 FRAMESETOPEN Function Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

HEADCLOSE Function

This function generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Function.

Syntax

```
HTF.HEADCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HEAD>
```

HEADER Function

This function generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTF.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–48 HEADER Function Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTF.header (1,'Overview')
  RETURN VARCHAR2;
```

produces:

```
<H1>Overview</H1>
```

HEADOPEN Function

This function generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Function.

Syntax

```
HTF.HEADOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HEAD>
```

HR Function

This function generates the <HR> tag, which generates a line in the HTML document.This subprogram performs the same operation as the LINE Function.

Syntax

```
HTF.HR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–49 HR Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

HTMLCLOSE Function

This function generates the </HTML> tag which marks the end of an HTML document. You use the HTMLOPEN Function to mark the beginning of an HTML document.

Syntax

```
HTF.HTMLCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</HTML>
```

HTMLOPEN Function

This function generates the <HTML> tag which marks the beginning of an HTML document. You use the HTMLCLOSE Function to mark the end of the an HTML document.

Syntax

```
HTF.HTMLOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<HTML>
```

IMG Function

This function generates the <IMG> tag which directs the browser to load an image onto the HTML page. The IMG2 Function performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTF.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–50 IMG Function Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

IMG2 Function

This function generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The IMG Function performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTF.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2   DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–51 IMG2 Function Parameters

Parameter	Description
`curl`	The value for the SRC attribute.
`calign`	The value for the `ALIGN` attribute.
`calt`	The value for the `ALT` attribute which specifies alternative text to display if the browser does not support images.
`cismap`	If the value for this parameter is not `NULL`, the `ISMAP` attribute is added to the tag. The attribute indicates that the image is an imagemap.
`cusemap`	The value for the `USEMAP` attribute which specifies a client-side image map.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

ISINDEX Function

This function creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program.

Syntax

```
HTF.ISINDEX(
   cprompt        IN       VARCHAR2    DEFAULT NULL,
   curl           IN       VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–52 ISINDEX Function Parameters

Parameter	Description
cprompt	The value for the PROMPT attribute.
curl	The value for the HREF attribute.

Examples

This function generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

ITALIC Function

This function generates

the <I> and

</I> tags which direct the browser to render the text in italics.

Syntax

```
HTF.ITALIC(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–53 ITALIC Function Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<I cattributes>ctext</I>
```

KBD Function

This function generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Function.

Syntax

```
HTF.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–54 KBD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

KEYBOARD Function

This function generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Function.

Syntax

```
HTF.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–55 KEYBOARD Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<KBD cattributes>ctext</KBD>
```

LINE Function

This function generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Function.

Syntax

```
HTF.LINE(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–56 LINE Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

LINKREL Function

This function generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Function. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREL(
   crel           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–57 LINKREL Function Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

LINKREV Function

This function generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Function. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Function.

Syntax

```
HTF.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–58 LINKREV Function Parameters

Parameter	Description
crev	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This function generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

LISTHEADER Function

This function generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTF.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–59 LISTHEADER Function Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LH cattributes>ctext</LH>
```

LISTINGCLOSE Function

This function generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Function.

Syntax

```
HTF.LISTINGCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</LISTING>
```

LISTINGOPEN Function

This function generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Function.

Syntax

```
HTF.LISTINGOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<LISTING>
```

LISTITEM Function

This function generates the <LI> tag, which indicates a list item.

Syntax

```
HTF.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–60 LISTITEM Function Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

MAILTO Function

This function generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTF.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–61 MAILTO Function Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTF.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

MAPCLOSE Function

This function generates the </MAP> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Function.

Syntax

```
HTF.MAPCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MAP>
```

MAPOPEN Function

This function generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Function.

Syntax

```
HTF.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–62 MAPOPEN Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<MAP NAME="cname" cattributes>
```

MENULISTCLOSE Function

This function generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Function. The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</MENU>
```

MENULISTOPEN Function

This function generates the <MENU> tag which create a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Function.The items in the list appear more compact than an unordered list. The LISTITEM Function defines the list items in a menu list.

Syntax

```
HTF.MENULISTOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<MENU>
```

META Function

This function generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTF.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 179–63 META Function Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This function generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTF.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

NL Function

This function generates the <BR> tag which begins a new line of text. It performs the same operation as the BR Function.

Syntax

```
HTF.NL(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–64 NL Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<BR CLEAR="cclear" cattributes>
```

NOBR Function

This function generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTF.NOBR(
ctext        IN        VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 179–65 NOBR Function Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This function generates

```
<NOBR>ctext</NOBR>
```

NOFRAMESCLOSE Function

This function generates the </NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</NOFRAMES>
```

NOFRAMESOPEN Function

This function generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Function. See also FRAME Function, FRAMESETOPEN Function and FRAMESETCLOSE Function.

Syntax

```
HTF.NOFRAMESOPEN
  RETURN VARCHAR2;
```

Examples

This function generates

```
<NOFRAMES>
```

OLISTCLOSE Function

This function generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</OL>
```

OLISTOPEN Function

This function generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Function. Numbered items are added using LISTITEM Function.

Syntax

```
HTF.OLISTOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–66 OLISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

PARA Function

This function generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPH Function.

Syntax

```
HTF.PARA
  RETURN VARCHAR2;
```

Examples

This function generates

```
<P>
```

PARAGRAPH Function

You can use this function to add attributes to the <P> tag created by the PARA Function.

Syntax

```
HTF.PARAGRAPH(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–67 PARAGRAPH Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

PARAM Function

This function generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Function to begin the invocation. Use one PARAM Function for each desired name-value pair, and use APPLETCLOSE Function to end the applet invocation.

Syntax

```
HTF.PARAM(
   cname           IN       VARCHAR2
   cvalue          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 179–68 PARAM Function Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This function generates

```
<PARAM NAME=cname VALUE="cvalue">
```

PLAINTEXT Function

This function generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTF.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–69 PLAINTEXT Function Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

PRECLOSE Function

This function generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Function.

Syntax

```
HTF.PRECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</PRE>
```

PREOPEN Function

This function generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Function.

Syntax

```
HTF.PREOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cwidth         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–70 PREOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

PRINT Functions

These functions generate the specified parameter as a string terminated with the \n newline character. The PRN Functions performs the same operation but does not terminate with a newline character.

Syntax

```
HTF.PRINT (
   cbuf      IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRINT (
   dbuf      IN       DATE)
  RETURN VARCHAR2;

HTF.PRINT (
   nbuf      IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 179–71 PRINT Function Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These functions do not have function equivalents.

PRN Functions

These functions generate the specified parameter as a string. Unlike the PRINT Functions the string is not terminated with the \n newline character.

Syntax

```
HTF.PRN (
   cbuf      IN       VARCHAR2)
  RETURN VARCHAR2;

HTF.PRN (
   dbuf      IN       DATE)
  RETURN VARCHAR2;

HTF.PRN (
   nbuf      IN       NUMBER)
  RETURN VARCHAR2;
```

Parameters

Table 179–72 PRN Function Parameters

Parameter	Description
cbuf	The string to generate (not terminated by a newline).
dbuf	The string to generate (not terminated by a newline).
nbuf	The string to generate (not terminated by a newline).

Usage Notes

These functions do not have function equivalents.

S Function

This function generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Function.

Syntax

```
HTF.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–73 S Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<S cattributes>ctext</S>
```

SAMPLE Function

This function generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTF.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–74 SAMPLE Function Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SAMP cattributes>ctext</SAMP>
```

SCRIPT Function

This function generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTF.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–75 SCRIPT Function Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This function generates

```
<SCRIPT LANGUAGE=clanguage>cscript</SCRIPT>
```

so that

```
HTF.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

SMALL Function

This function generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTF.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–76 SMALL Function Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SMALL cattributes>ctext</SMALL>
```

STRIKE Function

This function generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Function.

Syntax

```
STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–77 STRIKE Function Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRIKE cattributes>ctext</STRIKE>
```

STRONG Function

This function generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```
HTF.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–78 STRONG Function Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<STRONG cattributes>ctext</STRONG>
```

STYLE Function

This function generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTF.STYLE(
   cstyle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 179–79 STYLE Function Parameters

Parameter	Description
cstyle	The the style information to include.

Examples

This function generates

```
<STYLE>cstyle</STYLE>
```

SUB Function

This function generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTF.SUB(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–80 SUB Function Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

SUP Function

This function generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTF.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–81 SUP Function Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

TABLECAPTION Function

This function generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTF.TABLECAPTION(
   ccaption       IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–82 TABLECAPTION Function Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

TABLECLOSE Function

This function generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Function on page 179-126.

Syntax

```
HTF.TABLECLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

TABLEDATA Function

This function generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTF.TABLEDATA(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–83 TABLEDATA Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

TABLEHEADER Function

This function generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTF.TABLEHEADER(
   cvalue          IN       VARCHAR2   DEFAULT NULL,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   crowspan        IN       VARCHAR2   DEFAULT NULL,
   ccolspan        IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–84 TABLEHEADER Function Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

TABLEOPEN Function

This function generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Function.

Syntax

```
HTF.TABLEOPEN(
   cborder        IN       VARCHAR2   DEFAULT NULL
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–85 TABLEOPEN Function Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

TABLEROWCLOSE Function

This function generates the </TR> tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Function.

Syntax

```
HTF.TABLEROWCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</TABLE>
```

TABLEROWOPEN Function

This function generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Function.

Syntax

```
HTF.TABLEROWOPEN(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cvalign        IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–86 TABLEROWOPEN Function Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

TELETYPE Function

This function generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTF.TELETYPE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–87 TELETYPE Function Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<TT cattributes>ctext</TT>
```

TITLE Function

This function generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTF.TITLE(
   ctitle          IN       VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 179–88 TITLE Function Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This function generates

```
<TITLE>ctitle</TITLE>
```

ULISTCLOSE Function

This function generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTCLOSE
  RETURN VARCHAR2;
```

Examples

This function generates

```
</UL>
```

ULISTOPEN Function

This function generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Function. Add list items with LISTITEM Function.

Syntax

```
HTF.ULISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cdingbat        IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–89 ULISTOPEN Function Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Function

This function generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTF.UNDERLINE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–90 UNDERLINE Function Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<U cattributes>ctext</U>
```

VARIABLE Function

This function generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTF.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 179–91 VARIABLE Function Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This function generates

```
<VAR cattributes>ctext</VAR>
```

WBR Function

This function generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTF.WBR
  RETURN VARCHAR2;
```

Examples

This function generates

```
<WBR>
```

180

HTP

The HTP (hypertext procedures) and HTF (hypertext functions) packages generate HTML tags. For example, the HTP.ANCHOR procedure generates the HTML anchor tag, <A>.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- Using HTP
  - Operational Notes
  - Rules and Limits
  - Examples
- Summary of Tags
- Summary of HTP Subprograms

Using HTP

- Operational Notes
- Rules and Limits
- Examples

Operational Notes

For every HTP procedure that generates one or more HTML tags, there is a corresponding HTF function with identical parameters with the following exception:

- The PRINTS Procedure and the PS Procedure do not have HTF function equivalents. Use the ESCAPE_SC Function or the ESCAPE_URL Function if you need a string conversion function. Note that while there is a ESCAPE_SC Procedure that performs the same operation as the PRINTS Procedure and the PS Procedure, there is no procedural equivalent for the ESCAPE_URL Function.
- The FORMAT_CELL Function does not have an HTP equivalent. The function formats column values inside an HTML table using TABLEDATA Function which does have an HTP equivalent in the TABLEDATA Procedure. The advantage of this using the FORMAT_CELL Function is that it allows for better control over the HTML tables.

The function versions do not directly generate output in your Web page. Instead, they pass their output as return values to the statements that invoked them. Use these functions when you need to nest calls. To print the output of HTF functions, call the functions from within the HTP.`PRINT` procedure. It then prints its parameters to the generated Web page.

Rules and Limits

If you use values of the LONG data type in procedures such as HTP.PRINT, HTP.PRN, HTP.PRINTS, HTP.PA or OWA_UTIL.CELLSPRINT, only the first 32 K of the LONG data is used. The LONG data is bound to a VARCHAR2 data type in the procedure.

Examples

The following commands generate a simple HTML document:

```
CREATE OR REPLACE PROCEDURE hello AS
BEGIN
    HTP.HTMLOPEN;           -- generates <HTML>
    HTP.HEADOPEN;           -- generates <HEAD>
    HTP.TITLE('Hello');     -- generates <TITLE>Hello</TITLE>
    HTP.HEADCLOSE;          -- generates </HEAD>
    HTP.BODYOPEN;           -- generates <BODY>
    HTP.HEADER(1, 'Hello'); -- generates <H1>Hello</H1>
    HTP.BODYCLOSE;          -- generates </BODY>
    HTP.HTMLCLOSE;          -- generates </HTML>
END;
```

Summary of Tags

HTML, HEAD, and BODY Tags

HTMLOPEN Procedure, HTMLCLOSE Procedure - generate <HTML> and </HTML>

HEADOPEN Procedure, HEADCLOSE Procedure - generate <HEAD> and </HEAD>

BODYOPEN Procedure, BODYCLOSE Procedure - generate <BODY> and </BODY>

Comment Tag

COMMENT Procedure - generates <!-- and -->

Tags in the <HEAD> Area

BASE Procedure - generates <BASE>

LINKREL Procedure - generates <LINK> with the REL attribute

LINKREV Procedure - generates <LINK> with the REV attribute

TITLE Procedure - generates <TITLE>

META Procedure - generates <META>

SCRIPT Procedure - generates <SCRIPT>

STYLE Procedure - generates <STYLE>

ISINDEX Procedure - generates <ISINDEX>

Applet Tags

APPLETOPEN Procedure, APPLETCLOSE Procedure - generate <APPLET> and </APPLET>

PARAM Procedure - generates <PARAM>

List Tags

OLISTOPEN Procedure, OLISTCLOSE Procedure - generate <OL> and </OL>

ULISTOPEN Procedure, ULISTCLOSE Procedure - generate <UL> and </UL>

DLISTOPEN Procedure, DLISTCLOSE Procedure- generate <DL> and </DL>

DLISTTERM Procedure - generates <DT>

DLISTDEF Procedure - generates <DD>

DIRLISTOPEN Procedure, DIRLISTCLOSE Procedure - generate <DIR> and </DIR>

LISTHEADER Procedure - generates <LH>

LISTINGOPEN Procedure, LISTINGCLOSE Procedure - generate <LISTING> and </LISTING>

MENULISTOPEN Procedure - generate <MENU> and </MENU>

LISTITEM Procedure - generates <LI>

Form Tags

FORMOPEN Procedure, FORMCLOSE Procedure - generate <FORM> and </FORM>

FORMCHECKBOX Procedure - generates <INPUT TYPE="CHECKBOX">

FORMHIDDEN Procedure - generates <INPUT TYPE="HIDDEN">

FORMIMAGE Procedure - generates <INPUT TYPE="IMAGE">

FORMPASSWORD Procedure - generates <INPUT TYPE="PASSWORD">

FORMRADIO Procedure - generates <INPUT TYPE="RADIO">

FORMSELECTOPEN Procedure, FORMSELECTCLOSE Procedure - generate <SELECT> and </SELECT>

FORMSELECTOPTION Procedure - generates <OPTION>

FORMTEXT Procedure - generates <INPUT TYPE="TEXT">

FORMTEXTAREA Procedure - generate <TEXTAREA>

FORMTEXTAREAOPEN Procedure, FORMTEXTAREACLOSE Procedure - generate <TEXTAREA> and </TEXTAREA>

FORMRESET Procedure - generates <INPUT TYPE="RESET">

FORMSUBMIT Procedure - generates <INPUT TYPE="SUBMIT">

Table Tags

TABLEOPEN Procedure, TABLECLOSE Procedure - generate <TABLE> and </TABLE>

TABLECAPTION Procedure - generates <CAPTION>

TABLEROWOPEN Procedure, TABLEROWCLOSE Procedure - generate <TR> and </TR>

TABLEHEADER Procedure - generates <TH>

TABLEDATA Procedure - generates <TD>

IMG, HR, and A Tags

HR Procedure, LINE Procedure - generate <HR>

IMG Procedure, IMG2 Procedure - generate <IMG>

ANCHOR Procedure, ANCHOR2 Procedure - generate <A>

MAPOPEN Procedure, MAPCLOSE Procedure - generate <MAP> and </MAP>

Paragraph Formatting Tags

HEADER Procedure - generates heading tags (<H1> to <H6>)

PARA Procedure, PARAGRAPH Procedure - generate <P>

PRN Procedures, PRINT Procedures - generate any text that is passed in

PRINTS Procedure, PS Procedure - generate any text that is passed in; special characters in HTML are escaped

PREOPEN Procedure, PRECLOSE Procedure - generate <PRE> and </PRE>

BLOCKQUOTEOPEN Procedure, BLOCKQUOTECLOSE Procedure - generate <BLOCKQUOTE> and </BLOCKQUOTE>

DIV Procedure - generates <DIV>

NL Procedure, BR Procedure - generate

NOBR Procedure - generates <NOBR>

WBR Procedure - generates <WBR>

PLAINTEXT Procedure - generates <PLAINTEXT>

ADDRESS Procedure - generates <ADDRESS>

MAILTO Procedure - generates <A> with the MAILTO attribute

AREA Procedure - generates <AREA>

BGSOUND Procedure - generates <BGSOUND>

Character Formatting Tags

BASEFONT Procedure - generates <BASEFONT>

BIG Procedure - generates <BIG>

BOLD Procedure - generates <B>

CENTER Procedure - generates <CENTER> and </CENTER>

CENTEROPEN Procedure, CENTERCLOSE Procedure - generate <CENTER> and </CENTER>

CITE Procedure - generates <CITE>

CODE Procedure - generates <CODE>

DFN Procedure - generates <DFN>

EM Procedure, EMPHASIS Procedure - generate <EM>

FONTOPEN Procedure, FONTCLOSE Procedure - generate <FONT> and </FONT>

ITALIC Procedure - generates <I>

KBD Procedure, KEYBOARD Procedure - generate <KBD> and </KBD>

S Procedure - generates <S>

SAMPLE Procedure - generates <SAMP>

SMALL Procedure - generates <SMALL>

STRIKE Procedure - generates <STRIKE>

STRONG Procedure - generates <STRONG>

SUB Procedure - generates <SUB>

SUP Procedure - generates <SUP>

TELETYPE Procedure - generates <TT>

UNDERLINE Procedure - generates <U>

VARIABLE Procedure - generates <VAR>

Frame Tags

FRAME Procedure - generates <FRAME>

FRAMESETOPEN Procedure, FRAMESETCLOSE Procedure - generate <FRAMESET> and </FRAMESET>

NOFRAMESOPEN Procedure, NOFRAMESCLOSE Procedure - generate <NOFRAMES> and </NOFRAMES>

Summary of HTP Subprograms

Table 180–1 HTP Package Subprograms

Subprogram	Description
ADDRESS Procedure on page 180-15	Generate s the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document
ANCHOR Procedure on page 180-16	Generate s the <A> and </A> tags which specify the source or destination of a hypertext link
ANCHOR2 Procedure on page 180-17	Generates the <A> and </A> tags which specify the source or destination of a hypertext link
APPLETCLOSE Procedure on page 180-18	Closes the applet invocation with the </APPLET> tag
APPLETOPEN Procedure on page 180-19	Generates the <APPLET> tag which begins the invocation of a Java applet
AREA Procedure on page 180-20	Generates the <AREA> tag, which defines a client-side image map
BASE Procedure on page 180-21	Generates the <BASE> tag which records the URL of the document
BASEFONT Procedure on page 180-22	Generates the <BASEFONT> tag which specifies the base font size for a Web page
BGSOUND Procedure on page 180-23	Generates the <BGSOUND> tag which includes audio for a Web page
BIG Procedure on page 180-24	Generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font
BLOCKQUOTECLOSE Procedure on page 180-25	Generates the </BLOCKQUOTE> tag which mark the end of a section of quoted text
BLOCKQUOTEOPEN Procedure on page 180-26	Generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text
BODYCLOSE Procedure on page 180-27	Generates the </BODY> tag which marks the end of a body section of an HTML document
BODYOPEN Procedure on page 180-28	Generates the <BODY> tag which marks the beginning of the body section of an HTML document
BOLD Procedure on page 180-29	Generates the <B> and </B> tags which direct the browser to display the text in boldface
BR Procedure on page 180-30	Generates the tag which begins a new line of text
CENTER Procedure on page 180-31	Generates the <CENTER> and </CENTER> tags which center a section of text within a Web page
CENTERCLOSE Procedure on page 180-32	Generates the </CENTER> tag which marks the end of a section of text to center

Table 180–1 (Cont.) HTP Package Subprograms

Subprogram	Description
CENTEROPEN Procedure on page 180-33	Generates the <CENTER> tag which mark the beginning of a section of text to center
CITE Procedure on page 180-34	Generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation
CODE Procedure on page 180-35	Generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically
COMMENT Procedure on page 180-36	`Generates This procedure generates the comment tags` `<!-- ctext -->`
DFN Procedure on page 180-37	Generates the <DFN> and </DFN> tags which direct the browser to mark the text as italics or however "definition" is defined stylistically
DIRLISTCLOSE Procedure on page 180-38	Generates the </DIR> tag which ends a directory list section
DIRLISTOPEN Procedure on page 180-39	Generates the <DIR> which starts a directory list section
DIV Procedure on page 180-40	Generates the <DIV> tag which creates document divisions
DLISTCLOSE Procedure on page 180-41	Generates the </DL> tag which ends a definition list
DLISTDEF Procedure on page 180-42	Generates the <DD> tag, which inserts definitions of terms
DLISTOPEN Procedure on page 180-43	Generates the <DL> tag which starts a definition list
DLISTTERM Procedure on page 180-44	Generates the <DT> tag which defines a term in a definition list <DL>
EM Procedure on page 180-45	Generates the <EM> and </EM> tags, which define text to be emphasized
EMPHASIS Procedure on page 180-46	Generates the <EM> and </EM> tags, which define text to be emphasized
ESCAPE_SC Procedure on page 180-47	Replaces characters that have special meaning in HTML with their escape sequences
FONTCLOSE Procedure on page 180-48	Generates the </FONT> tag which marks the end of a section of text with the specified font characteristics
FONTOPEN Procedure on page 180-49	Generates the <FONT> which marks the beginning of section of text with the specified font characteristics
FORMCHECKBOX Procedure on page 180-50	Generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form
FORMCLOSE Procedure on page 180-51	Generates the </FORM> tag which marks the end of a form section in an HTML document
FORMOPEN Procedure on page 180-52	Generates the <FORM> tag which marks the beginning of a form section in an HTML document
FORMFILE Procedure on page 180-53	Generates the <INPUT> tag with TYPE="file" which inserts a file form element, and is used for file uploading for a given page
FORMHIDDEN Procedure on page 180-54	Generates the <INPUT> tag with TYPE="hidden"which inserts a hidden form element

Table 180–1 (Cont.) HTP Package Subprograms

Subprogram	Description
FORMIMAGE Procedure on page 180-55	Generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately
FORMPASSWORD Procedure on page 180-56	Generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field
FORMRADIO Procedure on page 180-57	Generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form
FORMRESET Procedure on page 180-58	Generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values
FORMSELECTCLOSE Procedure on page 180-59	Generates the </SELECT> tag which marks the end of a Select form element
FORMSELECTOPEN Procedure on page 180-60	Generates the </SELECT> tag which marks the beginning of a Select form element
FORMSELECTOPTION Procedure on page 180-61	Generates the <OPTION> tag which represents one choice in a Select element
FORMSUBMIT Procedure on page 180-62	Generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form
FORMTEXT Procedure on page 180-63	Generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text
FORMTEXTAREA Procedure on page 180-64	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area
FORMTEXTAREA2 Procedure on page 180-65	Generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area with the ability to specify a wrap style
FORMTEXTAREACLOSE Procedure on page 180-66	Generates the </TEXTAREA> tag which ends a text area form element
FORMTEXTAREAOPEN Procedure on page 180-67	Generates the <TEXTAREA> which marks the beginning of a text area form element
FORMTEXTAREAOPEN2 Procedure on page 180-68	Generates the <TEXTAREA> which marks the beginning of a text area form element with the ability to specify a wrap style
FRAME Procedure on page 180-69	Generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag
FRAMESETCLOSE Procedure on page 180-70	Generates the </FRAMESET> tag which ends a frameset section
FRAMESETOPEN Procedure on page 180-71	Generates the </FRAMESET> tag which begins a frameset section
HEADCLOSE Procedure on page 180-72	Generates the </HEAD> tag which marks the end of an HTML document head section
HEADER Procedure on page 180-73	Generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>)
HEADOPEN Procedure on page 180-74	Generates the <HEAD> tag which marks the beginning of the HTML document head section
HR Procedure on page 180-75	Generates the <HR> tag, which generates a line in the HTML document

Table 180–1 (Cont.) HTP Package Subprograms

Subprogram	Description
HTMLCLOSE Procedure on page 180-76	Generates the </HTML> tag which marks the end of an HTML document
HTMLOPEN Procedure on page 180-77	Generates the <HTML> tag which marks the beginning of an HTML document
IMG Procedure on page 180-78	Generates the <IMG> tag which directs the browser to load an image onto the HTML page
IMG2 Procedure on page 180-79	Generates the <IMG> tag which directs the browser to load an image onto the HTML page with the option of specifying values for the USEMAP attribute
ISINDEX Procedure on page 180-80	Creates a single entry field with a prompting text, such as "*enter value*," then sends that value to the URL of the page or program
ITALIC Procedure on page 180-81	Generates the <I> and </I> tags which direct the browser to render the text in italics
KBD Procedure on page 180-82	Generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font
KEYBOARD Procedure on page 180-83	Generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font
LINE Procedure on page 180-84	Generates the <HR> tag, which generates a line in the HTML document
LINKREL Procedure on page 180-85	Generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target
LINKREV Procedure on page 180-86	Generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor
LISTHEADER Procedure on page 180-87	Generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list
LISTINGCLOSE Procedure on page 180-88	Generates the </LISTING> tags which marks the end of a section of fixed-width text in the body of an HTML page
LISTINGOPEN Procedure on page 180-89	Generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page
LISTITEM Procedure on page 180-90	Generates the <LI> tag, which indicates a list item
MAILTO Procedure on page 180-91	Generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument
MAPCLOSE Procedure on page 180-92	Generates the </MAP> tag which marks the end of a set of regions in a client-side image map
MAPOPEN Procedure on page 180-93	Generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map
MENULISTCLOSE Procedure on page 180-94	Generates the </MENU> tag which ends a list that presents one line for each item
MENULISTOPEN Procedure on page 180-95	Generates the <MENU> tag which create a list that presents one line for each item

Table 180–1 (Cont.) HTP Package Subprograms

Subprogram	Description
META Procedure on page 180-96	Generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers
NL Procedure on page 180-97	Generates the tag which begins a new line of text
NOBR Procedure on page 180-98	Generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text
NOFRAMESCLOSE Procedure on page 180-99	Generates the </NOFRAMES> tag which marks the end of a no-frames section
NOFRAMESOPEN Procedure on page 180-100	Generates the <NOFRAMES> tag which mark the beginning of a no-frames section
OLISTCLOSE Procedure on page 180-101	Generates the </OL> tag which defines the end of an ordered list
OLISTOPEN Procedure on page 180-102	Generates the <OL> tag which marks the beginning of an ordered list
PARA Procedure on page 180-103	Generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph
PARAGRAPH Procedure on page 180-104	Adds attributes to the <P> tag
PARAM Procedure on page 180-105	Generates the <PARAM> tag which specifies parameter values for Java applets
PLAINTEXT Procedure on page 180-106	Generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type
PRECLOSE Procedure on page 180-107	Generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page
PREOPEN Procedure on page 180-108	Generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page
PRINT Procedures on page 180-109	Generates the specified parameter as a string terminated with the \n newline character
PRINTS Procedure on page 180-110	Generates a string and replaces the following characters with the corresponding escape sequence
PRN Procedures on page 180-111	Generates the specified parameter as a string
PS Procedure on page 180-112	Generates a string and replaces the following characters with the corresponding escape sequence.
S Procedure on page 180-113	Generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type
SAMPLE Procedure on page 180-114	Generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically
SCRIPT Procedure on page 180-115	Generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript
SMALL Procedure on page 180-116	Generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font

Table 180–1 (Cont.) HTP Package Subprograms

Subprogram	Description
STRIKE Procedure on page 180-117	Generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type
STRONG Procedure on page 180-118	Generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined stylistically
STYLE Procedure on page 180-119	Generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page
SUB Procedure on page 180-120	Generates the _{and} tags which direct the browser to render the text they surround as subscript
SUP Procedure on page 180-121	Generates the ^{and} tags which direct the browser to render the text they surround as superscript
TABLECAPTION Procedure on page 180-122	Generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table
TABLECLOSE Procedure on page 180-123	Generates the </TABLE> tag which marks the end of an HTML table
TABLEDATA Procedure on page 180-124	Generates the <TD> and </TD> tags which insert data into a cell of an HTML table
TABLEHEADER Procedure on page 180-125	Generates the <TH> and </TH> tags which insert a header cell in an HTML table.
TABLEOPEN Procedure on page 180-126	Generates the <TABLE> tag which marks the beginning of an HTML table
TABLEROWCLOSE Procedure on page 180-127	Generates the </TR> tag which marks the end of a new row in an HTML table
TABLEROWOPEN Procedure on page 180-128	Generates the <TR> tag which marks the beginning of a new row in an HTML table
TELETYPE Procedure on page 180-129	Generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font
TITLE Procedure on page 180-130	Generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window
ULISTCLOSE Procedure on page 180-131	Generates the </UL> tag which marks the end of an unordered list
ULISTOPEN Procedure on page 180-132	Generates the <UL> tag which marks the beginning of an unordered list
UNDERLINE Procedure on page 180-133	Generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline
VARIABLE Procedure on page 180-134	Generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.
WBR Procedure on page 180-135	Generates the <WBR> tag, which inserts a soft line break within a section of NOBR text

ADDRESS Procedure

This procedure generates the <ADDRESS> and </ADDRESS> tags which specify the address, author and signature of a document.

Syntax

```
HTP.ADDRESS (
   cvalue          IN       VARCHAR2
   cnowrap         IN       VARCHAR2   DEFAULT NULL
   cclear          IN       VARCHAR2   DEFAULT NULL
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–2 ADDRESS Procedure Parameters

Parameter	Description
cvalue	The string that goes between the <ADDRESS> and </ADDRESS> tags.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is included in the tag
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<ADDRESS CLEAR="cclear" NOWRAP cattributes>cvalue</ADDRESS>
```

ANCHOR Procedure

This procedure and the ANCHOR2 Procedure procedures generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that the ANCHOR2 Procedure provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–3 ANCHOR Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" cattributes>ctext</A>
```

Usage Notes

This tag accepts several attributes, but either HREF or NAME is required. HREF specifies to where to link. NAME allows this tag to be a target of a hypertext link.

ANCHOR2 Procedure

This procedure and the ANCHOR Procedure generate the <A> and </A> HTML tags which specify the source or destination of a hypertext link. The difference between these subprograms is that this procedures provides a target and therefore can be used for a frame.

Syntax

```
HTP.ANCHOR2 (
   curl           IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   ctarget        in       varchar2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–4 ANCHOR2 Procedure Parameters

Parameter	Description
curl	The value for the HREF attribute.
ctext	The string that goes between the <A> and </A> tags.
cname	The value for the NAME attribute
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

```
<A HREF="curl" NAME="cname" TARGET = "ctarget" cattributes>ctext</A>
```

APPLETCLOSE Procedure

This procedure closes the applet invocation with the `</APPLET>` tag. You must first invoke the a Java applet using APPLETOPEN Procedure.

Syntax

```
HTP.APPLETCLOSE;
```

APPLETOPEN Procedure

This procedure generates the <APPLET> tag which begins the invocation of a Java applet. You close the applet invocation with APPLETCLOSE Procedure which generates the </APPLET> tag.

Syntax

```
HTP.APPLETOPEN (
   ccode          IN       VARCHAR2,
   cheight        IN       NUMBER,
   cwidth         IN       NUMBER,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–5 APPLETOPEN Procedure Parameters

Parameter	Description
ccode	The the value for the CODE attribute which specifies the name of the applet class.
cheight	The value for the HEIGHT attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<APPLET CODE=ccode HEIGHT=cheight WIDTH=cwidth cattributes>
```

so that, for example,

```
HTP.appletopen('testclass.class', 100, 200, 'CODEBASE="/ows-applets"')
```

generates

```
<APPLET CODE="testclass.class" height=100 width=200 CODEBASE="/ows-applets">
```

Usage Notes

- Specify parameters to the Java applet using the PARAM Procedure procedure.
- Use the cattributes parameter to specify the CODEBASE attribute since the PL/SQL cartridge does not know where to find the class files. The CODEBASE attribute specifies the virtual path containing the class files.

AREA Procedure

This procedure generates the <AREA> tag, which defines a client-side image map. The <AREA> tag defines areas within the image and destinations for the areas.

Syntax

```
HTP.AREA (
   ccoords        IN       VARCHAR2
   cshape         IN       VARCHAR2   DEFAULT NULL,
   chref          IN       VARCHAR2   DEFAULT NULL,
   cnohref        IN       VARCHAR2   DEFAULT NULL,
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–6 AREA Procedure Parameters

Parameter	Description
ccords	The the value for the COORDS attribute.
cshape	The value for the SHAPE attribute.
chref	The value for the HREF attribute.
cnohref	If the value for this parameter is not NULL, the NOHREF attribute is added to the tag.
ctarget	The value for the TARGET attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<AREA COORDS="ccoords" SHAPE="cshape" HREF="chref" NOHREF TARGET="ctarget"
cattributes>
```

BASE Procedure

This procedure generates the <BASE> tag which records the URL of the document.

Syntax

```
HTP.BASE (
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–7 BASE Procedure Parameters

Parameter	Description
ctarget	The value for the TARGET attribute which establishes a window name to which all links in this document are targeted.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BASE HREF="<current URL>" TARGET="ctarget" cattributes>
```

BASEFONT Procedure

This procedure generates the <BASEFONT> tag which specifies the base font size for a Web page.

Syntax

```
HTP.BASEFONT (
   nsize    IN    INTEGER);
```

Parameters

Table 180–8 BASEFONT Procedure Parameters

Parameter	Description
nsize	The value for the SIZE attribute.

Examples

This procedure generates

```
<BASEFONT SIZE="nsize">
```

BGSOUND Procedure

This procedure generates the <BGSOUND> tag which includes audio for a Web page.

Syntax

```
HTP.BGSOUND (
   csrc           IN       VARCHAR2,
   cloop          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–9 BGSOUND Procedure Parameters

Parameter	Description
csrc	The value for the SRC attribute.
cloop	The value for the LOOP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BGSOUND SRC="csrc" LOOP="cloop" cattributes>
```

BIG Procedure

This procedure generates the <BIG> and </BIG> tags which direct the browser to render the text in a bigger font.

Syntax

```
HTP.BIG (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–10 BIG Procedure Parameters

Parameter	Description
ctext	The the text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BIG cattributes>ctext</BIG>
```

BLOCKQUOTECLOSE Procedure

This procedure generates the `</BLOCKQUOTE>` tag which mark the end of a section of quoted text. You mark the beginning of a section of text by means of the BLOCKQUOTEOPEN Procedure.

Syntax

```
HTP.BLOCKQUOTECLOSE;
```

Examples

This procedure generates

```
</BLOCKQUOTE>
```

BLOCKQUOTEOPEN Procedure

This procedure generates the <BLOCKQUOTE> tag, which marks the beginning of a section of quoted text. You mark the end of a section of text by means of the BLOCKQUOTECLOSE Procedure.

Syntax

```
HTP.BLOCKQUOTEOPEN (
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–11 BLOCKQUOTEOPEN Procedure Parameters

Parameter	Description
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BLOCKQUOTE CLEAR="cclear" NOWRAP cattributes>
```

BODYCLOSE Procedure

This procedure generates the </BODY> tag which marks the end of a body section of an HTML document.You mark the beginning of a body section by means of the BODYOPEN Procedure.

Syntax

```
HTP.BODYCLOSE;
```

Examples

This procedure generates

```
</BODY>
```

BODYOPEN Procedure

This procedure generates the <BODY> tag which marks the beginning of the body section of an HTML document. You mark the end of a body section by means of the BODYCLOSE Procedure.

Syntax

```
HTP.BODYOPEN (
   cbackground    IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–12 BODYOPEN Procedure Parameters

Parameter	Description
cbackground	The value for the BACKGROUND attribute which specifies a graphic file to use for the background of the document.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BODY background="cbackground" cattributes>
```

so that

```
HTP.BODYOPEN('/img/background.gif');
```

generates:

```
<BODY background="/img/background.gif">
```

BOLD Procedure

This procedure generates the <B> and </B> tags which direct the browser to display the text in boldface.

Syntax

```
HTP.BOLD (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–13 BOLD Procedure Parameters

Parameter	Description
ctext	The text that goes between the tags.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<B cattributes>ctext</B>
```

BR Procedure

This procedure generates the <BR> tag which begins a new line of text. It performs the same operation as the NL Procedure.

Syntax

```
HTP.BR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–14 BR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

CENTER Procedure

This procedure generates the <CENTER> and </CENTER> tags which center a section of text within a Web page.

Syntax

```
HTP.CENTER (
   ctext          IN       VARCHAR2);
```

Parameters

Table 180–15 CENTER Parameters

Parameter	Description
ctext	The text that goes between the tags.

Examples

This procedure generates

```
<CENTER>ctext</CENTER>
```

CENTERCLOSE Procedure

This procedure generates the </CENTER> tag which marks the end of a section of text to center. You mark the beginning of a of a section of text to center by means of the CENTEROPEN Procedure.

Syntax

```
HTP.CENTERCLOSE;
```

Examples

This procedure generates

```
</CENTER>
```

CENTEROPEN Procedure

This procedure generates the <CENTER> tag which mark the beginning of a section of text to center.You mark the beginning of a of a section of text to center by means of the CENTERCLOSE Procedure.

Syntax

```
HTP.CENTEROPEN;
```

Examples

This procedure generates

```
<CENTER>
```

CITE Procedure

This procedure generates the <CITE> and </CITE> tags which direct the browser to render the text as a citation.

Syntax

```
HTP.CITE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–16 CITE Procedure Parameters

Parameter	Description
ctext	The text to render as citation.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CITE cattributes>ctext</CITE>
```

CODE Procedure

This procedure generates the <CODE> and </CODE> tags which direct the browser to render the text in monospace font or however "code" is defined stylistically.

Syntax

```
HTP.CODE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–17 CODE Procedure Parameters

Parameter	Description
ctext	The text to render as code.
cattributes	The other attributes to be included as-is in the tag

Examples

This procedure generates

<CODE *cattributes*>*ctext*</CODE>

COMMENT Procedure

This procedure generates the comment tags.

Syntax

```
HTP.COMMENT (
   ctext           IN       VARCHAR2);
```

Parameters

Table 180–18 COMMENT Procedure Parameters

Parameter	Description
ctext	The comment.

Examples

This procedure generates

```
<!-- ctext -->
```

DFN Procedure

This procedure generates the <DFN> and </DFN> tags which direct the browser to mark the text in italics or however "definition" is described stylistically.

Syntax

```
HTP.DFN (
   ctext          IN       VARCHAR2);
```

Parameters

Table 180–19 DFN Procedure Parameters

Parameter	Description
ctext	The text to render in italics.

Examples

This procedure generates

```
<DFN>ctext</DFN>
```

DIRLISTCLOSE Procedure

This procedure generates the </DIR> tag which ends a directory list section. You start a directory list section with the DIRLISTOPEN Procedure.

Syntax

```
HTP.DIRLISTCLOSE;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
</DIR>
```

DIRLISTOPEN Procedure

This procedure generates the <DIR> which starts a directory list section. You end a directory list section with the DIRLISTCLOSE Procedure.

Syntax

```
HTP.DIRLISTOPEN;
```

Usage Notes

A directory list presents a list of items that contains up to 20 characters. Items in this list are typically arranged in columns, 24 characters wide. Insert the <LI> tag directly or invoke the LISTITEM Procedure so that the <LI> tag appears directly after the </DIR> tag to define the items as a list.

Examples

This procedure generates

```
<DIR>
```

DIV Procedure

This procedure generates the <DIV> tag which creates document divisions.

Syntax

```
HTP.DIV (
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–20 DIV Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DIV ALIGN="calign" cattributes>
```

DLISTCLOSE Procedure

This procedure generates the </DL> tag which ends a definition list. You start a definition list by means of the DLISTOPEN Procedure.

Syntax

```
HTP.DLISTCLOSE;
```

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
</DL>
```

DLISTDEF Procedure

This procedure generates the <DD> tag, which inserts definitions of terms. Use this tag for a definition list <DL>. Terms are tagged <DT> and definitions are tagged <DD>.

Syntax

```
HTP.DLISTDEF (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–21 DLISTDEF Procedure Parameters

Parameter	Description
ctext	The definition of the term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DD CLEAR="cclear" cattributes>ctext
```

DLISTOPEN Procedure

This procedure generates the <DL> tag which starts a definition list. You end a definition list by means of the DLISTCLOSE Procedure.

Syntax

```
HTP.DLISTOPEN (
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–22 DLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Usage Notes

A definition list looks like a glossary: it contains terms and definitions. Terms are inserted using the DLISTTERM Procedure and definitions are inserted using the DLISTDEF Procedure.

Examples

This procedure generates

```
<DL CLEAR="cclear" cattributes>
```

DLISTTERM Procedure

This procedure generates the <DT> tag which defines a term in a definition list <DL>.

Syntax

```
HTP.DLISTTERM (
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–23 DLISTERM Procedure Parameters

Parameter	Description
ctext	The term.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<DT CLEAR="cclear" cattributes>ctext
```

EM Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EMPHASIS Procedure.

Syntax

```
HTP.EM(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–24 EM Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

EMPHASIS Procedure

This procedure generates the <EM> and </EM> tags, which define text to be emphasized. It performs the same task as the EM Procedure.

Syntax

```
HTP.EMPHASIS(
     ctext          IN       VARCHAR2,
     cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–25 EMPHASIS Procedure Parameters

Parameter	Description
ctext	The text to emphasize.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<EM cattributes>ctext</EM>
```

ESCAPE_SC Procedure

This procedure replaces characters that have special meaning in HTML with their escape sequences. The following characters are converted:

- `&` to `&`
- `"` to `&quot:`
- `<` to `<`
- `>` to `>`

This procedure performs the same operation as PRINTS Procedures and PS Procedure.

Syntax

```
HTP.ESCAPE_SC(
     ctext          IN       VARCHAR2);
```

Parameters

Table 180–26 ESCAPE_SC Procedure Parameters

Parameter	Description
`ctext`	The text string to convert.

FONTCLOSE Procedure

This procedure generates the</FONT> tag which marks the end of a section of text with the specified font characteristics. You mark the beginning of the section text by means of the FONTOPEN Procedure.

Syntax

```
HTP.FONTCLOSE;
```

Examples

This procedure generates

```
</FONT>
```

FONTOPEN Procedure

This procedure generates the <FONT> which marks the beginning of section of text with the specified font characteristics. You mark the end of the section text by means of the FONTCLOSE Procedure.

Syntax

```
HTP.FONTOPEN(
   ccolor          IN       VARCHAR2   DEFAULT NULL,
   cface           IN       VARCHAR2   DEFAULT NULL,
   csize           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–27 FONTOPEN Procedure Parameters

Parameter	Description
ccolor	The value for the COLOR attribute.
cface	The value for the FACE attribute
csize	The value for the SIZE attribute
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FONT COLOR="ccolor" FACE="cface" SIZE="csize" cattributes>
```

FORMCHECKBOX Procedure

This procedure generates the <INPUT> tag with TYPE="checkbox" which inserts a checkbox element in a form. A checkbox element is a button that the user toggles on or off.

Syntax

```
HTP.FORMCHECKBOX(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT 'ON',
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–28 FORMCHECKBOX Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="checkbox" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMCLOSE Procedure

This procedure generates the `</FORM>` tag which marks the end of a form section in an HTML document.You mark the beginning of the form section by means of the FORMOPEN Procedure.

Syntax

```
HTP.FORMCLOSE;
```

Examples

This procedure generates

```
</FORM>
```

FORMOPEN Procedure

This procedure generates the <FORM> tag which marks the beginning of a form section in an HTML document. You mark the end of the form section by means of the FORMCLOSE Procedure.

Syntax

```
HTP.FORMOPEN(
   curl           IN       VARCHAR2,
   cmethod        IN       VARCHAR2   DEFAULT 'POST',
   ctarget        IN       VARCHAR2   DEFAULT NULL,
   cenctype       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–29 FORMOPEN Procedure Parameters

Parameter	Description
curl	The URL of the WRB or CGI script where the contents of the form is sent. This parameter is required.
cmethod	The value for the METHOD attribute. The value can be "GET" or "POST".
ctarget	The value for the TARGET attribute.
cenctype	The value for the ENCTYPE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FORM ACTION="curl" METHOD="cmethod" TARGET="ctarget" ENCTYPE="cenctype"
cattributes>
```

FORMFILE Procedure

This procedure generates the <INPUT> tag with TYPE="file" which inserts a file form element. This is used for file uploading for a given page.

Syntax

```
HTP.FORMFILE(
   cname          IN       VARCHAR2,
   caccept        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–30 FORMFILE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
caccept	A comma-delimited list of MIME types for upload.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="file" NAME="cname" ACCEPT="caccept" cattributes>
```

FORMHIDDEN Procedure

This procedure generates the <INPUT> tag with TYPE="hidden", which inserts a hidden form element. This element is not seen by the user. It submits additional values to the script.

Syntax

```
HTP.FORMHIDDEN(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–31 FORMHIDDEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="hidden" NAME="cname" VALUE="cvalue" cattributes>
```

FORMIMAGE Procedure

This procedure generates the <INPUT> tag with TYPE="image" which creates an image field that the user clicks to submit the form immediately. The coordinates of the selected point are measured in pixels, and returned (along with other contents of the form) in two name/value pairs. The x coordinate is submitted under the name of the field with .x appended, and the y coordinate with .y appended. Any VALUE attribute is ignored.

Syntax

```
HTP.FORMIMAGE(
   cname          IN       VARCHAR2,
   csrc           IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–32 FORMIMAGE Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csrc	The value for the SRC attribute that specifies the image file.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="image" NAME="cname" SRC="csrc" ALIGN="calign" cattributes>
```

FORMPASSWORD Procedure

This procedure generates the <INPUT> tag with TYPE="password" which creates a single-line text entry field. When the user enters text in the field, each character is represented by one asterisk. This is used for entering passwords.

Syntax

```
HTP.FORMPASSWORD(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–33 FORMPASSWORD Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="password" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength"
VALUE="cvalue" cattributes>
```

FORMRADIO Procedure

This procedure generates the <INPUT> tag with TYPE="radio", which creates a radio button on the HTML form. Within a set of radio buttons, the user selects only one. Each radio button in the same set has the same name, but different values. The selected radio button generates a name/value pair.

Syntax

```
HTP.FORMRADIO(
   cname          IN       VARCHAR2,
   cvalue         IN       VARCHAR2,
   cchecked       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–34 FORMRADIO Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cchecked	If the value for this parameter is not NULL, the CHECKED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="radio" NAME="cname" VALUE="cvalue" CHECKED cattributes>
```

FORMRESET Procedure

This procedure generates the <INPUT> tag with TYPE="reset" which creates a button that, when selected, resets the form fields to their initial values.

Syntax

```
HTP.FORMRESET(
   cvalue         IN       VARCHAR2   DEFAULT 'Reset',
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–35 FORMRESET Procedure Parameters

Parameter	Description
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="reset" VALUE="cvalue" cattributes>
```

FORMSELECTCLOSE Procedure

This procedure generates the </SELECT> tag which marks the end of a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the beginning of Select form element by means of the FORMSELECTOPEN Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
HTP.FORMSELECTCLOSE;
```

Examples

This procedure generates

```
</SELECT>
```

as shown under Examples of the FORMSELECTOPEN Procedure.

FORMSELECTOPEN Procedure

This procedure generates the <SELECT> tags which creates a Select form element. A Select form element is a listbox where the user selects one or more values. You mark the end of Select form element by means of the FORMSELECTCLOSE Procedure.The values are inserted using FORMSELECTOPTION Procedure.

Syntax

```
FORMSELECTOPEN(
   cname          IN       VARCHAR2,
   cprompt        IN       VARCHAR2   DEFAULT NULL,
   nsize          IN       INTEGER    DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–36 FORMSELECTOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cprompt	The string preceding the list box.
nsize	The value for the SIZE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
cprompt <SELECT NAME="cname" SIZE="nsize" cattributes>
</SELECT>
```

so that

```
HTP.FORMSELECTOPEN('greatest_player';
    'Pick the greatest player:');
HTP.FORMSELECTOPTION('Messier');
HTP.FORMSELECTOPTION('Howe');
HTP.FORMSELECTOPTION('Gretzky');.
HTP.FORMSELECTCLOSE;
```

generates

```
Pick the greatest player:
<SELECT NAME="greatest_player">
<OPTION>Messier
<OPTION>Howe
<OPTION>Gretzky
</SELECT>
```

FORMSELECTOPTION Procedure

This procedure generates the <OPTION> tag which represents one choice in a Select element.

Syntax

```
HTP.FORMSELECTOPTION(
   cvalue          IN       VARCHAR2,
   cselected       IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–37 FORMSELECTOPTION Procedure Parameters

Parameter	Description
cvalue	The text for the option.
cvalue	If the value for this parameter is not NULL, the SELECTED attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OPTION SELECTED cattributes>cvalue
```

as shown under Examples of the FORMSELECTOPEN Procedure.

FORMSUBMIT Procedure

This procedure generates the <INPUT> tag with TYPE="submit" which creates a button that, when clicked, submits the form. If the button has a NAME attribute, the button contributes a name/value pair to the submitted data.

Syntax

```
HTP.FORMSUBMIT(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cvalue        IN       VARCHAR2   DEFAULT 'Submit',
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–38 FORMSUBMIT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="submit" NAME="cname" VALUE="cvalue" cattributes>
```

FORMTEXT Procedure

This procedure generates the <INPUT> tag with TYPE="text", which creates a field for a single line of text.

Syntax

```
HTP.FORMTEXT(
   cname          IN       VARCHAR2,
   csize          IN       VARCHAR2   DEFAULT NULL,
   cmaxlength     IN       VARCHAR2   DEFAULT NULL,
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–39 FORMTEXT Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
csize	The value for the SIZE attribute.
cmaxlength	The value for the MAXLENGTH attribute.
cvalue	The value for the VALUE attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<INPUT TYPE="text" NAME="cname" SIZE="csize" MAXLENGTH="cmaxlength" VALUE="cvalue"
cattributes>
```

FORMTEXTAREA Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text. The same operation is performed by the FORMTEXTAREA2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign      , IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–40 FORMTEXTAREA Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign"
cattributes></TEXTAREA>
```

FORMTEXTAREA2 Procedure

This procedure generates the <TEXTAREA> tag, which creates a text field that has no predefined text in the text area. This field enables entering several lines of text.The same operation is performed by the FORMTEXTAREA Procedure except that in that case you cannot specify a wrap style.

Syntax

```
HTP.FORMTEXTAREA2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–41 FORMTEXTAREA2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP="cwrap"
cattributes></TEXTAREA>
```

FORMTEXTAREACLOSE Procedure

This procedure generates the `</TEXTAREA>` tag which ends a text area form element. You open a text area element by means of either FORMTEXTAREAOPEN Procedure or FORMTEXTAREAOPEN2 Procedure.

Syntax

```
HTP.FORMTEXTAREACLOSE;
```

Examples

This procedure generates

```
</TEXTAREA>
```

FORMTEXTAREAOPEN Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN2 Procedure which in addition has the cwrap parameter that lets you specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–42 FORMTEXTAREAOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" cattributes>
```

FORMTEXTAREAOPEN2 Procedure

This procedure generates the <TEXTAREA> which marks the beginning of a text area form element. The same operation is performed by the FORMTEXTAREAOPEN Procedure except that in that case you cannot specify a wrap style. You mark the end of a text area form element by means of the FORMTEXTAREACLOSE Procedure.

Syntax

```
HTP.FORMTEXTAREAOPEN2(
   cname          IN       VARCHAR2,
   nrows          IN       INTEGER,
   ncolumns       IN       INTEGER,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cwrap          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–43 FORMTEXTAREAOPEN2 Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
nrows	The value for the ROWS attribute.This is an integer.
ncolumns	The value for the COLS attribute.This is an integer.
calign	The value for the ALIGN attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TEXTAREA NAME="cname" ROWS="nrows" COLS="ncolumns" ALIGN="calign" WRAP = "cwrap"
cattributes>
```

FRAME Procedure

This procedure generates the <FRAME> tag which defines the characteristics of a frame created by a <FRAMESET> tag.

Syntax

```
HTP.FRAME(
   csrc           IN       VARCHAR2,
   cname          IN       VARCHAR2   DEFAULT NULL,
   cmarginwidth   IN       VARCHAR2   DEFAULT NULL,
   cmarginheight  IN       VARCHAR2   DEFAULT NULL,
   cscrolling     IN       VARCHAR2   DEFAULT NULL,
   cnoresize      IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–44 FRAME Procedure Parameters

Parameter	Description
csrc	The URL to display in the frame.
cname	The value for the NAME attribute.
cmarginwidth	The value for the MARGINWIDTH attribute.
cscrolling	The value for the SCROLLING attribute.
cnoresize	If the value for this parameter is not NULL, the NORESIZE attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAME SRC="csrc" NAME="cname" MARGINWIDTH="cmarginwidth"
MARGINHEIGHT="cmarginheight" SCROLLING="cscrolling" NORESIZE cattributes>
```

FRAMESETCLOSE Procedure

This procedure generates the </FRAMESET> tag which ends a frameset section. You mark the beginning of a frameset section by means of the FRAMESETOPEN Procedure.

Syntax

```
HTP.FRAMESETCLOSE;
```

Examples

This procedure generates

```
</FRAMESET>
```

FRAMESETOPEN Procedure

This procedure generates the <FRAMESET> tag which define a frameset section. You mark the end of a frameset section by means of the FRAMESETCLOSE Procedure.

Syntax

```
HTP.FRAMESETOPEN(
   crows          IN       VARCHAR2   DEFAULT NULL,
   ccols          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–45 FRAMESETOPEN Procedure Parameters

Parameter	Description
crows	The value for the ROWS attribute.
ccols	The value for the COLS attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<FRAMESET ROWS="crows" COLS="ccols" cattributes>
```

HEADCLOSE Procedure

This procedure generates the </HEAD> tag which marks the end of an HTML document head section. You mark the beginning of an HTML document head section by means of the HEADOPEN Procedure.

Syntax

```
HTP.HEADCLOSE;
```

Examples

This procedure generates

```
</HEAD>
```

HEADER Procedure

This procedure generates opening heading tags (<H1> to <H6>) and their corresponding closing tags (</H1> to </H6>).

Syntax

```
HTP.HEADER(
   nsize          IN       INTEGER,
   cheader        IN       VARCHAR2,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–46 HEADER Procedure Parameters

Parameter	Description
nsize	The the heading level. This is an integer between 1 and 6.
cheader	The text to display in the heading.
calign	The value for the ALIGN attribute.
cnowrap	The value for the NOWRAP attribute.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

```
HTP.header (1,'Overview');
```

produces:

```
<H1>Overview</H1>
```

HEADOPEN Procedure

This procedure generates the <HEAD> tag which marks the beginning of the HTML document head section. You mark the end of an HTML document head section by means of the HEADCLOSE Procedure.

Syntax

```
HTP.HEADOPEN;
```

Examples

This procedure generates

```
<HEAD>
```

HR Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document.This subprogram performs the same operation as the LINE Procedure.

Syntax

```
HTP.HR(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–47 HR Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

HTMLCLOSE Procedure

This procedure generates the </HTML> tag which marks the end of an HTML document. You use the HTMLOPEN Procedure to mark the beginning of an HTML document.

Syntax

```
HTP.HTMLCLOSE;
```

Examples

This procedure generates

```
</HTML>
```

HTMLOPEN Procedure

This procedure generates the <HTML> tag which marks the beginning of an HTML document. You use the HTMLCLOSE Procedure to mark the end of the an HTML document.

Syntax

```
HTP.HTMLOPEN;
```

Examples

This procedure generates

```
<HTML>
```

IMG Procedure

This procedure generates the <IMG> tag which directs the browser to load an image onto the HTML page. The IMG2 Procedure performs the same operation but additionally uses the cusemap parameter.

Syntax

```
HTP.IMG(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2
DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–48 IMG Procedure Parameters

Parameter	Description
curl	The value for the SRC attribute.
calign	The value for the ALIGN attribute.
calt	The value for the ALT attribute which specifies alternative text to display if the browser does not support images.
cismap	If the value for this parameter is not NULL, the ISMAP attribute is added to the tag. The attribute indicates that the image is an imagemap.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP cattributes>
```

IMG2 Procedure

This procedure generates the <IMG> tag, which directs the browser to load an image onto the HTML page. The IMG Procedure performs the same operation but does not use the `cusemap` parameter.

Syntax

```
HTP.IMG2(
   curl           IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   calt           IN       VARCHAR2   DEFAULT NULL,
   cismap         IN       VARCHAR2
DEFAULT NULL,
   cusemap        IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–49 IMG2 Procedure Parameters

Parameter	Description
`curl`	The value for the SRC attribute.
`calign`	The value for the `ALIGN` attribute.
`calt`	The value for the `ALT` attribute which specifies alternative text to display if the browser does not support images.
`cismap`	If the value for this parameter is not `NULL`, the `ISMAP` attribute is added to the tag. The attribute indicates that the image is an imagemap.
`cusemap`	The value for the `USEMAP` attribute which specifies a client-side image map.
`cattributes`	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<IMG SRC="curl" ALIGN="calign" ALT="calt" ISMAP USEMAP="cusemap" cattributes>
```

ISINDEX Procedure

This procedure creates a single entry field with a prompting text, such as "*enter value,*" then sends that value to the URL of the page or program.

Syntax

```
HTP.ISINDEX(
   cprompt        IN       VARCHAR2    DEFAULT NULL,
   curl           IN       VARCHAR2    DEFAULT NULL);
```

Parameters

Table 180–50 ISINDEX Procedure Parameters

Parameter	Description
`cprompt`	The value for the `PROMPT` attribute.
`curl`	The value for the `HREF` attribute.

Examples

This procedure generates

```
<ISINDEX PROMPT="cprompt" HREF="curl">
```

ITALIC Procedure

This procedure generates the <I> and </I> tags which direct the browser to render the text in italics.

Syntax

```
HTP.ITALIC(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–51 ITALIC Procedure Parameters

Parameter	Description
ctext	The text to be rendered in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<I *cattributes*>*ctext*</I>

KBD Procedure

This procedure generates the <KBD> and </KBD> tags which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KEYBOARD Procedure.

Syntax

```
HTP.KBD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–52 KBD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

KEYBOARD Procedure

This procedure generates the <KBD> and </KBD> tags, which direct the browser to render the text in monospace font. This subprogram performs the same operation as the KBD Procedure.

Syntax

```
HTP.KEYBOARD(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–53 KEYBOARD Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<KBD cattributes>ctext</KBD>
```

LINE Procedure

This procedure generates the <HR> tag, which generates a line in the HTML document. This subprogram performs the same operation as the HR Procedure.

Syntax

```
HTP.LINE(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–54 LINE Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
csrc	The value for the SRC attribute which specifies a custom image as the source of the line.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<HR CLEAR="cclear" SRC="csrc" cattributes>
```

LINKREL Procedure

This procedure generates the <LINK> tag with the REL attribute which delineates the relationship described by the hypertext link from the anchor to the target. This is only used when the HREF attribute is present. This is the opposite of LINKREV Procedure. This tag indicates a relationship between documents but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREL(
   crel           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–55 LINKREL Procedure Parameters

Parameter	Description
crel	The value for the REL attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REL="crel" HREF="curl" TITLE="ctitle">
```

LINKREV Procedure

This procedure generates the <LINK> tag with the REV attribute which delineates the relationship described by the hypertext link from the target to the anchor. This is the opposite of the LINKREL Procedure. This tag indicates a relationship between documents, but does not create a link. To create a link, use the ANCHOR Procedure.

Syntax

```
HTP.LINKREV(
   crev           IN       VARCHAR2,
   curl           IN       VARCHAR2,
   ctitle         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–56 LINKREV Procedure Parameters

Parameter	Description
crel	The value for the REV attribute.
curl	The value for the URL attribute.
ctitle	The value for the TITLE attribute.

Examples

This procedure generates

```
<LINK REV="crev" HREF="curl" TITLE="ctitle">
```

LISTHEADER Procedure

This procedure generates the <LH> and </LH> tags which print an HTML tag at the beginning of the list.

Syntax

```
HTP.LISTHEADER(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–57 LISTHEADER Procedure Parameters

Parameter	Description
ctext	The text to place between <LH> and </LH>.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

<LH *cattributes*>*ctext*</LH>

LISTINGCLOSE Procedure

This procedure generates the `</LISTING>` tags which marks the end of a section of fixed-width text in the body of an HTML page. To mark the beginning of a section of fixed-width text in the body of an HTML page, use the LISTINGOPEN Procedure.

Syntax

```
HTP.LISTINGCLOSE;
```

Examples

This procedure generates

```
</LISTING>
```

LISTINGOPEN Procedure

This procedure generates the <LISTING> tag which marks the beginning of a section of fixed-width text in the body of an HTML page. To mark the end of a section of fixed-width text in the body of an HTML page, use the LISTINGCLOSE Procedure.

Syntax

```
HTP.LISTINGOPEN;
```

Examples

This procedure generates

```
<LISTING>
```

LISTITEM Procedure

This procedure generates the <LI> tag, which indicates a list item.

Syntax

```
HTP.LISTITEM(
   ctext          IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cdingbat       IN       VARCHAR2   DEFAULT NULL,
   csrc           IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–58 LISTITEM Procedure Parameters

Parameter	Description
ctext	The text for the list item.
cclear	The value for the CLEAR attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<LI CLEAR="cclear" DINGBAT="cdingbat" SRC="csrc" cattributes>ctext
```

MAILTO Procedure

This procedure generates the <A> tag with the HREF set to 'mailto' prepended to the mail address argument.

Syntax

```
HTP.MAILTO(
   caddress       IN       VARCHAR2,
   ctext          IN       VARCHAR2,
   cname          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–59 MAILTO Procedure Parameters

Parameter	Description
caddress	The email address of the recipient.
ctext	The clickable portion of the link.
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<A HREF="mailto:caddress" NAME="cname" cattributes>ctext</A>
```

so that

```
HTP.mailto('pres@white_house.gov','Send Email to the President');
```

generates:

```
<A HREF="mailto:pres@white_house.gov">Send Email to the President</A>
```

MAPCLOSE Procedure

This procedure generates the </MAP> tag which marks the end of a set of regions in a client-side image map. To mark the beginning of a set of regions in a client-side image map, use the MAPOPEN Procedure.

Syntax

```
HTP.MAPCLOSE;
```

Examples

This procedure generates

```
</MAP>
```

MAPOPEN Procedure

This procedure generates the <MAP> tag which mark the beginning of a set of regions in a client-side image map. To mark the end of a set of regions in a client-side image map, use the MAPCLOSE Procedure.

Syntax

```
HTP.MAPOPEN(
   cname          IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–60 MAPOPEN Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<MAP NAME="cname" cattributes>
```

MENULISTCLOSE Procedure

This procedure generates the </MENU> tag which ends a list that presents one line for each item. To begin a list of this kind, use the MENULISTOPEN Procedure. The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTCLOSE;
```

Examples

This procedure generates

```
</MENU>
```

MENULISTOPEN Procedure

This procedure generates the <MENU> tag which create a list that presents one line for each item. To end a list of this kind, use the MENULISTCLOSE Procedure.The items in the list appear more compact than an unordered list. The LISTITEM Procedure defines the list items in a menu list.

Syntax

```
HTP.MENULISTOPEN;
```

Examples

This procedure generates

```
<MENU>
```

META Procedure

This procedure generates the <META> tag, which embeds meta-information about the document and also specifies values for HTTP headers. For example, you can specify the expiration date, keywords, and author name.

Syntax

```
HTP.META(
   chttp_equiv    IN       VARCHAR2,
   cname          IN       VARCHAR2,
   ccontent       IN       VARCHAR2);
```

Parameters

Table 180–61 META Procedure Parameters

Parameter	Description
chttp_equiv	The value for the CHTTP_EQUIV attribute.
cname	The value for the NAME attribute.
ccontent	The value for the CONTENT attribute.

Examples

This procedure generates

```
<META HTTP-EQUIV="chttp_equiv" NAME ="cname" CONTENT="ccontent">
```

so that

```
HTP.meta ('Refresh', NULL, 120);
```

generates

```
<META HTTP-EQUIV="Refresh" CONTENT=120>
```

On some Web browsers, this causes the current URL to be reloaded automatically every 120 seconds.

NL Procedure

This procedure generates the <BR> tag which begins a new line of text. It performs the same operation as the BR Procedure.

Syntax

```
HTP.NL(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–62 NL Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<BR CLEAR="cclear" cattributes>
```

NOBR Procedure

This procedure generates the <NOBR> and </NOBR> tags which turn off line-breaking in a section of text.

Syntax

```
HTP.NOBR(
ctext         IN        VARCHAR2);
```

Parameters

Table 180–63 NOBR Procedure Parameters

Parameter	Description
ctext	The text that is to be rendered on one line.

Examples

This procedure generates

```
<NOBR>ctext</NOBR>
```

NOFRAMESCLOSE Procedure

This procedure generates the </NOFRAMES> tag which marks the end of a no-frames section. To mark the beginning of a no-frames section, use the FRAMESETOPEN Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESCLOSE;
```

Examples

This procedure generates

```
</NOFRAMES>
```

NOFRAMESOPEN Procedure

This procedure generates the <NOFRAMES> tag which mark the beginning of a no-frames section. To mark the end of a no-frames section, use the FRAMESETCLOSE Procedure. See also FRAME Procedure, FRAMESETOPEN Procedure and FRAMESETCLOSE Procedure.

Syntax

```
HTP.NOFRAMESOPEN;
```

Examples

This procedure generates

```
<NOFRAMES>
```

OLISTCLOSE Procedure

This procedure generates the </OL> tag which defines the end of an ordered list. An ordered list presents a list of numbered items. To mark the beginning of a list of this kind, use the OLISTOPEN Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTCLOSE;
```

Examples

This procedure generates

```
</OL>
```

OLISTOPEN Procedure

This procedure generates the <OL> tag which marks the beginning of an ordered list. An ordered list presents a list of numbered items. To mark the end of a list of this kind, use the OLISTCLOSE Procedure. Numbered items are added using LISTITEM Procedure.

Syntax

```
HTP.OLISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–64 OLISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<OL CLEAR="cclear" WRAP="cwrap" cattributes>
```

PARA Procedure

This procedure generates the <P> tag which indicates that the text that comes after the tag is to be formatted as a paragraph. You can add attributes to the tag by means of the PARAGRAPH Procedure.

Syntax

```
HTP.PARA;
```

Examples

This procedure generates

```
<P>
```

PARAGRAPH Procedure

You can use this procedure to add attributes to the <P> tag created by the PARA Procedure.

Syntax

```
HTP.PARAGRAPH(
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–65 PARAGRAPH Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cnowrap	If the value for this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<P ALIGN="calign" NOWRAP CLEAR="cclear" cattributes>
```

PARAM Procedure

This procedure generates the <PARAM> tag which specifies parameter values for Java applets. The values can reference HTML variables. To invoke a Java applet from a Web page, use APPLETOPEN Procedure to begin the invocation. Use one PARAM Procedure for each desired name-value pair, and use APPLETCLOSE Procedure to end the applet invocation.

Syntax

```
HTP.PARAM(
   cname          IN       VARCHAR2
   cvalue         IN       VARCHAR2);
```

Parameters

Table 180–66 PARAM Procedure Parameters

Parameter	Description
cname	The value for the NAME attribute.
cvalue	The value for the VALUE attribute.

Examples

This procedure generates

```
<PARAM NAME=cname VALUE="cvalue">
```

PLAINTEXT Procedure

This procedure generates the <PLAINTEXT> and </PLAINTEXT> tags which direct the browser to render the text they surround in fixed-width type.

Syntax

```
HTP.PLAINTEXT(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–67 PLAINTEXT Procedure Parameters

Parameter	Description
ctext	The text to be rendered in fixed-width font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PLAINTEXT cattributes>ctext</PLAINTEXT>
```

PRECLOSE Procedure

This procedure generates the </PRE> tag which marks the end of a section of preformatted text in the body of the HTML page. To mark the beginning of a section of preformatted text in the body of the HTML page, use the PREOPEN Procedure.

Syntax

```
HTP.PRECLOSE;
```

Examples

This procedure generates

```
</PRE>
```

PREOPEN Procedure

This procedure generates the <PRE> tag which marks the beginning of a section of preformatted text in the body of the HTML page. To mark the end of a section of preformatted text in the body of the HTML page, use the PRECLOSE Procedure.

Syntax

```
HTP.PREOPEN(
   cclear         IN       VARCHAR2   DEFAULT NULL,
   cwidth         IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–68 PREOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwidth	The value for the WIDTH attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<PRE CLEAR="cclear" WIDTH="cwidth" cattributes>
```

PRINT Procedures

These procedures generate the specified parameter as a string terminated with the \n newline character. The PRN Procedures performs the same operation but does not terminate with a newline character.

Syntax

```
HTP.PRINT (
   cbuf      IN       VARCHAR2);

HTP.PRINT (
   dbuf      IN       DATE);

HTP.PRINT (
   nbuf      IN       NUMBER);
```

Parameters

Table 180–69 PRINT Procedure Parameters

Parameter	Description
cbuf	The string to generate terminated by a newline.
dbuf	The string to generate terminated by a newline.
nbuf	The string to generate terminated by a newline.

Usage Notes

- The \n character is not the same as <BR>. The \n character formats the HTML source but it does not affect how the browser renders the HTML source. Use <BR> to control how the browser renders the HTML source.
- These procedures do not have function equivalents.

PRINTS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- `<` to `<`
- `>` to `>`
- `"` to `"`
- `&` to `&`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure an the PS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PRINTS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 180–70 PRINTS Procedure Parameters

Parameter	Description
`ctext`	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 180-3 for the HTF implementation).

PRN Procedures

These procedures generate the specified parameter as a string. Unlike the PRINT Procedures the string is not terminated with the `\n` newline character.

Syntax

```
HTP.PRN (
   cbuf      IN       VARCHAR2);

HTP.PRN (
   dbuf      IN       DATE);

HTP.PRN (
   nbuf      IN       NUMBER);
```

Parameters

Table 180–71 PRN Procedure Parameters

Parameter	Description
`cbuf`	The string to generate (not terminated by a newline).
`dbuf`	The string to generate (not terminated by a newline).
`nbuf`	The string to generate (not terminated by a newline).

Usage Notes

These procedures do not have function equivalents.

PS Procedure

This procedure generates a string and replaces the following characters with the corresponding escape sequence.

- `<` to `<`
- `>` to `>`
- `"` to `"`
- `&` to `&`

If not replaced, the special characters are interpreted as HTML control characters and produce garbled output. This procedure and the PRINTS Procedure perform the same operation as the PRN Procedures but with character substitution.

Syntax

```
HTP.PS (
   ctext      IN       VARCHAR2);
```

Parameters

Table 180–72 PS Procedure Parameters

Parameter	Description
`ctext`	The string where to perform character substitution.

Usage Notes

This procedure does not have an HTF function equivalent (see Operational Notes on page 180-3 for the HTF implementation).

S Procedure

This procedure generates the <S> and </S> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as STRIKE Procedure.

Syntax

```
HTP.S (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–73 S Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<S cattributes>ctext</S>
```

SAMPLE Procedure

This procedure generates the <SAMP> and </SAMP> tags which direct the browser to render the text they surround in monospace font or however "sample" is defined stylistically.

Syntax

```
HTP.SAMPLE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–74 SAMPLE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in monospace font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SAMP cattributes>ctext</SAMP>
```

SCRIPT Procedure

This procedure generates the <SCRIPT> and </SCRIPT> tags which contain a script written in languages such as JavaScript and VBscript.

Syntax

```
HTP.SCRIPT (
   cscript        IN       VARCHAR2,
   clanguage      IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–75 SCRIPT Procedure Parameters

Parameter	Description
cscript	The text of the script. This is the text that makes up the script itself, not the name of a file containing the script.
clanguage	The language in which the script is written. If this parameter is omitted, the user's browser determines the scripting language.

Examples

This procedure generates

```
<SCRIPT LANGUAGE=language>cscript</SCRIPT>
```

so that

```
HTP.script ('Erupting_Volcano', 'Javascript');
```

generates

```
<SCRIPT LANGUAGE=Javascript>"script text here"</SCRIPT>
```

This causes the browser to run the script enclosed in the tags.

SMALL Procedure

This procedure generates the <SMALL> and </SMALL> tags, which direct the browser to render the text they surround using a small font.

Syntax

```
HTP.SMALL (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–76 SMALL Procedure Parameters

Parameter	Description
ctext	The text to be rendered in small font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SMALL cattributes>ctext</SMALL>
```

STRIKE Procedure

This procedure generates the <STRIKE> and </STRIKE> tags which direct the browser to render the text they surround in strikethrough type. This performs the same operation as S Procedure.

Syntax

```
HTP.STRIKE (
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–77 STRIKE Procedure Parameters

Parameter	Description
ctext	The text to be rendered in strikethrough type.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRIKE cattributes>ctext</STRIKE>
```

STRONG Procedure

This procedure generates the <STRONG> and </STRONG> tags which direct the browser to render the text they surround in bold or however "strong" is defined.

Syntax

```
HTP.STRONG(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–78 STRONG Procedure Parameters

Parameter	Description
ctext	The text to be emphasized.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<STRONG cattributes>ctext</STRONG>
```

STYLE Procedure

This procedure generates the <STYLE> and </STYLE> tags which include a style sheet in a Web page. You can get more information about style sheets at http://www.w3.org. This feature is not compatible with browsers that support only HTML versions 2.0 or earlier. Such browsers will ignore this tag.

Syntax

```
HTP.STYLE(
   cstyle          IN       VARCHAR2);
```

Parameters

Table 180–79 STYLE Procedure Parameters

Parameter	Description
cstyle	The the style information to include.

Examples

This procedure generates

```
<STYLE>cstyle</STYLE>
```

SUB Procedure

This procedure generates the _{and} tags which direct the browser to render the text they surround as subscript.

Syntax

```
HTP.SUB(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–80 SUB Procedure Parameters

Parameter	Description
ctext	The text to render in subscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUB ALIGN="calign" cattributes>ctext</SUB>
```

SUP Procedure

This procedure generates the ^{and} tags which direct the browser to render the text they surround as superscript.

Syntax

```
HTP.SUP(
   ctext          IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–81 SUP Procedure Parameters

Parameter	Description
ctext	The text to render in superscript.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<SUP ALIGN="calign" cattributes>ctext</SUP>
```

TABLECAPTION Procedure

This procedure generates the <CAPTION> and </CAPTION> tags which place a caption in an HTML table.

Syntax

```
HTP.TABLECAPTION(
   ccaption       IN       VARCHAR2,
   calign         in       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–82 TABLECAPTION Procedure Parameters

Parameter	Description
ctext	The text for the caption.
calign	The value for the ALIGN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<CAPTION ALIGN="calign" cattributes>ccaption</CAPTION>
```

TABLECLOSE Procedure

This procedure generates the </TABLE> tag which marks the end of an HTML table. To define the beginning of an HTML table, use the TABLEOPEN Procedure.

Syntax

```
HTP.TABLECLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

TABLEDATA Procedure

This procedure generates the <TD> and </TD> tags which insert data into a cell of an HTML table.

Syntax

```
HTP.TABLEDATA(
   cvalue         IN       VARCHAR2   DEFAULT NULL,
   calign         IN       VARCHAR2   DEFAULT NULL,
   cdp            IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   crowspan       IN       VARCHAR2   DEFAULT NULL,
   ccolspan       IN       VARCHAR2   DEFAULT NULL,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–83 TABLEDATA Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TD ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TD>
```

TABLEHEADER Procedure

This procedure generates the <TH> and </TH> tags which insert a header cell in an HTML table. The <TH> tag is similar to the <TD> tag except that the text in this case the rows are usually rendered in bold type.

Syntax

```
HTP.TABLEHEADER(
   cvalue          IN       VARCHAR2   DEFAULT NULL,
   calign          IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   crowspan        IN       VARCHAR2   DEFAULT NULL,
   ccolspan        IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–84 TABLEHEADER Procedure Parameters

Parameter	Description
cvalue	The data for the cell in the table.
calign	The value for the ALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
crispen	The value for the ROWSPAN attribute.
ccolspan	The value for the COLSPAN attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TH ALIGN="calign" DP="cdp" ROWSPAN="crowspan" COLSPAN="ccolspan" NOWRAP
cattributes>cvalue</TH>
```

TABLEOPEN Procedure

This procedure generates the <TABLE> tag which marks the beginning of an HTML table. To define the end of an HTML table, use the TABLECLOSE Procedure.

Syntax

```
HTP.TABLEOPEN(
   cborder        IN       VARCHAR2   DEFAULT NULL
   calign         IN       VARCHAR2   DEFAULT NULL,
   cnowrap        IN       VARCHAR2   DEFAULT NULL,
   cclear         IN       VARCHAR2   DEFAULT NULL
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–85 TABLEOPEN Procedure Parameters

Parameter	Description
border	The value for the BORDER attribute.
calign	The value for the ALIGN attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cclear	The value for the CLEAR attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TABLE "cborder" NOWRAP ALIGN="calign" CLEAR="cclear" cattributes>
```

TABLEROWCLOSE Procedure

This procedure generates the </TR> tag which marks the end of a new row in an HTML table. To mark the beginning of a new row, use the TABLEROWOPEN Procedure.

Syntax

```
HTP.TABLEROWCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

TABLEROWOPEN Procedure

This procedure generates the <TR> tag which marks the beginning of a new row in an HTML table. To mark the end of a new row, use the TABLEROWCLOSE Procedure.

Syntax

```
HTP.TABLEROWOPEN(
   calign          IN       VARCHAR2   DEFAULT NULL,
   cvalign         IN       VARCHAR2   DEFAULT NULL,
   cdp             IN       VARCHAR2   DEFAULT NULL,
   cnowrap         IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–86 TABLEROWOPEN Procedure Parameters

Parameter	Description
calign	The value for the ALIGN attribute.
cvalign	The value for the VALIGN attribute.
cdp	The value for the DP attribute.
cnowrap	If the value of this parameter is not NULL, the NOWRAP attribute is added to the tag.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<<TR ALIGN="calign" VALIGN="cvalign" DP="cdp" NOWRAP cattributes>
```

TELETYPE Procedure

This procedure generates the <TT> and </TT> tags which direct the browser to render the text they surround in a fixed width typewriter font, for example, the courier font.

Syntax

```
HTP.TELETYPE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–87 TELETYPE Procedure Parameters

Parameter	Description
ctext	The text to render in a fixed width typewriter font.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<TT cattributes>ctext</TT>
```

TITLE Procedure

This procedure generates the <TITLE> and </TITLE> tags which specify the text to display in the titlebar of the browser window.

Syntax

```
HTP.TITLE(
   ctitle          IN       VARCHAR2);
```

Parameters

Table 180–88 TITLE Procedure Parameters

Parameter	Description
ctitle	The text to display in the titlebar of the browser window.

Examples

This procedure generates

```
<TITLE>ctitle</TITLE>
```

ULISTCLOSE Procedure

This procedure generates the </UL> tag which marks the end of an unordered list. An unordered list presents items with bullets. To mark the beginning of an unordered list, use the ULISTOPEN Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTCLOSE;
```

Examples

This procedure generates

```
</TABLE>
```

ULISTOPEN Procedure

This procedure generates the <UL> tag which marks the beginning of an unordered list. An unordered list presents items with bullets. To mark the end of an unordered list, use the ULISTCLOSE Procedure. Add list items with LISTITEM Procedure.

Syntax

```
HTP.ULISTOPEN(
   cclear          IN       VARCHAR2   DEFAULT NULL,
   cwrap           IN       VARCHAR2   DEFAULT NULL,
   cdingbat        IN       VARCHAR2   DEFAULT NULL,
   csrc            IN       VARCHAR2   DEFAULT NULL,
   cattributes     IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–89 ULISTOPEN Procedure Parameters

Parameter	Description
cclear	The value for the CLEAR attribute.
cwrap	The value for the WRAP attribute.
cdingbat	The value for the DINGBAT attribute.
csrc	The value for the SRC attribute.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<UL CLEAR="cclear" WRAP="cwrap" DINGBAT="cdingbat" SRC="csrc" cattributes>
```

UNDERLINE Procedure

This procedure generates the <U> and </U> tags, which direct the browser to render the text they surround with an underline.

Syntax

```
HTP.UNDERLINE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–90 UNDERLINE Procedure Parameters

Parameter	Description
ctext	The text to render with an underline.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<U cattributes>ctext</U>
```

VARIABLE Procedure

This procedure generates the <VAR> and </VAR> tags which direct the browser to render the text they surround in italics or however "variable" is defined stylistically.

Syntax

```
HTP.VARIABLE(
   ctext          IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 180–91 VARIABLE Procedure Parameters

Parameter	Description
ctext	The text to render in italics.
cattributes	The other attributes to be included as-is in the tag.

Examples

This procedure generates

```
<VAR cattributes>ctext</VAR>
```

WBR Procedure

This procedure generates the <WBR> tag, which inserts a soft line break within a section of NOBR text.

Syntax

```
HTP.WBR;
```

Examples

This procedure generates

```
<WBR>
```

181

ORD_DICOM

This Oracle Multimedia package supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILEs rather than in an ORDDicom object type. See *Oracle Multimedia DICOM Developer's Guide* for a complete description of the ORDDicom object type.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other content. These include content such as single-frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

The Oracle Multimedia `ORD_DICOM` package provides functions and procedures in the DICOM relational interface to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM content. This Oracle Multimedia package also provides functions and procedures to check DICOM content for conformance based on a set of user-specified conformance rules, and to make DICOM content anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

The Oracle Multimedia `ORD_DICOM` package also provides functions and procedures in the DICOM data model utility interface to operate on the DICOM data model repository. See *Oracle Multimedia DICOM Developer's Guide* for a complete description of the DICOM data model utility interface.

- Documentation of ORD_DICOM

Documentation of ORD_DICOM

For a complete description of this package within the context of Oracle Multimedia, see `ORD_DICOM` in the *Oracle Multimedia DICOM Developer's Guide*.

182

ORD_DICOM_ADMIN

This Oracle Multimedia package is used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository.

The DICOM data model repository is a collection of documents. An initial set of documents is loaded during installation. After installation, DICOM administrators can use the procedures and functions provided in the data model repository API of the Oracle Multimedia `ORD_DICOM_ADMIN` package to obtain document content as well as to insert, edit, and delete documents in the data model repository.

- Documentation of ORD_DICOM_ADMIN

Documentation of ORD_DICOM_ADMIN

For a complete description of this package within the context of Oracle Multimedia, see `ORD_DICOM_ADMIN` in the *Oracle Multimedia DICOM Developer's Guide*.

183

OWA_CACHE

The `OWA_CACHE` package provides an interface that enables the `PL/SQL Gateway` cache to improve the performance of PL/SQL Web applications.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Using OWA_CACHE
  - Constants
- Summary of OWA_CACHE Subprograms

Using OWA_CACHE

- Constants

Constants

- `system_level CONSTANT VARCHAR(6) := 'SYSTEM';`
- `user_level CONSTANT VARCHAR(4) := 'USER';`

Summary of OWA_CACHE Subprograms

Table 183–1 OWA_CACHE Package Subprograms

Subprogram	Description
DISABLE Procedure on page 183-5	Disables the cache for this particular request
GET_ETAG Function on page 183-6	Returns the tag associated with the cached content (used in the Validation technique model only)
GET_LEVEL Function on page 183-7	Returns the caching level (used in the Validation technique model only)
SET_CACHE Procedure on page 183-8	Sets up the cache headers for validation model cache type
SET_EXPIRES Procedure on page 183-9	Sets up the cache headers for expires model cache type
SET_NOT_MODIFIED Procedure on page 183-10	Sets up the headers for a not modified cache hit (used in the Validation technique model only)
SET_SURROGATE_CONTROL Procedure on page 183-11	Sets up the headers for a surrogate-control header for Web cache

DISABLE Procedure

This procedure disables the cache for this particular request.

Syntax

```
OWA_CACHE.DISABLE;
```

GET_ETAG Function

This function returns the tag associated with the cached content. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.GET_ETAG
  RETURN VARCHAR2;
```

Return Values

The tag for cache hit, otherwise `NULL`.

GET_LEVEL Function

This returns the caching level. It is used in the Validation technique model only.

Syntax

```
OWA_CACHE.GET_LEVEL
  RETURN VARCHAR2;
```

Return Values

The caching level string ('USER' or 'SYSTEM') for cache hit, otherwise NULL.

SET_CACHE Procedure

This sets up the cache headers for validation model cache type.

Syntax

```
OWA_CACHE.SET_CACHE(
   p_etag        IN       VARCHAR2,
   p_level       IN       VARCHAR2);
```

Parameters

Table 183–2 SET_CACHE Procedure Parameters

Parameter	Description
p_etag	The etag associated with this content
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_etag is greater than 55
- p_level is not 'USER' or 'SYSTEM'

SET_EXPIRES Procedure

This procedure sets up the cache headers for expires model cache type.

Syntax

```
OWA_CACHE.SET_EXPIRES(
   p_expires      IN       NUMBER,
   p_level        IN       VARCHAR2);
```

Parameters

Table 183–3 SET_EXPIRES Procedure Parameters

Parameter	Description
p_expires	The number of minutes this content is valid.
p_level	The caching level ('USER' or 'SYSTEM').

Exceptions

VALUE_ERROR is thrown if

- p_expires is negative or zero
- p_level is not 'USER' or 'SYSTEM'
- p_expires is > 525600 (1 year)

SET_NOT_MODIFIED Procedure

This procedure sets up the headers for a not-modified cache hit. It is used in the Validation technique only.

Syntax

```
OWA_CACHE.SET_NOT_MODIFIED;
```

Exceptions

`VALUE_ERROR` is thrown if If the `etag` was not passed in

SET_SURROGATE_CONTROL Procedure

This procedure sets the headers for a surrogate-control header for Web cache

Syntax

```
OWA_CACHE.SET_SURROGATE_CONTROL(
   p_value        IN       VARCHAR2);
```

Parameters

Table 183–4 SET_SURROGATE_CONTROL Procedure Parameters

Parameter	Description
p_value	The value to be passed as the Surrogate-Control header .

Exceptions

VALUE_ERROR is thrown if If p_value is greater than 55 in length.

184

OWA_COOKIE

The OWA_COOKIE package provides an interface for sending and retrieving HTTP cookies from the client's browser.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Using OWA_COOKIE
  - Overview
  - Types
  - Rules and Limits
- Summary of OWA_COOKIE Subprograms

Using OWA_COOKIE

- Overview
- Types
- Rules and Limits

Overview

Cookies are opaque strings sent to the browser to maintain state between HTTP calls. State can be maintained throughout the client's sessions, or longer if an expiration date is included. The system date is calculated with reference to the information specified in the OWA_CUSTOM package.

Types

This data type contains cookie name-value pairs. Since the HTTP standard allows cookie names to be overloaded (that is, multiple values can be associated with the same cookie name), there is a PL/SQL `RECORD` holding all values associated with a given cookie name.

```
TYPE vc_arr IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER.

TYPE COOKIE IS RECORD (
   name           VARCHAR2(4000),
   vals           vc_arr,
   num_vals       INTEGER);
```

Rules and Limits

All HTTP headers must be in English and the ASCII character set. If the headers are generated from the database, verify they are created in the English language.

Summary of OWA_COOKIE Subprograms

Table 184–1 OWA_COOKIE Package Subprograms

Subprogram	Description
GET Function on page 184-7	Gets the value of the specified cookie
GET_ALL Procedure on page 184-8	Gets all cookie name-value pairs
REMOVE Procedure on page 184-9	Removes the specified cookie
SEND procedure on page 184-10	Generates a "Set-Cookie" line in the HTTP header

GET Function

This function returns the values associated with the specified cookie. The values are returned in a OWA_COOKIE.COOKIE DATA TYPE.

Syntax

```
OWA_COOKIE.GET(
    name           IN       VARCHAR2)
  RETURN COOKIE;
```

Parameters

Table 184–2 GET Procedure Parameters

Parameter	Description
name	The name of the cookie.

Return Values

OWA_COOKIE.COOKIE DATA TYPE.

GET_ALL Procedure

This procedure returns all cookie names and their values from the client's browser. The values appear in the order in which they were sent from the browser.

Syntax

```
OWA_COOKIE.GET_ALL(
   names          OUT      vc_arr,
   vals           OUT      vc_arr,
   num_vals       OUT      INTEGER);
```

Parameters

Table 184–3 GET_ALL Procedure Parameters

Parameter	Description
names	The names of the cookies.
vals	The values of the cookies.
num_vals	The number of cookie-value pairs.

REMOVE Procedure

This procedure forces a cookie to expire immediately by setting the "expires" field of a Set-Cookie line in the HTTP header to "01-Jan-1990". This procedure must be called within the context of an HTTP header.

Syntax

```
OWA_COOKIE.REMOVE(
   name           IN       VARCHAR2,
   val            IN       VARCHAR2,
   path           IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 184–4 REMOVE Procedure Parameters

Parameter	Description
name	The name of the cookie to expire.
val	The value of the cookie.
path	[Currently unused]

SEND procedure

This procedure generates a Set-Cookie line, which transmits a cookie to the client. This procedure must occur in the context of an HTTP header.

Syntax

```
OWA_COOKIE.SEND(
   name           in       varchar2,
   value          in       varchar2,
   expires        in       date       DEFAULT NULL,
   path           in       varchar2   DEFAULT NULL,
   domain         in       varchar2   DEFAULT NULL,
   secure         in       varchar2   DEFAULT NULL);
```

Parameters

Table 184–5 SEND Procedure Parameters

Parameter	Description
`name`	The name of the cookie.
`value`	The value of the cookie.
`expires`	The date at which the cookie will expire
`path`	The value for the path field.
`domain`	The value for the domain field.
`secure`	If the value of this parameter is not `NULL`, the "secure" field is added to the line.

185

OWA_CUSTOM

The OWA_CUSTOM package provides a Global PLSQL Agent Authorization callback function. It is used when PLSQL Agent's authorization scheme is set to GLOBAL or CUSTOM when there is no overriding OWA_CUSTOM package.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Using OWA_CUSTOM
  - Constants
- Summary of OWA_CUSTOM Subprograms

Using OWA_CUSTOM

- Constants

Constants

- `dbms_server_timezone CONSTANT VARCHAR2(3) := 'PST';`
- `dbms_server_gmtdiff CONSTANT NUMBER := NULL;`

Summary of OWA_CUSTOM Subprograms

Table 185–1 OWA_CUSTOM Package Subprograms

Subprogram	Description
AUTHORIZE Function on page 185-5	Provides a Global PLSQL Agent Authorization callback function

AUTHORIZE Function

This function is used when PLSQL Agent's authorization scheme is set to `GLOBAL` or `CUSTOM` when there is no overriding `OWA_CUSTOM` package.

Syntax

```
OWA_CUSTOM.AUTHORIZE
  RETURN BOOLEAN;
```

186

OWA_IMAGE

The `OWA_IMAGE` package provides an interface to access the coordinates where a user clicked on an image.

> **See Also:** For more information about implementation of this package:
>

  - Overview
  - Types
  - Variables
  - Examples
- Summary of OWA_IMAGE Subprograms

Using OWA_IMAGE

- Overview
- Types
- Variables
- Examples

Overview

Use this package when you have any image map whose destination links invoke the PL/SQL Gateway.

Types

This data type (`point`) contain the `X` and `Y` values of a coordinate, and so provides the coordinates of a user's click on an imagemap. It is defined as:

```
TYPE POINT IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER
```

Variables

This package variable (`null_point`) of `TYPE POINT` is used to default point parameters. Both the X and the Y fields of this variable are `NULL`.

Examples

```
CREATE OR REPLACE PROCEDURE process_image
    (my_img in OWA_IMAGE.POINT)
    AS
    x integer := OWA_IMAGE.GET_X(my_img);
    y integer := OWA_IMAGE.GET_Y(my_img);
BEGIN
    /* process the coordinate */
END
```

Summary of OWA_IMAGE Subprograms

Table 186–1 OWA_IMAGE Package Subprograms

Subprogram	Description
GET_X Function on page 186-8	Gets the X value of a point type
GET_Y Function on page 186-9	Gets the Y value of a point type

GET_X Function

This function returns the X coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_X(
   p         IN        point)
 RETURN INTEGER;
```

Parameters

Table 186–2 GET_X Procedure Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The X coordinate as an integer.

GET_Y Function

This function returns the Y coordinate of the point where the user clicked on an image map.

Syntax

```
OWA_IMAGE.GET_Y(
   p        IN        point)
 RETURN INTEGER;
```

Parameters

Table 186–3 GET_Y Procedure Parameters

Parameter	Description
p	The point where the user clicked.

Return Values

The Y coordinate as an integer.

187

OWA_OPT_LOCK

The `OWA_OPT_LOCK` package contains subprograms that impose optimistic locking strategies so as to prevent lost updates.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- Using OWA_OPT_LOCK
  - Overview
  - Types
- Summary of OWA_OPT_LOCK Subprograms

Using OWA_OPT_LOCK

- Overview
- Types

Overview

The OWA_OPT_LOCK package contains subprograms that impose optimistic locking strategies, so as to prevent lost updates.

It checks if the row that the user is interested in updating has been changed by someone else in the meantime.

The PL/SQL Gateway cannot use conventional database locking schemes because HTTP is a stateless protocol. The `OWA_OPT_LOCK` package gives you two ways of dealing with the lost update problem:

- The hidden fields method stores the previous values in hidden fields in the HTML page. When the user requests an update, the PL/SQL Gateway checks these values against the current state of the database. The update operation is performed only if the values match. To use this method, call the owa_opt_lock.store_values procedure.
- The checksum method stores a checksum rather than the values themselves. To use this method, call the owa_opt_lock.checksum function.

These methods are optimistic. They do not prevent other users from performing updates, but they do reject the current update if an intervening update has occurred.

Types

This data type is a PL/SQL table intended to hold ROWIDs.

```
TYPE VCARRAY IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER
```

Note that this is different from the `OWA_TEXT.VC_ARR DATA TYPE`.

Summary of OWA_OPT_LOCK Subprograms

Table 187–1 OWA_CACHE Package Subprograms

Subprogram	Description
CHECKSUM Functions on page 187-6	Returns the checksum value
GET_ROWID Function on page 187-7	Returns the ROWID value
STORE_VALUES Procedure on page 187-8	Stores unmodified values in hidden fields for later verification
VERIFY_VALUES Function on page 187-9	Verifies the stored values against modified values

CHECKSUM Functions

This function returns a `checksum` value for a specified string, or for a row in a table. For a row in a table, the function calculates the `checksum` value based on the values of the columns in the row. This function comes in two versions.

The first version returns a `checksum` based on the specified string. This is a "pure" 32-bit `checksum` executed by the database and based on the Internet 1 protocol.

The second version returns a `checksum` based on the values of a row in a table. This is a "impure" 32-bit checksum based on the Internet 1 protocol.

Syntax

```
OWA_OPT_LOCK.CHECKSUM(
   p_buff        IN       VARCHAR2)
 RETURN NUMBER;

OWA_OPT_LOCK.CHECKSUM(
   p_owner       IN      VARCHAR2,
   p_tname       IN       VARCHAR2,
   p_rowid       IN       ROWID)
  RETURN NUMBER;
```

Parameters

Table 187–2 CHECKSUM Procedure Parameters

Parameter	Description
`p_buff`	The nstring where you want to calculate the `checksum`.
`p_owner`	The owner of the table.
`p_tname`	The table name.
`p_rowid`	The row in `p_tname` where you want to calculate the `checksum` value. Use the GET_ROWID Function to convert `VCARRAY` values to proper rowids.

GET_ROWID Function

This function returns the ROWID data type from the specified OWA_OPT_LOCK.VCARRAY DATA TYPE.

Syntax

```
OWA_OPT_LOCK.GET_ROWID(
   p_old_values      IN      vcarray)
 RETURN ROWID;
```

Parameters

Table 187–3 GET_ROWID Procedure Parameters

Parameter	Description
p_old_values	This parameter is usually passed in from an HTML form.

STORE_VALUES Procedure

This procedure stores the column values of the row that you want to update later. The values are stored in hidden HTML form elements.

Syntax

```
OWA_OPT_LOCK.STORE_VALUES(
   p_owner        IN       VARCHAR2,
   p_tname        IN       VARCHAR2,
   p_rowid        IN       ROWID);
```

Parameters

Table 187–4 STORE_VALUES Procedure Parameters

Parameter	Description
p_owner	The owner of the table.
p_tname	The name of the table.
p_rowid	The row where you want to store values.

Usage Notes

Before updating the row, compare these values with the current row values to ensure that the values in the row have not been changed. If the values have changed, you can warn the users and let them decide if the update should take place.

The procedure generates series of hidden form elements:

- One hidden form element is created for the table owner. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the owner name.
- One hidden form element is created for the table name. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the table name.
- One element is created for each column in the row. The name of the element is "*old*_p_tname", where p_tname is the name of the table. The value of the element is the column value.

See also the VERIFY_VALUES Function.

VERIFY_VALUES Function

This function verifies whether values in the specified row have been updated since the last query. Use this function with the STORE_VALUES Procedure.

Syntax

```
OWA_OPT_LOCK.VERIFY_VALUES(
   p_old_values IN vcarray)
 RETURN BOOLEAN;
```

Parameters

Table 187–5 VERIFY_VALUES Procedure Parameters

Parameter	Description
p_old_values	A PL/SQL table containing the following information: ■ p_old_values(1) specifies the owner of the table. ■ p_old_values(2) specifies the table. ■ p_old_values(3) specifies the rowid of the row to verify. The remaining indexes contain values for the columns in the table. Typically, this parameter is passed in from the HTML form, where you have previously called the STORE_VALUES Procedure to store the row values on hidden form elements.

Return Values

TRUE if no other update has been performed, otherwise FALSE.

188

OWA_PATTERN

The OWA_PATTERN package provides an interface to locate text patterns within strings and replace the matched string with another string.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Using OWA_PATTERN
  - Types
  - Operational Notes
- Summary of OWA_PATTERN Subprograms

Using OWA_PATTERN

- Types
- Operational Notes

Types

You can use a pattern as both an input and output parameter. Thus, you can pass the same regular expression to `OWA_PATTERN` function calls, and it only has to be parsed once.

- `OWA_PATTERN.PATTERN`

Operational Notes

The OWA_PATTERN subprograms are overloaded. Specifically, there are six versions of MATCH, and four each of AMATCH and CHANGE. The subprograms use the following parameters:

- line - This is the target to be examined for a match. It can be more than one line of text or a owa_text.multi_line data type.
- pat - This is the pattern that the subprograms attempt to locate in line. The pattern can contain regular expressions. In the owa_pattern.change function and procedure, this parameter is called from_str.
- flags - This specifies whether the search is case-sensitive or if substitutions are done globally.

Use regular expressions with the subprograms in this package. You Specify a regular expression by creating the string you want to match interspersed with various wildcard tokens and quantifiers.

- Wildcards
- Quantifiers
- Flags

Wildcards

Wildcard tokens match something other than themselves:

Table 188–1 Wildcard tokens recognized by OWA_PATTERN package

Token	Description
^	Matches newline or the beginning of the target
$	Matches newline or the end of the target
\n	Matches newline
.	Matches any character except newline
\t	Matches tab
\d	Matches digits [0-9]
\D	Matches non-digits [not 0-9]
\w	Matches word characters (0-9, a-z, A-Z, or _)
\W	Matches non-word characters (not 0-9, a-z, A-Z, or _)
\s	Matches whitespace characters (blank, tab, or newline).
\S	Matches non-whitespace characters (not blank, tab, or newline)
\b	Matches "word" boundaries (between \w and \W)
\x<HEX>	Matches the value in the current character set of the two hexadecimal digits
\<OCT>	Matches the value in the current character set of the two or three octal digits
\	Followed by any character not covered by another case matches that character
&	Applies only to CHANGE. This causes the string that matched the regular expression to be included in the string that replaces it. This differs from the other tokens in that it specifies how a target is changed rather than how it is matched. This is explained further under CHANGE Functions and Procedures.

Quantifiers

Any tokens except & can have their meaning extended by any of the following quantifiers. You can also apply these quantifiers to literals:

Table 188–2 Quantifiers

Quantifier	Description
?	0 or 1 occurrence(s)
*	0 or more occurrences
+	1 or more occurrence(s)
{n}	Exactly *n* occurrences
(n,}	At least *n* occurrences
{n,m}	At least *n*, but not more than *m*, occurrences

Flags

In addition to targets and regular expressions, the OWA_PATTERN functions and procedures use flags to affect how they are interpreted.

Table 188–3 Flags

Flag	Description
i	This indicates a case-insensitive search.
g	This applies only to CHANGE. It indicates a global replace. That is, all portions of the target that match the regular expression are replaced.

Summary of OWA_PATTERN Subprograms

Table 188–4 OWA_CACHE Package Subprograms

Subprogram	Description
AMATCH Function on page 188-7	Determines if a string contains the specified pattern. It lets you specify where in the string the match has to occur
CHANGE Functions and Procedures on page 188-9	Replaces a pattern within a string. If you call it as a function it returns the number of times the regular expression was found and replaced
GETPAT Procedure on page 188-11	Generates a pattern data type from a `VARCHAR2` type
MATCH Function on page 188-12	Determines if a string contains the specified pattern

AMATCH Function

This function specifies if a pattern occurs in a particular location in a string. There are four versions to this function:

- The first and second versions of the function do not save the matched tokens (these are saved in the `backrefs` parameters in the third and fourth versions). The difference between the first and second versions is the `pat` parameter, which can be a `VARCHAR2` or a pattern data type.
- The third and fourth versions of the function save the matched tokens in the `backrefs` parameter. The difference between the third and fourth versions is the `pat` parameter, which can be a VARCHAR2 or a pattern data type.

> **Note:** If multiple overlapping strings match the regular expression, this function takes the longest match.

Syntax

```
OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2,
   from_loc       IN       INTEGER,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            in       varchar2
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.AMATCH(
   line           IN       VARCHAR2
   from_loc       IN       INTEGER
   pat            IN OUT   PATTERN
   backrefs       OUT      owa_text.vc_arr
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 188–5 AMATCH Procedure Parameters

Parameter	Description
`line`	The text to search in.

Table 188–5 (Cont.) AMATCH Procedure Parameters

Parameter	Description
from_loc	The location (in number of characters) in `line` where the search is to begin.
`pat`	The string to match. It can contain regular expressions. This can be either a `VARCHAR2` or a pattern. If it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the `OWA_TEXT.VC_ARR DATA TYPE` PL/SQL table.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

The index of the character after the end of the match, counting from the beginning of `line`. If there was no match, the function returns `0`.

CHANGE Functions and Procedures

This function or procedure searches and replaces a string or `multi_line` data type. If multiple overlapping strings match the regular expression, this subprogram takes the longest match.

Syntax

```
OWA_PATTERN.CHANGE(
   line           IN OUT    VARCHAR2,
   from_str       IN        VARCHAR2,
   to_str         IN        VARCHAR2,
   flags          IN        VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   line           IN OUT   VARCHAR2,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);

owa_pattern.change(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;

OWA_PATTERN.CHANGE(
   mline          IN OUT   owa_text.multi_line,
   from_str       IN       VARCHAR2,
   to_str         IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 188–6 CHANGE Procedure Parameters

Parameter	Description
`line`	The text to search in. The output value of this parameter is the altered string.
mline	The text to search in. This is a `owa_text.multi_line data type`. The output value of this parameter is the altered string.
`from_str`	The regular expression to replace.
to_str	The substitution pattern.
flags	Whether or not the search is case-sensitive, and whether or not changes are to be made globally. If `"i"` is specified, the search is case-insensitive. If `"g"` is specified, changes are made to all matches. Otherwise, the function stops after the first substitution is made.

Return Values

As a function, it returns the number of substitutions made. If the flag "g" is not used, this number can only be 0 or 1 and only the first match is replaced. The flag "g" specifies to replace all matches with the regular expression.

Examples

```
OWA_PATTERN.CHANGE('Cats in pajamas', 'C.+in', '& red ')
```

The regular expression matches the substring "`Cats in`". It then replaces this string with "& red". The ampersand character "`&`" indicates "`Cats in`" because that is what matched the regular expression. Thus, this procedure replaces the string "`Cats in pajamas`" with "`Cats in red`" If you call this as a function instead of a procedure, the value returned is 1, indicating that a single substitution has been made.

Example 2:

```
CREATE OR REPLACE PROCEDURE test_pattern as theline VARCHAR2(256);
num_found     INTEGER;
   BEGIN
       theline := 'what is the goal?';
       num_found := OWA_PATTERN.CHANGE(theline, 'goal', 'idea', 'g');
       HTP.PRINT(num_found); -- num_found is 1
       HTP.PRINT(theline); -- theline is 'what is the idea?'
   END;
/
SHOW ERRORS
```

GETPAT Procedure

This procedure converts a VARCHAR2 string into an OWA_PATTERN.PATTERN DATA TYPE.

Syntax

```
OWA_PATTERN.GETPAT(
   arg      IN          VARCHAR2,
   pat      IN OUT      pattern);
```

Parameters

Table 188–7 GETPAT Procedure Parameters

Parameter	Description
arg	The string to convert.
pat	the OWA_PATTERN.PATTERN DATA TYPE initialized with arg.

MATCH Function

This function determines if a string contains the specified pattern. The pattern can contain regular expressions. If multiple overlapping strings can match the regular expression, this function takes the longest match.

Syntax

```
owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   line           IN       VARCHAR2,
   pat            IN       VARCHAR2,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   line           IN       VARCHAR2,
   pat            IN OUT   PATTERN,
   backrefs       OUT      owa_text.vc_arr,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

owa_pattern.match(
   mline          IN       owa_text.multi_line,
   pat            IN       VARCHAR2,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;

OWA_PATTERN.MATCH(
   mline          IN       owa_text.multi_line,
   pat            IN OUT   pattern,
   rlist          OUT      owa_text.row_list,
   flags          IN       VARCHAR2   DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 188–8 CHANGE Procedure Parameters

Parameter	Description
`line`	The line to search in.
`mline`	The text to search in. This is a `owa_text.multi_line data type`..

Table 188–8 (Cont.) CHANGE Procedure Parameters

Parameter	Description
pat	The pattern to match. This is either a VARCHAR2 or a OWA_PATTERN.PATTERN DATA TYPE. It it is a pattern, the output value of this parameter is the pattern matched.
backrefs	The text that is matched. Each token that is matched is placed in a cell in the OWA_TEXT.VC_ARR DATA TYPE PL/SQL table. This parameter is a row_list that holds each string in the target that was matched by a sequence of tokens in the regular expression.
rlist	An output parameter containing a list of matches.
flags	Whether or not the search is case-sensitive. If the value of this parameter is "i", the search is case-insensitive. Otherwise the search is case-sensitive.

Return Values

TRUE if a match was found, FALSE otherwise.

Examples

KAZOO is the target where it is searching for the zoo.* regular expression. The period indicates any character other than newline, and the asterisk matches 0 or more of the preceding characters. In this case, it matches any character other than the newline.

Therefore, this regular expression specifies that a matching target consists of zoo, followed by any set of characters neither ending in nor including a newline (which does not match the period). The i flag indicates to ignore case in the search. In this case, the function returns TRUE, which indicates that a match had been found.

```
boolean foundMatch;
foundMatch := owa_pattern.match('KAZOO', 'zoo.*', 'i');
```

The following example searches for the string "goal" followed by any number of characters in sometext. If found,

```
sometext  VARCHAR2(256);
pat       VARCHAR2(256);

sometext    := 'what is the goal?'
pat         := 'goal.*';
IF OWA_PATTERN.MATCH(sometext, pat)
   THEN
      HTP.PRINT('Match found');
   ELSE
     HTP.PRINT('Match not found');
END IF;
```

Operational Notes

- The regular expression in this function can be either a VARCHAR2 or an OWA_PATTERN.PATTERN DATA TYPE. Create AN OWA_PATTERN.PATTERN DATA TYPE from a string using the OWA_PATTERN.GETPAT procedure.
- Create a MULTI_LINE DATA TYPE from a long string using the OWA_TEXT.STREAM2MULTI procedure. If a multi_line is used, the rlist parameter specifies a list of chunks where matches were found.

- If the line is a string and not a `multi_line`, you can add an optional output parameter called `backrefs`. This parameter is a `row_list` that holds each string in the target that was matched by a sequence of tokens in the regular expression.

189

OWA_SEC

The OWA_SEC package provides an interface for custom authentication.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Using OWA_SEC
  - Operational Notes
- Summary of OWA_SEC Subprograms

Using OWA_SEC

- Operational Notes

Operational Notes

Parameters that have default values are optional.

Summary of OWA_SEC Subprograms

Table 189–1 OWA_SEC Package Subprograms

Subprogram	Description
GET_CLIENT_HOSTNAME Function on page 189-5	Returns the client's hostname
GET_CLIENT_IP Function on page 189-6	Returns the client's IP address
GET_PASSWORD Function on page 189-7	Returns the password that the user entered
GET_USER_ID Function on page 189-8	Returns the username that the user entered
SET_AUTHORIZATION Procedure on page 189-9	Enables the PL/SQL application to use custom authentication
SET_PROTECTION_REALM Procedure on page 189-10	Defines the realm that the page is in

GET_CLIENT_HOSTNAME Function

This function returns the hostname of the client.

Syntax

```
OWA_SEC.GET_CLIENT_HOSTNAME
 RETURN VARCHAR2;
```

Return Values

The hostname.

GET_CLIENT_IP Function

This function returns the IP address of the client.

Syntax

```
OWA_SEC.GET_CLIENT_IP
  RETURN OWA_UTIL.IP_ADDRESS;
```

Return Values

The IP address. The `owa_util.ip_address data type` is a PL/SQL table where the first four elements contain the four numbers of the IP address. For example, if the IP address is `123.45.67.89` and the variable `ipaddr` is of the owa_util.ip_address data type, the variable would contain the following values:

```
ipaddr(1) = 123
ipaddr(2) = 45
ipaddr(3) = 67
ipaddr(4) = 89
```

GET_PASSWORD Function

This function returns the password that the user used to log in.

Syntax

```
OWA_SEC.GET_PASSWORD
  RETURN VARCHAR2;
```

Return Values

The password.

Usage Notes

For security reasons, this function returns a true value only when custom authentication is used. If you call this function when you are not using custom authentication, the function returns an undefined value. Thus, the database passwords are not exposed.

GET_USER_ID Function

This function returns the username that the user used to log in.

Syntax

```
OWA_SEC.GET_USER_ID
  RETURN VARCHAR2;
```

Return Values

The username.

SET_AUTHORIZATION Procedure

This procedure, called in the initialization portion of the OWA_CUSTOM package, sets the authorization scheme for the PL/SQL Gateway. This implements your `authorize` function, which authorizes the user before his requested procedure is run. The placement of the `authorize` function depends on the scheme you select.

Syntax

```
OWA_SEC.SET_AUTHORIZATION(
    scheme          IN       INTEGER);
```

Parameters

Table 189–2 SET_AUTHORIZATION Procedure Parameters

Parameter	Description

`scheme`	The authorization scheme. It is one of the following schemes for `SET_AUTHORIZATION`:
	■ `OWA_SEC.NO_CHECK` - Specifies that the PL/SQL application is not to do any custom authentication. This is the default.
	■ `OWA_SEC.GLOBAL` - Defines an authorize function that is called for all users and all procedures. This is the `OWA_CUSTOM`.AUTHORIZE Function in the "`sys`" schema.
	■ `OWA_SEC.PER_PACKAGE` - Define an `authorize` function that is called when procedures in a package or anonymous procedures are called. If the procedures are in a package, the package.`AUTHORIZE` function in the user's schema is called to authorize the user. If the procedures are not in a package, then the anonymous `authorize` function in the user's schema is called.
	■ `OWA_SEC.CUSTOM` - Implements different authorize functions for each user. The function `OWA_CUSTOM`.AUTHORIZE Function in the user's schema is called to authorize the user. If the user's schema does not contain an `OWA_CUSTOM`.AUTHORIZE Function, the PL/SQL Gateway looks for it in the "sys" schema.
	The custom `authorize` function has the following signature:
	`FUNCTION AUTHORIZE`
	`  RETURN BOOLEAN;`
	If the function returns `TRUE`, authentication succeeded. If it returns `FALSE`, authentication failed. If the `authorize` function is not defined, the Gateway returns an error and fails.

SET_PROTECTION_REALM Procedure

This procedure sets the realm of the page that is returned to the user. The user enters a username and login that already exist in the realm.

Syntax

```
OWA_SEC.SET_PROTECTION_REALM(
   realm      IN      VARCHAR2);
```

Parameters

Table 189–3 SET_PROTECTION_REALM Procedure Parameters

Parameter	Description
`realm`	The realm where the page belongs. This string is displayed to the user.

190

OWA_TEXT

The OWA_TEXT package contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Using OWA_TEXT
  - Types
- Summary of OWA_TEXT Subprograms

Using OWA_TEXT

- Types

Types

- MULTI_LINE DATA TYPE
- ROW_LIST DATA TYPE
- VC_ARR DATA TYPE

MULTI_LINE DATA TYPE

This data type is a PL/SQL record that holds large amounts of text. The rows field, of type OWA_TEXT.VC_ARR DATA TYPE, contains the text data in the record.

```
TYPE multi_line IS RECORD (
   rows           vc_arr,
   num_rows       INTEGER,
   partial_row    BOOLEAN);
```

ROW_LIST DATA TYPE

This is the data type for holding data to be processed.

```
TYPE row_list IS RECORD (
   rows           int_arr,
   num_rows       INTEGER);
```

```
int_arr IS DEFINED AS:
```
TYPE int_arr IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;

VC_ARR DATA TYPE

This is a component of the MULTI_LINE DATA TYPE and is used for holding large amounts of text.

```
TYPE vc_arr IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Summary of OWA_TEXT Subprograms

Table 190–1 OWA_TEXT Package Subprograms

Subprogram	Description
ADD2MULTI Procedure on page 190-5	Adds text to an existing `multi_line` type
NEW_ROW_LIST Function and Procedure on page 190-6	Creates a new `row_list`
PRINT_MULTI Procedure on page 190-7	Prints out the contents of a `multi_list`
PRINT_ROW_LIST Procedure on page 190-8	Prints out the contents of a `row_list`
STREAM2MULTI Procedure on page 190-9	Converts a varchar2 to a `multi_line` type

ADD2MULTI Procedure

This procedure adds content to an existing MULTI_LINE DATA TYPE.

Syntax

```
OWA_TEXT.ADD2MULTI(
   stream          IN       VARCHAR2,
   mline           IN OUT   multi_line,
  continue      IN      BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 190–2 ADD2MULTI Procedure Parameters

Parameter	Description
`stream`	The text to add.
`mline`	The `OWA_TEXT.MULTI_LINE DATA TYPE`. The output of this parameter contains *stream*.
`continue`	If `TRUE`, the procedure appends *stream* within the previous final row (assuming it is less than 32K). If `FALSE`, the procedure places *stream* in a new row.

NEW_ROW_LIST Function and Procedure

This function or procedure creates a new OWA_TEXT.ROW_LIST DATA TYPE. The function version uses no parameters and returns a new empty row_list. The procedure version creates the row_list data type as an output parameter.

Syntax

```
OWA_TEXT.NEW_ROW_LIST
  RETURN ROW_LIST;

OWA_TEXT.NEW_ROW_LIST(
  rlist    OUT     row_list);
```

Parameters

Table 190–3 NEW_ROW_LIST Procedure Parameters

Parameter	Description
rlist	This is an output parameter containing the new row_list data type

Return Values

The function version returns the new row_list data type.

PRINT_MULTI Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the OWA_TEXT.MULTI_LINE DATA TYPE.

Syntax

```
OWA_TEXT.PRINT_MULTI(
   mline       IN       multi_line);
```

Parameters

Table 190–4 PRINT_MULTI Procedure Parameters

Parameter	Description
mline	The multi_line data type to print.

Return Values

The contents of the multi_line.

PRINT_ROW_LIST Procedure

This procedure uses the PRINT Procedures or the PRN Procedures to print the "rows" field of the `OWA_TEXT.ROW_LIST DATA TYPE`.

Syntax

```
OWA_TEXT.PRINT_ROW_LIST(
   rlist       IN       multi_line);
```

Parameters

Table 190–5 PRINT_ROW_LIST Procedure Parameters

Parameter	Description
`rlist`	The row_list data type to print.

Return Values

The contents of the `row_list`.

STREAM2MULTI Procedure

This procedure converts a string to a `multi_line` data type.

Syntax

```
OWA_TEXT.STREAM2MULTI(
   stream          IN       VARCHAR2
   mline           OUT      multi_line);
```

Parameters

Table 190–6 STREAM2MULTI Procedure Parameters

Parameter	Description
`stream`	The string to convert.
`mline`	The stream in `OWA_TEXT.MULTI_LINE DATA TYPE` format

191

OWA_UTIL

The `OWA_UTIL` package contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

This chapter contains the following topics:

- Using OWA_UTIL
  - Overview
  - Types
- Summary of OWA_UTIL Subprograms

Using OWA_UTIL

- Overview
- Types

Overview

The OWA_UTIL package contains three types of utility subprograms.

- Dynamic SQL Utilities enable you to produce pages with dynamically generated SQL code.
- HTML utilities enable you to retrieve the values of CGI environment variables and perform URL redirects.
- Date utilities enable correct date-handling. Date values are simple strings in HTML, but are treated as a data type by the Oracle database.

Types

- DATETYPE Data Type
- IDENT_ARR Data Type
- IP_ADDRESS Data Type

DATETYPE Data Type

The TODATE Function converts an item of this type to the type `DATE`, which is understood and properly handled as data by the database. The procedure CHOOSE_DATE Procedure enables the user to select the desired date.

```
TYPE dateType IS TABLE OF VARCHAR2(10) INDEX BY BINARY_INTEGER;
```

IDENT_ARR Data Type

This data type is used for an array.

```
TYPE ident_arr IS TABLE OF VARCHAR2(30) INDEX BY BINARY_INTEGER;
```

IP_ADDRESS Data Type

This data type is used by the GET_CLIENT_IP Function in the "OWA_SEC" package on on page 189-1.

```
TYPE ip_address IS TABLE OF INTEGER INDEX BY BINARY_INTEGER;
```

Summary of OWA_UTIL Subprograms

Table 191–1 OWA_UTIL Package Subprograms

Subprogram	Description
BIND_VARIABLES Function on page 191-6	Prepares a SQL query and binds variables to it
CALENDARPRINT Procedures on page 191-7	Prints a calendar
CELLSPRINT Procedures on page 191-8	Prints the contents of a query in an HTML table
CHOOSE_DATE Procedure on page 191-10	Generates HTML form elements that allow the user to select a date
GET_CGI_ENV Function on page 191-11	Returns the value of the specified CGI environment variable
GET_OWA_SERVICE_PATH Function on page 191-12	Returns the full virtual path for the PL/SQL Gateway
GET_PROCEDURE Function on page 191-13	Returns the name of the procedure that is invoked by the PL/SQL Gateway
HTTP_HEADER_CLOSE Procedure on page 191-14	Closes the HTTP header
LISTPRINT Procedure on page 191-15	Generates a HTML form element that contains data from a query
MIME_HEADER Procedure on page 191-16	Generates the Content-type line in the HTTP header
PRINT_CGI_ENV Procedure on page 191-17	Generates a list of all CGI environment variables and their values
REDIRECT_URL Procedure on page 191-18	Generates the Location line in the HTTP header
SHOWPAGE Procedure on page 191-19	Prints a page generated by the HTP and HTF packages in SQL*Plus
SHOWSOURCE Procedure on page 191-20	Prints the source for the specified subprogram
SIGNATURE procedure on page 191-21	Prints a line that says that the page is generated by the PL/SQL Agent
STATUS_LINE Procedure on page 191-22	Generates the Status line in the HTTP header
TABLEPRINT Function on page 191-23	Prints the data from a table in the database as an HTML table
TODATE Function on page 191-26	Converts dateType data to the standard PL/SQL date type
WHO_CALLED_ME Procedure on page 191-27	Returns information on the caller of the procedure.

BIND_VARIABLES Function

This function prepares a SQL query by binding variables to it, and stores the output in an opened cursor. Use this function as a parameter to a procedure sending a dynamically generated query. Specify up to 25 bind variables.

Syntax

```
OWA_UTIL.BIND_VARIABLES(
   theQuery       IN       VARCHAR2   DEFAULT NULL,
   bv1Name        IN       VARCHAR2   DEFAULT NULL,
   bv1Value       IN       VARCHAR2   DEFAULT NULL,
   bv2Name        IN       VARCHAR2   DEFAULT NULL,
   bv2Value       IN       VARCHAR2   DEFAULT NULL,
   bv3Name        IN       VARCHAR2   DEFAULT NULL,
   bv3Value       IN       VARCHAR2   DEFAULT NULL,
        ...
   bv25Name       IN       VARCHAR2   DEFAULT NULL,
   bv25Value      IN       VARCHAR2   DEFAULT NULL)
 RETURN INTEGER;
```

Parameters

Table 191–2 BIND_VARIABLES Function Parameters

Parameter	Description
`theQuery`	The SQL query statement which must be a SELECT statement
`bv1Name`	The name of the variable
`bv1Value`	The value of the variable

Return Values

An integer identifying the opened cursor.

CALENDARPRINT Procedures

These procedures creates a calendar in HTML with a visible border. Each date in the calendar can contain any number of hypertext links.

This procedure has 2 versions.

- Version 1 uses a hard-coded query stored in a varchar2 string.
- Version 2 uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.CALENDARPRINT(
   p_query        IN       VARCHAR2,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');

OWA_UTIL.CALENDARPRINT(
   p_cursor       IN       INTEGER,
   p_mf_only      IN       VARCHAR2   DEFAULT 'N');
```

Parameters

Table 191–3 CALENDARPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_cursor	A PL/SQL cursor containing the same format as p_query.
p_mf_only	If "N" (the default), the generated calendar includes Sunday through Saturday. Otherwise, it includes Monday through Friday only.

Usage Notes

Design your query as follows:

- The first column is a DATE. This correlates the information produced by the query with the calendar output generated by the procedure.
- The query output must be sorted on this column using ORDER BY.
- The second column contains the text, if any, that you want printed for that date.
- The third column contains the destination for generated links. Each item in the second column becomes a hypertext link to the destination given in this column. If this column is omitted, the items in the second column are simple text, not links.

CELLSPRINT Procedures

This procedure generates an HTML table from the output of a SQL query. SQL atomic data items are mapped to HTML cells and SQL rows to HTML rows. You must write the code to begin and end the HTML table. There are nine versions of this procedure:

- The first version passes the results of a query into an index table. Perform the query and CELLSPRINT does the formatting. To have more control in generating an HTML table from the output of an SQL query, use the FORMAT_CELL Function in the "HTF" package on page 179-1.
- The second and third versions display rows (up to the specified maximum) returned by the query or cursor.
- The fourth and fifth versions exclude a specified number of rows from the HTML table. Use the fourth and fifth versions to scroll through result sets by saving the last row seen in a hidden form element.
- The sixth through ninth versions are the same as the first four versions, except that they return a row count output parameter.

Syntax

```
OWA_UTIL.CELLSPRINT(
   p_colCnt          IN    INTEGER,
   p_resultTbl       IN    vc_arr,
  p_format_numbers IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  iN    VARCHAR2   DEFAULT NULL);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER      DEFAULT 0,
   p_more_data       OUT   BOOLEAN);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
```

```
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theQuery        IN    VARCHAR2,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN
   p_reccnt          OUT   NUMBER);

OWA_UTIL.CELLSPRINT(
   p_theCursor       IN    INTEGER,
   p_max_rows        IN    NUMBER     DEFAULT 100,
   p_format_numbers  IN    VARCHAR2   DEFAULT NULL,
   p_skip_rec        IN    NUMBER     DEFAULT 0,
   p_more_data       OUT   BOOLEAN,
   p_reccnt          OUT   NUMBER);
```

Parameters

Table 191–4 CELLSPRINT Procedure Parameters

Parameter	Description
p_query	A PL/SQL query.
p_colCnt	The number of columns in the table.
p_theQuery	A SQL SELECT statement.
p_theCursor	A cursor ID. This can be the return value from the BIND_VARIABLES Function.
p_max_rows	The maximum number of rows to print.
p_format_numbers	If the value of this parameter is not NULL, number fields are right justified and rounded to two decimal places.
p_skip_rec	The number of rows to exclude from the HTML table.
p_more_data	TRUE if there are more rows in the query or cursor, FALSE otherwise.
p_reccnt	The number of rows that have been returned by the query. This value does not include skipped rows (if any).
p_resultTbl	The index table which will contain the result of the query. Each entry in the query will correspond to one column value.

Examples

This function generates

```
<tr><td>QueryResultItem</td><td>QueryResultItem</td></tr>...
```

CHOOSE_DATE Procedure

This procedure generates three HTML form elements that allow the user to select the day, the month, and the year.

Syntax

```
OWA_UTIL.CHOOSE_DATE(
   p_name         IN       VARCHAR2,
   p_date         IN       DATE       DEFAULT SYSDATE);
```

Parameters

Table 191–5 CHOOSE_DATE Procedure Parameters

Parameter	Description
p_name	The name of the form elements.
p_date	The initial date that is selected when the HTML page is displayed.

Usage Notes

- The parameter in the procedure that receives the data from these elements must be a GET_CGI_ENV Function.
- Use the TODATE Function to convert the GET_CGI_ENV Function value to the standard Oracle DATE data type.

Examples

```
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">1
     ...
<OPTION value="31">31
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="01">JAN
     ...
<OPTION value="12">DEC
</SELECT>
-
<SELECT NAME="p_name" SIZE="1">
<OPTION value="1992">1992
     ...
<OPTION value="2002">2002
</SELECT>
```

GET_CGI_ENV Function

This function returns the value of the specified CGI environment variable.

Syntax

```
OWA_UTIL.GET_CGI_ENV(
   param_name       IN      VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 191–6 GET_CGI_ENV Function Parameters

Parameter	Description
`param_name`	The name of the CGI environment variable. It is case-insensitive.

Return Values

The value of the specified CGI environment variable. If the variable is not defined, the function returns `NULL`.

GET_OWA_SERVICE_PATH Function

This function returns the full virtual path of the PL/SQL Gateway that is handling the request.

Syntax

```
OWA_UTIL.GET_OWA_SERVICE_PATH
 RETURN VARCHAR2;
```

Return Values

A virtual path of the PL/SQL Gateway that is handling the request.

GET_PROCEDURE Function

This function returns the name of the procedure that is being invoked by the PL/SQL Gateway.

Syntax

```
OWA_UTIL.GET_PROCEDURE
 RETURN VARCHAR2;
```

Return Values

The name of a procedure, including the package name if the procedure is defined in a package.

HTTP_HEADER_CLOSE Procedure

This procedure generates a newline character to close the HTTP header.

Syntax

```
OWA_UTIL.HTTP_HEADER_CLOSE;
```

Return Values

A newline character, which closes the HTTP header.

Usage Notes

- Use this procedure if you have not closed the header by using the `bclose_header` parameter in calls such as MIME_HEADER Procedure, REDIRECT_URL Procedure, or STATUS_LINE Procedure
- The HTTP header must be closed before any `HTP.PRINT` or `HTP.PRN` calls.

LISTPRINT Procedure

This procedure generates an HTML selection list form element from the output of a SQL query. There are two versions of this procedure.

- The first version contains a hard-coded SQL query.
- The second version uses a dynamic query prepared with the BIND_VARIABLES Function.

Syntax

```
OWA_UTIL.LISTPRINT(
   p_theQuery     IN       VARCHAR2,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);

OWA_UTIL.LISTPRINT(
   p_theCursor    IN    INTEGER,
   p_cname        IN       VARCHAR2,
   p_nsize        IN       NUMBER,
   p_multiple     IN       BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 191–7 LISTPRINT Procedure Parameters

Parameter	Description
p_theQuery	The SQL query.
p_theCursor	The cursor ID. This can be the return value from the BIND_VARIABLES Function.
p_cname	The name of the HTML form element.
p_nsize	The size of the form element (this controls how many items the user can see without scrolling).
p_multiple	Whether multiple selection is permitted.

Usage Notes

The columns in the output of the query are handled in the following manner:

- The first column specifies the values that are sent back. These values are for the VALUE attribute of the OPTION tag.
- The second column specifies the values that the user sees.
- The third column specifies whether or not the row is marked as SELECTED in the OPTION tag. If the value is not NULL, the row is selected.

Examples

```
<SELECT NAME="p_cname" SIZE="p_nsize">
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
<OPTION SELECTED value='value_from_the_first_column'>value_from_the_second_column
     ...
</SELECT>
```

MIME_HEADER Procedure

This procedure changes the default MIME header that the script returns. This procedure must come before any HTP.PRINT or HTP.PRN calls to direct the script not to use the default MIME header.

Syntax

```
OWA_UTIL.MIME_HEADER(
   ccontent_type    IN       VARCHAR2   DEFAULT 'text/html',
   bclose_header    IN       BOOLEAN    DEFAULT TRUE,
   ccharset         IN       VARCHAR2   DEFAULT NULL);
```

Parameters

Table 191–8 MIME_HEADER Procedure Parameters

Parameter	Description
ccontent_type	The MIME type to generate
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.
ccharset	The character set to use.The character set only makes sense if the MIME type is of type 'text'. Therefore, the character set is only tagged on to the Content-Type header only if the MIME type passed in is of type 'text'. Any other MIME type, such as 'image', will not have any character set tagged on.

Examples

```
Content-type: <ccontent_type>; charset=<ccharset>
```

so that

```
owa_util.mime_header('text/plain', false, 'ISO-8859-4')
```

generates

```
Content-type: text/plain; charset=ISO-8859-4\n
```

PRINT_CGI_ENV Procedure

This procedure generates all the CGI environment variables and their values made available by the PL/SQL Gateway to the stored procedure.

Syntax

```
OWA_UTIL.PRINT_CGI_ENV;
```

Examples

This procedure generates a list in the following format:

```
cgi_env_var_name = value\n
```

REDIRECT_URL Procedure

This procedure specifies that the application server is to visit the specified URL. The URL may specify either a Web page to return or a program to execute.

Syntax

```
OWA_UTIL.REDIRECT_URL(
   curl           IN       VARCHAR2
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 191–9 REDIRECT_URL Function Parameters

Parameter	Description
curl	The URL to visit.
bclose_header	Whether or not to close the HTTP header. If TRUE, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Usage Notes

This procedure must come before any HTP procedure or HTF function call.

Examples

This procedure generates

```
Location: <curl>\n\n
```

SHOWPAGE Procedure

This procedure prints out the HTML output of a procedure in SQL*Plus. The procedure must use the HTP or HTF packages to generate the HTML page, and this procedure must be issued after the HTP or HTF page-generating subprogram has been called and before any other HTP or HTF subprograms are directly or indirectly called.

Syntax

```
OWA_UTIL.SHOWPAGE;
```

Usage Notes

- This method is useful for generating pages filled with static data.
- This procedure uses the DBMS_OUTPUT package and is limited to 32767 characters for each line and an overall buffer size of 1,000,000 bytes.

Examples

The output of htp procedure is displayed in SQL*Plus, SQL*DBA, or Oracle Server Manager. For example:

```
SQL> set serveroutput on
SQL> spool gretzky.html
SQL> execute hockey.pass("Gretzky")
SQL> execute owa_util.showpage
SQL> exit
```

This would generate an HTML page that could be accessed from Web browsers.

SHOWSOURCE Procedure

This procedure prints the source of the specified procedure, function, or package. If a procedure or function which belongs to a package is specified, then the entire package is displayed.

Syntax

```
OWA_UTIL.SHOWSOURCE (
   cname      IN     VARCHAR2);
```

Parameters

Table 191–10 SHOWSOURCE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

SIGNATURE procedure

This procedure generates an HTML line followed by a signature line on the HTML document. If a parameter is specified, the procedure also generates a hypertext link to view the PL/SQL source for that procedure. The link calls the SHOWSOURCE Procedure.

Syntax

```
OWA_UTIL.SIGNATURE;

OWA_UTIL.SIGNATURE (
   cname        IN        VARCHAR2);
```

Parameters

Table 191–11 SIGNATURE Procedure Parameters

Parameter	Description
cname	The function or procedure whose source you want to show.

Examples

Without a parameter, the procedure generates a line that looks like the following:

```
This page was produced by the PL/SQL Agent on August 9, 2001 09:30.
```

With a parameter, the procedure generates a signature line in the HTML document that looks like the following:

```
This page was produced by the PL/SQL Agent on 8/09/01 09:30
View PL/SQL Source
```

STATUS_LINE Procedure

This procedure sends a standard HTTP status code to the client. This procedure must come before any `htp.print` or `htp.prn` calls so that the status code is returned as part of the header, rather than as "content data".

Syntax

```
OWA_UTIL.STATUS_LINE(
   nstatus        IN       INTEGER,
   creason        IN       VARCHAR2   DEFAULT NULL,
   bclose_header  IN       BOOLEAN    DEFAULT TRUE);
```

Parameters

Table 191–12 STATUS_LINE Procedure Parameters

Parameter	Description
`nstatus`	The status code.
`creason`	The string for the status code.
`bclose_header`	Whether or not to close the HTTP header. If `TRUE`, two newlines are sent, which closes the HTTP header. Otherwise, one newline is sent, and the HTTP header remains open.

Examples

This procedure generates

`Status: <`*`nstatus`*`> <`*`creason`*`>\n\n`

TABLEPRINT Function

This function generates either preformatted tables or HTML tables (depending on the capabilities of the user's browser) from database tables.

Syntax

```
OWA_UTIL.TABLEPRINT(
   ctable         IN       VARCHAR2,
   cattributes    IN       VARCHAR2   DEFAULT NULL,
   ntable_type    IN       INTEGER    DEFAULT HTML_TABLE,
   ccolumns       IN       VARCHAR2   DEFAULT '*',
   cclauses       IN
  VARCHAR2   DEFAULT NULL,
   ccol_aliases   IN       VARCHAR2   DEFAULT NULL,
   nrow_min       IN       NUMBER     DEFAULT 0,
   nrow_max       IN       NUMBER     DEFAULT NULL)
 RETURN BOOLEAN;
```

Parameters

Table 191–13 TABLEPRINT Function Parameters

Parameter	Description
ctable	The database table.
cattributes	Other attributes to be included as-is in the tag.
ntable_type	How to generate the table. Specify HTML_TABLE to generate the table using <TABLE> tags or PRE_TABLE to generate the table using the <PRE> tags. These are constants: ■ HTML_TABLE CONSTANT INTEGER := 1; ■ PRE_TABLE CONSTANT INTEGER := 2;
ccolumns	A comma-delimited list of columns from ctable to include in the generated table.
cclauses	WHERE or ORDER BY clauses, which specify which rows to retrieve from the database table, and how to order them.
ccol_aliases	A comma-delimited list of headings for the generated table.
nrow_min	The first row, of those retrieved, to display.
nrow_max	The last row, of those retrieved, to display.

Return Values

Returns TRUE if there are more rows beyond the nrow_max requested, FALSE otherwise.

Usage Notes

- RAW columns are supported, but LONG RAW columns are not. References to LONG RAW columns will print the result 'Not Printable'.
- Note that in this function, cattributes is the second rather than the last parameter.

Examples

For browsers that do not support HTML tables, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps IS
  ignore_more BOOLEAN;
BEGIN
  ignore_more := OWA_UTIL.TABLEPRINT('emp', 'BORDER', OWA_UTIL.PRE_TABLE);
END;
```

Requesting a URL such as

```
http://myhost:7777/pls/hr/showemps
```

returns to the following to the client:

```
<PRE>
---------------------------------------------------------------------
| EMPNO |ENAME |JOB      |MGR   |HIREDATE   | SAL | COMM | DEPTNO |
---------------------------------------------------------------------
| 7369| SMITH  | CLERK   | 7902 | 17-DEC-80 | 800 |      | 20 |
| 7499| ALLEN  | SALESMAN| 7698 | 20-FEB-81 | 1600 | 300 | 30 |
| 7521| WARD   | SALESMAN| 7698 | 22-FEB-81 | 1250 | 500 | 30 |
| 7566| JONES  | MANAGER | 7839 | 02-APR-81 | 2975 |     | 20 |
| 7654| MARTIN | SALESMAN| 7698 | 28-SEP-81 | 1250 | 1400| 30 |
| 7698| BLAKE  | MANAGER | 7839 | 01-MAY-81 | 2850 |     | 30 |
| 7782| CLARK  | MANAGER | 7839 | 09-JUN-81 | 2450 |     | 10 |
| 7788| SCOTT  | ANALYST | 7566 | 09-DEC-82 | 3000 |     | 20 |
| 7839| KING   | PRESIDENT |    | 17-NOV-81 | 5000 |     | 10 |
| 7844| TURNER | SALESMAN| 7698 | 08-SEP-81 | 1500 | 0   | 30 |
| 7876| ADAMS  | CLERK   | 7788 | 12-JAN-83 | 1100 |     | 20 |
| 7900| JAMES  | CLERK   | 7698 | 03-DEC-81 | 950  |     | 30 |
| 7902| FORD   | ANALYST | 7566 | 03-DEC-81 | 3000 |     | 20 |
| 7934| MILLER | CLERK   | 7782 | 23-JAN-82 | 1300 |     | 10 |
---------------------------------------------------------------------
</PRE>
```

To view the employees in department 10, and only their employee ids, names, and salaries, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showemps_10 IS
 ignore_more BOOLEAN;
begin
 ignore_more := OWA_UTIL.TABLEPRINT
    ('EMP', 'BORDER', OWA_UTIL.PRE_TABLE,
     'empno, ename, sal', 'WHERE deptno=10 ORDER BY empno',
     'Employee Number, Name, Salary');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showemps_10
```

would return the following to the client:

```
<PRE>
-------------------------------------
| Employee Number |Name    | Salary |
-------------------------------------
| 7782            | CLARK  | 2450   |
| 7839            | KING   | 5000   |
| 7934            | MILLER | 1300   |
-------------------------------------
```

```
</PRE>
```

For browsers that support HTML tables, to view the department table in an HTML table, create the following procedure:

```
CREATE OR REPLACE PROCEDURE showdept IS
 ignore_more BOOLEAN;
BEGIN
 ignore_more := oWA_UTIL.TABLEPRINT('dept', 'BORDER');
END;
```

A request for a URL like

```
http://myhost:7777/pls/hr/showdept
```

would return the following to the client:

```
<TABLE BORDER>
<TR>
<TH>DEPTNO</TH>
<TH>DNAME</TH>
<TH>LOC</TH>
</TR>
<TR>
<TD ALIGN="LEFT">10</TD>
<TD ALIGN="LEFT">ACCOUNTING</TD>
<TD ALIGN="LEFT">NEW YORK</TD>
</TR>
<TR>
<TD ALIGN="LEFT">20</TD>
<TD ALIGN="LEFT">RESEARCH</TD>
<TD ALIGN="LEFT">DALLAS</TD>
</TR>
<TR>
<TD ALIGN="LEFT">30</TD>
<TD ALIGN="LEFT">SALES</TD>
<TD ALIGN="LEFT">CHICAGO</TD>
</TR>
<TR>
<TD ALIGN="LEFT">40</TD>
<TD ALIGN="LEFT">OPERATIONS</TD>
<TD ALIGN="LEFT">BOSTON</TD>
</TR>
</TABLE>
```

A Web browser would format this to look like the following table:

DEPTNO	DNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO

TODATE Function

This function converts the DATETYPE Data Type to the standard Oracle `DATE` type.

Syntax

```
OWA_UTIL.TODATE(
   p_dateArray      IN     dateType)
 RETURN DATE;
```

Parameters

Table 191–14 TODATE Function Parameters

Parameter	Description
`p_dateArray`	The value to convert.

WHO_CALLED_ME Procedure

This procedure returns information (in the form of output parameters) about the PL/SQL code unit that invoked it.

Syntax

```
OWA_UTIL.WHO_CALLED_ME(
   owner          OUT      VARCHAR2,
   name           OUT      VARCHAR2,
   lineno         OUT      NUMBER,
   caller_t       OUT      VARCHAR2);
```

Parameters

Table 191–15 WHO_CALLED_ME Procedure Parameters

Parameter	Description
owner	The owner of the program unit.
name	The name of the program unit. This is the name of the package, if the calling program unit is wrapped in a package, or the name of the procedure or function if the calling program unit is a standalone procedure or function. If the calling program unit is part of an anonymous block, this is NULL.
lineno	The line number within the program unit where the call was made.
caller_t	The type of program unit that made the call. The possibilities are: package body, anonymous block, procedure, and function. Procedure and function are only for standalone procedures and functions.

192

SDO_CS

The SDO_CS package contains functions and procedures for working with coordinate systems. You can perform explicit coordinate transformations on a single geometry or an entire layer of geometries (that is, all geometries in a specified column in a table).

- Documentation of SDO_CS

Documentation of SDO_CS

For a complete description of this package within the context of Oracle Spatial, see `SDO_CS` in the *Oracle Spatial Developer's Guide*.

193

SDO_CSW_PROCESS

The SDO_CSW_PROCESS package contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW).

- Documentation of SDO_CSW_PROCESS

Documentation of SDO_CSW_PROCESS

For a complete description of this package within the context of Oracle Spatial, see `SDO_CSW_PROCESS` in the *Oracle Spatial Developer's Guide*.

194

SDO_GCDR

The SDO_GCDR package contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses.

- Documentation of SDO_GCDR

Documentation of SDO_GCDR

For a complete description of this package within the context of Oracle Spatial, see SDO_GCDR in *Oracle Spatial Developer's Guide.*

195

SDO_GEOM

The SDO_GEOM package contains the geometry functions, which can be grouped into the following categories (with examples of each):

- Relationship (True/False) between two objects: RELATE, WITHIN_DISTANCE
- Validation: VALIDATE_GEOMETRY_WITH_CONTEXT, VALIDATE_LAYER_WITH_CONTEXT
- Single-object operations: SDO_ARC_DENSIFY, SDO_AREA, SDO_BUFFER, SDO_CENTROID, SDO_CONVEXHULL, SDO_LENGTH, SDO_MBR, SDO_POINTONSURFACE
- Two-object operations: SDO_DISTANCE, SDO_DIFFERENCE, SDO_INTERSECTION, SDO_UNION, SDO_XOR

This chapter contains the following topic:

- Documentation of SDO_GEOM

Documentation of SDO_GEOM

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOM` in the *Oracle Spatial Developer's Guide*.

196

SDO_GEOR

The SDO_GEOR package contains functions and procedures for the Oracle Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated spatial vector geometry data and metadata.

- Documentation of SDO_GEOR

Documentation of SDO_GEOR

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR` in the *Oracle Spatial GeoRaster Developer's Guide*.

197

SDO_GEOR_ADMIN

The SDO_GEOR_ADMIN package contains subprograms for administrative operations related to GeoRaster.

- Documentation of SDO_GEOR_ADMIN

Documentation of SDO_GEOR_ADMIN

For a complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_ADMIN` in the *Oracle Spatial GeoRaster Developer's Guide*.

198

SDO_GEOR_UTL

The SDO_GEOR_UTL package contains utility functions and procedures for the Oracle Spatial GeoRaster feature, including those related to using triggers with GeoRaster data.

- Documentation of SDO_GEOR_UTL

Documentation of SDO_GEOR_UTL

For complete description of this package within the context of Oracle Spatial, see `SDO_GEOR_UTL` in the *Oracle Spatial GeoRaster Developer's Guide*.

199

SDO_LRS

The SDO_LRS package contains functions that create, modify, query, and convert linear referencing elements.

- Documentation of SDO_LRS

Documentation of SDO_LRS

For a complete description of this package within the context of Oracle Spatial, see `SDO_LRS` in the *Oracle Spatial Developer's Guide*.

200

SDO_MIGRATE

The SDO_MIGRATE package lets you upgrade geometry tables from previous releases of Oracle Spatial.

- Documentation of SDO_MIGRATE

Documentation of SDO_MIGRATE

For a complete description of this package within the context of Oracle Spatial, see `SDO_MIGRATE` in the *Oracle Spatial Developer's Guide*.

201

SDO_NET

The SDO_NET package contains functions and procedures for working with data modeled as nodes and links in a network.

- Documentation of SDO_NET

Documentation of SDO_NET

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET` in the *Oracle Spatial Topology and Network Data Models Developer's Guide.*

202

SDO_NET_MEM

The SDO_NET_MEM package contains functions and procedures for performing editing and analysis operations on network data using a network memory object.

- Documentation of SDO_NET_MEM

Documentation of SDO_NET_MEM

For a complete description of this package within the context of Oracle Spatial, see `SDO_NET_MEM` in the *Oracle Spatial Topology and Network Data Models Developer's Guide*.

203

SDO_OLS

The SDO_OLS package contains subprograms for Spatial OpenLS support.

- Documentation of SDO_OLS

Documentation of SDO_OLS

For a complete description of this package within the context of Oracle Spatial, see `SDO_OLS` in the *Oracle Spatial Developer's Guide*.

204

SDO_PC_PKG

The SDO_PC_PKG package contains subprograms to support the use of point clouds in Spatial.

- Documentation of SDO_PC_PKG

Documentation of SDO_PC_PKG

For a complete description of this package within the context of Oracle Spatial, see `SDO_PC_PKG` in the *Oracle Spatial Developer's Guide*.

205

SDO_SAM

The SDO_SAM package contains functions and procedures for spatial analysis and data mining.

- Documentation of SDO_SAM

Documentation of SDO_SAM

For a complete description of this package within the context of Oracle Spatial, see `SDO_SAM` in the *Oracle Spatial Developer's Guide*.

206

SDO_TIN_PKG

The SDO_TIN_PKG package contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial.

- Documentation of SDO_TIN_PKG

Documentation of SDO_TIN_PKG

For a complete description of this package within the context of Oracle Spatial, see `SDO_TIN_PKG` in the *Oracle Spatial Developer's Guide*.

207

SDO_TOPO

The SDO_TOPO package contains subprograms for creating and managing Oracle Spatial topologies.

- Documentation of SDO_TOPO

Documentation of SDO_TOPO

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO` in the *Oracle Spatial Topology and Network Data Models Developer's Guide.*

208

SDO_TOPO_MAP

The SDO_TOPO_MAP package contains subprograms for editing Oracle Spatial topologies using a cache (TopoMap object).

- Documentation of SDO_TOPO_MAP

Documentation of SDO_TOPO_MAP

For a complete description of this package within the context of Oracle Spatial, see `SDO_TOPO_MAP` in the *Oracle Spatial Topology and Network Data Models Developer's Guide.*

209

SDO_TUNE

The SDO_TUNE package contains Spatial tuning functions and procedures.

- Documentation of SDO_TUNE

Documentation of SDO_TUNE

For complete description of this package within the context of Oracle Spatial, see `SDO_TUNE` in the *Oracle Spatial Developer's Guide*.

210

SDO_UTIL

The SDO_UTIL package contains the utility functions and procedures for Oracle Spatial.

- Documentation of SDO_UTIL

Documentation of SDO_UTIL

For complete description of this package within the context of Oracle Spatial, see `SDO_UTIL` in the *Oracle Spatial Developer's Guide*.

211

SDO_WFS_LOCK

The SDO_WFS_LOCK package contains subprograms for WFS support for registering and unregistering feature tables. Registering a feature table enables the table for WFS transaction locking; unregistering a feature table disables the table for WFS transaction locking.

- Documentation of SDO_WFS_LOCK

Documentation of SDO_WFS_LOCK

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_LOCK` in the *Oracle Spatial Developer's Guide*.

212

SDO_WFS_PROCESS

The SDO_WFS_PROCESS package contains subprograms for various processing operations related to support for Web Feature Services.

- Documentation of SDO_WFS_PROCESS

Documentation of SDO_WFS_PROCESS

For a complete description of this package within the context of Oracle Spatial, see `SDO_WFS_PROCESS` in the *Oracle Spatial Developer's Guide*.

213

SEM_APIS

The `SEM_APIS` package contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.

- Documentation of SEM_APIS

Documentation of SEM_APIS

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_APIS` in the *Oracle Database Semantic Technologies Developer's Guide*.

214

SEM_PERF

The SEM_PERF package contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database.

- Documentation of SEM_PERF

Documentation of SEM_PERF

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_PERF` in the *Oracle Database Semantic Technologies Developer's Guide*.

215

SEM_RDFCTX

The SEM_RDFCTX package contains subprograms for managing extractor policies and semantic indexes created for documents.

- Documentation of SEM_RDFCTX

Documentation of SEM_RDFCTX

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFCTX` in the *Oracle Database Semantic Technologies Developer's Guide*.

216

SEM_RDFSA

The `SEM_RDFSA` package contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS).

- Documentation of SEM_RDFSA

Documentation of SEM_RDFSA

For a complete description of this package within the context of Oracle Database semantic technology support, see `SEM_RDFSA` in the *Oracle Database Semantic Technologies Developer's Guide*.

217

UTL_COLL

The UTL_COLL package lets PL/SQL programs use collection locators to query and update.

This chapter contains the following topics:

- Summary of UTL_COLL Subprograms

Summary of UTL_COLL Subprograms

Table 217–1 UTL_COLL Package Subprograms

Subprogram	Description
IS_LOCATOR Function on page 217-3	Determines whether a collection item is actually a locator or not

IS_LOCATOR Function

This function determines whether a collection item is actually a locator or not.

Syntax

```
UTL_COLL.IS_LOCATOR (
   coln IN STANDARD)
  RETURNS BOOLEAN;
```

Pragmas

Asserts `WNDS`, `WNPS` and `RNPS` pragmas

Parameters

Table 217–2 IS_LOCATOR Function Parameters

Parameter	Description
`coln`	Nested table or varray item.

Return Values

Table 217–3 IS_LOCATOR Function Return Values

Return Value	Description
`1`	Collection item is indeed a locator.
`0`	Collection item is not a locator.

Examples

```
CREATE OR REPLACE TYPE list_t as TABLE OF VARCHAR2(20);
/

CREATE OR REPLACE TYPE phone_book_t AS OBJECT (
  pno  number,
  ph   list_t );
/

CREATE TABLE phone_book OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph;
CREATE TABLE phone_book1 OF phone_book_t
      NESTED TABLE ph STORE AS nt_ph_1 RETURN LOCATOR;

INSERT INTO phone_book VALUES(1, list_t('650-633-5707','650-323-0953'));
INSERT INTO phone_book1 VALUES(1, list_t('415-555-1212'));

CREATE OR REPLACE PROCEDURE chk_coll IS
  plist list_t;
  plist1 list_t;
BEGIN
  SELECT ph INTO plist FROM phone_book WHERE pno=1;

  SELECT ph INTO plist1 FROM phone_book1 WHERE pno=1;

  IF (UTL_COLL.IS_LOCATOR(plist)) THEN
    DBMS_OUTPUT.PUT_LINE('plist is a locator');
```

```
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist is not a locator');
  END IF;

  IF (UTL_COLL.IS_LOCATOR(plist1)) THEN
    DBMS_OUTPUT.PUT_LINE('plist1 is a locator');
  ELSE
    DBMS_OUTPUT.PUT_LINE('plist1 is not a locator');
  END IF;

END chk_coll;

SET SERVEROUTPUT ON
EXECUTE chk_coll;
```

218

UTL_COMPRESS

The `UTL_COMPRESS` package provides a set of data compression utilities.

This chapter contains the following topics:

- Using UTL_COMPRESS
  - Constants
  - Exceptions
  - Operational Notes
- Summary of UTL_COMPRESS Subprograms

Using UTL_COMPRESS

- Constants
- Exceptions
- Operational Notes

Constants

Define max number of handles for piecewise operations:

```
UTLCOMP_MAX_HANDLE   CONSTANT  PLS_INTEGER := 5;
```

Exceptions

Table 218–1 UTL_COMPRESS Exceptions

Exception	Description
BUFFER_TOO_SMALL	The compressed representation is too big.
DATA_ERROR	The input or output data stream was found to be an invalid format.
INVALID_ARGUMENT	One of the arguments was an invalid type or value.
INVALID_HANDLE	Invalid handle for piecewise compress or uncompress.
STREAM_ERROR	An error occurred during compression or uncompression of the data stream

Operational Notes

- It is the caller's responsibility to free the temporary `LOB` returned by the `LZ*` functions with `DBMS_LOB.FREETEMPORARY` call.
- A `BFILE` passed into `LZ_COMPRESS*` or l`Z_UNCOMPRESS*` has to be opened by `DBMS_LOB.FILEOPEN`.
- Under special circumstances (especially if the input has already been compressed) the output produced by one of the `UTL_COMPRESS` subprograms may be the same size, or even slightly larger than, the input.
- The output of the `UTL_COMPRESS` compressed data is compatible with `gzip`(with `-n` option)`/gunzip` on a single file.

Summary of UTL_COMPRESS Subprograms

Table 218–2 UTL_COMPRESS Package Subprograms

Subprogram	Description
ISOPEN Function on page 218-7	Checks to see if the handle to a piecewise (un)compress context is open or closed
LZ_COMPRESS Functions and Procedures on page 218-8	Compresses data using Lempel-Ziv compression algorithm
LZ_COMPRESS_ADD Procedure on page 218-10	Adds a piece of compressed data
LZ_COMPRESS_CLOSE on page 218-11	Closes and finishes piecewise compress operation
LZ_COMPRESS_OPEN on page 218-12	Initializes a piecewise context that maintains the compress state and data
LZ_UNCOMPRESS Functions and Procedures on page 218-13	Accepts compressed input, verifies it to be a valid and uncompresses it
LZ_UNCOMPRESS_EXTRACT Procedure on page 218-14	Extracts a piece of uncompressed data
LZ_UNCOMPRESS_OPEN Function on page 218-15	Initializes a piecewise context that maintains the uncompress state and data
LZ_UNCOMPRESS_CLOSE Procedure on page 218-16	Closes and finishes the piecewise uncompress

ISOPEN Function

This function checks to see if the handle to a piecewise (un)compress context is open or closed.

Syntax

```
UTL_COMPRESS.ISOPEN(
   handle in binary_integer)
 RETURN BOOLEAN;
```

Parameters

Table 218–3 ISOPEN Function Parameters

Parameter	Description
handle	The handle to a piecewise uncompress context.

Return Values

TRUE if the given piecewise handle is opened, otherwise FALSE.

Examples

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) then
   UTL_COMPRESS.LZ_COMPRESS_CLOSE(myhandle, lob_1);
END IF;
```

Alternatively:

```
IF (UTL_COMPRESS.ISOPEN(myhandle) = TRUE) THEN
   UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(myhandle);
END IF;
```

LZ_COMPRESS Functions and Procedures

These functions and procedures compress data using Lempel-Ziv compression algorithm.

Syntax

This function accept a RAW as input, compress it and return the compressed RAW result and metadata:

```
UTL_COMPRESS.LZ_COMPRESS (
   src       IN           RAW,
   quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN RAW;
```

This function accept a BLOB as input, compress it and returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
  src       IN           BLOB,
  quality   IN           BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure returns the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
  src      IN            BLOB,
  dst      IN OUT NOCOPY BLOB,
  quality  IN            BINARY_INTEGER DEFAULT 6);
```

This function returns a temporary BLOB for the compressed data:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   quality IN            BINARY_INTEGER DEFAULT 6)
 RETURN BLOB;
```

This procedure will return the compressed data into the existing BLOB(dst) which is trimmed to the compressed data size:

```
UTL_COMPRESS.LZ_COMPRESS (
   src     IN            BFILE,
   dst     IN OUT NOCOPY BLOB,
   quality IN            BINARY_INTEGER DEFAULT 6);
```

Parameters

Table 218–4 LZ_COMPRESS Function and Procedures Parameters

Parameter	Description
src	Data (RAW, BLOB or BFILE) to be compressed.
dst	Destination for compressed data
quality	An integer in the range 1 to 9, 1=fast compression, 9=best compression, default=6

Usage Notes

- `quality` is an optional compression tuning value. It allows the `UTL_COMPRESS` user to choose between speed and compression quality, meaning the percentage of reduction in size. A faster compression speed will result in less compression of the data. A slower compression speed will result in more compression of the data. Valid values are [1..9], with 1=fastest and 9=slowest. The default 'quality' value is 6.

LZ_COMPRESS_ADD Procedure

This procedure adds a piece of compressed data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_ADD (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB,
   src    IN             RAW);
```

Parameters

Table 218–5 LZ_COMPRESS_ADD Procedure Parameters

Parameter	Description
`handle`	The handle to a piecewise compress context.
`dst`	The opened `LOB` from `LZ_COMPRESS_OPEN` to store compressed data.
`src`	The input data to be compressed.

Exceptions

- `invalid_handle` - out of range invalid or unopened handle.
- `invalid_argument` - `NULL` handle, src, dst, or invalid `dst`.

LZ_COMPRESS_CLOSE

This procedure closes and finishes piecewise compress operation.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_CLOSE (
   handle IN             BINARY_INTEGER,
   dst    IN OUT NOCOPY  BLOB);
```

Parameters

Table 218–6 LZ_COMPRESS_CLOSE Procedure Parameters

Parameter	Description
`handle`	The handle to a piecewise compress context.
`dst`	The opened `LOB` from `LZ_COMPRESS_OPEN` to store compressed data.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle, `dst`, or invalid `dst`.

LZ_COMPRESS_OPEN

This function initializes a piecewise context that maintains the compress state and data.

Syntax

```
UTL_COMPRESS.LZ_COMPRESS_OPEN (
   dst       IN OUT NOCOPY BLOB,
   quality   IN            BINARY_INTEGER DEFAULT 6)
 RETURN BINARY_INTEGER;
```

Parameters

Table 218–7 LZ_COMPRESS_OPEN Function Parameters

Parameter	Description
`dst`	User supplied LOB to store compressed data.
`quality`	Speed versus efficiency of resulting compressed output. ■ Valid values are the range 1..9, with a default value of 6. ■ 1=fastest compression, 9=slowest compression and best compressed file size.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- `invalid_handle` - invalid handle, too many open handles.
- `invalid_argument` - `NULL dst` or invalid quality specified.

Usage Notes

Close the opened handle with `LZ_COMPRESS_CLOSE`

- once the piecewise compress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

LZ_UNCOMPRESS Functions and Procedures

This procedure accepts as input a RAW, BLOB or BFILE compressed string, verifies it to be a valid compressed value, uncompresses it using Lempel-Ziv compression algorithm, and returns the uncompressed RAW or BLOB result.

Syntax

This function returns uncompressed data as RAW:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  RAW)
  RETURN RAW;
```

This function returns uncompressed data as a temporary BLOB:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB)
  RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst), which will be trimmed to the uncompressed data size:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BLOB,
   dst  IN OUT NOCOPY BLOB);
```

This function returns a temporary BLOB for the uncompressed data:

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN BFILE)
 RETURN BLOB;
```

This procedure returns the uncompressed data into the existing BLOB(dst). The original dst data will be overwritten.

```
UTL_COMPRESS.LZ_UNCOMPRESS(
   src  IN  BFILE,
   dst  IN OUT NOCOPY BLOB);
```

Parameters

Table 218–8 LZ_UNCOMPRESS Function and Procedures Parameters

Parameter	Description
src	Compressed data.
dst	Destination for uncompressed data.

LZ_UNCOMPRESS_EXTRACT Procedure

This procedure extracts a piece of uncompressed data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_EXTRACT(
   handle  IN          BINARY_INTEGER,
   dst     OUT NOCOPY  RAW);
```

Parameters

Table 218–9 LZ_UNCOMPRESS_EXTRACT Function Parameters

Parameter	Description
`handle`	The handle to a piecewise uncompress context.
`dst`	The uncompressed data.

Exceptions

- `no_data_found` - finished uncompress.
- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - NULL handle.

LZ_UNCOMPRESS_OPEN Function

This function initializes a piecewise context that maintains the uncompress state and data.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_OPEN(
   src  IN  BLOB)
  RETURN BINARY_INTEGER;
```

Parameters

Table 218–10 LZ_UNCOMPRESS_OPEN Function Parameters

Parameter	Description
src	The input data to be uncompressed.

Return Values

A handle to an initialized piecewise compress context.

Exceptions

- invalid_handle - invalid handle, too many open handles.
- invalid_argument - NULL src.

Usage Notes

Close the opened handle with LZ_UNCOMPRESS_CLOSE

- once the piecewise uncompress is completed
- in the event of an exception in the middle of process

because lack of doing so will cause these handles to leak.

LZ_UNCOMPRESS_CLOSE Procedure

This procedure closes and finishes the piecewise uncompress.

Syntax

```
UTL_COMPRESS.LZ_UNCOMPRESS_CLOSE(
   handle  IN   BINARY_INTEGER);
```

Parameters

Table 218–11 LZ_UNCOMPRESS_CLOSE Procedure Parameters

Parameter	Description
`handle`	The handle to a piecewise uncompress context.

Exceptions

- `invalid_handle` - out of range invalid or uninitialized handle.
- `invalid_argument` - `NULL` handle.

219

UTL_ENCODE

The UTL_ENCODE package provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts. You can use UTL_ENCODE functions to encode the body of email text. The package also contains the decode counterpart functions of the encode functions. The functions follow published standards for encoding to accommodate non-Oracle utilities on the sending or receiving ends.

This chapter contains the following topic:

- Summary of UTL_ENCODE Subprograms

Summary of UTL_ENCODE Subprograms

Table 219–1 UTL_ENCODE Package Subprograms

Subprogram	Description
BASE64_DECODE Function on page 219-3	Reads the base 64-encoded `RAW` input string and decodes it to its original `RAW` value
BASE64_ENCODE Function on page 219-4	Encodes the binary representation of the `RAW` value into base 64 elements and returns it in the form of a `RAW` string
MIMEHEADER_DECODE Function on page 219-5	Decodes a string from mime header format
MIMEHEADER_ENCODE Function on page 219-6	Encodes a string into mime header format
QUOTED_PRINTABLE_ DECODE Function on page 219-7	Reads the `varchar2` quoted printable format input string and decodes it to the corresponding `RAW` string
QUOTED_PRINTABLE_ ENCODE Function on page 219-8	Reads the `RAW` input string and encodes it to the corresponding quoted printable format string
TEXT_DECODE Function on page 219-9	Decodes a character set sensitive text string
TEXT_ENCODE Function on page 219-10	Encodes a character set sensitive text string
UUDECODE Function on page 219-11	Reads the `RAW` uuencode format input string and decodes it to the corresponding `RAW` string
UUENCODE Function on page 219-12	Reads the `RAW` input string and encodes it to the corresponding uuencode format string

BASE64_DECODE Function

This function reads the base 64-encoded RAW input string and decodes it to its original RAW value.

Syntax

```
UTL_ENCODE.BASE64_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 219–2 BASE64_DECODE Function Parameters

Parameter	Description
r	The RAW string containing base 64-encoded data. There are no defaults or optional parameters.

Return Values

Table 219–3 BASE64_DECODE Function Return Values

Return	Description
RAW	Contains the decoded string

BASE64_ENCODE Function

This function encodes the binary representation of the RAW value into base 64 elements and returns it in the form of a RAW string.

Syntax

```
UTL_ENCODE.BASE64_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(base64_encode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 219–4 BASE64_ENCODE Function Parameters

Parameter	Description
r	The RAW value to be encoded. There are no defaults or optional parameters.

Return Values

Table 219–5 BASE64_ENCODE Function Return Values

Return	Description
RAW	Contains the encoded base 64 elements

MIMEHEADER_DECODE Function

This function accepts as input an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some encoded text?=
```

The <encoded text> is encapsulated in mime header tags which give the MIMEHEADER_DECODE function information about how to decode the string. The mime header metadata tags are stripped from the input string and the <encoded text> is converted to the base database character set as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

The string is decoded using either quoted-printable or base64 decoding, as specified by the <encoding> metadata tag in the encoded word. The resulting converted and decoded text is returned to the caller as a VARCHAR2 string.

Syntax

```
UTL_ENCODE.MIMEHEADER_DECODE (
   buf    IN   VARCHAR2 CHARACTER SET ANY_CS)
  RETURN data VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 219–6 MIMEHEADER_DECODE Function Parameters

Parameter	Description
buf	The encoded text data with mime header format tags.

Return Values

Table 219–7 MIMEHEADER_DECODE Function Return Values

Return	Description
data	The encoded text data with mime header format tags

Examples

```
v2:=utl_encode.mimeheader_decode('=?ISO-8859-1?Q?Here is some encoded text?=');
```

MIMEHEADER_ENCODE Function

This function returns as an output an "encoded word" of the form:

```
=?<charset>?<encoding>?<encoded text>?=
=?ISO-8859-1?Q?Here is some text?=
```

The `buf` input parameter is the text to be encoded and becomes the `<encoded text>`.

The <encoding> value is either "Q" or "B" for quoted-printable encode or base64 encoding respectively. The ENCODING input parameter accepts as valid values `UTL_ENCODE.QUOTED_PRINTABLE` or `UTL_ENCODE.BASE64` or `NULL`. If `NULL`, quoted-printable encoding is selected as a default value.

The `<charset>` value is specified as the input parameter `encode_charset`. If `NULL`, the database character set is selected as a default value.

The mimeheader encoding process includes conversion of the `buf` input string to the character set specified by the `encode_charset` parameter. The converted string is encoded to either quoted-printable or base64 encoded format. The mime header tags are appended and prepended.

Finally, the string is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed.

Syntax

```
UTL_ENCODE.MIMEHEADER_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 219–8 MIMEHEADER_ENCODE Function Parameters

Parameter	Description
`buf`	The text data.
`encode_charset`	The target character set.
`encoding`	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`

Return Values

Table 219–9 MIMEHEADER_ENCODE Function Return Values

Return	Description
`string`	A `VARCHAR2` encoded string with mime header format tags.

QUOTED_PRINTABLE_DECODE Function

This function reads the varchar2 quoted printable format input string and decodes it to the corresponding RAW string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_DECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_decode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 219–10 QUOTED_PRINTABLE_DECODE Function Parameters

Parameters	Description
r	The RAW string containing a quoted printable data string. There are no defaults or optional parameters.

Return Values

Table 219–11 QUOTED_PRINTABLE_DECODE Function Return Values

Return	Description
RAW	The decoded string

QUOTED_PRINTABLE_ENCODE Function

This function reads the RAW input string and encodes it to the corresponding quoted printable format string.

Syntax

```
UTL_ENCODE.QUOTED_PRINTABLE_ENCODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(quoted_printable_encode, WNDS, RNDS,WNPS, RNPS);
```

Parameters

Table 219–12 QUOTED_PRINTABLE_ENCODE Function Parameters

Parameter	Description
r	The RAW string. There are no defaults or optional parameters.

Return Values

Table 219–13 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
RAW	Contains the quoted printable string

TEXT_DECODE Function

This function converts the input text to the target character set as specified by the encode_charset parameter, if not NULL. The encoded text is converted to the base character set of database, as follows:

- If this is a UTF16 platform, convert the encoded text from UTF16 to ASCII
- If this is an EBCDIC platform, convert the encoded text from EBCDIC to ASCII
- If this is an ASCII or UTF8 platform, no conversion needed

You can decode from either quoted-printable or base64 format, with regard to each encoding parameter. If NULL, quoted-printable is selected as a default decoding format. If encode_charset is not NULL, you convert the string from the specified character set to the database character set. The resulting decoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_DECODE(
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 219–14 TEXT_DECODE Function Parameters

Parameter	Description
buf	The encoded text data.
encode_charset	The source character set.
encoding	The encoding format. Valid values are UTL_ENCODE.BASE64, UTL_ENCODE.QUOTED_PRINTABLE and NULL.

Return Values

Table 219–15 QUOTED_PRINTABLE_ENCODE Function Return Values

Return	Description
string	A VARCHAR2 decoded text string.

Examples

```
v2:=UTL_ENCODE.TEXT_DECODE(
     'Here is some text',
      WE8ISO8859P1,
      UTL_ENCODE.BASE64);
```

TEXT_ENCODE Function

This function converts the input text to the target character set as specified by the `encode_charset` parameter, if not `NULL`. The text is encoded to either base64 or quoted-printable format, as specified by the `encoding` parameter. Quoted-printable is selected as a default if ENCODING is NULL.

The encoded text is converted to the base character set of the database:

- If this is a UTF16 platform, convert the encoded text to UTF16
- If this is an EBCDIC platform, convert the encoded text to EBCDIC
- If this is an ASCII or UTF8 platform, no conversion needed

The resulting encoded and converted text string is returned to the caller.

Syntax

```
UTL_ENCODE.TEXT_ENCODE (
   buf            IN  VARCHAR2 CHARACTER SET ANY_CS,
   encode_charset IN  VARCHAR2 DEFAULT NULL,
   encoding       IN  PLS_INTEGER DEFAULT NULL)
 RETURN string VARCHAR2 CHARACTER SET buf%CHARSET;
```

Parameters

Table 219–16 TEXT_ENCODE Function Parameters

Parameter	Description
`buf`	The text data.
`encode_charset`	The target character set.
`encoding`	The encoding format. Valid values are `UTL_ENCODE.BASE64`, `UTL_ENCODE.QUOTED_PRINTABLE` and `NULL`

Return Values

Table 219–17 TEXT_ENCODE Function Return Values

Return	Description
`string`	A `VARCHAR2` encoded string with mime header format tags.

Examples

```
v2:=utl_encode.text_encode(
   'Here is some text',
   'WE8ISO8859P1',
    UTL_ENCODE.BASE64);
```

UUDECODE Function

This function reads the RAW uuencode format input string and decodes it to the corresponding RAW string. See "UUENCODE Function" on page 219-12 for discussion of the cumulative nature of UUENCODE and UUDECODE for data streams.

Syntax

```
UTL_ENCODE.UUDECODE (
   r  IN RAW)
RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uudecode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 219–18 UUDECODE Function Parameters

Parameter	Description
r	The RAW string containing the uuencoded data string. There are no defaults or optional parameters.

Return Values

Table 219–19 UUDECODE Function Return Values

Return	Description
RAW	The decoded RAW string

UUENCODE Function

This function reads the RAW input string and encodes it to the corresponding uuencode format string. The output of this function is cumulative, in that it can be used to encode large data streams, by splitting the data stream into acceptably sized RAW values, encoded, and concatenated into a single encoded string.

Syntax

```
UTL_ENCODE.UUENCODE (
   r          IN RAW,
   type       IN PLS_INTEGER DEFAULT 1,
   filename   IN VARCHAR2 DEFAULT NULL,
   permission IN VARCHAR2 DEFAULT NULL) RETURN RAW;
```

Pragmas

```
pragma RESTRICT_REFERENCES(uuencode, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 219–20 UUENCODE Function Parameters

Parameter	Description
r	RAW string
type	Optional number parameter containing the type of uuencoded output. Options: complete—a defined PL/SQL constant with a value of 1. (default) header_piece ...middle_piece ...end_piece
filename	Optional varchar2 parameter containing the uuencode filename; the default is uuencode.txt
permission	Optional varchar2 parameter containing the permission mode; the default is 0 (a text string zero).

Return Values

Table 219–21 UUENCODE Function Return Values

Return	Description
RAW	Contains the uuencode format string

220

UTL_FILE

With the `UTL_FILE` package, PL/SQL programs can read and write operating system text files. `UTL_FILE` provides a restricted version of operating system stream file I/O.

This chapter contains the following topics:

- Using UTL_FILE
  - Security Model
  - Rules and Limits
  - Exceptions
  - Examples
- Data Structures
- Summary of UTL_FILE Subprograms

Using UTL_FILE

- Security Model
- Operational Notes
- Rules and Limits
- Exceptions
- Examples

Security Model

The set of files and directories that are accessible to the user through UTL_FILE is controlled by a number of factors and database parameters. Foremost of these is the set of directory objects that have been granted to the user. The nature of directory objects is discussed in the *Oracle Database SQL Language Reference*.

Assuming the user has both READ and WRITE access to the directory object USER_DIR, the user can open a file located in an accessible directory, but not in subdirectories or parent directories.

Lastly, the client (text I/O) and server implementations are subject to server-side file system permission checking.

UTL_FILE provides file access both on the client side and on the server side. When run on the server, UTL_FILE provides access to all operating system files that are accessible from the server. On the client side, as in the case for Forms applications, UTL_FILE provides access to operating system files that are accessible from the client.

In the past, accessible directories for the UTL_FILE functions were specified in the initialization file using the UTL_FILE_DIR parameter. However, UTL_FILE_DIR access is no longer recommended. Oracle recommends that you instead use the directory object feature, which replaces UTL_FILE_DIR. Directory objects offer more flexibility and granular control to the UTL_FILE application administrator, can be maintained dynamically (that is, without shutting down the database), and are consistent with other Oracle tools. CREATE ANY DIRECTORY privilege is granted only to SYS and SYSTEM by default.

Note: Use the CREATE DIRECTORY feature instead of UTL_FILE_DIR for directory access verification.

On UNIX systems, the owner of a file created by the FOPEN function is the owner of the shadow process running the instance. Normally, this owner is ORACLE. Files created using FOPEN are always writable and readable using the UTL_FILE subprograms. However, non-privileged users who need to read these files outside of PL/SQL may need access from a system administrator.

Caution:

- **The privileges needed to access files in a directory object are operating system specific.** UTL_FILE **directory object privileges give you read and write access to all files within the specified directory.**
- **Attempting to apply invalid options will give rise to unpredictable results.**

Operational Notes

The file location and file name parameters are supplied to the FOPEN function as separate strings, so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects. Together, the file location and name must represent a legal filename on the system, and the directory must be accessible. A subdirectory of an accessible directory is not necessarily also accessible; it too must be specified using a complete path name matching an ALL_DIRECTORIES object.

UTL_FILE implicitly interprets line terminators on read requests, thereby affecting the number of bytes returned on a GET_LINE call. For example, the len parameter of UTL_FILE.GET_LINE specifies the requested number of bytes of character data. The number of bytes actually returned to the user will be the lesser of:

- The GET_LINE len parameter, or
- The number of bytes until the next line terminator character, or
- The max_linesize parameter specified by UTL_FILE.FOPEN

The FOPEN max_linesize parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies a default value of 1024. The GET_LINE len parameter must be a number in the range 1 and 32767. If unspecified, Oracle supplies the default value of max_linesize. If max_linesize and len are defined to be different values, then the lesser value takes precedence.

UTL_FILE.GET_RAW ignores line terminators and returns the actual number of bytes requested by the GET_RAW len parameter.

When data encoded in one character set is read and Globalization Support is told (such as by means of NLS_LANG) that it is encoded in another character set, the result is indeterminate. If NLS_LANG is set, it should be the same as the database character set.

Rules and Limits

Operating system-specific parameters, such as C-shell environment variables under UNIX, cannot be used in the file location or file name parameters.

UTL_FILE I/O capabilities are similar to standard operating system stream file I/O (OPEN, GET, PUT, CLOSE) capabilities, but with some limitations. For example, you call the FOPEN function to return a file handle, which you use in subsequent calls to GET_LINE or PUT to perform stream I/O to a file. When file I/O is done, you call FCLOSE to complete any output and free resources associated with the file.

Note: The UTL_FILE package is similar to the client-side TEXT_IO package currently provided by Oracle Procedure Builder. Restrictions for a server implementation require some API differences between UTL_FILE and TEXT_IO. In PL/SQL file I/O, errors are returned using PL/SQL exceptions.

Exceptions

Table 220–1 UTL_FILE Package Exceptions

Exception Name	Description
INVALID_PATH	File location is invalid.
INVALID_MODE	The open_mode parameter in FOPEN is invalid.
INVALID_FILEHANDLE	File handle is invalid.
INVALID_OPERATION	File could not be opened or operated on as requested.
READ_ERROR	Destination buffer too small, or operating system error occurred during the read operation
WRITE_ERROR	Operating system error occurred during the write operation.
INTERNAL_ERROR	Unspecified PL/SQL error
CHARSETMISMATCH	A file is opened using FOPEN_NCHAR, but later I/O operations use nonchar functions such as PUTF or GET_LINE.
FILE_OPEN	The requested operation failed because the file is open.
INVALID_ MAXLINESIZE	The MAX_LINESIZE value for FOPEN() is invalid; it should be within the range 1 to 32767.
INVALID_FILENAME	The filename parameter is invalid.
ACCESS_DENIED	Permission to access to the file location is denied.
INVALID_OFFSET	Causes of the INVALID_OFFSET exception: ■ ABSOLUTE_OFFSET = NULL and RELATIVE_OFFSET = NULL, or ■ ABSOLUTE_OFFSET < 0, or ■ Either offset caused a seek past the end of the file
DELETE_FAILED	The requested file delete operation failed.
RENAME_FAILED	The requested file rename operation failed.

Procedures in UTL_FILE can also raise predefined PL/SQL exceptions such as NO_DATA_FOUND or VALUE_ERROR.

Examples

Example 1

Note: The examples are UNIX-specific.

Given the following:

```
SQL> CREATE DIRECTORY log_dir AS '/appl/gl/log';
SQL> GRANT READ ON DIRECTORY log_dir TO DBA;
SQL> GRANT WRITE ON DIRECTORY log_dir TO DBA;

SQL> CREATE DIRECTORY USER_DIR AS '/appl/gl/user'';
SQL> GRANT READ ON DIRECTORY USER_DIR TO PUBLIC;
SQL> GRANT WRITE ON DIRECTORY USER_DIR TO PUBLIC;
```

The following file locations and filenames are valid and accessible as follows:

File Location	Filename	READ and WRITE
/appl/gl/log	L12345.log	Users with DBA privilege
/appl/gl/user	u12345.tmp	All users

The following file locations and filenames are invalid:

File Location	Filename	Invalid Because
/appl/gl/log/backup	L12345.log	# subdirectories are not accessible
/APPL/gl/log	L12345.log	# directory strings must follow case sensitivity rules as required by the O/S
/appl/gl/log	backup/L1234.log	# filenames may not include portions of directory paths
/user/tmp	L12345.log	# no corresponding CREATE DIRECTORY command has been issued

Example 2

```
DECLARE
  V1 VARCHAR2(32767);
  F1 UTL_FILE.FILE_TYPE;
BEGIN
  -- In this example MAX_LINESIZE is less than GET_LINE's length request
  -- so the number of bytes returned will be 256 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R',256);
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, FOPEN's MAX_LINESIZE is NULL and defaults to 1024,
  -- so the number of bytes returned will be 1024 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
```

```
  UTL_FILE.GET_LINE(F1,V1,32767);
  UTL_FILE.FCLOSE(F1);

  -- In this example, GET_LINE doesn't specify a number of bytes, so it defaults
to
  -- the same value as FOPEN's MAX_LINESIZE which is NULL in this case and
defaults to 1024.
  -- So the number of bytes returned will be 1024 or less if a line terminator is
seen.
  F1 := UTL_FILE.FOPEN('USER_DIR','u12345.tmp','R');
  UTL_FILE.GET_LINE(F1,V1);
  UTL_FILE.FCLOSE(F1);
END;
```

Data Structures

The `UTL_FILE` package defines a `RECORD` type.

Record Types

- FILETYPE Record Type

FILETYPE Record Type

The contents of FILE_TYPE are private to the UTL_FILE package. You should not reference or change components of this record.

```
TYPE file_type IS RECORD (
   id          BINARY_INTEGER,
   datatype    BINARY_INTEGER,
   byte_mode   BOOLEAN);
```

Fields

Table 220–2 FILE_TYPE Fields

Field	Description
id	A numeric value indicating the internal file handle number
datatype	Indicates whether the file is a CHAR file, Nchar file or other (binary)
byte_mode	Indicates whether the file was open as a binary file, or as a text file

Caution: Oracle does not guarrantee the persistence of FILE_TYPE values between database sessions or within a single session. Attempts to clone file handles or use dummy file handles may have inderterminate outcomes.

Summary of UTL_FILE Subprograms

Table 220–3 UTL_FILE Subprograms

Subprogram	Description
FCLOSE Procedure on page 220-13	Closes a file
FCLOSE_ALL Procedure on page 220-14	Closes all open file handles
FCOPY Procedure on page 220-15	Copies a contiguous portion of a file to a newly created file
FFLUSH Procedure on page 220-16	Physically writes all pending output to a file
FGETATTR Procedure on page 220-17	Reads and returns the attributes of a disk file
FGETPOS Function on page 220-18	Returns the current relative offset position within a file, in bytes
FOPEN Function on page 220-19	Opens a file for input or output
FOPEN_NCHAR Function on page 220-21	Opens a file in Unicode for input or output
FREMOVE Procedure on page 220-22	Deletes a disk file, assuming that you have sufficient privileges
FRENAME Procedure on page 220-23	Renames an existing file to a new name, similar to the UNIX `mv` function
FSEEK Procedure on page 220-24	Adjusts the file pointer forward or backward within the file by the number of bytes specified
GET_LINE Procedure on page 220-25	Reads text from an open file
GET_LINE_NCHAR Procedure on page 220-26	Reads text in Unicode from an open file
GET_RAW Function on page 220-27	Reads a `RAW` string value from a file and adjusts the file pointer ahead by the number of bytes read
IS_OPEN Function on page 220-28	Determines if a file handle refers to an open file
NEW_LINE Procedure on page 220-29	Writes one or more operating system-specific line terminators to a file
PUT Procedure on page 220-30	Writes a string to a file
PUT_LINE Procedure on page 220-31	Writes a line to a file, and so appends an operating system-specific line terminator
PUT_LINE_NCHAR Procedure on page 220-32	Writes a Unicode line to a file
PUT_NCHAR Procedure on page 220-33	Writes a Unicode string to a file
PUTF Procedure on page 220-34	A `PUT` procedure with formatting

Table 220–3 (Cont.) UTL_FILE Subprograms

Subprogram	Description
PUTF_NCHAR Procedure on page 220-36	A `PUT_NCHAR` procedure with formatting, and writes a Unicode string to a file, with formatting
PUT_RAW Function on page 220-37	Accepts as input a `RAW` data value and writes the value to the output buffer

FCLOSE Procedure

This procedure closes an open file identified by a file handle.

Syntax

```
UTL_FILE.FCLOSE (
   file IN OUT FILE_TYPE);
```

Parameters

Table 220–4 FCLOSE Procedure Parameters

Parameter	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call

Usage Notes

If there is buffered data yet to be written when FCLOSE runs, then you may receive a WRITE_ERROR exception when closing a file.

Exceptions

```
WRITE_ERROR
INVALID_FILEHANDLE
```

FCLOSE_ALL Procedure

This procedure closes all open file handles for the session. This should be used as an emergency cleanup procedure, for example, when a PL/SQL program exits on an exception.

Syntax

```
UTL_FILE.FCLOSE_ALL;
```

Usage Notes

Note: `FCLOSE_ALL` does not alter the state of the open file handles held by the user. This means that an `IS_OPEN` test on a file handle after an `FCLOSE_ALL` call still returns `TRUE`, even though the file has been closed. No further read or write operations can be performed on a file that was open before an `FCLOSE_ALL`.

Exceptions

```
WRITE_ERROR
```

FCOPY Procedure

This procedure copies a contiguous portion of a file to a newly created file. By default, the whole file is copied if the `start_line` and `end_line` parameters are omitted. The source file is opened in read mode. The destination file is opened in write mode. A starting and ending line number can optionally be specified to select a portion from the center of the source file for copying.

Syntax

```
UTL_FILE.FCOPY (
   src_location    IN VARCHAR2,
   src_filename    IN VARCHAR2,
   dest_location   IN VARCHAR2,
   dest_filename   IN VARCHAR2,
   start_line      IN BINARY_INTEGER DEFAULT 1,
   end_line        IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 220–5 FCOPY Procedure Parameters

Parameters	Description
`src_location`	Directory location of the source file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive)
`src_filename`	Source file to be copied
`dest_location`	Destination directory where the destination file is created
`dest_filename`	Destination file created from the source file
`start_line`	Line number at which to begin copying. The default is `1` for the first line
`end_line`	Line number at which to stop copying. The default is `NULL`, signifying end of file

FFLUSH Procedure

`FFLUSH` physically writes pending data to the file identified by the file handle. Normally, data being written to a file is buffered. The `FFLUSH` procedure forces the buffered data to be written to the file. The data must be terminated with a newline character.

Flushing is useful when the file must be read while still open. For example, debugging messages can be flushed to the file so that they can be read immediately.

Syntax

```
UTL_FILE.FFLUSH (
   file  IN FILE_TYPE);
invalid_maxlinesize  EXCEPTION;
```

Parameters

Table 220–6 FFLUSH Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` or `FOPEN_NCHAR` call

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

FGETATTR Procedure

This procedure reads and returns the attributes of a disk file.

Syntax

```
UTL_FILE.FGETATTR(
   location    IN VARCHAR2,
   filename    IN VARCHAR2,
   fexists     OUT BOOLEAN,
   file_length OUT NUMBER,
   blocksize   OUT BINARY_INTEGER);
```

Parameters

Table 220–7 FGETATTR Procedure Parameters

Parameters	Description
`location`	Directory location of the source file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive)
`filename`	Name of the file to be examined
`fexists`	A `BOOLEAN` for whether or not the file exists
`file_length`	Length of the file in bytes. `NULL` if file does not exist.
`blocksize`	File system block size in bytes. `NULL` if the file does not exist.

FGETPOS Function

This function returns the current relative offset position within a file, in bytes.

Syntax

```
UTL_FILE.FGETPOS (
   fileid IN FILE_TYPE)
 RETURN PLS_INTEGER;
```

Parameters

Table 220–8 FGETPOS Parameters

Parameters	Description
`fileid`	Directory location of the source file

Return Values

`FGETPOS` returns the relative offset position for an open file, in bytes. It raises an exception if the file is not open. It returns `0` for the beginning of the file.

Usage Notes

If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

FOPEN Function

This function opens a file. You can specify the maximum line size and have a maximum of 50 files open simultaneously. See also FOPEN_NCHAR Function on page 220-21.

Syntax

```
UTL_FILE.FOPEN (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER DEFAULT 1024)
  RETURN FILE_TYPE;
```

Parameters

Table 220–9 FOPEN Function Parameters

Parameter	Description
location	Directory location of file. This string is a directory object name and is case sensitive. The default is uppercase. Read privileges must be granted on this directory object for the UTL_FILE user to run FOPEN.
filename	File name, including extension (file type), without directory path. If a directory path is given as a part of the filename, it is ignored by FOPEN. On Unix, the filename cannot end with /.
open_mode	Specifies how the file is opened. Modes include: ■ r -- read text ■ w -- write text ■ a -- append text ■ rb -- read byte mode ■ wb -- write byte mode ■ ab -- append byte mode If you try to open a file specifying 'a' or 'ab' for open_mode but the file does not exist, the file is created in write mode.
max_linesize	Maximum number of characters for each line, including the newline character, for this file (minimum value 1, maximum value 32767). If unspecified, Oracle supplies a default value of 1024.

Return Values

FOPEN returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 220–10 FOPEN Function Return Values

Return	Description
FILE_TYPE	Handle to open file.

Usage Notes

The file location and file name parameters must be supplied to the FOPEN function as quoted strings so that the file location can be checked against the list of accessible directories as specified by the ALL_DIRECTORIES view of accessible directory objects.

Exceptions

```
INVALID_PATH: File location or name was invalid.
INVALID_MODE: The open_mode string was invalid.
INVALID_OPERATION: File could not be opened as requested.
INVALID_MAXLINESIZE: Specified max_linesize is too large or too small.
```

FOPEN_NCHAR Function

This function opens a file in national character set mode for input or output, with the maximum line size specified. You can have a maximum of 50 files open simultaneously. With this function, you can read or write a text file in Unicode instead of in the database character set.

Even though the contents of an NVARCHAR2 buffer may be AL16UTF16 or UTF8 (depending on the national character set of the database), the contents of the file are always read and written in UTF8. UTL_FILE converts between UTF8 and AL16UTF16 as necessary.

See also FOPEN Function on page 220-19.

Syntax

```
UTL_FILE.FOPEN_NCHAR (
   location     IN VARCHAR2,
   filename     IN VARCHAR2,
   open_mode    IN VARCHAR2,
   max_linesize IN BINARY_INTEGER DEFAULT 1024)
RETURN FILE_TYPE;
```

Parameters

Table 220–11 FOPEN_NCHAR Function Parameters

Parameter	Description
location	Directory location of file
filename	File name (including extension)
open_mode	Open mode (r,w,a,rb,wb,ab)
max_linesize	Maximum number of characters for each line, including the newline character, for this file. (minimum value 1, maximum value 32767).

Return Values

FOPEN_NCHAR returns a file handle, which must be passed to all subsequent procedures that operate on that file. The specific contents of the file handle are private to the UTL_FILE package, and individual components should not be referenced or changed by the UTL_FILE user.

Table 220–12 FOPEN_NCHAR Function Return Values

Return	Description
FILE_TYPE	Handle to open file

FREMOVE Procedure

This procedure deletes a disk file, assuming that you have sufficient privileges.

Syntax

```
UTL_FILE.FREMOVE (
   location IN VARCHAR2,
   filename IN VARCHAR2);
```

Parameters

Table 220–13 FREMOVE Procedure Parameters

Parameters	Description
`location`	Directory location of the file, a `DIRECTORY_NAME` from `ALL_DIRECTORIES` (case sensitive)
`filename`	Name of the file to be deleted

Usage Notes

The `FREMOVE` procedure does not verify privileges before deleting a file. The O/S verifies file and directory permissions. An exception is returned on failure.

FRENAME Procedure

This procedure renames an existing file to a new name, similar to the UNIX `mv` function.

Syntax

```
UTL_FILE.FRENAME (
   src_location     IN   VARCHAR2,
   src_filename     IN   VARCHAR2,
   dest_location    IN   VARCHAR2,
   dest_filename    IN   VARCHAR2,
   overwrite        IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 220–14 FRENAME Procedure Parameters

Parameters	Description
`src_location`	Directory location of the source file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive)
`src_filename`	Source file to be renamed
`dest_location`	Destination directory of the destination file, a `DIRECTORY_NAME` from the `ALL_DIRECTORIES` view (case sensitive)
`dest_filename`	New name of the file
`overwrite`	Default is `FALSE`

Usage Notes

Permission on both the source and destination directories must be granted. You can use the `overwrite` parameter to specify whether or not to overwrite a file if one exists in the destination directory. The default is `FALSE` for no overwrite.

FSEEK Procedure

This procedure adjusts the file pointer forward or backward within the file by the number of bytes specified.

Syntax

```
UTL_FILE.FSEEK (
   file             IN  UTL_FILE.FILE_TYPE,
   absolute_offset  IN  PL_INTEGER DEFAULT NULL,
   relative_offset  IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 220–15 FSEEK Procedure Parameters

Parameters	Description
`file`	File ID
`absolute_offset`	Absolute location to which to seek; default = `NULL`
`relative_offset`	Number of bytes to seek forward or backward; positive = forward, negative integer = backward, zero = current position, default = `NULL`

Usage Notes

- Using `FSEEK`, you can read previous lines in the file without first closing and reopening the file. You must know the number of bytes by which you want to navigate.
- If `relative_offset`, the procedure seeks forward. If `relative_offset` > 0, or backward, if `relative_offset` < 0, the procedure seeks through the file by the number of `relative_offset` bytes specified.
- If the beginning of the file is reached before the number of bytes specified, then the file pointer is placed at the beginning of the file. If the end of the file is reached before the number of bytes specified, then an `INVALID_OFFSET` error is raised.
- If `absolute_offset`, the procedure seeks to an absolute location specified in bytes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

GET_LINE Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. Text is read up to, but not including, the line terminator, or up to the end of the `len` parameter. It cannot exceed the `max_linesize` specified in `FOPEN`.

Syntax

```
UTL_FILE.GET_LINE (
   file        IN  FILE_TYPE,
   buffer      OUT VARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 220–16 GET_LINE Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` call. The file must be open for reading (mode `r`); otherwise an `INVALID_OPERATION` exception is raised.
`buffer`	Data buffer to receive the line read from the file
`len`	The number of bytes read from the file. Default is `NULL`. If `NULL`, Oracle supplies the value of `max_linesize`.

Usage Notes

If the line does not fit in the buffer, a `READ_ERROR` exception is raised. If no text was read due to end of file, the `NO_DATA_FOUND` exception is raised. If the file is opened for byte mode operations, the `INVALID_OPERATION` exception is raised.

Because the line terminator character is not read into the buffer, reading blank lines returns empty strings.

The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`.

If unspecified, Oracle supplies a default value of 1024. See also "GET_LINE_NCHAR Procedure" on page 220-26.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
READ_ERROR
NO_DATA_FOUND
```

GET_LINE_NCHAR Procedure

This procedure reads text from the open file identified by the file handle and places the text in the output buffer parameter. With this function, you can read a text file in Unicode instead of in the database character set.

The file must be opened in national character set mode, and must be encoded in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype, such as NCHAR, NCLOB, or VARCHAR2 is specified, PL/SQL will perform standard implicit conversion from NVARCHAR2 after the text is read.

See also GET_LINE Procedure on page 220-25

Syntax

```
UTL_FILE.GET_LINE_NCHAR (
   file        IN  FILE_TYPE,
   buffer      OUT NVARCHAR2,
   len         IN  PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 220–17 GET_LINE_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Data buffer to receive the line read from the file.
len	The number of bytes read from the file. Default is NULL. If NULL, Oracle supplies the value of max_linesize.

GET_RAW Function

This function reads a RAW string value from a file and adjusts the file pointer ahead by the number of bytes read. UTL_FILE.GET_RAW ignores line terminators and returns the actual number of bytes requested by the GET_RAW len parameter.

Syntax

```
UTL_FILE.GET_RAW (
   file       IN            UTL_FILE.FILE_TYPE,
   buffer     OUT NOCOPY    RAW,
   len        IN            PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 220–18 GET_RAW Procedure Parameters

Parameters	Description
file	File ID
buffer	RAW data
len	The number of bytes read from the file. Default is NULL. If NULL, len is assumed to be the maximum length of RAW.

Usage Notes

The subprogram will raise No_Data_Found when it attempts to read past the end of the file. Your application should allow for this by catching the exception in its processing loop.

```
PROCEDURE Sys.p (n IN VARCHAR2) IS
      h     UTL_FILE.FILE_TYPE := UTL_FILE.FOPEN('D', n, 'r', 32767);
      Buf   RAW(32767);
      Amnt  CONSTANT PLS_INTEGER := 32767;
    BEGIN
      LOOP
        BEGIN
          Utl_File.Get_Raw(h, Buf, Amnt);
          -- Do something with this chunk
        EXCEPTION WHEN No_Data_Found THEN EXIT; END;
      END LOOP;
      UTL_FILE.FCLOSE (h);
    END;
```

IS_OPEN Function

This function tests a file handle to see if it identifies an open file. `IS_OPEN` reports only whether a file handle represents a file that has been opened, but not yet closed. It does not guarantee that there will be no operating system errors when you attempt to use the file handle.

Syntax

```
UTL_FILE.IS_OPEN (
   file  IN FILE_TYPE)
  RETURN BOOLEAN;
```

Parameters

Table 220–19 IS_OPEN Function Parameters

Parameter	Description
`file`	Active file handle returned by an `FOPEN` or `FOPEN_NCHAR` call

Return Values

`TRUE` or `FALSE`

NEW_LINE Procedure

This procedure writes one or more line terminators to the file identified by the input file handle. This procedure is separate from PUT because the line terminator is a platform-specific character or sequence of characters.

Syntax

```
UTL_FILE.NEW_LINE (
   file     IN FILE_TYPE,
   lines    IN NATURAL := 1);
```

Parameters

Table 220–20 NEW_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN or FOPEN_NCHAR call
lines	Number of line terminators to be written to the file

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

PUT Procedure

PUT writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. No line terminator is appended by PUT; use NEW_LINE to terminate the line or use PUT_LINE to write a complete line with a line terminator. See also "PUT_NCHAR Procedure" on page 220-33.

Syntax

```
UTL_FILE.PUT (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2);
```

Parameters

Table 220–21 PUT Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for writing.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

PUT_LINE Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. The file must be open for write operations. PUT_LINE terminates the line with the platform-specific line terminator character or characters.

See also "PUT_LINE_NCHAR Procedure" on page 220-32.

Syntax

```
UTL_FILE.PUT_LINE (
   file      IN FILE_TYPE,
   buffer    IN VARCHAR2,
   autoflush IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 220–22 PUT_LINE Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN call
buffer	Text buffer that contains the lines to be written to the file.
autoflush	Flushes the buffer to disk after the WRITE.

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

PUT_LINE_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle. With this function, you can write a text file in Unicode instead of in the database character set. This procedure is equivalent to the PUT_NCHAR Procedure, except that the line separator is appended to the written text. See also PUT_LINE Procedure on page 220-31.

Syntax

```
UTL_FILE.PUT_LINE_NCHAR (
   file    IN FILE_TYPE,
   buffer  IN NVARCHAR2);
```

Parameters

Table 220–23 PUT_LINE_NCHAR Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN_NCHAR` call. The file must be open for writing.
`buffer`	Text buffer that contains the lines to be written to the file

Usage Notes

- The maximum size of the `buffer` parameter is 32767 bytes unless you specify a smaller size in `FOPEN`. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential `PUT` calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.

PUT_NCHAR Procedure

This procedure writes the text string stored in the buffer parameter to the open file identified by the file handle.

With this function, you can write a text file in Unicode instead of in the database character set. The file must be opened in the national character set mode. The text string will be written in the UTF8 character set. The expected buffer datatype is NVARCHAR2. If a variable of another datatype is specified, PL/SQL will perform implicit conversion to NVARCHAR2 before writing the text.

See also PUT Procedure on page 220-30

Syntax

```
UTL_FILE.PUT_NCHAR (
   file      IN FILE_TYPE,
   buffer    IN NVARCHAR2);
```

Parameters

Table 220–24 PUT_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
buffer	Buffer that contains the text to be written to the file. User must have opened the file using mode w or mode a; otherwise, an INVALID_OPERATION exception is raised.

Usage Notes

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

PUTF Procedure

This procedure is a formatted `PUT` procedure. It works like a limited `printf`(). See also PUTF_NCHAR Procedure on page 220-36.

Syntax

```
UTL_FILE.PUTF (
   file    IN FILE_TYPE,
   format  IN VARCHAR2,
   [arg1   IN VARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN VARCHAR2  DEFAULT NULL]);
```

Parameters

Table 220–25 PUTF Procedure Parameters

Parameters	Description
`file`	Active file handle returned by an `FOPEN` call
`format`	Format string that can contain text as well as the formatting characters `\n` and `%s`
`arg1..arg5`	From one to five operational argument strings. Argument strings are substituted, in order, for the `%s` formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each `%s` for which there is no argument.

Usage Notes

- If file is opened for byte mode operations, then the `INVALID OPERATION` exception is raised.
- The format string can contain any text, but the character sequences `%s` and `\n` have special meaning.

Character Sequence	Meaning
`%s`	Substitute this sequence with the string value of the next argument in the argument list.
`\n`	Substitute with the appropriate platform-specific line terminator.

Examples

The following example writes the lines:

```
Hello, world!
I come from Zork with greetings for all earthlings.
```

```
my_world  varchar2(4) := 'Zork';
...
PUTF(my_handle, 'Hello, world!\nI come from %s with %s.\n',
                my_world,
                'greetings for all earthlings');
```

If there are more `%s` formatters in the format parameter than there are arguments, then an empty string is substituted for each `%s` for which there is no matching argument.

Exceptions

```
INVALID_FILEHANDLE
INVALID_OPERATION
WRITE_ERROR
```

PUTF_NCHAR Procedure

This procedure is a formatted version of a PUT_NCHAR Procedure. Using PUTF_NCHAR, you can write a text file in Unicode instead of in the database character set. It accepts a format string with formatting elements \n and %s, and up to five arguments to be substituted for consecutive instances of %s in the format string. The expected datatype of the format string and the arguments is NVARCHAR2.

If variables of another datatype are specified, PL/SQL will perform implicit conversion to NVARCHAR2 before formatting the text. Formatted text is written in the UTF8 character set to the file identified by the file handle. The file must be opened in the national character set mode.

Syntax

```
UTL_FILE.PUTF_NCHAR (
   file    IN FILE_TYPE,
   format  IN NVARCHAR2,
   [arg1   IN NVARCHAR2  DEFAULT NULL,
   . . .
   arg5    IN NVARCHAR2  DEFAULT NULL]);
```

Parameters

Table 220–26 PUTF_NCHAR Procedure Parameters

Parameters	Description
file	Active file handle returned by an FOPEN_NCHAR call. The file must be open for reading (mode r). If the file is opened by FOPEN instead of FOPEN_NCHAR, a CHARSETMISMATCH exception is raised.
format	Format string that can contain text as well as the formatting characters \n and %s
arg1..arg5	From one to five operational argument strings. Argument strings are substituted, in order, for the %s formatters in the format string. If there are more formatters in the format parameter string than there are arguments, then an empty string is substituted for each %s for which there is no argument.

Usage Notes

- The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.
- If file is opened for byte mode operations, then the INVALID OPERATION exception is raised.

PUT_RAW Function

This function accepts as input a RAW data value and writes the value to the output buffer.

Syntax

```
UTL_FILE.PUT_RAW (
   file          IN    UTL_FILE.FILE_TYPE,
   buffer        IN    RAW,
   autoflush     IN    BOOLEAN DEFAULT FALSE);
```

Parameters

Table 220–27 PUT_RAW Procedure Parameters

Parameters	Description
file	File ID.
buffer	The RAW data written to the buffer.
autoflush	If TRUE, performs a flush after writing the value to the output buffer; default is FALSE.

Usage Notes

You can request an automatic flush of the buffer by setting the third argument to TRUE.

The maximum size of the buffer parameter is 32767 bytes unless you specify a smaller size in FOPEN. If unspecified, Oracle supplies a default value of 1024. The sum of all sequential PUT calls cannot exceed 32767 without intermediate buffer flushes.

221

UTL_HTTP

The `UTL_HTTP` package makes Hypertext Transfer Protocol (HTTP) callouts from SQL and PL/SQL. You can use it to access data on the Internet over HTTP.

When the package fetches data from a Web site using HTTPS, it requires Oracle Wallet Manager which can be created by either Oracle Wallet Manager or the orapki utility. Non-HTTPS fetches do not require an Oracle wallet.

Using UTL_HTTP

This section contains topics which relate to using the `UTL_HTTP` package.

- Overview
- Security Model
- Constants
- Datatypes
- Operational Notes
- Exceptions
- Examples

Overview

With the UTL_HTTP package, you can write PL/SQL programs that communicate with Web (HTTP) servers. And UTL_HTTP contains a function that can be used in SQL queries.

The package supports HTTP over the Secured Socket Layer protocol (SSL), also known as HTTPS. It also supports SSL client authentication by sending the client-certificate in a wallet to authenticate with the remote Web server.

Other Internet-related data-access protocols (such as the File Transfer Protocol (FTP) or the Gopher protocol) are also supported using an HTTP proxy server that supports those protocols.

Security Model

This package is an invoker's rights package and the invoking user will need the `connect` privilege granted in the access control list assigned to the remote network host to which he wants to connect, as well as the `use-client-certificates` or the `use-passwords` privilege to authenticate himself with the remote Web server using the credentials stored in an Oracle wallet.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

Constants

The UTL_HTTP package uses the constants shown in following tables.

- UTL_HTTP Constants - HTTP Versions
- UTL_HTTP Constants - Default Ports
- UTL_HTTP Constants - HTTP 1.1 Status Codes

Table 221–1 UTL_HTTP Constants - HTTP Versions

Name	Type	Value	Description
HTTP_VERSION_1_0	VARCHAR2(10)	'HTTP /1.0'	Denotes HTTP version 1.0 that can be used in the function BEGIN_REQUEST.
HTTP_VERSION_1_1	VARCHAR2(10)	'HTTP /1.1'	Denotes HTTP version 1.1 that can be used in the function BEGIN_REQUEST.

Table 221–2 UTL_HTTP Constants - Default Ports

Name	Type	Value	Description
DEFAULT_HTTP_PORT	PLS_INTEGER	80	The default TCP/IP port (80) at which a Web server or proxy server listens
DEFAULT_HTTPS_PORT	PLS_INTEGER	443	The default TCP/IP port (443) at which an HTTPS Web server listens

Table 221–3 UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_CONTINUE	PLS_INTEGER	100	The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server.
HTTP_SWITCHING_ PROTOCOLS	PLS_INTEGER	101	The server understands and is willing to comply with the client's request, through the Upgrade message header field, for a change in the application protocol being used on this connection. The server will switch protocols to those defined by the response's Upgrade header field immediately after the empty line which terminates the 101 response.
HTTP_OK	PLS_INTEGER	200	The request has succeeded. The information returned with the response is dependent on the method used in the request
HTTP_CREATED CONSTANT	PLS_INTEGER	201	The request has been fulfilled and resulted in a new resource being created.
HTTP_ACCEPTED	PLS_INTEGER	202	The request has been accepted for processing, but the processing has not been completed. The request might or might not eventually be acted upon, as it might be disallowed when processing actually takes place.

Table 221–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_NON_ AUTHORITATIVE_INFO	PLS_INTEGER	203	The returned metainformation in the entity-header is not the definitive set as available from the origin server, but is gathered from a local or a third-party copy.
HTTP_NO_CONTENT	PLS_INTEGER	204	The server has fulfilled the request but does not need to return an entity-body, and might want to return updated metainformation.
HTTP_RESET_CONTENT	PLS_INTEGER	205	The server has fulfilled the request and the user agent should reset the document view which caused the request to be sent. The response must not include an entity.
HTTP_PARTIAL_ CONTENT	PLS_INTEGER	206	The server has fulfilled the partial GET request for the resource.
HTTP_MULTIPLE_ CHOICES	PLS_INTEGER	300	The requested resource corresponds to any one of a set of representations, each with its own specific location, and agent-driven negotiation information is being provided so that the user (or user agent) can select a preferred representation and redirect its request to that location.
HTTP_MOVED_ PERMANENTLY	PLS_INTEGER	301	The requested resource has been assigned a new permanent URI and any future references to this resource should use one of the returned URIs.
HTTP_FOUND CONSTANT	PLS_INTEGER	302	The requested resource resides temporarily under a different URI.
HTTP_SEE_OTHER	PLS_INTEGER	303	The response to the request can be found under a different URI and should be retrieved using a GET method on that resource.
HTTP_NOT_MODIFIED	PLS_INTEGER	304	If the client has performed a conditional GET request and access is allowed, but the document has not been modified, the server responds with this status code.
HTTP_USE_PROXY	PLS_INTEGER	305	The requested resource must be accessed through the proxy given by the Location field. The Location field gives the URI of the proxy.
HTTP_TEMPORARY_ REDIRECT	PLS_INTEGER	307	The requested resource resides temporarily under a different URI.
HTTP_BAD_REQUEST	PLS_INTEGER	400	The request could not be understood by the server due to malformed syntax.
HTTP_UNAUTHORIZED	PLS_INTEGER	401	The request requires user authentication. The client may repeat the request with a suitable Authorization header field. If the request already included Authorization credentials, then the 401 response indicates that authorization has been refused for those credentials.
HTTP_PAYMENT_ REQUIRED	PLS_INTEGER	402	This code is reserved for future use.

Table 221–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_FORBIDDEN	PLS_INTEGER	403	The server understood the request, but is refusing to fulfill it.
HTTP_NOT_FOUND	PLS_INTEGER	404	The server has not found anything matching the Request-URI.
HTTP_NOT_ ACCEPTABLE	PLS_INTEGER	406	The resource identified by the request is only capable of generating response entities which have content characteristics not acceptable according to the accept headers sent in the request.
HTTP_PROXY_AUTH_ REQUIRED	PLS_INTEGER	407	This code is similar to 401 (Unauthorized), but indicates that the client must first authenticate itself with the proxy.
HTTP_REQUEST_TIME_ OUT	PLS_INTEGER	408	The client did not produce a request within the time that the server was prepared to wait.
HTTP_CONFLICT	PLS_INTEGER	409	The request could not be completed due to a conflict with the current state of the resource.
HTTP_GONE	PLS_INTEGER	410	The requested resource is no longer available at the server and no forwarding address is known.
HTTP_LENGTH_ REQUIRED	PLS_INTEGER	411	The server refuses to accept the request without a defined `Content-Length`.
HTTP_PRECONDITION_ FAILED	PLS_INTEGER	412	The precondition given in one or more of the request-header fields evaluated to false when it was tested on the server.
HTTP_REQUEST_ ENTITY_TOO_LARGE CONSTANT	PLS_INTEGER	413	The server is refusing to process a request because the request entity is larger than the server is willing or able to process.
HTTP_REQUEST_URI_ TOO_LARGE	PLS_INTEGER	414	The server is refusing to service the request because the Request-URI is longer than the server is willing to interpret.
HTTP_UNSUPPORTED_ MEDIA_TYPE	PLS_INTEGER	415	The server is refusing to service the request because the entity of the request is in a format not supported by the requested resource for the requested method.
HTTP_REQ_RANGE_ NOT_SATISFIABLE	PLS_INTEGER	416	A server returns a response with this status code if a request included a Range request-header field, and none of the range-specifier values in this field overlap the current extent of the selected resource, and the request did not include an If-Range request-header field.
HTTP_EXPECTATION_ FAILED	PLS_INTEGER	417	The expectation given in an Expect request-header field could not be met by this server, or, if the server is a proxy, the server has unambiguous evidence that the request could not be met by the next-hop server.

Table 221–3 (Cont.) UTL_HTTP Constants - HTTP 1.1 Status Codes

Name	Type	Value	Description
HTTP_NOT_IMPLEMENTED	PLS_INTEGER	501	The server does not support the functionality required to fulfill the request.
HTTP_BAD_GATEWAY	PLS_INTEGER	502	The server, while acting as a gateway or proxy, received an invalid response from the upstream server it accessed in attempting to fulfill the request
HTTP_SERVICE_UNAVAILABLE	PLS_INTEGER	503	The server is currently unable to handle the request due to a temporary overloading or maintenance of the server.
HTTP_GATEWAY_TIME_OUT	PLS_INTEGER	504	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the URI (for example, HTTP, FTP, LDAP) or some other auxiliary server (for example, DNS) it needed to access in attempting to complete the request.
HTTP_VERSION_NOT_SUPPORTED	PLS_INTEGER	505	The server does not support, or refuses to support, the HTTP protocol version that was used in the request message.

Datatypes

- REQ Type
- RESP Type
- COOKIE and COOKIE_TABLE Types
- CONNECTION Type
- REQUEST_CONTEXT_KEY Type

REQ Type

Use this PL/SQL record type to represent an HTTP request.

Syntax

```
TYPE req IS RECORD (
   url           VARCHAR2(32767),
   method        VARCHAR2(64),
   http_version  VARCHAR2(64));
```

Parameters

Table 221–4 REQ Type Parameters

Parameter	Description
`url`	The URL of the HTTP request. It is set after the request is created by `BEGIN_REQUEST`.
`method`	The method to be performed on the resource identified by the URL. It is set after the request is created by `BEGIN_REQUEST`.
`http_version`	The HTTP protocol version used to send the request. It is set after the request is created by `BEGIN_REQUEST`.

Usage Notes

The information returned in `REQ` from the interface `begin_request` is for read-only. Changing the field values in the record has no effect on the request.

There are other fields in `REQ` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

REQUEST_CONTEXT_KEY Type

This type is used to represent the key to a request context. A request context is a context that holds a private wallet and cookie table to make a HTTP request. This private wallet and cookie table, unlike the session-wide ones maintained in the package, will not be shared with other HTTP requests within the database session.

Syntax

```
SUBTYPE request_context_key IS PLS_INTEGER;
```

Usage Notes

To provide enhanced security, `UTL_HTTP` allows PL/SQL programs to create request contexts. A request context is a private context that holds a wallet and a cookie table that will not be shared with other programs in the same database session when

making HTTP requests and receiving HTTP responses. PL/SQL programs should use request contexts when they need to use wallets or cookies that contain sensitive information such as authentication credentials.

RESP Type

This PL/SQL record type is used to represent an HTTP response.

Syntax

```
TYPE resp IS RECORD (
   status_code    PLS_INTEGER,
   reason_phrase  VARCHAR2(256),
   http_version   VARCHAR2(64));
```

Parameters

Table 221–5 RESP Type Parameters

Parameter	Description
`status_code`	The status code returned by the Web server. It is a 3-digit integer that indicates the results of the HTTP request as handled by the Web server. It is set after the response is processed by `GET_RESPONSE`.
`reason_phrase`	The short textual message returned by the Web server that describe the status code. It gives a brief description of the results of the HTTP request as handled by the Web server. It is set after the response is processed by `GET_RESPONSE`.
`http_version`	The HTTP protocol version used in the HTTP response. It is set after the response is processed by `GET_RESPONSE`.

Usage Notes

The information returned in `RESP` from the interface `GET_RESPONSE` is read-only. There are other fields in the `RESP` record type whose names begin with the prefix `private_`. The fields are private and are intended for use by implementation of the `UTL_HTTP` package. You should not modify the fields.

COOKIE and COOKIE_TABLE Types

The `COOKIE` type is the PL/SQL record type that represents an HTTP cookie. The `COOKIE_TABLE` type is a PL/SQL index-by-table type that represents a collection of HTTP cookies.

Syntax

```
TYPE cookie IS RECORD (
   name  VARCHAR2(256),
   value  VARCHAR2(1024),
   domain  VARCHAR2(256),
   expire  TIMESTAMP WITH TIME ZONE,
   path  VARCHAR2(1024),
   secure  BOOLEAN,
   version  PLS_INTEGER,
   comment  VARCHAR2(1024));

TYPE cookie_table IS TABLE OF cookie INDEX BY binary_integer;
```

Fields of COOKIE Record Type

Table 221–6 shows the fields for the COOKIE and COOKIE_TABLE record types.

Table 221–6 Fields of COOKIE and COOKIE_TABLE Type

Field	Description
name	The name of the HTTP cookie
value	The value of the cookie
domain	The domain for which the cookie is valid
expire	The time by which the cookie will expire
path	The subset of URLs to which the cookie applies
secure	Should the cookie be returned to the Web server using secured means only.
version	The version of the HTTP cookie specification the cookie conforms. This field is NULL for Netscape cookies.
comment	The comment that describes the intended use of the cookie. This field is NULL for Netscape cookies.

Usage Notes

PL/SQL programs do not usually examine or change the cookie information stored in the UTL_HTTP package. The cookies are maintained by the package transparently. They are maintained inside the UTL_HTTP package, and they last for the duration of the database session only. PL/SQL applications that require cookies to be maintained beyond the lifetime of a database session can read the cookies using GET_COOKIES, store them persistently in a database table, and re-store the cookies back in the package using ADD_COOKIES in the next database session. All the fields in the cookie record, except for the comment field, must be stored. Do not alter the cookie information, which can result in an application error in the Web server or compromise the security of the PL/SQL and the Web server applications. See "Retrieving and Restoring Cookies" on page 221-22.

CONNECTION Type

Use the PL/SQL record type to represent the remote hosts and TCP/IP ports of a network connection that is kept persistent after an HTTP request is completed, according to the HTTP 1.1 protocol specification. The persistent network connection may be reused by a subsequent HTTP request to the same host and port. The subsequent HTTP request may be completed faster because the network connection latency is avoided. connection_table is a PL/SQL table of connection.

For a direct HTTP persistent connection to a Web server, the host and port fields contain the host name and TCP/IP port number of the Web server. The proxy_host and proxy_port fields are not set. For an HTTP persistent connection that was previously used to connect to a Web server using a proxy, the proxy_host and proxy_port fields contain the host name and TCP/IP port number of the proxy server. The host and port fields are not set, which indicates that the persistent connection, while connected to a proxy server, is not bound to any particular target Web server. An HTTP persistent connection to a proxy server can be used to access any target Web server that is using a proxy.

The SSL field indicates if Secured Socket Layer (SSL) is being used in an HTTP persistent connection. An HTTPS request is an HTTP request made over SSL. For an HTTPS (SSL) persistent connection connected using a proxy, the host and port fields contain the host name and TCP/IP port number of the target HTTPS Web server and

the fields will always be set. An HTTPS persistent connection to an HTTPS Web server using a proxy server can only be reused to make another request to the same target Web server.

Syntax

```
TYPE connection IS RECORD (
   host  VARCHAR2(256),
   port  PLS_INTEGER,
   proxy_host  VARCHAR2(256),
   proxy_port  PLS_INTEGER,
   ssl  BOOLEAN);

TYPE connection_table IS TABLE OF connection INDEX BY BINARY_INTEGER;
```

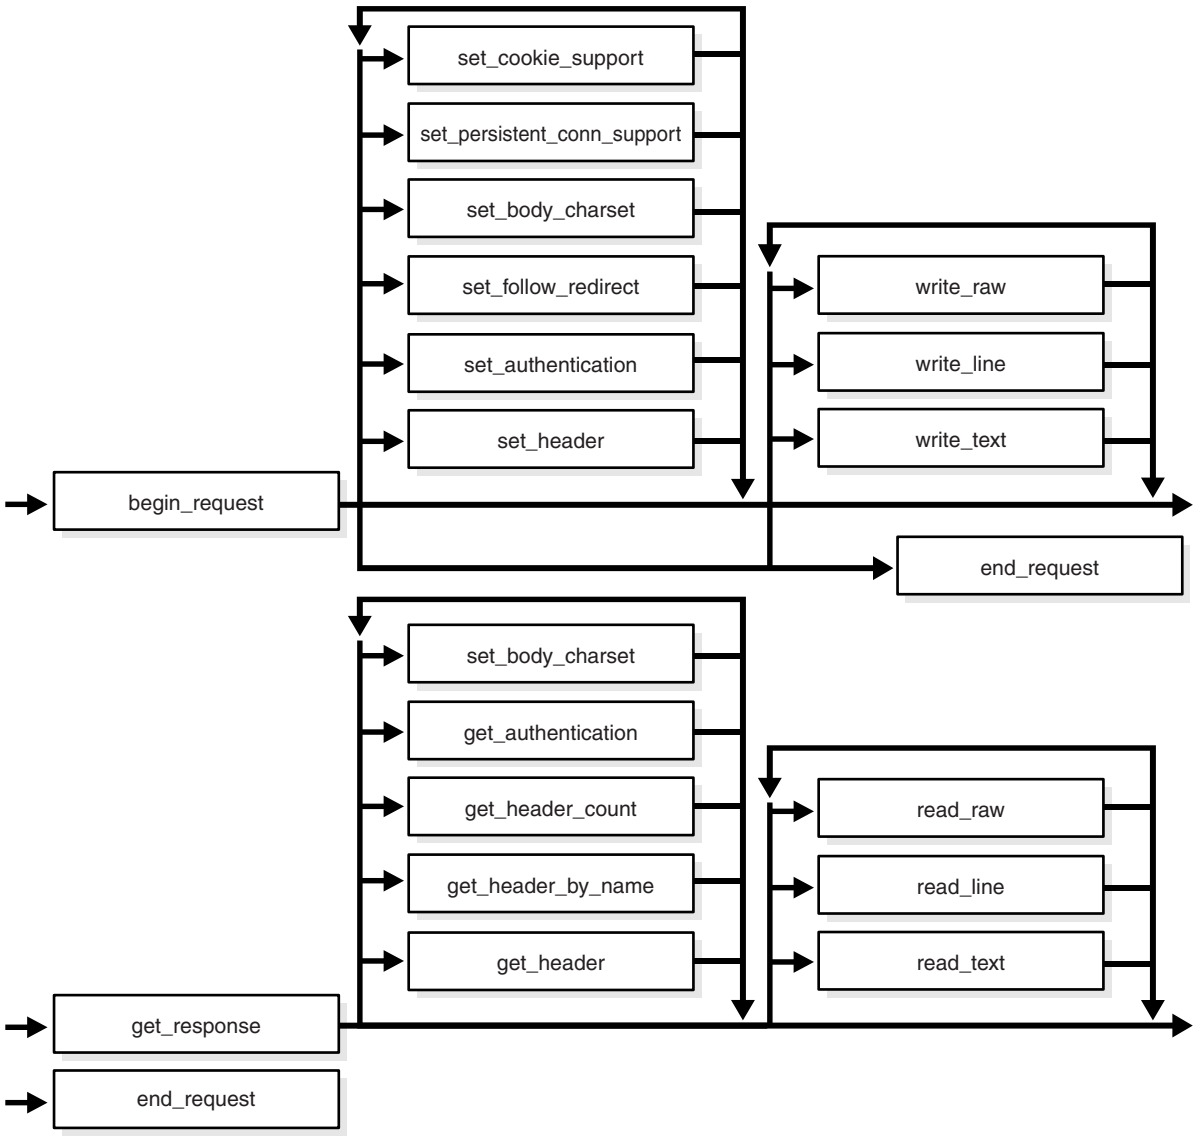
- Request Context
- External Password Store

Operational Flow

The `UTL_HTTP` package provides access to the HTTP protocol. The interfaces must be called in the order shown in Figure 221–1, or an exception will be raised.

Figure 221–1 Flow of the Core UTL_HTTP Package



This illustration describes execution flow in UTL_HTTP that has two phases: (1) beginning with "begin_request" and ending with "end_request", (2) beginning with "get_response" and ending with with "end_response". Key to the symbols used:

- ... -> denotes "continue to next step", for example, "begin_request" -> "get_response"
- ... material enclosed in double quotation marks denotes an action, for example "PARSE"
- ... material enclosed in single qutotation marks denotes a choice point, for example, 'perform pre-response set operations': Yes/No
- ... material unenclosed denotes a choice of direction, for example, Yes

---

PHASE #1.

- "begin_request" -> 'perform pre-response set operations': Yes/No
  - 'perform set operations': Yes -> "set_cookie_support" (optional with option to repeat multiple times) -> "set_persistent_conn_support" (optional with option to repeat multiple times)-> "set_body_charset" (optional with option to repeat multiple times) -> "set_follow_redirect" (optional with option to repeat multiple times) ->"set_authentication" (optional with option to repeat multiple times) -> "set_header" (optional with option to repeat multiple times) -> 'perform pre-response write operations':Yes/No
  - 'perform set operations': No -> 'perform write operations':Yes/No
- 'perform pre-response write operations':Yes -> "write_raw" (optional with option to repeat multiple times) -> "write_line" (optional with option to repeat multiple times) -> "write_text" (optional with option to repeat multiple times) -> "end_request"
- 'perform pre-response write operations': No -> "end_request"

PHASE #2.

- "get_response" -> 'perform get operations': Yes/No
  - 'perform get operations': Yes -> "set_body_charset" (optional with option to repeat multiple times) -> "get_authentication" (optional with option to repeat multiple times) -> "get_header_count" (optional with option to repeat multiple times) ->"get_header_by_name" (optional with option to repeat multiple times) -> 'peform read operations':Yes/No
  - 'perform get operations': No -> 'peform read operations':Yes/No
- 'peform read operations':Yes -> "read_raw" (optional with option to repeat multiple times) ->"read_line" (optional with option to repeat multiple times) -> "read_text" (optional with option to repeat multiple times) -> end_response
- 'peform read operations':No -> end_response

****

The following can be called at any time:

- Non-protocol interfaces that manipulate cookies
  - `GET_COOKIE_COUNT`
  - `GET_COOKIES`
  - `ADD_COOKIES`
  - `CLEAR_COOKIES`
- Persistent connections
  - `GET_PERSISTENT_CONN_COUNT`
  - `GET_PERSISTENT_CONNS`
  - `CLOSE_PERSISTENT_CONN`
  - `CLOSE_PERSISTENT_CONNS`
- Interfaces that manipulate attributes and configurations of the `UTL_HTTP` package in the current session
  - `SET_PROXY`
  - `GET_PROXY`

  - SET_COOKIE_SUPPORT
  - GET_COOKIE_SUPPORT
  - SET_FOLLOW_REDIRECT
  - GET_FOLLOW_REDIRECT
  - SET_BODY_CHARSET
  - GET_BODY_CHARSET
  - SET_PERSISTENT_CONN_SUPPORT
  - GET_PERSISTENT_CONN_SUPPORT
  - SET_DETAILED_EXCP_SUPPORT
  - GET_DETAILED_EXCP_SUPPORT
  - SET_WALLET
  - SET_TRANSFER_TIMEOUT
  - GET_TRANSFER_TIMEOUT
- Interfaces that retrieve the last detailed exception code and message UTL_HTTP package in the current session
  - GET_DETAILED_SQLCODE
  - GET_DETAILED_SQLERRM

NOTE: Some of the request and response interfaces bear the same name as the interface that manipulates the attributes and configurations of the package in the current session. They are overloaded versions of the interface that manipulate a request or a response.

Simple HTTP Fetches

REQUEST and REQUEST_PIECES take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

You should not expect REQUEST or REQUEST_PIECES to succeed in contacting a URL unless you can contact that URL by using a browser on the same machine (and with the same privileges, environment variables, and so on.)

If REQUEST or REQUEST_PIECES fails (for example, if it raises an exception, or if it returns an HTML-formatted error message, but you believe that the URL argument is correct), then try contacting that same URL with a browser to verify network availability from your machine. You may have a proxy server set in your browser that needs to be set with each REQUEST or REQUEST_PIECES call using the optional proxy parameter.

Note: UTL_HTTP can also use environment variables to specify its proxy behavior. For example, on UNIX, setting the environment variable http_proxy to a URL uses that service as the proxy server for HTTP requests. Setting the environment variable no_proxy to a domain name does not use the HTTP proxy server for URLs in that domain. When the UTL_HTTP package is executed in the Oracle database server, the environment variables are the ones that are set when the database instance is started.

See Also: Simple HTTP Fetches in a Single Call Subprograms on page 221-26

HTTP Requests

The HTTP Requests group of subprograms begin an HTTP request, manipulate attributes, and send the request information to the Web server. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout of the current session. The settings can be changed by calling the request interface.

See Also: HTTP Requests Subprograms on page 221-28

HTTP Responses

The HTTP Responses group of subprograms manipulate an HTTP response obtained from GET_RESPONSE and receive response information from the Web server. When a response is created for a request, it inherits settings of the HTTP cookie support, follow-redirect, body character set, persistent-connection support, and transfer timeout from the request. Only the body character set can be changed by calling the response interface.

See Also: HTTP Responses Subprograms on page 221-30

HTTP Cookies

The UTL_HTTP package provides subprograms to manipulate HTTP cookies.

See Also: HTTP Cookies Subprograms on page 221-31

HTTP Persistent Connections

The UTL_HTTP package provides subprograms to manipulate persistent connections.

See Also: HTTP Persistent Connections Subprograms on page 221-32

Error Conditions

The UTL_HTTP package provides subprograms to retrieve error information.

See Also: Error Conditions Subprograms on page 221-33

Session Settings

Session settings manipulate the configuration and default behavior of UTL_HTTP when HTTP requests are executed within a database user session. When a request is created, it inherits the default settings of the HTTP cookie support, follow-redirect,

body character set, persistent-connection support, and transfer timeout of the current session. Those settings can be changed later by calling the request interface. When a response is created for a request, it inherits those settings from the request. Only the body character set can be changed later by calling the response interface.

See Also: Session Settings Subprograms on page 221-27

Request Context

The `UTL_HTTP` package maintains a common wallet and cookie table within the database session that all HTTP requests and responses share. This makes it easy for users to share the wallet or to maintain application state in the cookies within the session. However, if an application stores private information in the wallet or in the cookies that it does not want to share with other applications in the same database session, it may define a request context to hold its own wallet and cookie table and use this request context to make HTTP requests.

See Also: HTTP Requests Subprograms on page 221-28

External Password Store

The `UTL_HTTP` package allows HTTP password credentials to be stored in an Oracle wallet's external password store. The external password store provides an easy but secure storage for passwords and frees the application developers from the need to maintain their own storage.

See Also: SET_AUTHENTICATION_FROM_WALLET Procedure on page 221-79

Exceptions

Table 221–7 lists the exceptions that the UTL_HTTP package interface can raise. By default, UTL_HTTP raises the exception request_failed when a request fails to execute. If the package is set to raise a detailed exception by set_detailed_excp_support, the rest of the exceptions will be raised directly (except for the exception end_of_body, which will be raised by READ_TEXT, READ_LINE, and READ_RAW regardless of the setting).

Table 221–7 UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
BAD_ARGUMENT	29261	The argument passed to the interface is bad	Any HTTP request or response interface when detailed_exception is enabled
BAD_URL	29262	The requested URL is badly formed	BEGIN_REQUEST, when detailed_exception is enabled
END_OF_BODY	29266	The end of HTTP response body is reached	READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled
HEADER_NOT_FOUND	29265	The header is not found	GET_HEADER, GET_HEADER_BY_NAME, when detailed_exception is enabled
HTTP_CLIENT_ERROR	29268	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 4xx range). Or from begin_request, the HTTP proxy returns a status code in the 4xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled
HTTP_SERVER_ERROR	29269	From GET_RESPONSE, the response status code indicates that a client error has occurred (status code in 5xx range). Or from begin_request, the HTTP proxy returns a status code in the 5xx range when making an HTTPS request through the proxy.	GET_RESPONSE, BEGIN_REQUEST when detailed_exception is enabled
NETWORK_ACCESS_DENIED	24247	Access to the remote network host or credentials in an Oracle wallet is denied	BEGIN_REQUEST and SET_AUTHENTICATION_FROM_WALLET when detailed_exception is enabled
ILLEGAL_CALL	29267	The call to UTL_HTTP is illegal at the current state of the HTTP request	SET_HEADER, SET_AUTHENTICATION, and SET_PERSISTENT_CONN_SUPPORT, when detailed_exception is enabled
PARTIAL_MULTIBYTE_EXCEPTION	29275	No complete character is read and a partial multibyte character is found at the end of the response body	READ_TEXT and READ_LINE, when detailed_exception is enabled
PROTOCOL_ERROR	29263	An HTTP protocol error occurs when communicating with the Web server	SET_HEADER, GET_RESPONSE, READ_RAW, READ_TEXT, and READ_LINE, when detailed_exception is enabled

Table 221–7 (Cont.) UTL_HTTP Exceptions

Exception	Error Code	Reason	Where Raised
REQUEST_FAILED	29273	The request fails to executes	Any HTTP request or response interface when detailed_exception is disabled
TOO_MANY_REQUESTS	29270	Too many requests or responses are open	BEGIN_REQUEST, when detailed_exception is enabled
TRANSFER_TIMEOUT	29276	No data is read and a read timeout occurred	READ_TEXT and READ_LINE, when detailed_exception is enabled
UNKNOWN_SCHEME	29264	The scheme of the requested URL is unknown	BEGIN_REQUEST and GET_RESPONSE, when detailed_exception is enabled

NOTE: The partial_multibyte_char and transfer_timeout exceptions are duplicates of the same exceptions defined in UTL_TCP. They are defined in this package so that the use of this package does not require the knowledge of the UTL_TCP. As those exceptions are duplicates, an exception handle that catches the partial_multibyte_char and transfer_timeout exceptions in this package also catch the exceptions in the UTL_TCP.

For REQUEST and REQUEST_PIECES, the request_failed exception is raised when any exception occurs and detailed_exception is disabled.

Examples

The following examples demonstrate how to use UTL_HTTP.

- General Usage
- Retrieving HTTP Response Headers
- Handling HTTP Authentication
- Retrieving and Restoring Cookies
- Making HTTP Request with Private Wallet and Cookie Table

General Usage

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  LOOP
    UTL_HTTP.READ_LINE(resp, value, TRUE);
    DBMS_OUTPUT.PUT_LINE(value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
EXCEPTION
  WHEN UTL_HTTP.END_OF_BODY THEN
    UTL_HTTP.END_RESPONSE(resp);
END;
```

Retrieving HTTP Response Headers

```
SET SERVEROUTPUT ON SIZE 40000

DECLARE
  req   UTL_HTTP.REQ;
  resp  UTL_HTTP.RESP;
  name  VARCHAR2(256);
  value VARCHAR2(1024);
BEGIN
  UTL_HTTP.SET_PROXY('proxy.my-company.com', 'corp.my-company.com');
  req := UTL_HTTP.BEGIN_REQUEST('http://www-hr.corp.my-company.com');
  UTL_HTTP.SET_HEADER(req, 'User-Agent', 'Mozilla/4.0');
  resp := UTL_HTTP.GET_RESPONSE(req);
  DBMS_OUTPUT.PUT_LINE('HTTP response status code: ' || resp.status_code);
  DBMS_OUTPUT.PUT_LINE('HTTP response reason phrase: ' || resp.reason_phrase);
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);
  END LOOP;
  UTL_HTTP.END_RESPONSE(resp);
END;
```

Handling HTTP Authentication

```
SET serveroutput ON SIZE 40000

CREATE OR REPLACE PROCEDURE get_page (url      IN VARCHAR2,
                                      username IN VARCHAR2 DEFAULT NULL,
                                      password IN VARCHAR2 DEFAULT NULL,
                                      realm    IN VARCHAR2 DEFAULT NULL) AS
  req       UTL_HTTP.REQ;
  resp      UTL_HTTP.RESP;
  my_scheme VARCHAR2(256);
  my_realm  VARCHAR2(256);
  my_proxy  BOOLEAN;
BEGIN
  -- Turn off checking of status code. We will check it by ourselves.
  UTL_HTTP.HTTP_RESPONSE_ERROR_CHECK(FALSE);
  req := UTL_HTTP.BEGIN_REQUEST(url);
  IF (username IS NOT NULL) THEN
    UTL_HTTP.SET_AUTHENTICATION(req, username, password); -- Use HTTP Basic
Authen. Scheme
  END IF;
  resp := UTL_HTTP.GET_RESPONSE(req);
  IF (resp.status_code = UTL_HTTP.HTTP_UNAUTHORIZED) THEN
    UTL_HTTP.GET_AUTHENTICATION(resp, my_scheme, my_realm, my_proxy);
    IF (my_proxy) THEN
       DBMS_OUTPUT.PUT_LINE('Web proxy server is protected.');
       DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the proxy
server.');
    ELSE
      DBMS_OUTPUT.PUT_LINE('Web page ' || url || ' is protected.');
      DBMS_OUTPUT.PUT('Please supplied the required ' || my_scheme || '
authentication username/password for realm ' || my_realm || ' for the Web page.');
    END IF;
    UTL_HTTP.END_RESPONSE(resp);
    RETURN;
  END IF;
  FOR i IN 1..UTL_HTTP.GET_HEADER_COUNT(resp) LOOP
    UTL_HTTP.GET_HEADER(resp, i, name, value);
    DBMS_OUTPUT.PUT_LINE(name || ': ' || value);

Subprogram Groups

UTL_HTTP subprograms are grouped by function:

- Simple HTTP Fetches in a Single Call Subprograms
- Session Settings Subprograms
- HTTP Requests Subprograms
- HTTP Request Contexts Subprograms
- HTTP Responses Subprograms
- HTTP Cookies Subprograms
- HTTP Persistent Connections Subprograms
- Error Conditions Subprograms

Simple HTTP Fetches in a Single Call Subprograms

`REQUEST` and `REQUEST_PIECES` take a string uniform resource locator (URL), contact that site, and return the data (typically HTML) obtained from that site.

Table 221–8 UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

Subprogram	Description
REQUEST Function on page 221-73	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.
REQUEST_PIECES Function on page 221-75	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL

Session Settings Subprograms

Table 221–9 UTL_HTTP Subprograms—Session Settings

Subprogram	Description
GET_BODY_CHARSET Procedure on page 221-51	Retrieves the default character set of the body of all future HTTP requests
GET_COOKIE_SUPPORT Procedure on page 221-53	Retrieves the current cookie support settings
GET_DETAILED_EXCP_SUPPORT Procedure on page 221-55	Checks if the `UTL_HTTP` package will raise a detailed exception or not
GET_FOLLOW_REDIRECT Procedure on page 221-58	Retrieves the follow-redirect setting in the current session
GET_PERSISTENT_CONN_SUPPORT Procedure on page 221-63	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session
GET_PROXY Procedure on page 221-65	Retrieves the current proxy settings
GET_RESPONSE_ERROR_CHECK Procedure on page 221-67	Checks if the response error check is set or not
GET_TRANSFER_TIMEOUT Procedure on page 221-68	Retrieves the current network transfer timeout value
SET_TRANSFER_TIMEOUT Procedure on page 221-92	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures on page 221-83	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session
SET_DETAILED_EXCP_SUPPORT Procedure on page 221-85	Sets the `UTL_HTTP` package to raise a detailed exception
SET_FOLLOW_REDIRECT Procedures on page 221-86	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP responses to future requests in the `GET_RESPONSE` function
SET_PERSISTENT_CONN_SUPPORT Procedure on page 221-88	Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session
SET_PROXY Procedure on page 221-90	Sets the proxy to be used for requests of HTTP or other protocols
SET_RESPONSE_ERROR_CHECK Procedure on page 221-91	Sets whether or not `GET_RESPONSE` raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges
SET_TRANSFER_TIMEOUT Procedure on page 221-92	Sets the timeout value for `UTL_HTTP` to read the HTTP response from the Web server or proxy server
SET_WALLET Procedure on page 221-93	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS

HTTP Requests Subprograms

Table 221–10 UTL_HTTP Subprograms—HTTP Requests

Subprogram	Description
BEGIN_REQUEST Function on page 221-39	Begins a new HTTP request.`UTL_HTTP` establishes the network connection to the target Web server or the proxy server and sends the HTTP request line.
SET_HEADER Procedure on page 221-87	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.
SET_AUTHENTICATION Procedure on page 221-78	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.
SET_AUTHENTICATION_FROM_ WALLET Procedure on page 221-79	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.
SET_BODY_CHARSET Procedures on page 221-81	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header
SET_COOKIE_SUPPORT Procedures on page 221-83	Enables or disables support for the HTTP cookies in the request
SET_FOLLOW_REDIRECT Procedures on page 221-86	Sets the maximum number of times `UTL_HTTP` follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE Function on page 221-66
SET_PERSISTENT_CONN_SUPPORT Procedure on page 221-88	Enables or disables support for the HTTP 1.1 persistent-connection in the request
SET_PROXY Procedure on page 221-90	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in `UTL_TCP`)
WRITE_RAW Procedure on page 221-95	Writes some binary data in the HTTP request body
WRITE_TEXT Procedure on page 221-96	Writes some text data in the HTTP request body

HTTP Request Contexts Subprograms

Table 221–11 UTL_HTTP Subprograms—HTTP Request Contexts

Subprogram	Description
CREATE_REQUEST_CONTEXT Function on page 221-45	Creates a request context in `UTL_HTTP` for a wallet and a cookie table
DESTROY_REQUEST_CONTEXT Procedure on page 221-47	Destroys a request context in `UTL_HTTP`

HTTP Responses Subprograms

Table 221–12 UTL_HTTP Subprograms—HTTP Responses

Subprogram	Description
END_RESPONSE Procedure on page 221-49	Ends the HTTP response. It completes the HTTP request and response.
GET_AUTHENTICATION Procedure on page 221-50	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header
GET_HEADER Procedure on page 221-59	Returns the n^{th} HTTP response header name and value returned in the response
GET_HEADER_BY_NAME Procedure on page 221-60	Returns the HTTP response header value returned in the response given the name of the header
GET_HEADER_COUNT Function on page 221-61	Returns the number of HTTP response headers returned in the response
GET_RESPONSE Function on page 221-66	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed.
READ_LINE Procedure on page 221-69	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer
READ_RAW Procedure on page 221-70	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer
READ_TEXT Procedure on page 221-71	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer
SET_BODY_CHARSET Procedures on page 221-81	Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header

HTTP Cookies Subprograms

Table 221–13 UTL_HTTP Subprograms—HTTP Cookies

Subprogram	Description
ADD_COOKIES Procedure on page 221-38	Add the cookies either to a request context or to the UTL_HTTP package's session state
CLEAR_COOKIES Procedure on page 221-41	Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state
GET_COOKIE_COUNT Function on page 221-52	Returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session states
GET_COOKIES Function on page 221-54	Returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

HTTP Persistent Connections Subprograms

Table 221–14 UTL_HTTP Subprograms—HTTP Persistent Connections

Subprogram	Description
CLOSE_PERSISTENT_CONN Procedure on page 221-42	Closes an HTTP persistent connection maintained by the `UTL_HTTP` package in the current database session
CLOSE_PERSISTENT_CONNS Procedure on page 221-43	Closes a group of HTTP persistent connections maintained by the `UTL_HTTP` package in the current database session
GET_PERSISTENT_CONN_COUNT Function on page 221-62	Returns the number of network connections currently kept persistent by the `UTL_HTTP` package to the Web servers
GET_PERSISTENT_CONNS Procedure on page 221-64	Returns all the network connections currently kept persistent by the `UTL_HTTP` package to the Web servers

Error Conditions Subprograms

Table 221–15 UTL_HTTP Subprograms—Error Conditions

Subprogram	Description
GET_DETAILED_SQLCODE Function on page 221-56	Retrieves the detailed SQLCODE of the last exception raised
GET_DETAILED_SQLERRM Function on page 221-57	Retrieves the detailed SQLERRM of the last exception raised

Summary of UTL_HTTP Subprograms

Table 221–16 UTL_HTTP Package Subprograms

Subprogram	Description	Group
ADD_COOKIES Procedure on page 221-38	Add the cookies either to a request context or to the UTL_HTTP package's session state	HTTP Cookies Subprograms on page 221-31
BEGIN_REQUEST Function on page 221-39	Begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line	HTTP Requests Subprograms on page 221-28
CLEAR_COOKIES Procedure on page 221-41	Clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state	HTTP Cookies Subprograms on page 221-31
CLOSE_PERSISTENT_CONN Procedure on page 221-42	Closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms on page 221-32
CLOSE_PERSISTENT_CONNS Procedure on page 221-43	Closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session	HTTP Persistent Connections Subprograms on page 221-32
CREATE_REQUEST_ CONTEXT Function on page 221-45	Creates a request context in UTL_HTTP for a wallet and a cookie table	HTTP Requests Subprograms on page 221-28
DESTROY_REQUEST_ CONTEXT Procedure on page 221-47	Destroys a request context in UTL_HTTP for a wallet and a cookie table	HTTP Requests Subprograms on page 221-28
END_REQUEST Procedure on page 221-48	Ends the HTTP request	HTTP Requests Subprograms on page 221-28
END_RESPONSE Procedure on page 221-49	Ends the HTTP response. It completes the HTTP request and response	HTTP Responses Subprograms on page 221-30
GET_AUTHENTICATION Procedure on page 221-50	Retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header	HTTP Responses Subprograms on page 221-30
GET_BODY_CHARSET Procedure on page 221-51	Retrieves the default character set of the body of all future HTTP requests	Session Settings Subprograms on page 221-27
GET_COOKIE_COUNT Function on page 221-52	Returns the number of cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms on page 221-31
GET_COOKIE_SUPPORT Procedure on page 221-53	Retrieves the current cookie support settings	Session Settings Subprograms on page 221-27
GET_COOKIES Function on page 221-54	Returns all the cookies currently maintained by the UTL_HTTP package set by all Web servers	HTTP Cookies Subprograms on page 221-31

Table 221–16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_DETAILED_EXCP_SUPPORT Procedure on page 221-55	Checks if the UTL_HTTP package will raise a detailed exception or not	Session Settings Subprograms on page 221-27
GET_DETAILED_SQLCODE Function on page 221-56	Retrieves the detailed SQLCODE of the last exception raised	Error Conditions Subprograms on page 221-33
GET_DETAILED_SQLERRM Function on page 221-57	Retrieves the detailed SQLERRM of the last exception raised	Error Conditions Subprograms on page 221-33
GET_FOLLOW_REDIRECT Procedure on page 221-58	Retrieves the follow-redirect setting in the current session	Session Settings Subprograms on page 221-27
GET_HEADER Procedure on page 221-59	Returns the n^{th} HTTP response header name and value returned in the response	HTTP Responses Subprograms on page 221-30
GET_HEADER_BY_NAME Procedure on page 221-60	Returns the HTTP response header value returned in the response given the name of the header	HTTP Responses Subprograms on page 221-30
GET_HEADER_COUNT Function on page 221-61	Returns the number of HTTP response headers returned in the response	HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30
GET_PERSISTENT_CONN_COUNT Function on page 221-62	Returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers	HTTP Persistent Connections Subprograms on page 221-32
GET_HEADER_COUNT Function on page 221-61	Sees whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session	Session Settings Subprograms on page 221-27
GET_PERSISTENT_CONN_SUPPORT Procedure on page 221-63	Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session (see Session Settings Subprograms on page 221-27)	HTTP Persistent Connections Subprograms on page 221-32
GET_PERSISTENT_CONNS Procedure on page 221-64	Returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers	HTTP Persistent Connections Subprograms on page 221-32
GET_PROXY Procedure on page 221-65	Retrieves the current proxy settings	Session Settings Subprograms on page 221-27
GET_RESPONSE Function on page 221-66	Reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed	HTTP Responses Subprograms on page 221-30
GET_RESPONSE_ERROR_CHECK Procedure on page 221-67	Checks if the response error check is set or no	Session Settings Subprograms on page 221-27

Table 221–16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
GET_TRANSFER_TIMEOUT Procedure on page 221-68	Retrieves the current network transfer timeout value	Session Settings Subprograms on page 221-27
READ_LINE Procedure on page 221-69	Reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 221-30
READ_RAW Procedure on page 221-70	Reads the HTTP response body in binary form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 221-30
READ_TEXT Procedure on page 221-71	Reads the HTTP response body in text form and returns the output in the caller-supplied buffer	HTTP Responses Subprograms on page 221-30
REQUEST Function on page 221-73	Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.	Simple HTTP Fetches in a Single Call Subprograms on page 221-26
REQUEST_PIECES Function on page 221-75	Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL	Simple HTTP Fetches in a Single Call Subprograms on page 221-26
SET_AUTHENTICATION Procedure on page 221-78	Sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.	HTTP Requests Subprograms on page 221-28
SET_AUTHENTICATION_ FROM_WALLET Procedure on page 221-79	Sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.	HTTP Requests Subprograms on page 221-28
SET_BODY_CHARSET Procedures on page 221-81	Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header	Session Settings Subprograms on page 221-27
SET_BODY_CHARSET Procedures on page 221-81	Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header	HTTP Requests Subprograms on page 221-28
SET_BODY_CHARSET Procedures on page 221-81	Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header	HTTP Responses Subprograms and Session Settings Subprograms on page 221-27
SET_COOKIE_SUPPORT Procedures on page 221-83	Enables or disables support for the HTTP cookies in the request	HTTP Requests Subprograms on page 221-28
SET_DETAILED_EXCP_ SUPPORT Procedure on page 221-85	Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session	Session Settings Subprograms on page 221-27

Table 221–16 (Cont.) UTL_HTTP Package Subprograms

Subprogram	Description	Group
SET_DETAILED_EXCP_SUPPORT Procedure on page 221-85	Sets the UTL_HTTP package to raise a detailed exception	Session Settings Subprograms on page 221-27
SET_FOLLOW_REDIRECT Procedures on page 221-86	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request in the GET_RESPONSE function	HTTP Requests Subprograms on page 221-28
SET_HEADER Procedure on page 221-87	Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function	Session Settings Subprograms on page 221-27
SET_HEADER Procedure on page 221-87	Sets an HTTP request header. The request header is sent to the Web server as soon as it is set.	HTTP Requests Subprograms on page 221-28
SET_PERSISTENT_CONN_SUPPORT Procedure on page 221-88	Enables or disables support for the HTTP 1.1 persistent-connection in the request	HTTP Requests Subprograms on page 221-28
SET_PROXY Procedure on page 221-90	Sets the proxy to be used for requests of HTTP or other protocols	Session Settings on page 221-17 and Session Settings Subprograms on page 221-27
SET_RESPONSE_ERROR_CHECK Procedure on page 221-91	Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges	Session Settings Subprograms on page 221-27
SET_TRANSFER_TIMEOUT Procedure on page 221-92	Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server	Session Settings on page 221-17 and Session Settings Subprograms on page 221-27
SET_WALLET Procedure on page 221-93	Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS	Session Settings Subprograms on page 221-27
WRITE_LINE Procedure on page 221-94	Writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP	HTTP Requests Subprograms on page 221-28
WRITE_RAW Procedure on page 221-95	Writes some binary data in the HTTP request body	HTTP Requests Subprograms on page 221-28
WRITE_TEXT Procedure on page 221-96	Writes some text data in the HTTP request body	HTTP Requests Subprograms on page 221-28

ADD_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL_HTTP package's session state.

> **See Also:** HTTP Cookies on page 221-17 and HTTP Cookies Subprograms on page 221-31

Syntax

```
UTL_HTTP.ADD_COOKIES (
   cookies          IN  cookie_table,
   request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

Table 221–17 ADD_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies to be added
request_context	Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

BEGIN_REQUEST Function

This functions begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

See Also: HTTP Requests on page 221-17 and HTTP Requests Subprograms on page 221-28

Syntax

```
UTL_HTTP.BEGIN_REQUEST (
   url               IN  VARCHAR2,
   method            IN  VARCHAR2 DEFAULT 'GET',
   http_version      IN  VARCHAR2 DEFAULT NULL,
   request_context   IN  request_context_key DEFAULT NULL)
RETURN req;
```

Parameters

Table 221–18 BEGIN_REQUEST Function Parameters

Parameter	Description
url	The URL of the HTTP request
method	The method performed on the resource identified by the URL
http_version	The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.
request_context	Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead.

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the UTL_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See Chapter 235, "UTL_URL" for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.
- BEGIN_REQUEST can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a

subsequent invocation of the GET_RESPONSE Function will raise the PROTOCOL_ERROR exception.

A URL will be long when its QUERY_STRING (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the POST method.

```
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r      =>  req,
                     name   =>  'Content-Type',
                     value  =>  'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r      =>   req,
                     name   =>   'Content-Length',
                     value  =>'  <length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r      =>   req,
                     data   =>   'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE
                     (r     =>   req);
...
```

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the SET_WALLET Procedure procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the use-client-certificates privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.
- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the UTL_HTTP must have the connect ACL privilege to the remote Web server host or the proxy host respectively.

CLEAR_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

> **See Also:** HTTP Cookies on page 221-17 and HTTP Cookies Subprograms on page 221-31

Syntax

```
UTL_HTTP.CLEAR_COOKIES (
   request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

Table 221–19 CLEAR_COOKIES Procedure Parameters

Parameter	Description
request_context	Request context to clear the cookies. If NULL, the cookies maintained in the UTL_HTTP package's session state will be cleared instead.

CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session.

See Also: HTTP Persistent Connections on page 221-17 and HTTP Persistent Connections Subprograms on page 221-32

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONN (
   conn  IN connection);
```

Parameters

Table 221–20 CLOSE_PERSISTENT_CONN Procedure Parameters

Parameter	Description
conn	The HTTP persistent connection to close

CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');
```

And the following call to the procedure closes all persistent connections through the proxy www-proxy at TCP/IP port 80:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',
                                proxy_port => 80);
```

And the following call to the procedure closes all persistent connections:

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS;
```

> **See Also:** HTTP Persistent Connections on page 221-17 and HTTP Persistent Connections Subprograms on page 221-32

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS (
   host        IN VARCHAR2 DEFAULT NULL,
   port        IN PLS_INTEGER DEFAULT NULL,
   proxy_host  IN VARCHAR2 DEFAULT NULL,
   proxy_port  IN PLS_INTEGER DEFAULT NULL,
   ssl         IN BOOLEAN DEFAULT NULL);
```

Parameters

Table 221–21 CLOSE_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
host	The host for which persistent connections are to be closed
port	The port number for which persistent connections are to be closed
proxy_host	The proxy host for which persistent connections are to be closed
proxy_port	The proxy port for which persistent connections are to be closed
ssl	Close persistent SSL connection

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL

of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a `NULL` value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a `NULL` value in a parameter to match only a `NULL` value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the `CLOSE_PERSISTENT_CONN` procedure that closes a specific persistent connection.

CREATE_REQUEST_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

See Also: Request Context on page 221-18 and HTTP Request Contexts Subprograms on page 221-29

Syntax

```
UTL_HTTP.CREATE_REQUEST_CONTEXT (
 wallet_path          IN VARCHAR2 DEFAULT NULL,
 wallet_password      IN VARCHAR2 DEFAULT NULL,
 enable_cookies       IN BOOLEAN  DEFAULT TRUE,
 max_cookies          IN PLS_INTEGER DEFAULT 300,
 max_cookies_per_site IN PLS_INTEGER DEFAULT 20)
RETURN request_context_key;
```

Parameters

Table 221–22 CREATE_REQUEST_CONTEXT Function Parameters

Parameter	Description
`wallet_path`	Directory path that contains the Oracle wallet. The format is `file:`*`directory-path`*
`wallet_password`	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to `NULL`. See the *Oracle Database Advanced Security Administrator's Guide* for detailed information about wallets.
`enable_cookies`	Sets whether HTTP requests using this request context should support HTTP cookies or not: `TRUE` to enable the support, `FALSE` to disable it.
`max_cookies`	Sets the maximum total number of cookies that will be maintained in this request context
`max_cookies_per_site`	Sets the maximum number of cookies per each Web site that will be maintained in this request context

Return Values

The request context created.

Examples

```
DECLARE
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
  req              utl_http.req;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(
       wallet_path          => 'file:/oracle/wallets/test_wallets',
       wallet_password      => NULL,
       enable_cookies       => TRUE,
       max_cookies          => 300,
       max_cookies_per_site => 20);
  req := UTL_HTTP.BEGIN_REQUEST(
       url                  => 'http://www.example.com/',
```

```
        request_context      => request_context);
END;
```

DESTROY_REQUEST_CONTEXT Procedure

This procedure destroys a request context in UTL_HTTP. A request context cannot be destroyed when it is in use by a HTTP request or response.

See Also: Request Context on page 221-18 and HTTP Request Contexts Subprograms on page 221-29

Syntax

```
UTL_HTTP.DESTROY_REQUEST_CONTEXT (
   request_context     request_context_key);
```

Parameters

Table 221–23 DESTROY_REQUEST_CONTEXT Procedure Parameters

Parameter	Description
request_context	Request context to destroy

Examples

```
DECLARE
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(…);
  …
  UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
```

END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

> **See Also:** HTTP Requests on page 221-17 and HTTP Requests Subprograms on page 221-28

Syntax

```
UTL_HTTP.END_REQUEST (
   r  IN OUT NOCOPY req);
```

Parameters

Table 221–24 END_REQUEST Procedure Parameters

Parameter	Description
r	The HTTP request

END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

> **See Also:** HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30

Syntax

```
UTL_HTTP.END_RESPONSE (
   r  IN OUT NOCOPY resp);
```

Parameters

Table 221–25 END_RESPONSE Procedure Parameters

Parameter	Description
r	The HTTP response

GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

See Also: HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30

Syntax

```
UTL_HTTP.GET_AUTHENTICATION(
   r          IN OUT NOCOPY resp,
   scheme     OUT VARCHAR2,
   realm      OUT VARCHAR2,
   for_proxy  IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 221–26 GET_AUTHENTICATION Procedure Parameters

Parameter	Description
`r`	The HTTP response
`scheme`	The scheme for the required HTTP authentication
`realm`	The realm for the required HTTP authentication
`for_proxy`	Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is `FALSE`

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling `GET_AUTHENTICATION`. The Web client makes the second request and supplies the required authentication information with `SET_AUTHORIZATION`. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.GET_BODY_CHARSET (
   charset  OUT NOCOPY VARCHAR2);
```

Parameters

Table 221–27 GET_BODY_CHARSET Procedure Parameters

Parameter	Description
`charset`	The default character set of the body of all future HTTP requests

GET_COOKIE_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session state.

> **See Also:** HTTP Cookies on page 221-17 and HTTP Cookies Subprograms on page 221-31

Syntax

```
UTL_HTTP.GET_COOKIE_COUNT (
   request_context  IN  request_context_key DEFAULT NULL)
 RETURN PLS_INTEGER;
```

Parameters

Table 221–28 GET_COOKIE_COUNT Function Parameters

Parameter	Description
request_context	Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead.

GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.GET_COOKIE_SUPPORT (
   enable               OUT BOOLEAN,
   max_cookies          OUT PLS_INTEGER,
   max_cookies_per_site  OUT PLS_INTEGER);
```

Parameters

Table 221–29 GET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
`enable`	Indicates whether future HTTP requests should support HTTP cookies (`TRUE`) or not (`FALSE`)
`max_cookies`	Indicates the maximum total number of cookies maintained in the current session
`max_cookies_per_site`	Indicates the maximum number of cookies maintained in the current session for each Web site

GET_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

> **See Also:** HTTP Cookies on page 221-17 and HTTP Cookies Subprograms on page 221-31

Syntax

```
UTL_HTTP.GET_COOKIES (
   cookies          IN  OUT NOCOPY cookie_table,
   request_context  IN             request_context_key DEFAULT NULL);
```

Parameters

Table 221–30 GET_COOKIES Procedure Parameters

Parameter	Description
cookies	The cookies returned
request_context	Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead.

GET_DETAILED_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.GET_DETAILED_EXCP_SUPPORT (
   enable  OUT BOOLEAN);
```

Parameters

Table 221–31 GET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE

GET_DETAILED_SQLCODE Function

This function retrieves the detailed `SQLCODE` of the last exception raised.

See Also: Error Conditions on page 221-17 and Error Conditions Subprograms on page 221-33

Syntax

```
UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;
```

GET_DETAILED_SQLERRM Function

This function retrieves the detailed `SQLERRM` of the last exception raised.

> **See Also:** Error Conditions on page 221-17 and Error Conditions Subprograms on page 221-33

Syntax

```
UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2;
```

GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

See Also: Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.GET_FOLLOW_REDIRECT (
   max_redirects  OUT PLS_INTEGER);
```

Parameters

Table 221–32 GET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
`max_redirects`	The maximum number of redirections for all future HTTP requests

GET_HEADER Procedure

This procedure returns the n^{th} HTTP response header name and value returned in the response.

> **See Also:** HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30

Syntax

```
UTL_HTTP.GET_HEADER (
   r      IN OUT NOCOPY resp,
   n      IN PLS_INTEGER,
   name   OUT NOCOPY VARCHAR2,
   value  OUT NOCOPY VARCHAR2);
```

Parameters

Table 221–33 GET_HEADER Procedure Parameters

Parameter	Description
r	The HTTP response
n	The n^{th} header to return
name	The name of the HTTP response header
value	The value of the HTTP response header

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

> **See Also:** HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
   r      IN OUT NOCOPY resp,
   name   IN VARCHAR2,
   value  OUT NOCOPY VARCHAR2,
   n      IN PLS_INTEGER DEFAULT 1);
```

Parameters

Table 221–34 GET_HEADER_BY_NAME Procedure Parameters

Parameter	Description
`r`	The HTTP response
`name`	The name of the HTTP response header for which the value is to return
`value`	The value of the HTTP response header
`n`	The n^{th} occurrence of an HTTP response header by the specified name to return. The default is 1.

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

> **See Also:** HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30

Syntax

```
UTL_HTTP.GET_HEADER_COUNT (
   r  IN OUT NOCOPY resp)
RETURN PLS_INTEGER;
```

Parameters

Table 221–35 GET_HEADER_COUNT Function Parameters

Parameter	Description
r	The HTTP response

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

> **See Also:** HTTP Persistent Connections on page 221-17 and HTTP Persistent Connections Subprograms on page 221-32

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_COUNT
RETURN PLS_INTEGER;
```

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks:

- If the persistent connection support is enabled
- Gets the maximum number of persistent connections in the current session

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (
   enable     OUT BOOLEAN,
   max_conns  OUT PLS_INTEGER);
```

Parameters

Table 221–36 GET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
`enable`	`TRUE` if persistent connection support is enabled; otherwise `FALSE`
`max_conns`	the maximum number of persistent connections maintained in the current session

GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the `UTL_HTTP` package to the Web servers.

> **See Also:** HTTP Persistent Connections on page 221-17 and HTTP Persistent Connections Subprograms on page 221-32

Syntax

```
UTL_HTTP.get_persistent_conns (
   connections  IN OUT NOCOPY connection_table);
```

Parameters

Table 221–37 GET_PERSISTENT_CONNS Procedure Parameters

Parameter	Description
`connections`	The network connections kept persistent

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

GET_PROXY Procedure

This procedure retrieves the current proxy settings.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.GET_PROXY (
   proxy             OUT NOCOPY VARCHAR2,
   no_proxy_domains  OUT NOCOPY VARCHAR2);
```

Parameters

Table 221–38 GET_PROXY Procedure Parameters

Parameter	Description
`proxy`	The proxy (host and an optional port number) currently used by the `UTL_HTTP` package
`no_proxy_domains`	The list of hosts and domains for which no proxy is used for all requests

GET_RESPONSE Function

This function reads the HTTP response. When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

> **See Also:** HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30

Syntax

```
UTL_HTTP.GET_RESPONSE (
   r  IN OUT NOCOPY req)
RETURN resp;
```

Parameters

Table 221–39 GET_RESPONSE Procedure Parameters

Parameter	Description
r	The HTTP response

GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (
   enable  OUT BOOLEAN);
```

Parameters

Table 221–40 GET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
`enable`	`TRUE` if the response error check is set; otherwise `FALSE`

GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (
   timeout  OUT PLS_INTEGER);
```

Parameters

Table 221–41 GET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
`timeout`	The network transfer timeout value in seconds

READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer. The end of line is as defined in the function `read_line` of UTL_TCP. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

> **See Also:** HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30

Syntax

```
UTL_HTTP.READ_LINE(
   r            IN OUT NOCOPY resp,
   data         OUT NOCOPY  VARCHAR2 CHARACTER SET ANY_CS,
   remove_crlf  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 221–42 READ_LINE Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in text form
`remove_crlf`	Removes the newline characters if set to `TRUE`

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_line` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_line` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the `READ_RAW` procedure, or set the character set of the response body explicitly using the `SET_BODY_CHARSET` procedure and read the response body as text again.

READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached.

> **See Also:** HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30

Syntax

```
UTL_HTTP.READ_RAW(
   r     IN OUT NOCOPY resp,
   data  OUT NOCOPY RAW,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 221–43 READ_RAW Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in binary form
`len`	The number of bytes of data to read. If `len` is `NULL`, this procedure will read as much input as possible to fill the buffer allocated in `data`. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the `transfer_timeout` amount of time has elapsed. The default is `NULL`

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_raw` waits for each data packet to be ready to read until timeout occurs. If it occurs, `read_raw` stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

> **See Also:** HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30

Syntax

```
UTL_HTTP.READ_TEXT(
   r     IN OUT NOCOPY resp,
   data  OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   len   IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 221–44 READ_TEXT Procedure Parameters

Parameter	Description
`r`	The HTTP response
`data`	The HTTP response body in text form
`len`	The maximum number of characters of data to read. If `len` is NULL, this procedure will read as much input as possible to fill the buffer allocated in `data`. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the `transfer_timeout` amount of time has elapsed. The default is NULL.

Usage Notes

The `UTL_HTTP` package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, `read_text` waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, `read_text` stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `read_raw` procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

When the `Content-Type` response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "`ORA-01482:`

unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the READ_RAW procedure, or set the character set of the response body explicitly using the SET_BODY_CHARSET procedure and read the response body as text again.

REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL. This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

```
scheme://[user[:password]@]host[:port]/[...]
```

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

> **See Also:** Simple HTTP Fetches on page 221-16 and Simple HTTP Fetches in a Single Call Subprograms on page 221-26

Syntax

```
UTL_HTTP.REQUEST (
   url              IN VARCHAR2,
   proxy            IN VARCHAR2 DEFAULT NULL,
   wallet_path      IN VARCHAR2 DEFAULT NULL,
   wallet_password  IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

Parameters

Table 221–45 REQUEST Function Parameters

Parameter	Description
`url`	Uniform resource locator
`proxy`	(Optional) Specifies a proxy server to use when making the HTTP request. See `SET_PROXY` for the full format of the proxy setting.
`wallet_path`	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of `wallet_path` on a PC is, for example, file:`c:\WINNT\Profiles\`*`username`*`\WALLETS`, and in Unix is, for example, `file:/home/`*`username`*`/wallets` When the `UTL_HTTP` package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See `SET_WALLET` for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
`wallet_password`	(Optional) Specifies the password required to open the wallet

Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function `SET_WALLET` on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
<head><title>My Company Home Page</title>
<!--changed Jan. 16, 19
1 row selected.
```

If you are behind a firewall, include the `proxy` parameter. For example, from within the Oracle firewall, where there might be a proxy server named `www-proxy.my-company.com`:

```
SQLPLUS> SELECT
UTL_HTTP.REQUEST('http://www.my-company.com', 'www-proxy.us.my-company.com') FROM
DUAL;
```

REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL. You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

> **See Also:** Simple HTTP Fetches on page 221-16 and Simple HTTP Fetches in a Single Call Subprograms on page 221-26

Syntax

```
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (
   url             IN VARCHAR2,
   max_pieces      IN NATURAL DEFAULT 32767,
   proxy           IN VARCHAR2 DEFAULT NULL,
   wallet_path     IN VARCHAR2 DEFAULT NULL,
   wallet_password IN VARCHAR2 DEFAULT NULL)
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 221–46 REQUEST_PIECES Function Parameters

Parameter	Description
`url`	Uniform resource locator
`max_pieces`	(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that `REQUEST_PIECES` should return. If provided, then that argument should be a positive integer.
`proxy`	(Optional) Specifies a proxy server to use when making the HTTP request. See `SET_PROXY` for the full format of the proxy setting.
`wallet_path`	(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, `file:c:\WINNT\Profiles\`*`username`*`\WALLETS`, and in Unix is, for example, `file:/home/`*`username`*`/wallets`. When the `UTL_HTTP` package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See `SET_WALLET` for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.
`wallet_password`	(Optional) Specifies the password required to open the wallet

Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

```
INIT_FAILED
REQUEST_FAILED
```

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
<BODY>
<H1>Fatal Error 500</H1>
Can't Access Document:  http://home.nothing.comm.
<P>
<B>Reason:</B> Can't locate remote host:  home.nothing.comm.
<P>
<P><HR>
<ADDRESS><A HREF="http://www.w3.org">
CERN-HTTPD3.0A</A></ADDRESS>
</BODY>
</HTML>
```

Examples

```
SET SERVEROUTPUT ON

DECLARE
   x   UTL_HTTP.HTML_PIECES;
   len PLS_INTEGER;
BEGIN
   x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
   DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved.');
   DBMS_OUTPUT.PUT_LINE('with total length ');
   IF x.count < 1 THEN
      DBMS_OUTPUT.PUT_LINE('0');
```

```
  ELSE
   len := 0;
   FOR i in 1..x.count LOOP
      len := len + length(x(i));
   END LOOP;
   DBMS_OUTPUT.PUT_LINE(i);
  END IF;
END;
/
-- Output
Statement processed.
4 pieces were retrieved.
with total length
7687
```

SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

> **See Also:** HTTP Requests on page 221-17 and HTTP Requests Subprograms on page 221-28

Syntax

```
UTL_HTTP.SET_AUTHENTICATION(
   r         IN OUT NOCOPY req,
   username  IN VARCHAR2,
   password  IN VARCHAR2,
   scheme    IN VARCHAR2 DEFAULT 'Basic',
   for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 221–47 SET_AUTHENTICATION Procedure Parameters

Parameter	Description
`r`	HTTP request
`username`	Username for the HTTP authentication
`password`	Password for the HTTP authentication
`scheme`	HTTP authentication scheme. Either `Basic` for the HTTP basic or `AWS` for Amazon S3 authentication scheme. Default is basic.
`for_proxy`	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is `FALSE`.

Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

SET_AUTHENTICATION_FROM_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

> **See Also:** External Password Store on on page 221-18, and HTTP Requests Subprograms on page 221-28

Syntax

```
UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
   r         IN OUT NOCOPY req,
   alias     IN VARCHAR2,
   scheme    IN VARCHAR2 DEFAULT 'Basic',
   for_proxy IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 221–48 SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

Parameter	Description
`r`	The HTTP request
`alias`	Alias to identify and retrieve the username and password credential stored in the Oracle wallet
`scheme`	HTTP authentication scheme. Either `Basic` for the HTTP basic or `AWS` for Amazon S3 authentication scheme. Default is basic.
`for_proxy`	Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is `FALSE`.

Usage Notes

- To use the password credentials in a wallet, the `UTL_HTTP` user must have the `use-passwords` privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

Examples

Creating a wallet and entering username and password in the wallet

```
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: ******
Enter password again: ******
> mkstore -wrl /oracle/wallets/test_wallet -createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: ******
```

Granting the use-passwords privilege on the wallet to a user by the database administrator

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
```

```
    acl         => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-passwords');
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
      acl          => 'wallet-acl.xml',
      wallet_path  => 'file: /oracle/wallets/test_wallet');
END;
```

Using username and password from the wallet

```
DECLARE
  req  UTL_HTTP.req;
BEGIN
  UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
  req := UTL_HTTP.BEGIN_REQUEST(…);
  UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
  …
END;
```

SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

See Also:

- HTTP Responses on page 221-17 and HTTP Responses Subprograms on page 221-30
- Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is ISO-8859-1 in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (
   charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "`ISO-8859-1`". Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(
   r        IN OUT NOCOPY req,
   charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is "text" but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is "text" but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to "ISO-8859-1". Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(
   r        IN OUT NOCOPY resp,
   charset  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 221–49 SET_BODY_CHARSET Procedure Parameters

Parameter	Description
`r`	The HTTP response.
`charset`	The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If `charset` is `NULL`, the database character set is assumed.

SET_COOKIE_SUPPORT Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

This procedure

See Also:

- HTTP Requests on page 221-17 andHTTP Requests Subprograms on page 221-28
- Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```
UTL_HTTP.SET_COOKIE_SUPPORT(
   r       IN OUT NOCOPY REQ,
   enable  IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```
UTL_HTTP.SET_COOKIE_SUPPORT (
   enable       IN BOOLEAN,
   max_cookies  IN PLS_INTEGER DEFAULT 300,
   max_cookies_per_site  IN PLS_INTEGER DEFAULT 20);
```

Parameters

Table 221–50 SET_COOKIE_SUPPORT Procedure Parameters

Parameter	Description
`r`	The HTTP request
`enable`	Set enable to `TRUE` to enable HTTP cookie support; `FALSE` to disable
`max_cookies`	Sets the maximum total number of cookies maintained in the current session
`max_cookies_per_site`	Sets the maximum number of cookies maintained in the current session for each Web site

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "Examples" on page 221-21 for how to use `GET_COOKIES` and `ADD_COOKIES` to retrieve, save, and restore cookies.

SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the UTL_HTTP package to raise a detailed exception. By default, UTL_HTTP raises the request_failed exception when an HTTP request fails. Use GET_DETAILED_SQLCODE and GET_DETAILED_SQLEERM for more detailed information about the error.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.SET_DETAILED_EXCP_SUPPORT (
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 221–51 SET_DETAILED_EXCP_SUPPORT Procedure Parameters

Parameter	Description
enable	Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE

SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

See Also:

- HTTP Requests on page 221-17 and HTTP Requests Subprograms on page 221-28
- Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

Use this procedure to set the maximum number of redirections:

```
UTL_HTTP.SET_FOLLOW_REDIRECT (
   max_redirects  IN PLS_INTEGER DEFAULT 3);
```

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

```
UTL_HTTP.SET_FOLLOW_REDIRECT(
   r              IN OUT NOCOPY req,
   max_redirects  IN PLS_INTEGER DEFAULT 3);
```

Parameters

Table 221–52 SET_FOLLOW_REDIRECT Procedure Parameters

Parameter	Description
r	The HTTP request
max_redirects	The maximum number of redirects. Set to zero to disable redirects.

Usage Notes

If max_redirects is set to a positive number, the GET_RESPONSE Function will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the REQ record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function FOLLOW_REDIRECT and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The SET_FOLLOW_REDIRECT procedure must be called before GET_RESPONSE for any redirection to take effect.

SET_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

> **See Also:** HTTP Requests on page 221-17 and HTTP Requests Subprograms on page 221-28

Syntax

```
UTL_HTTP.SET_HEADER (
   r      IN OUT NOCOPY req,
   name   IN VARCHAR2,
   value  IN VARCHAR2);
```

Parameters

Table 221–53 SET_HEADER Procedure Parameters

Parameter	Description
r	The HTTP request
name	The name of the HTTP request header
value	The value of the HTTP request header

Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, UTL_HTTP sets the Host header automatically for you.

When you set the Content-Type header with this procedure, UTL_HTTP looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the SET_BODY_CHARSET procedure.

When you set the Transfer-Encoding header with the value chunked, UTL_HTTP automatically encodes the request body written by the WRITE_TEXT, WRITE_LINE and WRITE_RAW procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

SET_PERSISTENT_CONN_SUPPORT Procedure

This procedure enables or disables support for the HTTP 1.1 persistent-connection in the request.

> **See Also:** HTTP Requests on page 221-17 and HTTP Requests Subprograms on page 221-28

Syntax

```
UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
   r       IN OUT NOCOPY req,
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 221–54 SET_PERSISTENT_CONN_SUPPORT Procedure Parameters

Parameter	Description
`r`	The HTTP request
`enable`	TRUE to keep the network connection persistent. `FALSE` otherwise.

Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in `UTL_HTTP` may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "Examples" on page 221-89.

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Examples

Using SET_PERSISTENT_CONN_SUPPORT in HTTP Requests

```
DECLARE
  TYPE vc2_table IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
  paths VC2_TABLE;

UTL_HTTP.fetch_pages(paths IN vc2_table) AS
    url_prefix   VARCHAR2(256) := 'http://www.my-company.com/';
    req          UTL_HTTP.REQ;
    resp         UTL_HTTP.RESP;
    data  VARCHAR2(1024);
  BEGIN
    FOR i IN 1..paths.count LOOP
      req := UTL_HTTP.BEGIN_REQUEST(url_prefix || paths(i));
      -- Use persistent connection except for the last request
      IF (i < paths.count) THEN
        UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(req, TRUE);
      END IF;
      resp := UTL_HTTP.GET_RESPONSE(req);
      BEGIN
        LOOP
          UTL_HTTP.READ_TEXT(resp, data);
          -- do something with the data
        END LOOP;
      EXCEPTION
        WHEN UTL_HTTP.END_OF_BODY THEN
          NULL;
      END;
      UTL_HTTP.END_RESPONSE(resp);
    END LOOP;
  END;

BEGIN
  UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(FALSE, 1);
  paths(1) := '...';
  paths(2) := '...';
  ...
  fetch_pages(paths);
END;
```

SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in `no_proxy_domains`. `no_proxy_domains` is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.SET_PROXY (
   proxy             IN VARCHAR2,
   no_proxy_domains  IN VARCHAR2);
```

Parameters

Table 221–55 SET_PROXY Procedure Parameters

Parameter	Description
`proxy`	The proxy (host and an optional port number) to be used by the `UTL_HTTP` package
`no_proxy_domains`	The list of hosts and domains for which no proxy should be used for all requests

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is `[http://]host[:port][/]`, for example, `www-proxy.my-company.com:80`. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, `corp.my-company.com`, `eng.my-company.com:80`. When `no_proxy_domains` is `NULL` and the proxy is set, all requests go through the proxy. When the proxy is not set, `UTL_HTTP` sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port][/]
```

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables `http_proxy` and `no_proxy` are assumed. Proxy settings set by this procedure override the initial settings.

SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges. For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
   enable  IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 221–56 SET_RESPONSE_ERROR_CHECK Procedure Parameters

Parameter	Description
enable	TRUE to check for response errors; otherwise FALSE

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, GET_RESPONSE will raise the HTTP_CLIENT_ERROR or HTTP_SERVER_ERROR exception. If SET_RESPONSE_ERROR_CHECK is set to FALSE, GET_RESPONSE will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The GET_RESPONSE function can raise other exceptions when SET_RESPONSE_ERROR_CHECK is set to FALSE.

SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the UTL_HTTP package should attempt while reading the HTTP response from the Web server or proxy server. This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

> **See Also:** Session Settings on page 221-17 and Session Settings Subprograms on page 221-27

Syntax

```
UTL_HTTP.SET_TRANSFER_TIMEOUT (
   timeout  IN PLS_INTEGER DEFAULT 60);
```

Parameters

Table 221–57 SET_TRANSFER_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The network transfer timeout value in seconds.

Usage Notes

The default value of the time out is 60 seconds.

SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS. When the UTL_HTTP package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the UTL_HTTP package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the UTL_HTTP package. An Oracle wallet is required to make an HTTPS request.

See Also:

- Session Settings on page 221-17 and Session Settings Subprograms on page 221-27
- "Managing Fine-Grained Access in PL/SQL Network Utility Packages" in the *Oracle Database Security Guide*

Syntax

```
UTL_HTTP.SET_WALLET (
   path      IN VARCHAR2,
   password  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 221–58 SET_WALLET Procedure Parameters

Parameter	Description
path	The directory path that contains the Oracle wallet. The format is file:*directory-path*. The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles*username*\WALLETS, and in Unix is, for example, file:/home/*username*/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.
password	The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See "Using Wallets with Automatic Login Enabled" in the *Oracle Database Advanced Security Administrator's Guide* for information about using Oracle Wallet Manager and the ORAPKI utility to create an auto-login wallet

Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager

See Also: *Oracle Database Advanced Security Administrator's Guide* for more information on Wallet Manager

WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with new-line characters (CRLF as defined in UTL_TCP). As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also: HTTP Requests on page 221-17 and HTTP Requests Subprograms on page 221-28

Syntax

```
UTL_HTTP.WRITE_LINE(
   r     IN OUT NOCOPY req,
   data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 221–59 WRITE_LINE Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text line to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The UTL_HTTP package performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.

If you send the Content-Length header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the Content-Length header, and the results using the WRITE_RAW procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where UTL_HTTP handles the length of the chunks transparently.

WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

> **See Also:** HTTP Requests on page 221-17 and HTTP Requests Subprograms on page 221-28

Syntax

```
UTL_HTTP.WRITE_RAW(
   r     IN OUT NOCOPY REQ,
   data  IN            RAW);
```

Parameters

Table 221–60 WRITE_RAW Procedure Parameters

Parameter	Description
r	The HTTP request
data	The binary data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding:chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

> **See Also:** HTTP Requests on page 221-17 and HTTP Requests Subprograms on page 221-28

Syntax

```
UTL_HTTP.WRITE_TEXT(
   r     IN OUT NOCOPY REQ,
   data  IN            VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 221–61 WRITE_TEXT Procedure Parameters

Parameter	Description
r	The HTTP request
data	The text data to send in the HTTP request body

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remove Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

UTL_I18N

`UTL_I18N` is a set of services that provides additional globalization functionality for applications written in PL/SQL.

> **See Also:** *Oracle Database Globalization Support Guide*

The chapter contains the following topics:

- Using UTL_I18N
  - Overview
  - Constants
- Summary of UTL_I18N Subprograms

Using UTL_I18N

This section contains topics which relate to using the `UTL_I18N` package.

- Overview
- Constants

Overview

The UTL_I18N PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
- A function that returns a listing of the most commonly used time zones.

Constants

The UTL_I18N package uses the constants shown in Table 222–1.

Table 222–1 UTL_I18N Constants

Constant	Type	Value	Description
GENERIC_CONTEXT	PLS_INTEGER	0	Returns the default character set for general cases.
MAIL_GENERIC	PLS_INTEGER	0	Map from an Oracle character set name to an email safe character set name on a non-Windows platform.
ORACLE_TO_IANA	PLS_INTEGER	0	Map from an Oracle character set name to an IANA character set name.
SHIFT_IN	PLS_INTEGER	0	Used with shift_status. Must be set the first time it is called in piecewise conversion.
IANA_TO_ORACLE	PLS_INTEGER	1	Map from an IANA character set name to an Oracle character set name.
MAIL_CONTEXT	PLS_INTEGER	1	The mapping is between an Oracle character set name and an email safe character set name.
MAIL_WINDOWS	PLS_INTEGER	1	Map from an Oracle character set name to an email safe character set name on a Windows platform.
SHIFT_OUT	PLS_INTEGER	1	
FWKATAKANA_HIRAGANA	VARCHAR2(30)	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
FWKATAKANA_HWKATAKANA	VARCHAR2(30)	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
HIRAGANA_FWKATAKANA	VARCHAR2(30)	'hiragana_fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_HWKATAKANA	VARCHAR2(30)	'hiragana_hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.
HWKATAKANA_FWKATAKANA	VARCHAR2(30)	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	VARCHAR2(30)	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
KANA_FWKATAKANA	VARCHAR2(30)	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HIRAGANA	VARCHAR2(30)	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.

Table 222–1 (Cont.) UTL_I18N Constants

Constant	Type	Value	Description
KANA_ HWKATAKANA	VARCHAR2(30)	'kana_ hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.

Summary of UTL_I18N Subprograms

Table 222–2 UTL_I18N Package Subprograms

Procedure	Description
ESCAPE_REFERENCE Function on page 222-8	Converts a given text string to its character reference counterparts, for characters that fall outside the document character set.
GET_COMMON_TIME_ZONES Function on page 222-9	Returns the list of common time zone IDs that are independent of the locales.
GET_DEFAULT_CHARSET Function on page 222-10	Returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.
GET_DEFAULT_ISO_CURRENCY Function on page 222-11	Returns the default ISO 4217 currency code for the specified territory.
GET_DEFAULT_LINGUISTIC_SORT Function on page 222-12	Returns the default linguistic sort name for the specified language.
GET_LOCAL_LANGUAGES Function on page 222-13	Returns the local language names for the specified territory.
GET_LOCAL_LINGUISTIC_SORTS Function on page 222-14	Returns the local linguistic sort names for the specified language.
GET_LOCAL_TERRITORIES Function on page 222-15	Returns the local territory names for the specified language.
GET_LOCAL_TIME_ZONES Function on page 222-16	Returns the local time zone IDs for the specified territory.
GET_TRANSLATION Function on page 222-18	Returns the translation of the language and territory name in the specified translation language.
MAP_CHARSET Function on page 222-19	▪ Maps an Oracle character set name to an IANA character set name. ▪ Maps an IANA character set name to an Oracle character set name. ▪ Maps an Oracle character set name to an e-mail safe character set name.
MAP_FROM_SHORT_LANGUAGE Function on page 222-21	Maps an Oracle short language name to an Oracle language name.
MAP_LANGUAGE_FROM_ISO Function on page 222-22	Returns an Oracle language name from an ISO locale name.
MAP_LOCALE_TO_ISO Function on page 222-23	Returns an ISO locale name from the Oracle language and territory name.
MAP_TERRITORY_FROM_ISO Function on page 222-24	Returns an Oracle territory name from an ISO locale name.
MAP_TO_SHORT_LANGUAGE Function on page 222-25	Maps an Oracle language name to an Oracle short language name.
RAW_TO_CHAR Functions on page 222-26	Converts `RAW` data that is not encoded in the database character set into a `VARCHAR2` string
RAW_TO_NCHAR Functions on page 222-28	Converts `RAW` data that is not encoded in the national character set into an `NVARCHAR2` string
STRING_TO_RAW Function on page 222-30	Converts a `VARCHAR2` or `NVARCHAR2` string to another character set. The result is returned as a `RAW` datatype.

Table 222–2 (Cont.) UTL_I18N Package Subprograms

Procedure	Description
TRANSLITERATE Function on page 222-31	Transliterates between Japanese hiragana and katakana.
UNESCAPE_REFERENCE Function on page 222-33	Converts an input string that contains character references to a text string.

ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document. Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document.

Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `å` is the numeric character reference for the small letter "a" with a ring above, whereas `å` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `<` represents the < (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.

Syntax

```
UTL_I18N.ESCAPE_REFERENCE(
    str            IN VARCHAR2 CHARACTER SET ANY_CS,
    page_cs_name   IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 222–3 ESCAPE_REFERENCE Function Parameters

Parameter	Description
`str`	Specifies the input string
`page_cs_name`	Specifies the character set of the document. If `page_cs_name` is `NULL`, then the database character set is used for `CHAR` data and the national character set is used for `NCHAR` data.

Usage Notes

If the user specifies an invalid character set or a `NULL` string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')
```

This returns `'hello < å'`.

GET_COMMON_TIME_ZONES Function

This function returns a listing of the most commonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

```
UTL_I18N.GET_COMMON_TIME_ZONES
 RETURN STRING_ARRAY;
```

Examples

Returns the list of the most commonly used time zones.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
BEGIN
   retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/
```

GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

> **See Also:** "MAP_CHARSET Function" on page 222-19 for an explanation of an e-mail safe character set

Syntax

```
UTL_I18N.GET_DEFAULT_CHARSET(
   language  IN VARCHAR2,
   context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
   iswindows IN BOOLEAN DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 222–4 GET_DEFAULT_CHARSET Function Parameters

Parameter	Description
`language`	Specifies a valid Oracle language
`context`	`GENERIC_CONTEXT | MAIL_CONTEXT` `GENERIC_CONTEXT`: Returns the default character set for general cases `MAIL_CONTEXT`: Returns the default e-mail safe character set name
`iswindows`	If `context` is set as `MAIL_CONTEXT`, then `iswindows` should be set to `TRUE` if the platform is Windows and `FALSE` if the platform is not Windows. The default is `FALSE`. `iswindows` has no effect if `context` is set as `GENERIC_CONTEXT`.

Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a `NULL` string.

Examples

GENERIC_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns `'WE8ISO8859P1'`.

MAIL_CONTEXT, iswindows=TRUE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

MAIL_CONTEXT, iswindows=FALSE

```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

Syntax

```
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (
   territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 222–5 GET_DEFAULT_ISO_CURRENCY Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Displays the default ISO currency code for China.

```
DECLARE
   retval VARCHAR2(50);
BEGIN
   retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
   DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

Syntax

```
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 222–6 GET_DEFAULT_LINGUISTIC_SORT Function Parameters

Parameter	Description
`language`	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE
   retval VARCHAR2(50);
BEGIN
  SELECT value INTO retval FROM nls_session_parameters
   WHERE parameter = 'NLS_LANGUAGE';
   retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
   DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

GET_LOCAL_LANGUAGES Function

This function returns the local language names for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_LANGUAGES (
   territory    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 222–7 GET_LOCAL_LANGUAGES Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Returns the list of local languages used in Belgium.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt    INTEGER;
BEGIN
   retval   :=  UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
   DBMS_OUTPUT.PUT('Count = ');
   DBMS_OUTPUT.PUT_LINE(retval.LAST);
   cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt);
   END LOOP;
END;
/
...
Count = 2
DUTCH
FRENCH
```

GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A `BINARY` sort is included for all languages.

Syntax

```
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

Table 222–8 GET_LOCAL_LINGUISTIC_SORTS Function Parameters

Parameter	Description
`language`	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Displays the local linguistic sort names for `JAPANESE`.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt INTEGER;
BEGIN
  retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
  DBMS_OUTPUT.PUT('Count = ');
  DBMS_OUTPUT.PUT_LINE(retval.COUNT);
  cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

...
Count = 2
JAPANESE_M
BINARY
```

GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
   language  IN VARCHAR2 CHARACTER SET ANY_CS)
 RETURN STRING_ARRAY;
```

Parameters

Table 222–9 GET_LOCAL_TERRITORIES Function Parameters

Parameter	Description
`language`	Specifies a valid Oracle language. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a `NULL` string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
   retval  UTL_I18N.STRING_ARRAY;
   cnt     INTEGER;
BEGIN
   retval  := UTL_I18N.GET_LCOAL_TERRITORIIES('GERMAN');
   DBMS_OUTPUT.PUT('Count = ');
   DBMS_OUTPUT.PUT_LINE(retval.LAST);
  cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt));
   END LOOP;
END;
/
...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
   territory      IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
RETURN STRING_ARRAY;
```

Parameters

Table 222–10 GET_LOCAL_TIME_ZONES Function Parameters

Parameter	Description
territory	Specifies a valid Oracle territory. It is case-insensitive.

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Creates a function that returns the list of time zones locally used in the territory AZERBAIJAN followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```
CREATE OR REPLACE FUNCTION get_time_zones
(territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
  retval  utl_i18n.string_array;
  retval2 utl_i18n.string_array;
  stpos   INTEGER;
BEGIN
  retval  := utl_i18n.get_local_time_zones(
    territory);
  retval2 := utl_i18n.get_common_time_zones;
  stpos := retval.LAST + 1;
  retval(stpos) := '-----'; -- a separator
  FOR i IN retval2.FIRST..retval2.LAST LOOP
    stpos := stpos + 1;
    retval(stpos) := retval2(i);
  END LOOP;
  RETURN retval;
END;
/
```

Returns the list of local time zones for AZERBAIJAN followed by the common time zones with a separator string of five dashes (-----).

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt INTEGER;
BEGIN
   DBMS_OUTPUT.ENABLE(100000);
   retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
   cnt := retval.FIRST;
```

```
  WHILE cnt IS NOT NULL LOOP
    DBMS_OUTPUT.PUT_LINE(retval(cnt));
    cnt := retval.NEXT(cnt);
  END LOOP;
END;
/

America/Managua
America/Costa_Rica
America/Montreal
...
```

GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```
UTL_I18N.GET_TRANSLATION (
   parameter        IN VARCHAR2 CHARACTER SET ANY_CS,
   trans_language   IN VARCHAR2 'AMERICAN',
   flag             IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

Table 222–11 GET_TRANSLATION Function Parameters

Parameter	Description
`parameter`	Specifies a valid language name, territory name, or a combined string in the form of *`language_territory`*. It is case-insensitive.
`trans_language`	Specifies a translation language name. For example, `ITALIAN` is for the Italian language. The default is `AMERICAN`, which indicates American English.
`flag`	Specifies the translation type: ■ `LANGUAGE_TRANS`: The function returns the language translation. ■ `TERRITORY_TRANS`: The function returns the territory translation. ■ `LANGUAGE_TERRITORY_TRANS`: The function returns the language and territory translation. The default translation type is `LANGUAGE_TRANS`.

Usage Notes

If `VARCHAR2` is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using `NVARCHAR2` as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide `GUJARATI` translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE
   CURSOR c1 IS
     SELECT value FROM V$NLS_VALID_VALUES
     WHERE parameter = 'LANGUAGE'
  ORDER BY value;
  retval NVARCHAR2(100);
BEGIN
   FOR item IN c1 LOOP
     retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');
   END LOOP;
END;
```

MAP_CHARSET Function

This function maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

Syntax

```
UTL_I18N.MAP_CHARSET(
   charset   IN VARCHAR2,
   context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
   flag      IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

Table 222–12 MAP_CHARSET Function Parameters

Parameter	Description
charset	Specifies the character set name to be mapped. The mapping is case-insensitive.
context	GENERIC_CONTEXT | MAIL_CONTEXT GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value. MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.
flag	■ ORACLE_TO_IANA | IANA_TO_ORACLE if GENERIC_CONTEXT is set ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default. IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name. ■ MAIL_GENERIC | MAIL_WINDOWS if MAIL_CONTEXT is set MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform. MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP_CHARSET function with the ORACLE_TO_IANA option, providing the e-mail safe character set name as input.

For example, no e-mail client recognizes message contents in the WE8DEC character set, whose corresponding IANA name is DEC-MCS. If WE8DEC is passed to the MAP_CHARSET function with the MAIL_CONTEXT option, then the function returns WE8ISO8859P1. Its corresponding IANA name, ISO-8859-1, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the MAP_CHARSET function with the MAIL_CONTEXT | MAIL_GENERIC option with the database character set name, WE8DEC. The result is WE8ISO8859P1.
2. Convert the contents stored in the database to WE8ISO8859P1.
3. Call the MAP_CHARSET function with the ORACLE_TO_IANA | GENERIC_CONTEXT option with the e-mail safe character set, WE8ISO8859P1. The result is ISO-8859-1.
4. Specify ISO-8859-1 in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns NULL.

Note: Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.

Examples

Generic Context

```
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_
ORACLE)
```

This returns 'WE8ISO8859P1'.

Context

```
UTL_I18N.MAP_CHARSET('WE8DEC', utl_i18n.mail_context,  utl_i18n.mail_generic)
```

This returns 'WE8ISO8859P1'.

See Also: *Oracle Database Globalization Support Guide* for a list of valid Oracle character sets

MAP_FROM_SHORT_LANGUAGE Function

This function maps an Oracle short language name to an Oracle language name.

Syntax

```
UTL_I18N.MAP_FROM_SHORT_LANGUAGE (
   language           IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 222–13 MAP_FROM_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid short language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table customers is from the oe user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the GET_DEFAULT_LINGUISTIC_SORT procedure.

```
DECLARE
   short_n VARCHAR2(10);
   ling_n VARCHAR2(50);
BEGIN
   SELECT nls_language INTO short
   FROM customers WHERE customer_id = 9000;
   ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
   UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
   DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/
```

MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
  isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 222–14 MAP_LANGUAGE_FROM_ISO Function Parameters

Parameter	Description
`isolocale`	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the language (for example, `en_` instead of `en_US`), then the function returns the default language name for the specified language (for example, `American`).

Examples

```
UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')
```

This returns `'American'`.

> **See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle languages

MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name. A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

```
UTL_I18N.MAP_LOCALE_TO_ISO (
   ora_language   IN VARCHAR2,
   ora_territory  IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 222–15 MAP_LOCALE_TO_ISO Function Parameters

Parameter	Description
`ora_language`	Specifies an Oracle language name. It is case-insensitive.
ora_territory	Specifies an Oracle territory name. It is case-insensitive.

Usage Notes

If the user specifies an invalid string, then the function returns a `NULL` string.

Examples

```
UTL_I18N.MAP_LOCALE_TO_ISO('American','America')
```

This returns `'en_US'`.

> **See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle languages and territories

MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```
UTL_I18N.MAP_TERRITORY_FROM_ISO (
  isolocale IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 222–16 MAP_TERRITORY_FROM_ISO Function Parameters

Parameter	Description
`isolocale`	Specifies the ISO locale. The mapping is case-insensitive.

Usage Notes

If the user specifies an invalid locale string, then the function returns a `NULL` string.

If the user specifies a locale string that includes only the territory (for example, `_fr` instead of `fr_fr`), then the function returns the default territory name for the specified territory (for example, `French`).

Examples

```
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns `'America'`.

> **See Also:** *Oracle Database Globalization Support Guide* for a list of valid Oracle territories

MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

```
UTL_I18N.MAP_TO_SHORT_LANGUAGE (
   language    IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2;
```

Parameters

Table 222–17 MAP_TO_SHORT_LANGUAGE Function Parameters

Parameter	Description
language	Specifies a valid full language name. It is case-insensitive.

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

```
DECLARE
  retval VARCHAR2(100);
BEGIN
  retval := UTL_I18N.MAP_TO_SHORT_LANGUAGE('american');
  DBMS_OUTPUT.PUT_LINE(retval);
END;
/

US
```

RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_CHAR(
   data          IN RAW,
   src_charset   IN VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_CHAR (
   data            IN RAW,
   src_charset     IN VARCHAR2 DEFAULT NULL,
   scanned_length  OUT PLS_INTEGER,
   shift_status    IN OUT PLS_INTEGER)
RETURN VARCHAR2;
```

Parameters

Table 222–18 RAW_TO_CHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to a VARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. **Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')
```

This returns the following string in the database character set:

```
'abcde'||chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)
```

This expression returns the following string in the database character set:

```
'abcde'||chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to `8`.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
  nvalue VARCHAR2(1024);
  conversion_state  PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;

  ...
  conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                    remote_port => 2000);
  LOOP
      tlen := utl_tcp.read_raw(conn, rvalue, 1024);
      rvalue := utl_raw.concat(rtemp, rvalue);
      nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
      if (converted_len < utl_raw.length(rvalue) )
      then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
      else
        rtemp := '';
      end if;
      /* do anything you want with nvalue */
      /* e.g htp.prn(nvalue); */
    END LOOP;
    utl_tcp.close_connection(conn);
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      utl_tcp.close_connection(conn);
END;
```

RAW_TO_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

```
UTL_I18N.RAW_TO_NCHAR (
   data         IN RAW,
   src_charset  IN VARCHAR2 DEFAULT NULL)
 RETURN NVARCHAR2;
```

Piecewise conversion converts raw data into character data piece by piece:

```
UTL_I18N.RAW_TO_NCHAR (
   data            IN RAW,
   src_charset      IN VARCHAR2 DEFAULT NULL,
   scanned_length   OUT PLS_INTEGER,
   shift_status     IN OUT PLS_INTEGER)
 RETURN NVARCHAR2;
```

Parameters

Table 222–19 RAW_TO_NCHAR Function Parameters

Parameter	Description
data	Specifies the RAW data to be converted to an NVARCHAR2 string
src_charset	Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.
scanned_length	Specifies the number of bytes of source data scanned
shift_status	Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. **Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')
```

This returns the following string in the national character set:

```
'abcde'||chr(170)
```

Piecewise Conversion

```
UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)
```

This expression returns the following string in the national character set:

```
'abcde'||chr(170)
```

It also sets `shf` to `SHIFT_IN` and `slen` to `8`.

The following example converts data from the Internet piece by piece to the national character set.

```
rvalue RAW(1050);
  nvalue NVARCHAR2(1024);
  converstion_state  PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;

  ...
  conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                    remote_port => 2000);
  LOOP
      tlen := utl_tcp.read_raw(conn, rvalue, 1024);
      rvalue := utl_raw.concat(rtemp, rvalue);
      nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
conversion_stat);
      if (converted_len < utl_raw.length(rvalue) )
      then
        rtemp := utl_raw.substr(rvalue, converted_len+1);
      else
        rtemp := '';
      end if;
      /* do anything you want with nvalue */
      /* e.g htp.prn(nvalue); */
    END LOOP;
    utl_tcp.close_connection(conn);
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      utl_tcp.close_connection(conn);
  END;
```

STRING_TO_RAW Function

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

Syntax

```
UTL_I18N.STRING_TO_RAW(
   data          IN VARCHAR2 CHARACTER SET ANY_CS,
   dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

Parameters

Table 222–20 STRING_TO_RAW Function Parameters

Parameter	Description
data	Specifies the VARCHAR2 or NVARCHAR2 string to convert.
dst_charset	Specifies the destination character set. If dst_charset is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.

Usage Notes

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

Examples

```
DECLARE
    r raw(50);
    s varchar2(20);
  BEGIN
    s:='abcdef'||chr(170);
    r:=utl_i18n.string_to_raw(s,'utf8');
    dbms_output.put_line(rawtohex(r));
  end;
/
```

This returns a hex value of '616263646566C2AA'.

TRANSLITERATE Function

This function performs script transliteration. In this release, the TRANSLITERATE function only supports Japanese Kana conversion.

Syntax

```
UTL_I18N.TRANSLITERATE (
  data IN VARCHAR2 CHARACTER SET ANY_CS,
  name IN VARCHAR2)
RETURN VARCHAR2 CHARACTER SET data%CHARSET;
```

Parameters

Table 222–21 TRANSLITERATE Function Parameters

Parameter	Description
data	Specifies the data to be converted. Either CHAR or NCHAR data type can be specified.
name	Specifies the transliteration name string. For a list of valid names, see Table 222–22.

Constants

These options specify Japanese Kana conversions.

Table 222–22 TRANSLITERATE Function Constants

Constant Name	Value	Description
KANA_FWKATAKANA	'kana_fwkatakana'	Converts any type of Kana character to a fullwidth Katakana character.
KANA_HWKATAKANA	'kana_hwkatakana'	Converts any type of Kana character to a halfwidth Katakana character.
KANA_HIRAGANA	'kana_hiragana'	Converts any type of Kana character to a fullwidth Hiragana character.
FWKATAKANA_HWKATAKANA	'fwkatakana_hwkatakana'	Converts only fullwidth Katakana characters to halfwidth Katakana characters.
FWKATAKANA_HIRAGANA	'fwkatakana_hiragana'	Converts only fullwidth Katakana characters to fullwidth Hiragana characters.
HWKATAKANA_FWKATAKANA	'hwkatakana_fwkatakana'	Converts only halfwidth Katakana characters to fullwidth Katakana characters.
HWKATAKANA_HIRAGANA	'hwkatakana_hiragana'	Converts only halfwidth Katakana characters to fullwidth Hiragana characters.
HIRAGANA_FWKATAKANA	'hiragana_fwkatakana'	Converts only fullwidth Hiragana characters to fullwidth Katakana characters.
HIRAGANA_HWKATAKANA	'hiragana_hwkatakana'	Converts only fullwidth Hiragana characters to halfwidth Katakana characters.

Usage Notes

The function returns the converted string.

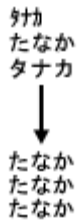
Examples

Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
   SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

Figure shows how this output might look.

Figure 222–1 Loading Locale-Specific Data to the Database



The image kana_small_arrow.gif is partially described in the preceding text. It shows how three versions of the word "Tanaka" can be standardized and converted into one form.

****

The following statement normalizes one kana name to hiragana:

```
DECLARE
   Name  japanese_emp.ename%TYPE;
   Eno   CONSTANT  NUMBER(4) := 1;
BEGIN
   SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
   name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
   UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
   WHEN  UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
   DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
/
```

UNESCAPE_REFERENCE Function

This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

> **See Also:** "ESCAPE_REFERENCE Function" on page 222-8 for more information about escape sequences

Syntax

```
UTL_I18N.UNESCAPE_REFERENCE (
   str IN VARCHAR2 CHARACTER SET ANY_CS)
 RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

Table 222–23 UNESCAPE_REFERENCE Function Parameters

Parameter	Description
`str`	Specifies the input string

Usage Notes

If the user specifies a `NULL` string or a string whose length is 0, then the function returns a `NULL` string. If the function fails, then it returns the original string.

Examples

```
UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &#xe5;')
```

This returns `'hello <'||chr(229).`

223

UTL_IDENT

The `UTL_IDENT` package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- Using UTL_IDENT
  - Overview
  - Security Model
  - Constants

Using UTL_IDENT

This section contains topics which relate to using the `UTL_IDENT` package.

- Overview
- Security Model
- Constants

Overview

The `UTL_IDENT` package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

Security Model

The UTL_IDENT package runs as the package owner SYS. The public synonym UTL_IDENT, and EXECUTE permission on this package is granted to PUBLIC.

Constants

The UTL_IDENT package uses the constants shown in Table 223–1, " UTL_IDENT Constants".

Table 223–1 UTL_IDENT Constants

Constant	Type	Value	Description
IS_ORACLE_SERVER	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Server or not
IS_ORACLE_CLIENT	BOOLEAN	TRUE/FALSE	Stipulates if Oracle Client or not
IS_TIMESTEN	BOOLEAN	TRUE/FALSE	Stipulates if TimesTen or not

224

UTL_INADDR

The `UTL_INADDR` package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- Using UTL_INADDR
  - Exceptions
  - Examples
- Summary of UTL_INADDR Subprograms

Using UTL_INADDR

- Exceptions
- Examples

Exceptions

Table 224–1 Exception - Internet Address Package

Number	Exception	Description
ORA-24247	NETWORK_ACCESS_DENIED	Access to network is denied.
ORA-29257	UNKNOWN_HOST	The host is unknown.

Examples

Retrieve the local host name and IP address.

```
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME);  -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS);  -- get local IP addr
END;
/
```

Summary of UTL_INADDR Subprograms

Table 224–2 UTL_INADDR Package Subprograms

Subprogram	Description
GET_HOST_ADDRESS Function on page 224-6	Retrieves the IP address of the local or remote host given its name
GET_HOST_NAME Function on page 224-7	Retrieves the name of the local or remote host given its IP address

GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```
UTL_INADDR.GET_HOST_ADDRESS (
   host  IN VARCHAR2 DEFAULT NULL)
RETURN host_address VARCHAR2;
```

Parameters

Table 224–3 GET_HOST_ADDRESS Function Parameters

Parameter	Description
host	The name of the host to retrieve the IP address.

Return Values

Table 224–4 GET_HOST_ADDRESS Function Return Values

Parameter	Description
host_address	The IP address of the specified host, or that of the local host if host is NULL.

Exceptions

UNKNOWN_HOST: The specified IP address is unknown.

GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```
UTL_INADDR.GET_HOST_NAME (
   ip  IN VARCHAR2 DEFAULT NULL)
RETURN host_name VARCHAR2;
```

Parameters

Table 224–5 GET_HOST_NAME Function Parameters

Parameter	Description
ip	The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.

Return Values

Table 224–6 GET_HOST_NAME Function Return Values

Parameter	Description
host_name	The name of the local or remote host of the specified IP address .

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

225

UTL_LMS

`UTL_LMS` retrieves and formats error messages in different languages.

See Also: *Oracle Database Globalization Support Guide*

This chapter contains the following topics:

- Using UTL_LMS
  - Security Model
- Summary of UTL_LMS Subprograms

Using UTL_LMS

This section contains topics which relate to using the `UTL_LMS` package.

- Security Model

Security Model

This package must be created as the user SYS.

Summary of UTL_LMS Subprograms

Table 225–1 UTL_LMS Package Subprograms

Function	Description
FORMAT_MESSAGE Function on page 225-5	Formats a retrieved error message
GET_MESSAGE Function on page 225-6	Retrieves an error message based on error number, product, facility, language, and message specified

FORMAT_MESSAGE Function

This function formats a message retrieved by the GET_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

Special Character	Description
'%s'	Substitute the next string argument
'%d'	Substitute the next integer argument
'%%'	Represents the special character %

Syntax

```
UTL_LMS.FORMAT_MESSAGE (
   format IN VARCHAR2 CHARACTER SET ANY_CS,
   args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)
 RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

Parameters

Table 225–2 FORMAT_MESSAGE Procedure Parameters

Parameter	Description
format	Specifies the string to format
args	Specifies the list of arguments

Examples

```
DECLARE
   s varchar2(200);
   i  pls_integer;
BEGIN
   i:= utl_lms.get_messsage(26052, 'rdbms', 'ora', 'french', s);
   dbms_output.put_line('before format, message is: '||s);
   dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9,
'my_column_name');
END;
/
```

The following is an unformatted message:

```
Type %d non pris en charge pour l'expression SQL sur la colonne %s.
```

The following is the formatted message:

```
Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.
```

GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the `lmsgen` utility.

It returns `0` when it is successful. It returns `-1` when it fails.

> **See Also:** *Oracle Database Globalization Support Guide* for more information about the `lmsgen` utility

Syntax

```
UTL_LMS.GET_MESSAGE (
   errnum    IN PLS_INTEGER,
   product   IN VARCHAR2,
   facility  IN VARCHAR2,
   language  IN VARCHAR2,
   message   OUT NOCOPY VARCHAR2CHARCTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

Table 225–3 GET_MESSAGE Function Parameters

Parameter	Description
`errnum`	Specifies the error number. Example: `'972'` (for `ORA-00972`)
`product`	Specifies the product to which the error message applies Example: '`rdbms`'
`facility`	Specifies the error message prefix Example: `'ora'`
`language`	Specifies the language of the message. The parameter is case-insensitive. The default is `NULL`, which causes `GET_MESSAGE` to use the value of the `NLS_LANGUAGE` session parameter.
`message`	Specifies the output buffer for the retrieved message

Usage Notes

If the `language` parameter is set to `NULL`, then the value of the `NLS_LANGUAGE` session parameter is used as the default.

Examples

```
DECLARE
  s varchar2(200);
  i pls_integer;
BEGIN
   i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
   dbms_output.put_line('OCI--00601 is: '||s);
END
/
```

The following output results:

```
OCI--00601 is: Echec du processus de nettoyage.
```

226

UTL_MAIL

The `UTL_MAIL` package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- Using UTL_MAIL
  - Security Model
  - Operational Notes
  - Rules and Limits
- Summary of UTL_MAIL Subprograms

Using UTL_MAIL

- Security Model
- Operational Notes
- Rules and Limits

Security Model

UTL_MAIL is not installed by default because of the SMTP_OUT_SERVER configuration requirement and the security exposure this involves. In installing UTL_MAIL, you should take steps to prevent the port defined by SMTP_OUT_SERVER being swamped by data transmissions .

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

---

Operational Notes

You must both install UTL_MAIL and define the SMTP_OUT_SERVER.

- To install UTL_MAIL:

```
sqlplus sys/<pwd>
SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
```

- You define the SMTP_OUT_SERVER parameter in the init.ora rdbms initialization file. However, if SMTP_OUT_SERVER is not defined, this invokes a default of DB_DOMAIN which is guaranteed to be defined to perform appropriately.

Rules and Limits

Use `UTL_MAIL` only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

Summary of UTL_MAIL Subprograms

Table 226–1 UTL_MAIL Package Subprograms

Subprogram	Description
SEND Procedure on page 226-7	Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients
SEND_ATTACH_RAW Procedure on page 226-8	Represents the `SEND` Procedure overloaded for `RAW` attachments
SEND_ATTACH_VARCHAR2 Procedure on page 226-9	Represents the `SEND` Procedure overloaded for `VARCHAR2` attachments

SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients. It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```
UTL_MAIL.SEND (
   sender      IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients  IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message     IN    VARCHAR2 CHARACTER SET ANY_CS,
   mime_type   IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
   priority    IN    PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 226–2 SEND Procedure Parameters

Parameter	Description
`sender`	The email address of the sender.
`recipients`	The email addresses of the recipient(s), separated by commas.
`cc`	The email addresses of the CC recipient(s), separated by commas, default is `NULL`
`bcc`	The email addresses of the BCC recipient(s), separated by commas, default is `NULL`
`subject`	A string to be included as email subject string, default is `NULL`
`message`	A text message body.
`mime_type`	The mime type of the message, default is `'text/plain; charset=us-ascii'`
`priority`	The message priority, default is `NULL`.

SEND_ATTACH_RAW Procedure

This procedure is the SEND Procedure overloaded for RAW attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_RAW (
   sender           IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients       IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   mime_type        IN    VARCHAR2 DEFAULT CHARACTER SET ANY_CS
                              DEFAULT 'text/plain; charset=us-ascii',
   priority         IN    PLS_INTEGER DEFAULT 3,
   attachment       IN    RAW,
   att_inline       IN    BOOLEAN DEFAULT TRUE,
   att_mime_type    IN    VARCHAR2 CHARACTER SET ANY_CS
                                       DEFAULT 'text/plain; charset=us-ascii',
   att_filename     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 226–3 SEND_ATTACH_RAW Procedure Parameters

Parameter	Description
sender	The email address of the sender.
recipients	The email addresses of the recipient(s), separated by commas.
cc	The email addresses of the CC recipient(s), separated by commas, default is NULL.
bcc	The email addresses of the BCC recipient(s), separated by commas, default is NULL.
subject	A string to be included as email subject string, default is NULL.
message	A text message body.
mime_type	The mime type of the message, default is 'text/plain; charset=us-ascii'.
priority	The message priority, the default is NULL.
attachment	A RAW attachment.
att_inline	Specifies whether the attachment is viewable inline with the message body, default is TRUE.
att_mime_type	The mime type of the attachment, default is 'application/octet'.
att_filename	The string specifying a filename containing the attachment, default is NULL.

SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```
UTL_MAIL.SEND_ATTACH_VARCHAR2 (
   sender            IN    VARCHAR2 CHARACTER SET ANY_CS,
   recipients        IN    VARCHAR2 CHARACTER SET ANY_CS,
   cc                IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   bcc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   subject           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   message           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
   mime_type         IN    VARCHAR2 CHARACTER SET ANY_CS
                                    DEFAULT 'text/plain; charset=us-ascii',
   priority          IN    PLS_INTEGER DEFAULT 3,
   attachment        IN    VARCHAR2 CHARACTER SET ANY_CS, ,
   att_inline        IN    BOOLEAN DEFAULT TRUE,
   att_mime_type     IN    VARCHAR2 CHARACTER SET ANY_CS
                                    DEFAULT 'text/plain; charset=us-ascii,
   att_filename      IN    VARCHAR2CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 226–4 SEND_ATTACH_VARCHAR2 Procedure Parameters

Parameter	Description
sender	The email address of the sender.
recipients	The email addresses of the recipient(s), separated by commas.
cc	The email addresses of the CC recipient(s), separated by commas, default is NULL.
bcc	The email addresses of the BCC recipient(s), separated by commas, default is NULL.
subject	A string to be included as email subject string, default is NULL.
message	A text message body.
mime_type	The mime type of the message, default is 'text/plain; charset=us-ascii.
priority	The message priority, the default is NULL.
attachment	A text attachment.
att_inline	Specifies whether the attachment is inline, default TRUE.
att_mime_type	The mime type of the attachment, default is 'text/plain; charset=us-ascii'.
att_filename	The string specifying a filename containing the attachment, default is NULL.

UTL_MATCH

The `UTL_MATCH` package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- Using UTL_MATCH
  - Overview
  - Security Model
- Summary of UTL_MATCH Subprograms

Using UTL_MATCH

- Overview
- Security Model

Overview

"Edit Distance" also known as "Levenshtein Distance "(named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of Similarity between two strings, s1 and s2. The distance is the number of insertions, deletions or substitutions required to transform s1 to s2.

```
The Edit Distance between strings "shackleford" and "shackelford" = 2
```

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

Table 227–1 shows similarity values returned by Jaro-Winkler and Edit Distance

Table 227–1 Comparison between normalized values returned by Jaro-Winkler and Edit Distance algorithms

String 1	String 2	Jaro Winkler	Edit Distance
Dunningham	Cunnigham	89	80
Abroms	Abrams	92	83
Lampley	Campley	90	86
Marhta	Martha	96	67
Jonathon	Jonathan	95	88
Jeraldine	Geraldine	92	89

Security Model

The UTL_MATCH package runs with definer's rights. UTL_MATCH must be created under SYS. Operations provided by this package are performed with SYS privileges.

Summary of UTL_MATCH Subprograms

Table 227–2 DBMS_ALERT Package Subprograms

Subprogram	Description
EDIT_DISTANCE Function on page 227-6	Calculates the number of changes required to transform string-1 into string-2
EDIT_DISTANCE_ SIMILARITY Function on page 227-7	Calculates the number of changes required to transform string-1 into string-2, returning a value between 0 (no match) and 100 (perfect match)
JARO_WINKLER Function on page 227-8	Calculates the measure of agreement between string-1 and string-2
JARO_WINKLER_ SIMILARITY Function on page 227-9	Calculates the measure of agreement between string-1 and string-2, returning a value between 0 (no match) and 100 (perfect match)

EDIT_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

Syntax

```
UTL_MATCH.EDIT_DISTANCE (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 227–3 EDIT_DISTANCE Function Parameters

Parameter	Description
`s1`	The string to be transformed
`s2`	The string into which `s1` is to be transformed

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;
-------------
returns 2
```

EDIT_DISTANCE_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two Strings. The value is typically between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.EDIT_DISTANCE_SIMILARITY (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 227–4 EDIT_DISTANCE_SIMILARITY Function Parameters

Parameter	Description
s1	The string to be transformed
s2	The string into which s1 is to be transformed

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
--------------
returns 82
```

JARO_WINKLER Function

This function calculates the measure of agreement between two strings.

Syntax

```
UTL_MATCH.JARO_WINKLER (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN BINARY_DOUBLE;
```

Parameters

Table 227–5 JARO_WINKLER Function Parameters

Parameter	Description
s1	Input
s2	input

Examples

```
SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;
--------------
returns 9.818E-001
```

JARO_WINKLER_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

Syntax

```
UTL_MATCH.JARO_WINKLER (
   s1  IN  VARCHAR2,
   s2  IN  VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 227–6 JARO_WINKLER Function Parameters

Parameter	Description
s1	Input
s2	input

Examples

```
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
--------------
returns 98
```

228

UTL_NLA

The `UTL_NLA` package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as `VARRAY`s.

This chapter contains the following topics:

- Using UTL_NLA
  - Overview
  - Rules and Limits
- Subprogram Groups
  - BLAS Level 1 (Vector-Vector Operations) Subprograms
  - BLAS Level 2 (Matrix-Vector Operations) Subprograms
  - BLAS Level 3 (Matrix-Matrix Operations) Subprograms
  - LAPACK Driver Routines (Linear Equations) Subprograms
  - LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
- Summary of UTL_NLA Subprograms

Using UTL_NLA

This section contains topics which relate to using the `UTL_NLA` package.

- Overview
- Rules and Limits

Overview

The UTL_NLA package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage)(Version 3.0) operations on vectors and matrices represented as VARRAYs.

Standards

For more information on the BLAS and LAPACK standards see

http://www.netlib.org/blas/
http://www.netlib.org/lapack/

Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the BLAS_ prefix (for example, theBLAS_ASUM Functions). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.
- All LAPACK functions have the LAPACK_ prefix (for example, the LAPACK_ GBSV Procedures). The subroutines in LAPACK are mapped to PL/SQL procedures. Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all /work/ arguments have been removed. The UTL_NLA package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, pack, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

Rules and Limits

Vectors and matrices are stored in `VARRAY`s with a maximum size of one million entries. Given this restriction, `UTL_NLA` vectors can be up to one million entries but matrices need to be of size RxC <= 1,000,000.

Subprogram Groups

- BLAS Level 1 (Vector-Vector Operations) Subprograms
- BLAS Level 2 (Matrix-Vector Operations) Subprograms
- BLAS Level 3 (Matrix-Matrix Operations) Subprograms
- LAPACK Driver Routines (Linear Equations) Subprograms
- LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 228–1 BLAS Level 1 (Vector-Vector Operations) Subprograms

Subprogram	Description
BLAS_ASUM Functions on page 228-17	Computes the sum of the absolute values of the vector components
BLAS_AXPY Procedures on page 228-18	Copies `alpha*X + Y` into vector `Y`
BLAS_COPY Procedures on page 228-19	Copies the contents of vector `X` to vector `Y`
BLAS_DOT Functions on page 228-20	Returns the dot (scalar) product of two vectors `X` and `Y`
BLAS_IAMAX Functions on page 228-30	Computes the index of the first element of a vector that has the largest absolute value
BLAS_NRM2 Functions on page 228-31	Computes the vector 2-norm (Euclidean norm)
BLAS_ROT Procedures on page 228-32	Returns the plane rotation of points
BLAS_ROTG Procedures on page 228-33	Returns the Givens rotation of points
BLAS_SCAL Procedures on page 228-34	Scales a vector by a constant
BLAS_SWAP Procedures on page 228-43	Swaps the contents of two vectors each of size n

BLAS Level 2 (Matrix-Vector Operations) Subprograms

Table 228–2 BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_GBMV Procedures on page 228-21	Performs the matrix-vector operation `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals
BLAS_GEMV Procedures on page 228-26	Performs the matrix-vector operations `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix
BLAS_GER Procedures on page 228-28	Performs a rank 1 operation `A := alpha*x*y' + A` where `alpha` is a scalar, `x` is an `m` element vector, `y` is an n element vector and `A` is an `m` by `n` matrix
BLAS_SBMV Procedures on page 228-41	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are n element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals
BLAS_SPMV Procedures on page 228-35	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SPR Procedures on page 228-37	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SPR2 Procedures on page 228-39	Performs a symmetric rank 2 operation `A := alpha*x*y' + alpha*y*x' +A` where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix, supplied in packed form
BLAS_SBMV Procedures on page 228-41	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are n element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals
BLAS_SYMV Procedures on page 228-46	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix
BLAS_SYR Procedures on page 228-48	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix
BLAS_SYR2 Procedures on page 228-50	Performs a symmetric rank 2 operation `A := alpha*x*y' + alpha*y*x' + A` where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix
BLAS_TBMV Procedures on page 228-57	Performs a matrix-vector operation `x := A*x` or `A'*x = b` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals
BLAS_TBSV Procedures on page 228-59	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an `n` by n unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals

Table 228–2 (Cont.) BLAS Level 2 (Matrix-Vector Operations) Subprograms

Subprogram	Description
BLAS_TPMV Procedures on page 228-61	Performs a matrix-vector operation `x := A*x` or `x := A'*x` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TPSV Procedures on page 228-63	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix, supplied in packed form
BLAS_TRMV Procedures on page 228-68	Performs a matrix-vector operation `x := A*x` or `x := A'*x` where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular matrix
BLAS_TRSV Procedures on page 228-73	Solves one of the systems of equation `A*x = b` or `A'*x = b` where `b` and `x` are `n` element vectors and `A` is an n by `n` unit, or non-unit, upper or lower triangular matrix

BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Table 228–3 BLAS Level 3 (Matrix-Matrix Operations) Subprograms

Subprogram	Description
BLAS_GEMM Procedures on page 228-26	Performs one of the matrix-vector operations `C := alpha*op(A)*op(B) + beta*C` where `op(X) is one of op(X) = X or op(X) = X'` where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix
BLAS_SYMM Procedures on page 228-44	Performs one of the matrix-vector operations `C := alpha*A*B + beta*C` or `C := alpha*B*A + beta*C` where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices
BLAS_SYR2K Procedures on page 228-52	Performs one of the symmetric rank2 k operations `C := alpha*A*B' + alpha*B*A' + beta*C` or `C := alpha*A'*B + alpha*B'*A + beta*C` where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case
BLAS_SYRK Procedures on page 228-55	Performs one of the symmetric rank `k` operations `C := alpha*A*A' + beta*C` or `C := alpha*A'*A + beta*C` where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` is an `n` by `k` matrix in the first case and a `k` by `n` matrix in the second case
BLAS_TRMM Procedures on page 228-65	Performs one of the matrix-vector operations `B := alpha*op(A)*B` or `B := alpha*B*op(A)` where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of two alternatives
BLAS_TRSM Procedures on page 228-70	Performs one of the matrix-vector operations `op(A)*X = alpha*B` or `X*op(A) = alpha*B` where `alpha` is a scalar, `X` and `B` are `m` by `n` matrices, `A` is a unit, or non-unit, upper or lower triangular matrix, `op(A)` is one of two alternatives. The matrix `X` is overwritten on `B`

LAPACK Driver Routines (Linear Equations) Subprograms

Table 228–4 LAPACK Driver Routines (Linear Equations) Subprograms

Subprogram	Description
LAPACK_GBSV Procedures on page 228-75	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.
LAPACK_GESV Procedures on page 228-84	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.
LAPACK_GTSV Procedures on page 228-92	This procedure solves the equation `a * x = b` where `a` is an `n` by `n` tridiagonal matrix, by Gaussian elimination with partial pivoting.
LAPACK_PBSV Procedures on page 228-94	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_POSV Procedures on page 228-96	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_PPSV Procedures on page 228-98	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.
LAPACK_PTSV Procedures on page 228-100	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite tridiagonal matrix, and `x` and `b` are `n` by `nrhs` matrices.
LAPACK_SPSV Procedures on page 228-110	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix stored in packed format, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.
LAPACK_SYSV Procedures on page 228-120	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.

LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 228–5 LAPACK Driver Routines (LLS and Eigenvalue Problems)

Subprogram	Description
LAPACK_GEES Procedures on page 228-77	Computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization A = Z*T*(Z**T).
LAPACK_GEEV Procedures on page 228-89	Computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.
LAPACK_GELS Procedures on page 228-79	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.
LAPACK_GESDD Procedures on page 228-81	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_GESVD Procedures on page 228-86	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and/or right singular vectors. The SVD is written A = U * SIGMA * transpose(V).
LAPACK_SBEV Procedures on page 228-102	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix A
LAPACK_SBEVD Procedures on page 228-104	Ccomputes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SPEV Procedures on page 228-106	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage
LAPACK_SPEVD Procedures on page 228-108	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_STEV Procedures on page 228-112	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A
LAPACK_STEVD Procedures on page 228-114	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.
LAPACK_SYEV Procedures on page 228-116	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A
LAPACK_SYEVD Procedures on page 228-118	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

Summary of UTL_NLA Subprograms

Table 228–6 UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_ASUM Functions on page 228-17	Computes the sum of the absolute values of the vector components	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_AXPY Procedures on page 228-18	Copies `alpha*X + Y` into vector `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_COPY Procedures on page 228-19	Copies the contents of vector `X` to vector `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_DOT Functions on page 228-20	Returns the dot (scalar) product of two vectors `X` and `Y`	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_GBMV Procedures on page 228-21	Performs the matrix-vector operation `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GEMM Procedures on page 228-26	Performs one of the matrix-vector operations where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_GEMV Procedures on page 228-26	Performs the matrix-vector operations `y := alpha*A*x + beta*y` or `y := alpha*A'*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_GER Procedures on page 228-28	Performs a rank 1 operation `A := alpha*x*y' + A` where `alpha` is a scalar, `x` is an `m` element vector, `y` is an n element vector and `A` is an `m` by `n` matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_IAMAX Functions on page 228-30	Computes the index of the first element of a vector that has the largest absolute value	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_NRM2 Functions on page 228-31	Computes the vector 2-norm (Euclidean norm)	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROT Procedures on page 228-32	Returns the plane rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_ROTG Procedures on page 228-33	Returns the Givens rotation of points	BLAS Level 1 (Vector-Vector Operations) Subprograms

Table 228–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_SBMV Procedures on page 228-41	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SCAL Procedures on page 228-34	Scales a vector by a constant	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SPMV Procedures on page 228-35	Performs a matrix-vector operation `y := alpha*A*x + beta*y` where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR Procedures on page 228-37	Performs a symmetric rank 1 operation `A := alpha*x*x' + A` where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SPR2 Procedures on page 228-39	Performs a symmetric rank 2 operation where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SWAP Procedures on page 228-43	Swaps the contents of two vectors each of size n	BLAS Level 1 (Vector-Vector Operations) Subprograms
BLAS_SYMM Procedures on page 228-44	Performs one of the matrix-vector operations where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYMV Procedures on page 228-46	Performs a matrix-vector operation where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR Procedures on page 228-48	Performs a symmetric rank 1 operation where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2 Procedures on page 228-50	Performs a symmetric rank 2 operation where `alpha` is a scalar, `x` and `y` are `n` element vectors, and `A` is an `n` by `n` symmetric matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_SYR2K Procedures on page 228-52	Performs one of the symmetric rank2 k operations where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_SYRK Procedures on page 228-55	Performs one of the symmetric rank `k` operations where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` is an `n` by `k` matrix in the first case and a `k` by `n` matrix in the second case	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_TBMV Procedures on page 228-57	Performs a matrix-vector operation where `x` is an `n` element vector and `A` is an `n` by `n` unit, or non-unit, upper or lower triangular band matrix, with `(k + 1)` diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms

Table 228–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
BLAS_TBSV Procedures on page 228-59	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k + 1) diagonals	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPMV Procedures on page 228-61	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TPSV Procedures on page 228-63	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMM Procedures on page 228-65	Performs one of the matrix-vector operations wherealpha is a scalar, B is an m by n matrix, A is a unit, or non-unit, upper or lower triangular matrix and op(A) is one of two alternatives	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRMV Procedures on page 228-68	Performs a matrix-vector operation where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
BLAS_TRSM Procedures on page 228-70	Performs one of the matrix-vector operations op(A)*X = alpha*B or X*op(A) = alpha*B where alpha is a scalar, X and B are m by n matrices, A is a unit, or non-unit, upper or lower triangular matrix, op(A) is one of two alternatives. The matrix X is overwritten on B	BLAS Level 3 (Matrix-Matrix Operations) Subprograms
BLAS_TRSV Procedures on page 228-73	Solves one of the systems of equation where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular matrix	BLAS Level 2 (Matrix-Vector Operations) Subprograms
LAPACK_GBSV Procedures on page 228-75	This procedure computes the solution to a real system of linear equations a * x = b where a is an n by n matrix and x and b are n by nrhs matrices. The LU decomposition with partial pivoting and row interchanges is used to factor A.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_GEES Procedures on page 228-77	Computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization A = Z*T*(Z**T).	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GEEV Procedures on page 228-89	Computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GELS Procedures on page 228-79	Solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ GESDD Procedures on page 228-81	Computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 228–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
LAPACK_GESV Procedures on page 228-84	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices. The `LU` decomposition with partial pivoting and row interchanges is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_ GESVD Procedures on page 228-86	Computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and/or right singular vectors. The SVD is written `A = U * SIGMA * transpose(V)`.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_GTSV Procedures on page 228-92	This procedure solves the equation `a * x = b` where `a` is an `n` by `n` tridiagonal matrix, by Gaussian elimination with partial pivoting.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PBSV Procedures on page 228-94	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_POSV Procedures on page 228-96	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PPSV Procedures on page 228-98	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices. The Cholesky decomposition is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_PTSV Procedures on page 228-100	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric positive definite tridiagonal matrix, and `x` and `b` are `n` by `nrhs` matrices.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_SBEV Procedures on page 228-102	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric band matrix `A`	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ SBEVD Procedures on page 228-104	Ccomputes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_SPEV Procedures on page 228-106	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ SPEVD Procedures on page 228-108	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A` in packed storage. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

Table 228–6 (Cont.) UTL_NLA Package Subprograms

Subprogram	Description	Group
LAPACK_SPSV Procedures on page 228-110	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix stored in packed format, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms
LAPACK_STEV Procedures on page 228-112	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ STEVD Procedures on page 228-114	Computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_ SYEVD Procedures on page 228-118	Computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix `A`. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.	LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
LAPACK_SYSV Procedures on page 228-120	This procedure computes the solution to a real system of linear equations `a * x = b` where `a` is an n by n symmetric matrix, and `x` and `b` are `n` by `nrhs` matrices. The diagonal pivoting method is used to factor `A`.	LAPACK Driver Routines (Linear Equations) Subprograms

BLAS_ASUM Functions

This procedure computes the sum of the absolute values of the vector components.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 228-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ASUM (
   n      IN       POSITIVEN,
   x      IN       UTL_NLA_ARRAY_DBL,
   incx   IN       POSITIVEN)
 RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_ASUM (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_FLT)
 RETURN BINARY_FLOAT
```

Parameters

Table 228–7 BLAS_ASUM Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_AXPY Procedures

This procedure copies `alpha*X + Y` into vector `Y`.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 228-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_AXPY (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_DBL,
   incx   IN       POSITIVEN,
   y      IN OUT   UTL_NLA_ARRAY_DBL,
   incy   IN       POSITIVEN);

UTL_NLA.BLAS_AXPY (
   n      IN       POSITIVEN,
   alpha  IN       SCALAR_DOUBLE,
   x      IN       UTL_NLA_ARRAY_FLT,
   incx   IN       POSITIVEN,
   y      IN OUT   UTL_NLA_ARRAY_FLT,
   incy   IN       POSITIVEN);
```

Parameters

Table 228–8 BLAS_AXPY Procedure Parameters

Parameter	Description
`n`	Specifies the number of elements of the vectors `x` and `y`. `n` must be at least zero.
`alpha`	Specifies the scalar alpha.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of `dimension` at least `( 1 + ( n - 1 )*abs( incx ) )`
`incx`	Specifies the increment for the elements of `x`. `incx` must not be zero.
`y`	`UTL_NLA_ARRAY_FLT/DBL` of `DIMENSION` at least `( 1 + ( n - 1 )*abs( incy) )`
`incy`	Specifies the increment for the elements of `y`. `incy` must not be zero.

BLAS_COPY Procedures

This procedure copies the contents of vector X to vector Y.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 228-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_COPY (
   n     IN     POSITIVEN,
   x     IN     UTL_NLA_ARRAY_DBL,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_DBL,
   incy  IN     POSITIVEN);

UTL_NLA.BLAS_COPY (
   n     IN     POSITIVEN,
   x     IN     UTL_NLA_ARRAY_FLT,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_FLT,
   incy  IN     POSITIVEN);
```

Parameters

Table 228–9 BLAS_COPY Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

BLAS_DOT Functions

This function returns the dot (scalar) product of two vectors `X` and `Y`.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 228-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_DOT (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN,
   y     IN   UTL_NLA_ARRAY_DBL,
   incy  IN   POSITIVEN)
  RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_DOT (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN,
   y     IN   UTL_NLA_ARRAY_FLT,
   incy  IN   POSITIVEN)
  RETURN BINARY_FLOAT;
```

Parameters

Table 228–10 BLAS_DOT Function Parameters

Parameter	Description
`n`	Specifies the number of elements of the vectors `x` and `y`. `n` must be at least zero.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( n - 1 )*abs( incx ) )`
`incx`	Specifies the increment for the elements of `x`. `incx` must not be zero.
`y`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( n - 1 )*abs( incy) )`
`incy`	Specifies the increment for the elements of `y`. `incy` must not be zero.

BLAS_GBMV Procedures

This procedure performs one of the matrix-vector operations

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` band matrix, with `kl` sub-diagonals and `ku` super-diagonals.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 228-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_GEMV (
   trans  IN      flag,
   m      IN      POSITIVEN,
   n      IN      POSITIVEN,

   beta   IN      SCALAR_FLOAT,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 228–11 BLAS_GBMV Procedure Parameters

Parameter	Description
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'y := alpha*A*x + beta*y ■ trans = 'T' or 't'y := alpha*A'*x + beta*y ■ trans = 'C' or 'c'y := alpha*A'*x + beta*y
m	Specifies the number of rows of the matrix A. m must be at least zero.
n	Specifies the number of columns of the matrix A. n must be at least zero.
kl	Specifies the number of sub-diagonals of the matrix A. kl must satisfy 0. le. kl.
ku	Specifies the number of super-diagonals of the matrix A. ku must satisfy 0 .le. ku.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry, the leading (kl + ku + 1) by n part of the array A must contain the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (ku+1) of the array, the first super-diagonal starting at position 2 in row ku, the first sub-diagonal starting at position 1 in row (ku+2), and so on. Elements in the array A that do not correspond to elements in the band matrix (such as the top left ku by ku triangle) are not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (kl+ku+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx)) when trans = ''N' or 'n' and at least (1 + (m - 1)*abs(incx)) otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (m - 1)*abs(incy)) when trans = 'N' or 'n' and at least (1+(n-1)*abs(incy)) otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.

Table 228–11 (Cont.) BLAS_GBMV Procedure Parameters

Parameter	Description
`pack`	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_GEMM Procedures

This procedure performs one of the matrix-matrix operations

```
C := alpha*op( A )*op( B ) + beta*C
```

where `op(X)` is one of

```
op(X) = X
```

or

```
op(X) = X'
```

where `alpha` and `beta` are scalars, and `A`, `B` and `C` are matrices, with `op(A)` an `m` by `k` matrix, `op(B)` a `k` by `n` matrix and `C` an `m` by `n` matrix.

> **See Also:** BLAS Level 3 (Matrix-Matrix Operations) Subprograms on page 228-9 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_GEMM (

```

Parameters

Table 228–12 BLAS_GEMM Procedure Parameters

Parameter	Description
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: ■ transa = 'N' or 'n': op(A) = 'A' ■ transa = 'T' or 't': op(A) = 'A' ■ transa = 'C' or 'c': op(A) = 'A'
transb	Specifies the form of op(B) to be used in the matrix multiplication as follows: ■ transb = 'N' or 'n': op(B) = B ■ transb = 'T' or 't': op(B) = B' ■ transb = 'C' or 'c': op(B) = B'
m	Specifies the number of rows of the matrix op(A) and of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix op(B) and of the matrix C. n must be at least zero.
k	Specifies the rows of the matrix op(A) and the number of columns of the matrix op(B). k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, ka) where ka is k when transa = 'N' or 'n', and is m otherwise. Before entry with transa = 'N' or 'n', the leading m by k part of the array A must contain the matrix A, otherwise the leading k by m part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When transa = 'N' or 'n', lda must be at least max (1,k).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, kb) where kb is n when transb = ''N' or 'n', and is k otherwise. Before entry with transb = 'N' or 'n', the leading k by n part of the array b must contain the matrix B, otherwise the leading n by k part of the arrayb must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When transb = 'N' or 'n', ldb must be at least max (1, n).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc, n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the arrayC is overwritten by the m by n matrix (alpha*op(A)*op(B) + beta*C).
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1, m).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_GEMV Procedures

This procedure performs one of the matrix-vector operations

```
y := alpha*A*x + beta*y
```

or

```
y := alpha*A'*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are vectors and `A` is an `m` by `n` matrix.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 228-7 for other subprograms in this group

Syntax

```

```

Parameters

Table 228–13 BLAS_GEMV Procedure Parameters

Parameter	Description
`trans`	Specifies the operation to be performed: ▪ `trans = 'N'` or `'n'`,`y := alpha*A*x + beta*y` ▪ `trans = 'T'` or `'t'y := alpha*A'*x + beta*y` ▪ `trans = 'C'` or `'c'y := alpha*A'*x + beta*y`
`m`	Specifies the number of rows of the matrix A. `m` must be at least zero.

Table 228–13 (Cont.) BLAS_GEMV Procedure Parameters

Parameter	Description
n	Specifies the number of columns of the matrix A. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, m).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx)) when trans = ''N' or 'n' and at least (1+(m-1)*abs(incx)) otherwise. Before entry, the incremented array X must contain the vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (m - 1)*abs(incy)) when trans = 'N' or 'n' and at least (1 + (n - 1)*abs(incy)) otherwise. Before entry with beta nonzero, the incremented array Y must contain the vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_GER Procedures

This procedure performs the rank 1 operation

```
A := alpha*x*y' + A
```

where `alpha` is a scalar, `x` is an `m` element vector, `y` is an n element vector and `A` is an `m` by `n` matrix.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 228-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_GER (
   m      IN      POSITIVEN,

   lda    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 228–14 BLAS_GER Procedure Parameters

Parameter	Description
`m`	Specifies the number of rows of the matrix `A`. `m` must be at least zero.
`n`	Specifies the number of columns of the matrix `A`. `n` must be at least zero.
`alpha`	Specifies the scalar alpha.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( m - 1 )*abs( incx ) )` Before entry, the incremented array `X` must contain the m element vector `x`.
`incx`	Specifies the increment for the elements of `x`. incx must not be zero.

Table 228–14 (Cont.) BLAS_GER Procedure Parameters

Parameter	Description
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy)) Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incx must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry, the leading m by n part of the array a must contain the matrix of coefficients. On exit, a is overwritten by the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, m)
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_IAMAX Functions

This function computes the index of first element of a vector that has the largest absolute value.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 228-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_IAMAX (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN,
  RETURN POSITIVEN;

UTL_NLA.BLAS_IAMAX (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN,
  RETURN POSITIVEN;
```

Parameters

Table 228–15 BLAS_IAMAX Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_NRM2 Functions

This function computes the vector 2-norm (Euclidean norm).

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 228-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_NRM2 (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_DBL,
   incx  IN   POSITIVEN)
  RETURN BINARY_DOUBLE;

UTL_NLA.BLAS_NRM2 (
   n     IN   POSITIVEN,
   x     IN   UTL_NLA_ARRAY_FLT,
   incx  IN   POSITIVEN)
  RETURN BINARY_FLOAT;
```

Parameters

Table 228–16 BLAS_NRM2 Function Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_ROT Procedures

This procedure returns the plane rotation of points.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 228-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROT (
   n      IN      POSITIVEN,
   x      IN OUT  UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   y      IN OUT  UTL_NLA_ARRAY_DBL,
   incy   IN      POSITIVEN,
   c      IN      SCALAR_DOUBLE,
   s      IN      SCALAR_DOUBLE);

UTL_NLA.BLAS_ROT (
   n      IN      POSITIVEN,
   x      IN OUT  UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   c      IN      SCALAR_DOUBLE,
   s      IN      SCALAR_DOUBLE);
```

Parameters

Table 228–17 BLAS_ROT Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)* abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1+(n-1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.
c	SCALAR_FLOAT/DOUBLE.Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE.Specifies the scalar S.

BLAS_ROTG Procedures

This procedure returns the Givens rotation of points.

> **See Also:** BLAS Level 1 (Vector-Vector Operations) Subprograms on page 228-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_ROTG (
   a   IN OUT   SCALAR_DOUBLE,
   b   IN OUT   SCALAR_DOUBLE,
   c   IN OUT   SCALAR_DOUBLE,
   s   IN OUT   SCALAR_DOUBLE);

UTL_NLA.BLAS_ROTG (
   a   IN OUT   SCALAR_FLOAT,
   b   IN OUT   SCALAR_FLOAT,
   c   IN OUT   SCALAR_FLOAT,
   s   IN OUT   SCALAR_FLOAT);
```

Parameters

Table 228–18 BLAS_ROT G Procedure Parameters

Parameter	Description
a	SCALAR_FLOAT/DOUBLE. Specifies the scalar A.
b	SCALAR_FLOAT/DOUBLE. Specifies the scalar B.
c	SCALAR_FLOAT/DOUBLE. Specifies the scalar C.
s	SCALAR_FLOAT/DOUBLE. Specifies the scalar S.

BLAS_SCAL Procedures

This procedure scales a vector by a constant.

See Also: BLAS Level 1 (Vector-Vector Operations) Subprograms on page 228-6 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SCAL (
   n      IN  POSITIVEN,
   alpha  IN  SCALAR_DOUBLE,
   x      IN  OUT UTL_NLA_ARRAY_DBL,
   incx   IN  POSITIVEN);

UTL_NLA.BLAS_SCAL (
   n      IN  POSITIVEN,
   alpha  IN  SCALAR_FLOAT,
   x      IN  OUT UTL_NLA_ARRAY_FLT,
   incx   IN  POSITIVEN);
```

Parameters

Table 228–19 BLAS_SCAL Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.

BLAS_SPMV Procedures

This procedure performs the matrix-vector operation

```
y := alpha*A*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix, supplied in packed form.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 228-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DOUBLE,
   ap     IN      UTL_NLA_ARRAY_DBL,
   x      IN      UTL_NLA_ARRAY_DBL,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_DOUBLE,
   y      IN OUT  UTL_NLA_ARRAY_DBL,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');

UTL_NLA.BLAS_SPMV (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_FLOAT,
   ap      IN     UTL_NLA_ARRAY_FLT,
   x      IN      UTL_NLA_ARRAY_FLT,
   incx   IN      POSITIVEN,
   beta   IN      SCALAR_FLOAT,
   y      IN OUT  UTL_NLA_ARRAY_FLT,
   incy   IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 228–20 BLAS_SPMV Procedure Parameters

Parameter	Description
`uplo`	Specifies the upper or lower triangular part of the matrix A is supplied in the packed array `AP`: ▪ `uplo = 'U'` or `'u'`. The upper triangular part of `A` is supplied in `AP`. ▪ `uplo = 'L'` or `'l'`. The lower triangular part of `A` is supplied in `AP`.
`n`	Specifies the order of the matrix `A`. `n` must be at least zero.
`alpha`	`SCALAR_FLOAT/DOUBLE`. Specifies the scalar alpha.

Table 228–20 (Cont.) BLAS_SPMV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains, ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then Y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at leasT (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SPR Procedures

This procedure performs the rank 1 operation

```
A := alpha*x*x' + A
```

where alpha is a real scalar, x is an n element vector, and A is an n by n symmetric matrix, supplied in packed form.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 228-7 for other subprograms in this group

Syntax

```
UTL_NLA.BLAS_SPR (
   uplo   IN      flag,
   n      IN      POSITIVEN,
   alpha  IN      SCALAR_DBL,

   ap     IN OUT  UTL_NLA_ARRAY_FLT,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 228–21 BLAS_SPR Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array ap: ■ uplo = 'U' or 'u': The upper triangular part of A is supplied in ap. ■ uplo = 'L' or 'l': The lower triangular part of A is supplied in ap.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.

Table 228–21 (Cont.) BLAS_SPR Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n +1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. On exit, the array ap is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. On exit, the array ap is overwritten by the lower triangular part of the updated matrix
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SPR2 Procedures

This procedure performs the rank 2 operation

```
A := alpha*x*y' + alpha*y*x' +A
```

where alpha is a scalar, x and y are n element vectors, and A is an n by n symmetric matrix, supplied in packed form.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 228-7 for other subprograms in this group

Syntax

   a      IN OUT  UTL_NLA_ARRAY_FLT,
   lda    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 228–22 BLAS_SPR2 Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the matrix A is supplied in the packed array ap : ■ uplo = 'U' or 'u' : The upper triangular part of A is supplied in ap. ■ uplo = 'L' or 'l' : The lower triangular part of A is supplied in ap.
n	Specifies the order of the matrix A. n must be at least zero.
alpha	Specifies the scalar alpha.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the m element vector x.

Table 228–22 (Cont.) BLAS_SPR2 Procedure Parameters

Parameter	Description
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array X must contain the m element vector y.
incy	Specifies the increment for the elements of y. incy must not be zero.
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. On exit, the array ap is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. On exit, the array ap is overwritten by the lower triangular part of the updated matrix
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SBMV Procedures

This procedure performs the matrix-vector operation

```
y := alpha*A*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric band matrix, with `k` super-diagonals.

> **See Also:** BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 228-7 for other subprograms in this group

Syntax

```

```

Parameters

Table 228–23 BLAS_SBMV Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the band matrix `A` is being supplied: ▪ `uplo` = `'U'` or `'u'`. The upper triangular part of `A` is supplied. ▪ `uplo` = `'L'` or `'l'`. The lower triangular part of `A` is supplied.
`n`	Specifies the order of the matrix `A`. `n` must be at least zero.
`k`	Specifies the number of super-diagonals of the matrix `A`. `k` must satisfy `0 .le. k`.

Table 228–23 (Cont.) BLAS_SBMV Procedure Parameters

Parameter	Description
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in rowk, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the symmetric matrix, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Unchanged on exit
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k + 1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SWAP Procedures

This procedure swaps the contents of two vectors each of size n.

Syntax

```
UTL_NLA.BLAS_SWAP (
   n     IN     POSITIVEN,
   x     IN OUT UTL_NLA_ARRAY_DBL,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_DBL,
   incy  IN     POSITIVEN);

UTL_NLA.BLAS_SWAP (
   n     IN     POSITIVEN,
   x     IN OUT UTL_NLA_ARRAY_FLT,
   incx  IN     POSITIVEN,
   y     IN OUT UTL_NLA_ARRAY_FLT,
   incy  IN     POSITIVEN);
```

Parameters

Table 228–24 BLAS_SWAP Procedure Parameters

Parameter	Description
n	Specifies the number of elements of the vectors x and y. n must be at least zero.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx))
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of DIMENSION at least (1+(n-1)*abs(incy))
incy	Specifies the increment for the elements of y. incy must not be zero.

BLAS_SYMM Procedures

This procedure performs one of the matrix-matrix operations

```
C := alpha*A*B + beta*C
```

or

```
C := alpha*B*A + beta*C
```

where `alpha` and `beta` are scalars, `A` is a symmetric matrix, and `B` and `C` are `m` by `n` matrices.

> **See Also:** BLAS Level 3 (Matrix-Matrix Operations) Subprograms on page 228-9 for other subprograms in this group

Syntax

   ldc    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 228–25 BLAS_SYMM Procedure Parameters

Parameter	Description
`side`	Specifies whether the symmetric matrix `A` appears on the left or right in the operation: ▪ `side = 'L'` or `'l'` : `C := alpha*A*B + beta*C` ▪ `side = 'R'` or `'r'` : `C := alpha*B*A + beta*C`

Table 228–25 (Cont.) BLAS_SYMM Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U' or 'u' : Only the upper triangular part of the symmetric matrix is to be referenced. ■ uplo = 'L' or 'l' : Only the lower triangular part of the symmetric matrix is to be referenced.
m	Specifies the number of rows of the matrix C. m must be at least zero.
n	Specifies the number of columns of the matrix C. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where ka is m when side = 'L' or 'l', and is n otherwise. Before entry with side = 'L' or 'l', the leading m by m part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading m by m upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading m by m lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. Before entry with side = 'R' or 'r', the n by n part of the array A must contain the symmetric matrix, such that when uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced, and when uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then c need not be set on input.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry, the leading m by n part of the array C must contain the matrix C, except when beta is zero, in which case C need not be set on entry. On exit, the array C is overwritten by the m by n updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max (1,m).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYMV Procedures

This procedure performs the matrix-vector operation

```
y := alpha*A*x + beta*y
```

where `alpha` and `beta` are scalars, `x` and `y` are `n` element vectors and `A` is an `n` by `n` symmetric matrix.

```

Parameters

Table 228–26 BLAS_SYMV Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the array `A` is to be referenced: ▪ `uplo` = `'U'` or `'u'`. Only the upper triangular part of `A` is to be referenced. ▪ `uplo` = `'L'` or `'l'`. Only the lower triangular part of `A` is to be referenced.
`n`	Specifies the order of the matrix `A`. `n` must be at least zero.
`alpha`	`SCALAR_FLOAT/DOUBLE`. Specifies the scalar alpha.

Table 228–26 (Cont.) BLAS_SYMV Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1,n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)) Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta. When beta is supplied as zero then y need not be set on input.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incy)) Before entry, the incremented array Y must contain the n element vector y. On exit, Y is overwritten by the updated vector y.
incy	Specifies the increment for the elements of y. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYR Procedures

This procedure performs the rank 1 operation

```
A := alpha*x*x' + A
```

where `alpha` is a real scalar, `x` is an `n` element vector, and `A` is an `n` by `n` symmetric matrix.

See Also: BLAS Level 2 (Matrix-Vector Operations) Subprograms on page 228-7 for other subprograms in this group

Syntax

   lda    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 228–28 BLAS_SYR2 Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the array `A` is to be referenced: ▪ `uplo = 'U'` or `'u'`: Only the upper triangular part of `A` is to be referenced. ▪ `uplo = 'L'` or `'l'`: Only the lower triangular part of `A` is to be referenced.
`n`	Specifies the order of the matrix `A`. `n` must be at least zero.
`alpha`	Specifies the scalar alpha.
`x`	`UTL_NLA_ARRAY_FLT/DBL` of dimension at least `( 1 + ( n - 1 )*abs( incx ) )` Before entry, the incremented array `X` must contain the m element vector `x`.

Table 228–28 (Cont.) BLAS_SYR2 Procedure Parameters

Parameter	Description
incx	Specifies the increment for the elements of x. incx must not be zero.
y	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1)*abs(incy)) Before entry, the incremented array Y must contain the m element vector y.
incy	Specifies the increment for the elements of y. incy must not be zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n) With uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of A is not referenced. On exit, the upper triangular part of the array A is overwritten by the upper triangular part of the updated matrix. With uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of A is not referenced. On exit, the lower triangular part of the array A is overwritten by the lower triangular part of the updated matrix.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1, n)
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYR2K Procedures

This procedure performs one of the symmetric rank2 k operations

```
C := alpha*A*B' + alpha*B*A' + beta*C
```

or

```
C := alpha*A'*B + alpha*B'*A + beta*C
```

where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and `A` and `B` are `n` by `k` matrices in the first case and `k` by `n` matrices in the second case.

> **See Also:** BLAS Level 3 (Matrix-Matrix Operations) Subprograms on page 228-9 for other subprograms in this group

Syntax

```

   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 228–29 BLAS_SYR2K Procedure Parameters

Parameter	Description
uplo	Specifies whether the upper or lower triangular part of the array C is to be referenced: ■ uplo = 'U' or 'u' : Only the upper triangular part of C is to be referenced. ■ uplo = 'L' or 'l' : Only the lower triangular part of C is to be referenced.
trans	Specifies the operations to be performed: ■ trans = 'N' or 'n'C : C := alpha*A*B' + alpha*B*A' + beta*C ■ trans = 'T' or 't'C : C := alpha*A'*B + alpha*B'*A + beta*C ■ trans = 'C' or 'c'C : C := alpha*A'*B + alpha*B'*A + beta*C
n	Specifies the order of matrix C. n must be at least zero.
k	On entry with trans = 'N' or 'n', k specifies the number of columns of the matrices A and B. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrices A and B. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where kb is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n by k part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at leastmax(1,n), otherwise lda must be at least max(1,k).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,kb) where kb is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n by k part of the array B must contain the matrix B, otherwise the leading k by n part of the array B must contain the matrix B.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. When trans = 'N' or 'n', ldb must be at least max (1,n), otherwise ldb must be at least max (1,k).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.

Table 228–29 (Cont.) BLAS_SYR2K Procedure Parameters

Parameter	Description
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1,n).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_SYRK Procedures

This procedure performs one of the symmetric rank k operations

```
C := alpha*A*A' + beta*C
```

or

```
C := alpha*A'*A + beta*C
```

where `alpha` and `beta` are scalars, `C` is an `n` by `n` symmetric matrix and`A` is an `n` by `k` matrix in the first case and a `k` by`n` matrix in the second case.

```

Parameters

Table 228–30 BLAS_SYRK Procedure Parameters

Parameter	Description
`uplo`	Specifies whether the upper or lower triangular part of the array `C` is to be referenced: ▪ `uplo = 'U'` or `'u'` : Only the upper triangular part of `C` is to be referenced. ▪ `uplo = 'L'` or `'l'` : Only the lower triangular part of `C` is to be referenced.

Table 228–30 (Cont.) BLAS_SYRK Procedure Parameters

Parameter	Description
trans	Specifies the operations to be performed: ■ trans = 'N' or 'n' : C := alpha*A*A' + beta*C ■ trans = 'T' or 't' : C := alpha*A'*A + beta*C ■ trans ='C' or 'c' : C := alpha*A'*A + beta*C
n	Specifies the order of matrix C. n must be at least zero.
k	On entry with trans = 'N' or 'n', k specifies the number of columns of the matrix A. On entry with trans = 'T' or 't' or trans = 'C' or 'c', k specifies the number of rows of the matrix A. k must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,ka) where ka is k when trans = 'N' or 'n', and is n otherwise. Before entry with trans = 'N' or 'n', the leading n by k part of the array A must contain the matrix A, otherwise the leading k by n part of the array A must contain the matrix A.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When trans = 'N' or 'n', lda must be at least max(1,n), otherwise lda must be at least max(1,k).
beta	SCALAR_FLOAT/DOUBLE. Specifies the scalar beta.
c	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldc,n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array C must contain the upper triangular part of the symmetric matrix and the strictly lower triangular part of C is not referenced. On exit, the upper triangular part of the array C is overwritten by the upper triangular part of the updated matrix. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array C must contain the lower triangular part of the symmetric matrix and the strictly upper triangular part of C is not referenced. On exit, the lower triangular part of the array C is overwritten by the lower triangular part of the updated matrix.
ldc	Specifies the first dimension of C as declared in the calling (sub) program. ldc must be at least max(1,n).
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TBMV Procedures

This procedure performs the matrix-vector operations

```
x := A*x
```

or

```
x := A'*x
```

where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k+1) diagonals.

Parameters

Table 228–31 BLAS_TBMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'x := A*x ■ trans = 'T' or 't'x := A'*x ■ trans = 'C' or 'c'x := A'*x

Table 228–31 (Cont.) BLAS_TBMV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies whether or not A is unit triangular: ■ with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A. ■ with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A. K must satisfy 0 .le. k.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = ''U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*abs(incx)). Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TBSV Procedures

This procedure solves one of the systems of equations

```
A*x = b
```

or

```
A'*x = b
```

where b and x are n element vectors and A is an n by n unit, or non-unit, upper or lower triangular band matrix, with (k+1) diagonals.

Parameters

Table 228–32 BLAS_TBSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the equations to be solved: ■ trans = 'N' or 'n : 'A*x = b ■ trans = 'T' or 't': A'*x = b ■ trans = 'C' or 'c': A'*x = b

Table 228–32 (Cont.) BLAS_TBSV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u' : A is assumed to be unit triangular. ■ diag = 'N' or 'n' : A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
k	Specifies whether or not A is unit triangular: ■ with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A. ■ with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A. K must satisfy 0 .le. k.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,n). Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced. Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced. Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity.
lda	On entry, lda specifies the first dimension of A as declared in the calling (sub) program. lda must be at least (k+1).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) *abs(incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

BLAS_TPMV Procedures

This procedure performs the matrix-vector operations

```
x := A*x
```

or

```
x := A'*x
```

where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix, supplied in packed form.

Parameters

Table 228–34 BLAS_TPSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u' : A is an upper triangular matrix. ■ uplo = 'L' or 'l' : A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n' : A*x = b ■ trans = 'T' or 't' : A'*x = b ■ trans = 'C' or 'c' : A'*x = b
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u' : A is assumed to be unit triangular. ■ diag = 'N' or 'n' : 'A is not assumed to be unit triangular.

Table 228–34 (Cont.) BLAS_TPSV Procedure Parameters

Parameter	Description
n	Specifies the order of the matrix A. n must be at least zero.
ap	UTL_NLA_ARRAY_FLT/DBL of dimension at least ((n*(n+1))/2) Before entry with uplo = 'U' or 'u', the array ap must contain the upper triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(1,2) and a(2,2) respectively, and so on. Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity.
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) *abs(incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. incx must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

BLAS_TRMM Procedures

This procedure performs one of the matrix-matrix operations

```
B := alpha*op( A )*B
```

or

```
B := alpha*B*op( A )
```

where `alpha` is a scalar, `B` is an `m` by `n` matrix, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

   b      IN OUT  UTL_NLA_ARRAY_FLT,
   ldb    IN      POSITIVEN,
   pack   IN      flag DEFAULT 'C');
```

Parameters

Table 228–35 BLAS_TRMM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: ■ side = 'L' or 'l' : B := alpha*op(A)*B ■ side = 'R' or 'r' : B := alpha*B*op(A)
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U' or 'u' : A is an upper triangular matrix. ■ uplo = 'L' or 'l'' : A is a lower triangular matrix.
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: ■ transa = 'N' or 'n' : op(A) = A ■ transa = 'T' or 't' : op(A) = A' ■ transa ='C' or 'c' : op(A) = A'
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda,k) where k is m when side = 'L' or 'l', and is n when side ='R' or 'r'. Before entry with uplo = 'U' or 'u' , the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k byk lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag ='U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1,m), otherwise lda must be at least max(1,n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb,n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the transformed matrix.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1,m).

Table 228–35 (Cont.) BLAS_TRMM Procedure Parameters

Parameter	Description
`pack`	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TRMV Procedures

This procedure performs the matrix-vector operations

```
x := A*x
```

or

```
x := A'*x
```

where x is an n element vector and A is an n by n unit, or non-unit, upper or lower triangular matrix.

Parameters

Table 228–36 BLAS_TRMV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'x := A*x ■ trans= 'T' or 't'x := A'*x ■ trans = 'C' or 'c'x := A'*x

Table 228–36 (Cont.) BLAS_TRMV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity
lda	Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least max(1,n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1+(n-1)*as(incx)). Before entry, the incremented array X must contain the n element vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

BLAS_TRSM Procedures

This procedure performs one of the matrix-matrix operations

```
op( A )*X = alpha*B
```

or

```
X*op( A ) = alpha*B
```

where `alpha` is a scalar, `X` and `B` are `m` by `n` matrices, `A` is a unit, or non-unit, upper or lower triangular matrix and `op(A)` is one of

```
op( A ) = A
```

or

```
op( A ) = A'
```

The matrix `X` is overwritten on `B`.

Parameters

Table 228–37 BLAS_TRSM Procedure Parameters

Parameter	Description
side	Specifies whether the symmetric matrix A appears on the left or right in the operation: ■ side = 'L' or 'l' : op(A)*X = alpha*B ■ side = 'R' or 'r' : X*op(A) = alpha*B
uplo	Specifies whether the upper or lower triangular part of the array A is to be referenced: ■ uplo = 'U' or 'u' : A is an upper triangular matrix. ■ uplo = 'L' or 'l' : A is a lower triangular matrix.
transa	Specifies the form of op(A) to be used in the matrix multiplication as follows: ■ transa = 'N' or 'n' : op(A) = A ■ transa = 'T' or 't' : op(A) = A' ■ transa = 'C' or 'c' : op(A) = A'
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
m	Specifies the number of rows of the B. m must be at least zero.
n	Specifies the number of columns of B. n must be at least zero.
alpha	SCALAR_FLOAT/DOUBLE. Specifies the scalar alpha. When alpha is zero then A is not referenced and B need not be set before entry.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, k) where k is m when side = 'L' or 'l', and is n when side = 'R' or 'r'. Before entry with uplo = 'U' or 'u', the leading k by k upper triangular part of the array A must contain the upper triangular matrix, and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading k by k lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of a as declared in the calling (sub) program. When side = 'L' or 'l', lda must be at least max(1, m), otherwise lda must be at least max (1, n).
b	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (ldb, n). Before entry, the leading m by n part of the array B must contain the matrix B, and on exit is overwritten by the solution matrix X.
ldb	Specifies the first dimension of b as declared in the calling (sub) program. ldb must be at least max(1, m).

Parameters

Table 228–38 BLAS_TRSV Procedure Parameters

Parameter	Description
uplo	Specifies whether the matrix is an upper or lower triangular matrix: ■ uplo = 'U' or 'u'. A is an upper triangular matrix. ■ uplo = 'L' or 'l'. A is a lower triangular matrix.
trans	Specifies the operation to be performed: ■ trans = 'N' or 'n'A*x = b ■ trans = 'T' or 't'A'*x = b ■ trans = 'C' or 'c'A'*x = b

Table 228–38 (Cont.) BLAS_TRSV Procedure Parameters

Parameter	Description
diag	Specifies whether or not A is unit triangular: ■ diag = 'U' or 'u'. A is assumed to be unit triangular. ■ diag = 'N' or 'n'. A is not assumed to be unit triangular.
n	Specifies the order of the matrix A. n must be at least zero.
a	UTL_NLA_ARRAY_FLT/DBL of DIMENSION (lda, n). Before entry with uplo = 'U' or 'u', the leading n by n upper triangular part of the array A must contain the upper triangular matrix and the strictly lower triangular part of A is not referenced. Before entry with uplo = 'L' or 'l', the leading n by n lower triangular part of the array A must contain the lower triangular matrix and the strictly upper triangular part of A is not referenced. Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced either, but are assumed to be unity.
lda	Specifies the first dimension of A as declared in the calling (sub) program. lda must be at least max(1, n).
x	UTL_NLA_ARRAY_FLT/DBL of dimension at least (1 + (n - 1) * abs (incx)) Before entry, the incremented array X must contain the n element right-hand side vector b. On exit, X is overwritten with the solution vector x.
incx	Specifies the increment for the elements of x. Must not be zero.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where a is a band matrix of order n with kl sub diagonals and ku superdiagonals, and x and b are n by nrhs matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor A as

```
a = L * U
```

where L is a product of permutation and unit lower triangular matrices with kl sub diagonals, and U is upper triangular with kl+ku superdiagonals. The factored form of a is then used to solve the system of equations

```
a * x = b
```

> **See Also:** LAPACK Driver Routines (Linear Equations) Subprograms on page 228-10 for other subprograms in this group

Syntax

```

```

Parameters

Table 228–39 LAPACK_GBSV Procedure Parameters

Parameter	Description
n	The number of linear equations, equivalent to the order of the matrixa .n >= 0
kl	The number of sub diagonals within the band of a. kl >= 0.

Table 228–39 (Cont.) LAPACK_GBSV Procedure Parameters

Parameter	Description
ku	The number of superdiagonals within the band of a . ku >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the matrix a in band storage, in rows kl+1 to 2*kl+ku+1; rows 1 to kl of the array need not be set. The j-th column of A is stored in the j-th column of the array ab: ab(kl+ku+1+i-j,j) = a(i,j) for max(1,j-ku)<=i<=min(n,j+kl) On exit, details of the factorization: U is stored as an upper triangular band matrix with kl+ku superdiagonals in rows 1 to KL+KU+1, and the multipliers used during the factorization are stored in rows: kl+ku+2 to 2*kl+ku+1
ldab	The leading dimension of the array ab. ldab >= 2*kl+ku+1
ipiv	INTEGER array, DIMENSION (n). The pivot indices that define the permutation matrix P; row iof the matrix was interchanged with row ipiv(i).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, U(i,i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, and the solution has not been computed
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GEES Procedures

This procedure computes for an n by n real nonsymmetric matrix A, the eigenvalues, the real Schur form T, and, optionally, the matrix of Schur vectors Z. This gives the Schur factorization A = Z*T*(Z**T).

A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

```
[  a  b  ]
[  c  a  ]
```

where b*c < 0. The eigenvalues of such a block are a +- sqrt(bc).

> **See Also:** LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms on page 228-11 for other subprograms in this group

Syntax

```
UTL_NLA.LAPACK_GEES (
   jobvs   IN       flag,
   n       IN       POSITIVEN,
   a       IN  OUT  UTL_NLA_ARRAY_DBL,
   lda     IN       POSITIVEN,

   ldvs    IN       POSITIVEN,
   info    OUT      INTEGER,
   pack    IN       flag DEFAULT 'C');

UTL_NLA.LAPACK_GEES (
   jobvs   IN       flag,
   n       IN       POSITIVEN,
   a       IN OUT   UTL_NLA_ARRAY_FLT,
   lda     IN       POSITIVEN,
   wr      IN       OUT UTL_NLA_ARRAY_FLT,
   wi      IN       OUT UTL_NLA_ARRAY_FLT,
   vs      IN OUT   UTL_NLA_ARRAY_FLT,
   ldvs    IN       POSITIVEN,
   info    OUT      integer,
   pack    IN       flag DEFAULT 'C');
```

Parameters

Table 228–40 LAPACK_GEES Procedure Parameters

Parameter	Description
jobz	■ 'N': Schur vectors are not computed. ■ 'V': Schur vectors are computed.
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). ■ On entry, the n by n matrix A. ■ On exit, A has been overwritten by its real Schur form T.
lda	The leading dimension of the array a. lda >= max(1,n).

Table 228–40 (Cont.) LAPACK_GEES Procedure Parameters

Parameter	Description
wr	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues in the same order that they appear on the diagonal of the output Schur form T. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
wi	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz, n). wr and wi contain the real and imaginary parts respectively of the computed eigenvalues in the same order that they appear on the diagonal of the output Schur form T. Complex conjugate pairs of eigenvalues will appear consecutively with the eigenvalue having the positive imaginary part first.
vs	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ If jobvs = 'V', vs contains the orthogonal matrix Z of Schur vectors. ■ If jobvs = 'N', vs is not referenced.
ldvs	The leading dimension of the array vs. VS. ldvs >= 1. If jobvs = 'V', ldvs >= N
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, and i is <= N: the QR algorithm failed to compute all the eigenvalues. Elements 1:ILO-1 and i+1:N of wr and wi contain those eigenvalues which have converged. If jobvs = 'V', vs contains the matrix which reduces A to its partially converged Schur form.
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an `m` by `n` matrix `A`, or its transpose, using a `QR` or `LQ` factorization of `A`. It is assumed that `A` has full rank.

The following options are provided:

1. If `TRANS = 'N'` and `m >= n`: find the least squares solution of an overdetermined system, that is, solve the least squares problem.

   ```
   minimize || B - A*X ||
   ```

2. If `TRANS = 'N'` and `m < n`: find the minimum norm solution of an underdetermined system `A * X = B`.
3. If `TRANS = 'T'` and `m >= n`: find the minimum norm solution of an undetermined system `A**T * X = B`.
4. If `TRANS = 'T'` and `m < n`: find the least squares solution of an overdetermined system, that is, solve the least squares problem `minimize || B - A**T * X ||`.

  pack     IN       flag DEFAULT 'C');
```

Parameters

Table 228–41 LAPACK_GELS Procedure Parameters

Parameter	Description
`trans`	■ `CHARACTER = 'N'`: The linear system involves `A`. ■ `CHARACTER = 'T'`: The linear system involves `A**T`.

Table 228–41 (Cont.) LAPACK_GELS Procedure Parameters

Parameter	Description
m	The number of rows of the matrix a. M >= 0.
n	The number of columns of the matrix a. N >= 0.
nrhs	The number of right-hand sides, which is the number of columns of the matrix band x.nrhs >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the matrix b of right hand side vectors, stored columnwise; b is m by nrhs if TRANS = 'N', or n by nrhsif trans = 'T'. On exit, if m >= n, a is overwritten by details of its QR factorization as returned by SGEQRF. If m < n, A is overwritten by details of its LQ factorization as returned by SGELQF.
lda	The leading dimension of the array A. lda >= max(1,m).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the matrix b of right hand side vectors, stored columnwise. b is m bynrhs if trans = 'n', or n by nrhs if trans = 'T'. On exit, b is overwritten by the solution vectors, stored columnwise: ■ If trans = 'n' and m >= n, rows 1 to n of b contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements n+1 to m in that column. ■ If trans = 'n' and m < n, rows 1 to n of b contain the minimum norm solution vectors. ■ If trans = 'T' and m >= n, rows 1 to m of b contain the minimum norm solution vectors. ■ If trans = 'T' and m < n, rows 1 to m of b contain the least squares solution vectors; the residual sum of squares for the solution in each column is given by the sum of squares of elements m+1 to n in that column.
ldb	The leading dimension of the array b. ldb >= max(1,m,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GESDD Procedures

This procedures computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

```
A = U * SIGMA * transpose(V)
```

where SIGMA is an `m` by `n` matrix which is zero except for its `min(m,n)` diagonal elements, `U` is an`m` by `m` orthogonal matrix, and `V` is an`n` by `n` orthogonal matrix. The diagonal elements of SIGMA are the singular values of `A`, they are real and non-negative, and are returned in descending order. The first `min(m,n)` columns of `U` and `V` are the left and right singular vectors of `A`.

Note that the routine returns `V**T`, not `V`.

```

Parameters

Table 228–42 LAPACK_GESDD Procedure Parameters

Parameter	Description
jobz	Specifies options for computing all or part of the matrix U: ■ 'A': All m columns of u and all n rows of V**T are returned in arrays u and vt. ■ 'S': The first min(m,n) columns of u and the first min(m,n) rows of V**T are returned in the arrays u and vt. ■ 'O': The first min(m,n) columns of u (the left singular vectors) are overwritten on the array a. jobu and jobvt cannot both be 'O ■ 'N': No columns of u (no left singular vectors) are computed.
m	The order of the matrix a. m >= 0.
n	The order of the matrix a. n >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n matrix A. On exit: ■ If jobz = 'O', a is overwritten with the first min(m,n) columns of u (the left singular vectors, stored columnwise). ■ If m >= n, a is overwritten with the first m rows of V**T (the right singular vectors, stored rowwise). ■ If jobz .ne. 'O', the contents of a are destroyed.
lda	The leading dimension of the array a. lda >= max(1,m).
s	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (min(m,n). The singular values of a, sorted so that S(i) >= S(i+1).
u	UTL_NLA_ARRAY_FLT/DBL. ucol = m if jobz = 'A' or jobz = 'O' and m < n; ucol = min(m,n) if jobz = 'S'. ■ If jobz = 'A' or jobz = 'O' and m < n, u contains the m by m orthogonal matrix u. ■ If jobz = 'S', u contains the first min(m,n) columns of u (the left singular vectors, stored columnwise). ■ If jobz = 'O' and m >= n, or jobz = 'n', u is not referenced.
ldu	The leading dimension of the array U. ldu >= 1. If jobz = 'S' or 'A',or jobz = 'O' and m < n, ldu >= m.
vt	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldvt, n). ■ If jobz = 'A' or jobz = 'O' and m >= n, vt contains the n by n orthogonal matrix V**T. ■ If jobz = 'S', vt contains the first min(m,n) rows of V**T (the right singular vectors, stored rowwise). ■ If jobz = 'O' and m < n, or jobz = 'N', vt is not referenced.

Table 228–42 (Cont.) LAPACK_GESDD Procedure Parameters

Parameter	Description
ldvt	The leading dimension of the array vt. ldvt >= 1. ■ If jobz = 'A', or jobz = 'O' and m >= n, ldvt >= n. ■ If jobz = 'S', ldvt >= min(m,n).
info	■ = 0 : successful exit ■ < 0 : If info = -i, the i-th argument had an illegal value ■ > 0 : SBDSDC did not converge, updating process failed.
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GESV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an `n` by `n` matrix and `x` and `b` are `n` by `nrhs` matrices.

The `LU` decomposition with partial pivoting and row interchanges is used to factor `A` as

```
a = P * L * U
```

where `P` is a permutation matrix, `L` is unit lower triangular, and `U` is upper triangular. The factored form of `a` is then used to solve the system of equations

```
a * x = b
```

Parameters

Table 228–43 LAPACK_GESV Procedure Parameters

Parameter	Description
`n`	The number of linear equations, equivalent to the order of the matrix `a`. `n >= 0`
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 228–43 (Cont.) LAPACK_GESV Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n coefficient matrix a. On exit, the factors L and U from the factorization a = P*L*U; the unit diagonal elements of L are not stored.
lda	The leading dimension of the array a. lda >= max(1,n)
ipiv	INTEGER array, DIMENSION (n). The pivot indices that define the permutation matrix P; row iof the matrix was interchanged with row ipiv(i).
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, U(i,i) is exactly zero. The factorization has been completed, but the factor U is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GESVD Procedures

This procedures computes the singular value decomposition (SVD) of a real `m` by `n` matrix `A`, optionally computing the left and/or right singular vectors. The SVD is written

```
A = U * SIGMA * transpose(V)
```

where SIGMA is an `m` by `n` matrix which is zero except for its `min(m,n)` diagonal elements, `U` is an`m` by `m` orthogonal matrix, and `V` is an`n` by `n` orthogonal matrix. The diagonal elements of SIGMA are the singular values of `A`, they are real and non-negative, and are returned in descending order. The first `min(m,n)` columns of `U` and `V` are the left and right singular vectors of `A`.

Note that the routine returns `V**T`, not `V`.

Parameters

Table 228–44 LAPACK_GESVD Procedure Parameters

Parameter	Description
jobu	Specifies options for computing all or part of the matrix U: ■ 'A': All m columns of U are returned in array U. ■ 'S': The first min(m,n) columns of U (the left singular vectors) are returned in the array U. ■ 'O': The first min(m,n) columns of U (the left singular vectors) are overwritten on the array a. jobu and jobvt cannot both be 'O ■ 'N': No columns of U (no left singular vectors) are computed.
jobvt	Specifies options for computing all or part of the matrix V**T: ■ 'A': All n rows of V**T are returned in the array vt. ■ 'S': The first min(m,n) rows of V**T (the right singular vectors) are returned in the array vt. ■ 'O': The first min(m,n) rows of V**T (the right singular vectors) are overwritten on the array a. jobvt and jobu cannot both be 'O'. ■ 'N': No rows of V**T (no right singular vectors) are computed.
m	The order of the matrix a. M >= 0.
n	The order of the matrix a. N >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). On entry, the n by n matrix A. On exit: ■ If jobu = 'O', A is overwritten with the first min(m,n) columns of U (the left singular vectors, stored columnwise); ■ If jobvt = 'O', A is overwritten with the first min(m,n) rows of V**T (the right singular vectors, stored rowwise); ■ If jobu.ne.'O' and jobvt.ne.'O', the contents of A are destroyed.
lda	The leading dimension of the array a. lda >= max(1,n).
s	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (min(m,n). The singular values of A, sorted so that S(i) >= S(i+1).
u	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldu,ucol).(ldu,m) if jobu = 'A' or (ldu,min(m,n)) if jobu = 'S'. ■ If jobu = 'A', U contains the m by m orthogonal matrix U. ■ If jobu = 'S', U contains the first min(m,n) columns of U (the left singular vectors, stored columnwise). ■ If jobu = 'N' or 'O', U is not referenced.
ldu	The leading dimension of the array U. ldu >= 1. If jobu = 'S' or 'a', ldu >= m.

Table 228–44 (Cont.) LAPACK_GESVD Procedure Parameters

Parameter	Description
vt	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldvt, n). ■ If jobvt = 'A', vt contains the n by n orthogonal matrix V**T. ■ If jobvt = 'S', vt contains the first min(m,n) rows of V**T (the right singular vectors, stored rowwise). ■ If jobvt = 'N' or 'O', vt is not referenced.
ldvt	The leading dimension of the array vt. ldvt >= 1. ■ If jobvt = 'A', ldvt >= n. ■ If jobvt = 'S', ldvt >= min(m,n).
info	■ = 0 : successful exit ■ < 0 : If info = -i, the i-th argument had an illegal value ■ > 0 : If SBDSQR did not converge, info specifies how many superdiagonals of an intermediate bidiagonal form B did not converge to zero.
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_GEEV Procedures

This procedures computes for an `n` by `n` real nonsymmetric matrix `A`, the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector `v(j)` of `A` satisfies `A * v(j) = lambda(j) * v(j)` where `lambda(j)` is its eigenvalue.
- The left eigenvector `u(j)` of `A` satisfies `u(j)**H * A = lambda(j) * u(j)**H` where `u(j)**H` denotes the conjugate transpose of `u(j)`.

The computed eigenvectors are normalized to have Euclidean norm equal to `1` and largest component real.

Parameters

Table 228–46 LAPACK_GTSV Procedure Parameters

Parameter	Description
n	The order of the matrix a .n >= 0
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
dl	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, dl must contain the (n-1) sub-diagonal elements of a. On exit, dl is overwritten by the (n-2) elements of the second super-diagonal of the upper triangular matrix U from the LU factorization of a, in dl(1), ..., dl(n-2).
d	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). On entry, d must contain the diagonal elements of a. On exit, d is overwritten by the n diagonal elements of U.

Table 228–46 (Cont.) LAPACK_GTSV Procedure Parameters

Parameter	Description
du	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, du must contain the (n-1) super-diagonal elements of a. On exit, du is overwritten by the (n-1) elements of the first super-diagonal of U.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (LDB, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0, the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max (1, n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, U(i,i) is exactly zero, and the solution has not been computed. The factorization has not been completed unless i = n.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_PBSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric positive definite band matrix and `x` and `b` are `n` by `nrhs` matrices.

The Cholesky decomposition is used to factor `A` as

`A = U**T*U` if `UPLO ='U'`

or

`A = L * L**T` if `UPLO = 'L'`

where `U` is an upper triangular matrix and `L` is a lower triangular matrix. The factored form of `A` is then used to solve the system of equations `A * X = B`.

Parameters

Table 228–48 LAPACK_POSV Procedure Parameters

Parameter	Description
`uplo`	■ `uplo` = 'U'. Upper triangular of `A` is stored. ■ `uplo` = `'L'`. Lower triangular of `A` is stored.
`n`	The number of linear equations, that is, the order of the matrix `a` .`n >= 0`
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 228–48 (Cont.) LAPACK_POSV Procedure Parameters

Parameter	Description
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (lda, n). If uplo = 'U', the leading NRHS n by n upper triangular part of a contains the upper NRHS triangular part of the matrix A, and the strictly lower NRHS triangular part of A is not referenced. If uplo = ''L', then rhs leading n by n lower triangular part of a contains the lower nrhs triangular part of the matrix a, and the strictly upper nrhs triangular part of a is not referenced. On exit, if info = 0, the factor U or L from the Cholesky factorization A = U**T*U or A = L*L**T.
lda	The leading dimension of the array a. lda >= max (1, n)
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_PPSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric positive definite matrix stored in packed format and `x` and `b` are `n` by `nrhs` matrices.

The Cholesky decomposition is used to factor `A` as

`A = U**T* U` if `UPLO = 'U'`

or

`A = L * L**T` if `UPLO = 'L'`

where **U** is an upper triangular matrix and `L` is a lower triangular matrix. The factored form of `A` is then used to solve the system of equations `A * X = B`.

   info      OUT     INTEGER,
   pack      IN      flag DEFAULT 'C');
```

Parameters

Table 228–49 LAPACK_PPSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'` . Upper triangular of `A` is stored. ▪ `uplo = 'L'`. Lower triangular of `A` is stored.
`n`	The number of linear equations, that is, the order of the matrix `a` .`n >= 0`
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 228–49 (Cont.) LAPACK_PPSV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix a, packed columnwise in a linear array. The j-th column of a is stored in the array ap as follows: If uplo = 'U', AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j; If uplo = 'L', AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n; On exit, if info = 0, the factor U or 'L' from the Cholesky factorization A = U**T*U or A = L*L**T in the same storage format as A.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, the leading minor of order i of a is not positive definite, so the factorization could not be completed, and the solution has not been computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_PTSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where a is an n by n symmetric positive definite tridiagonal matrix, and x and b are n by nrhs matrices.

a is factored as A = L*D*L**T, and the factored form of a is then used to solve the system of equations.

Parameters

Table 228–51 LAPACK_SBEV Procedure Parameters

Parameter	Description
`jobz`	▪ `'N'`: Compute eigenvalues only. ▪ `'V'`: Compute eigenvalues and eigenvectors.
`uplo`	▪ `'U'`: Upper triangle of A is stored. ▪ `'L'`: Lower triangle of A is stored.
`n`	The order of the matrix `a. N >= 0`.
`kd`	The number of superdiagonals of the matrix `A` if `uplo = 'U'`, or the number of subdiagonals if `uplo = 'L'. kd >= 0`.

Table 228–51 (Cont.) LAPACK_SBEV Procedure Parameters

Parameter	Description
ab	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldab, n). On entry, the upper or lower triangle of the symmetric band matrix A stored in the first kd+1 rows of the array. The j-th column of A is stored in the j-th column of the array ab: ■ If uplo = 'U', ab(kd+1+i-j,j) = a(i,j) for max(1,j-kd)<=i<=j. ■ If uplo = 'L', AB(1+i-j,j) = A(i,j) for j<=i<=min(n,j+kd). On exit, ab is overwritten by values generated during the reduction to tridiagonal form: ■ If uplo = 'U', the diagonal and first superdiagonal of the tridiagonal matrix T are returned in rows kd and kd+1 of ab. ■ If uplo = 'L', the diagonal and first subdiagonal of T are returned in the first two rows of ab.
ldab	The leading dimension of the array ab. ldab >= kd + 1.
w	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). If info = 0, the eigenvalues in ascending order.
z	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). ■ If jobz = 'N', then z is not referenced.
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v', ldz >= max(1,n).
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_SBEVD Procedures

This procedure computes all the eigenvalues and, optionally, eigenvectors of a real symmetric matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

`n`	The order of the matrix `a. N >= 0`.

Table 228–54 (Cont.) LAPACK_SPEVD Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix a packed columnwise in a linear array. The j-th column of a is stored in the array ap: ■ If uplo = 'U',ap(i + (j-1)*j/2) = a(i,j) for 1<=i<=j. ■ If uplo = 'L',ap(i + (j-1)*(2*n-j)/2) = a(i,j) for j<=i<=n. On exit, ap is overwritten by values generated during the reduction to tridiagonal form: ■ If uplo = 'U', the diagonal and first superdiagonal of the tridiagonal matrix T overwrite the corresponding elements of A. ■ If uplo = 'L', the diagonal and first subdiagonal of T overwrite the corresponding elements of A.
w	UTL_NLA_ARRAY_FLT/DBL,DIMENSION (n). If info = 0, the eigenvalues in ascending order.
z	UTL_NLA_ARRAY_FLT/DBL,DIMENSION (ldz,n). ■ If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with w(i). ■ If jobz = 'N', then z is not referenced.
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v',ldz >= max(1,n).
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_SPSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric matrix stored in packed format, and `x` and `b` are n by nrhs matrices.

The diagonal pivoting method is used to factor `A` as

`A = U * D * U**T`, if `UPLO = 'U'`

or

`A = L * D * L**T`, if `UPLO = 'L'`

where `U` (or `L`) is a product of permutation and unit upper (lower) triangular matrices, and `D` is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of `A` is then used to solve the system of equations `A * X = B`.

```

Parameters

Table 228–55 LAPACK_SPSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'`. Upper triangular of `A` is stored. ▪ `uplo = 'L'` . Lower triangular of `A` is stored.
`n`	The number of linear equations, which is the order of the matrix `a`. `N >= 0`.
`nrhs`	The number of right-hand sides, which is the number of columns of the matrix `b`. `nrhs >= 0`.

Table 228–55 (Cont.) LAPACK_SPSV Procedure Parameters

Parameter	Description
ap	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n*(n+1)/2). On entry, the upper or lower triangle of the symmetric matrix A, packed columnwise in a linear array. The j-th column of A is stored in the array ap as follows: ■ uplo = 'U': AP(i + (j-1)*j/2) = A(i,j) for 1<=i<=j ■ uplo = 'L': AP(i + (j-1)*(2n-j)/2) = A(i,j) for j<=i<=n See below for further details. On exit, the block diagonal matrix D and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSPTRF, stored as a packed triangular matrix in the same storage format as A.
ipiv	INTEGER array, DIMENSION (n). Details of the interchanges and the block structure of d, as determined by SSPTRF. ■ If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by1 diagonal block. ■ If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block. ■ If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_STEV Procedures

Parameter	Description
jobz	■ 'N': Compute eigenvalues only. ■ 'V': Compute eigenvalues and eigenvectors.
n	The order of the matrix a. N >= 0.
d	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ On entry, the n diagonal elements of the tridiagonal matrix A. ■ On exit, if info = 0, the eigenvalues in ascending order.
e	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). ■ On entry, the (n-1) subdiagonal elements of the tridiagonal matrix A, stored in elements 1 to n-1 of e. e(n) need not be set, but is used by the subprogram. ■ On exit, the contents of e are destroyed.
z	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldz, n). ■ If jobz = 'V', then if info = 0, z contains the orthonormal eigenvectors of the matrix A, with the i-th column of z holding the eigenvector associated with d(i). ■ If jobz = 'N', then z is not referenced.

Table 228–56 (Cont.) LAPACK_STEV Procedure Parameters

Parameter	Description
ldz	The leading dimension of the array z. ldz >= 1, and if jobz = 'v',ldz >= max(1,n).
info	■ = 0 : successful exit ■ < 0 : if info = -i, the i-th argument had an illegal value ■ > 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero
pack	(Optional) Flags the packing of the matricies: ■ 'C': column-major (default) ■ 'R': row-major

LAPACK_STEVD Procedures

This procedure computes all eigenvalues and, optionally, eigenvectors of a real symmetric tridiagonal matrix. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

Table 228–59 (Cont.) LAPACK_SYEVD Procedure Parameters

Parameter	Description
`lda`	The leading dimension of the array `a`. `lda >= max(1,n)`.
`w`	`UTL_NLA_ARRAY_FLT/DBL`, `DIMENSION (n)`. If `info = 0`, the eigenvalues in ascending order.
`info`	■ `= 0` : successful exit ■ `< 0` : if `info = -i`, the `i`-th argument had an illegal value ■ `> 0` : if `info = i`, the algorithm failed to converge; `i` off-diagonal elements of an intermediate tridiagonal form did not converge to zero
`pack`	(Optional) Flags the packing of the matricies: ■ `'C'`: column-major (default) ■ `'R'`: row-major

LAPACK_SYSV Procedures

This procedure computes the solution to a real system of linear equations

```
a * x = b
```

where `a` is an n by n symmetric matrix, and `x` and `b` are n by nrhs matrices.

The diagonal pivoting method is used to factor `A` as

`A = U * D * U**T`, if `UPLO = 'U'`

or

`A = L * D * L**T`, if `UPLO = 'L'`

where `U` (or `L`) is a product of permutation and unit upper (lower) triangular matrices, and `D` is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of `A` is then used to solve the system of equations `A * X = B`.

> **See Also:** LAPACK Driver Routines (Linear Equations) Subprograms on page 228-10 for other subprograms in this group

Syntax

```
UTL_NLA.LAPACK_SYSV (
   uplo    IN      flag,
   n       IN      POSITIVEN,
   nrhs    IN      POSITIVEN,

   a      IN OUT   UTL_NLA_ARRAY_FLT,
   lda    IN       POSITIVEN,
   ipiv   IN OUT   UTL_NLA_ARRAY_INT,
   b      IN OUT   UTL_NLA_ARRAY_FLT,
   ldb    IN       POSITIVEN,
   info   OUT      INTEGER,
   pack   IN       flag DEFAULT 'C');
```

Parameters

Table 228–60 LAPACK_SYSV Procedure Parameters

Parameter	Description
`uplo`	▪ `uplo = 'U'`. Upper triangular of `A` is stored. ▪ `uplo = 'L'` . Lower triangular of `A` is stored.
`n`	The number of linear equations, which is the order of the matrix `a`. `N >= 0`.

Table 228–60 (Cont.) LAPACK_SYSV Procedure Parameters

Parameter	Description
nrhs	The number of right-hand sides, which is the number of columns of the matrix b. nrhs >= 0.
a	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n-1). On entry, the symmetric matrix a. If UPLO = 'U', the leading n by n upper triangular part of a contains the upper triangular part of the matrix a, and the strictly lower triangular part of a is not referenced. If uplo = 'L', the leading n by n lower triangular part of a contains the lower triangular part of the matrix a, and the strictly upper triangular part of a is not referenced. On exit, if info = 0, the block diagonal matrix d and the multipliers used to obtain the factor U or L from the factorization A = U*D*U**T or A = L*D*L**T as computed by SSYTRF.
lda	The leading dimension of the array a. lda >= max(1,n)
ipiv	INTEGER array, DIMENSION (ldb, nrhs). Details of the interchanges and the block structure of d, as determined by SSYTRF. ■ If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by1 diagonal block. ■ If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block. ■ If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block.
b	UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0 , the n by nrhs solution matrix X.
ldb	The leading dimension of the array b. ldb >= max(1,n)
info	■ = 0 : successful exit ■ < 0 : if info = -i , the i-th argument had an illegal value ■ > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed.
pack	(Optional) Flags the packing of the matrices: ■ 'C': column-major (default) ■ 'R': row-major

229

UTL_RAW

The `UTL_RAW` package provides SQL functions for manipulating `RAW` datatypes.

This chapter contains the following topics:

- Using UTL_RAW
  - Overview
  - Operational Notes
- Summary of UTL_RAW Subprograms

Using UTL_RAW

- Overview
- Operational Notes

Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.

Operational Notes

UTL_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the hextoraw and rawtohex functions.

Summary of UTL_RAW Subprograms

Table 229–1 UTL_RAW Package Subprograms

Subprogram	Description
BIT_AND Function on page 229-7	Performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW
BIT_COMPLEMENT Function on page 229-8	Performs bitwise logical "complement" of the values in RAW r and returns the "complement'ed" result RAW
BIT_OR Function on page 229-9	Performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the "or'd" result RAW
BIT_XOR Function on page 229-10	Performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the "xor'd" result RAW
CAST_FROM_BINARY_DOUBLE Function on page 229-11	Returns the binary representation of a BINARY_DOUBLE (in RAW)
CAST_FROM_BINARY_FLOAT Function on page 229-12	Returns the binary representation of a BINARY_FLOAT (in RAW)
CAST_FROM_BINARY_INTEGER Function on page 229-13	Returns the binary representation of a BINARY_INTEGER (in RAW)
CAST_FROM_NUMBER Function on page 229-14	Returns the binary representation of a NUMBER (in RAW)
CAST_TO_BINARY_DOUBLE Function on page 229-15	Casts the binary representation of a RAW into a BINARY_DOUBLE
CAST_TO_BINARY_FLOAT Function on page 229-17	Casts the binary representation of a RAW into a BINARY_FLOAT
CAST_TO_BINARY_INTEGER Function on page 229-19	Casts the binary representation of a BINARY_INTEGER (in RAW) into a BINARY_INTEGER
CAST_TO_NUMBER Function on page 229-20	Casts the binary representation of a NUMBER (in RAW) into a NUMBER
CAST_TO_RAW Function on page 229-21	Converts a VARCHAR2 represented using n data bytes into a RAW with n data bytes
CAST_TO_VARCHAR2 Function on page 229-22	Converts a RAW represented using n data bytes into VARCHAR2 with n data bytes
CAST_TO_NVARCHAR2 Function on page 229-23	Converts a RAW represented using n data bytes into NVARCHAR2 with n data bytes
COMPARE Function on page 229-24	Compares RAW r1 against RAW r2
CONCAT Function on page 229-25	Concatenates up to 12 RAWs into a single RAW
CONVERT Function on page 229-26	Converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW
COPIES Function on page 229-27	Returns n copies of r concatenated together
LENGTH Function on page 229-28	Returns the length in bytes of a RAW r

Table 229–1 (Cont.) UTL_RAW Package Subprograms

Subprogram	Description
OVERLAY Function on page 229-29	Overlays the specified portion of target `RAW` with overlay `RAW`, starting from byte position `pos` of target and proceeding for `len` bytes
REVERSE Function on page 229-31	Reverses a byte sequence in `RAW r` from end to end
SUBSTR Function on page 229-32	Returns `len` bytes, starting at `pos` from `RAW r`
TRANSLATE Function on page 229-34	Translates the bytes in the input `RAW r` according to the bytes in the translation `RAWs from_set` and `to_set`
TRANSLITERATE Function on page 229-36	Converts the bytes in the input `RAW r` according to the bytes in the transliteration `RAWs from_set` and `to_set`
XRANGE Function on page 229-38	Returns a `RAW` containing all valid 1-byte encodings in succession, beginning with the value `start_byte` and ending with the value `end_byte`

BIT_AND Function

This function performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW.

Syntax

```
UTL_RAW.BIT_AND (
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–2 BIT_AND Function Parameters

Parameter	Description
r1	RAW to "and" with r2.
r2	RAW to "and" with r1.

Return Values

Table 229–3 BIT_AND Function Return Values

Return	Description
RAW	Containing the "and" of r1 and r2.
NULL	Either r1 or r2 input parameter was NULL.

Usage Notes

If r1 and r2 differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW r and returns the complement'ed result RAW. The result length equals the input RAW r length.

Syntax

```
UTL_RAW.BIT_COMPLEMENT (
   r IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–4 BIT_COMPLEMENT Function Parameters

Parameter	Description
r	RAW to perform "complement" operation.

Return Values

Table 229–5 BIT_COMPLEMENT Function Return Values

Return	Description
RAW	The "complement" of r1.
NULL	If r input parameter was NULL.

BIT_OR Function

This function performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the or'd result RAW.

Syntax

```
UTL_RAW.BIT_OR (
   r1 IN RAW,
   r2 IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–6 BIT_OR Function Parameters

Parameters	Description
r1	RAW to "or" with r2.
r2	RAW to "or" with r1.

Return Values

Table 229–7 BIT_OR Function Return Values

Return	Description
RAW	Containing the "or" of r1 and r2.
NULL	Either r1 or r2 input parameter was NULL.

Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

Syntax

```
UTL_RAW.BIT_XOR (
   r1 IN RAW,
   r2 IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(bit_xor, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–8 BIT_XOR Function Parameters

Parameter	Description
r1	RAW to "xor" with r2.
r2	RAW to "xor" with r1.

Return Values

Table 229–9 BIT_XOR Function Return Values

Return	Description
RAW	Containing the "xor" of r1 and r2.
NULL	If either r1 or r2 input parameter was NULL.

Usage Notes

If r1 and r2 differ in length, then the "xor" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

CAST_FROM_BINARY_DOUBLE Function

This function returns the binary representation of a BINARY_DOUBLE (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
   n          IN BINARY_DOUBLE,
   endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–10 CAST_FROM_BINARY_DOUBLE Function Parameters

Parameter	Description
n	The BINARY_DOUBLE value.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit  8
byte 7: bit  7 ~ bit  0
```

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
big_endian	db0	db1	db2	db3	db4	db5	db6	db7
little_endian	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the BINARY_DOUBLE argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

CAST_FROM_BINARY_FLOAT Function

This function returns the binary representation of a BINARY_FLOAT (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_FLOAT(
   n          IN BINARY_FLOAT,
   endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–11 CAST_FROM_BINARY_FLOAT Function Parameters

Parameter	Description
n	The BINARY_FLOAT value.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The binary representation (RAW) of the BINARY_FLOAT value, or NULL if the input is NULL.

Usage Notes

- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit  8
byte 3: bit 7 ~  bit  0
```

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

	rb0	rb1	rb2	rb3
big_endian	fbo	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the BINARY_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

CAST_FROM_BINARY_INTEGER Function

This function returns the binary representation of a BINARY_INTEGER (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_BINARY_INTEGER (
   n          IN BINARY_INTEGER
   endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–12 CAST_FROM_BINARY_INTEGER Function Parameters

Parameter	Description
n	The BINARY_INTEGER value.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The binary representation of the BINARY_INTEGER value.

CAST_FROM_NUMBER Function

This function returns the binary representation of a NUMBER (in RAW).

Syntax

```
UTL_RAW.CAST_FROM_NUMBER (
   n  IN NUMBER)
 RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–13 CAST_FROM_NUMBER Function Parameters

Parameter	Description
n	The NUMBER value.

Return Values

The binary representation of the NUMBER value.

CAST_TO_BINARY_DOUBLE Function

This function casts the binary representation of a BINARY_DOUBLE (in RAW) into a BINARY_DOUBLE.

Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–14 CAST_TO_BINARY_DOUBLE Function Parameters

Parameter	Description
r	The binary representation of a BINARY_INTEGER.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_DOUBLE value.

Usage Notes

- If the RAW argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_DOUBLE_NAN is returned.
- If the RAW argument is less than 8 bytes, a VALUE_ERROR exception is raised.
- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:

```
byte 0: bit 63 ~ bit 56
byte 1: bit 55 ~ bit 48
byte 2: bit 47 ~ bit 40
byte 3: bit 39 ~ bit 32
byte 4: bit 31 ~ bit 24
byte 5: bit 23 ~ bit 16
byte 6: bit 15 ~ bit  8
byte 7: bit  7 ~ bit  0
```

- The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

	rb0	rb1	rb2	rb3	rb4	rb5	rb6	rb7
big_endian	db0	db1	db2	db3	db4	db5	db6	db7
little_endian	db7	db6	db5	db4	db3	db2	db1	db0

- In case of machine-endian, the 8 bytes of the `RAW` argument are copied straight across into the `BINARY_DOUBLE` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_TO_BINARY_FLOAT Function

This function casts the binary representation of a BINARY_FLOAT (in RAW) into a BINARY_FLOAT.

Syntax

```
UTL_RAW.CAST_TO_BINARY_FLOAT (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_FLOAT;
```

Pragmas

```
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–15 CAST_TO_BINARY_FLOAT Function Parameters

Parameter	Description
r	The binary representation of a BINARY_FLOAT.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:

```
byte 0: bit 31 ~ bit 24
byte 1: bit 23 ~ bit 16
byte 2: bit 15 ~ bit  8
byte 3: bit 7 ~  bit  0
```

- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

	rb0	rb1	rb2	rb3
big_endian	fbo	fb1	fb2	fb3
little_endian	fb3	fb2	fb1	fb0

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has

passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

CAST_TO_BINARY_INTEGER Function

This function casts the binary representation of a BINARY_INTEGER (in RAW) into a BINARY_INTEGER.

Syntax

```
UTL_RAW.CAST_TO_BINARY_INTEGER (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN BINARY_INTEGER;
```

Pragmas

```
pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–16 CAST_TO_BINARY_INTEGER Function Parameters

Parameter	Description
r	The binary representation of a BINARY_INTEGER.
endianess	A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.

Return Values

The BINARY_INTEGER value

CAST_TO_NUMBER Function

This function casts the binary representation of a NUMBER (in RAW) into a NUMBER.

Syntax

```
UTL_RAW.CAST_TO_NUMBER (
   r  IN RAW)
 RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–17 CAST_TO_NUMBER function Parameters

Parameter	Description
r	The binary representation of a NUMBER

Return Values

The NUMBER value.

CAST_TO_RAW Function

This function converts a VARCHAR2 represented using n data bytes into a RAW with n data bytes. The data is not modified in any way; only its datatype is recast to a RAW datatype.

Syntax

```
UTL_RAW.CAST_TO_RAW (
   c  IN VARCHAR2)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–18 CAST_TO_RAW Function Parameters

Parameter	Description
c	VARCHAR2 to be changed to a RAW.

Return Values

Table 229–19 CAST_TO_RAW Function Return Values

Return	Description
RAW	Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field.
NULL	If c input parameter was NULL.

CAST_TO_VARCHAR2 Function

This function converts a RAW represented using n data bytes into VARCHAR2 with n data bytes.

> **Note:** When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (
   r IN RAW)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–20 CAST_TO_VARCHAR2 Function Parameters

Parameter	Description
r	RAW (without leading length field) to be changed to a VARCHAR2.

Return Values

Table 229–21 CAST_TO_VARCHAR2 Function Return Values

Return	Description
VARCHAR2	Containing having the same data as the input RAW.
NULL	If r input parameter was NULL.

CAST_TO_NVARCHAR2 Function

This function converts a RAW represented using n data bytes into NVARCHAR2 with n data bytes.

> **Note:** When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (
   r IN RAW)
RETURN NVARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–22 CAST_TO_NVARCHAR2 Function Parameters

Parameter	Description
r	RAW (without leading length field) to be changed to a NVARCHAR2).

Return Values

Table 229–23 CAST_TO_NVARCHAR2 Function Return Values

Return	Description
NVARCHAR2	Containing having the same data as the input RAW.
NULL	If r input parameter was NULL.

COMPARE Function

This function compares RAW r1 against RAW r2. If r1 and r2 differ in length, then the shorter RAW is extended on the right with pad if necessary.

Syntax

```
UTL_RAW.COMPARE (
   r1  IN RAW,
   r2  IN RAW,
   pad IN RAW DEFAULT NULL)
  RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–24 COMPARE Function Parameters

Parameter	Description
r1	1st RAW to be compared, may be NULL or 0 length.
r2	2nd RAW to be compared, may be NULL or 0 length.
pad	This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: x'00'

Return Values

Table 229–25 COMPARE Function Return Values

Return	Description
NUMBER	Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte.

CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned

Syntax

```
UTL_RAW.CONCAT (
   r1  IN RAW DEFAULT NULL,
   r2  IN RAW DEFAULT NULL,
   r3  IN RAW DEFAULT NULL,
   r4  IN RAW DEFAULT NULL,
   r5  IN RAW DEFAULT NULL,
   r6  IN RAW DEFAULT NULL,
   r7  IN RAW DEFAULT NULL,
   r8  IN RAW DEFAULT NULL,
   r9  IN RAW DEFAULT NULL,
   r10 IN RAW DEFAULT NULL,
   r11 IN RAW DEFAULT NULL,
   r12 IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(concat, WNDS, RNDS, WNPS, RNPS);
```

Parameters

r1....r12 are the RAW items to concatenate.

Return Values

Table 229–26 CONCAT Function Return Values

Return	Description
RAW	Containing the items concatenated.

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

CONVERT Function

This function converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW.

Both from_charset and to_charset must be supported character sets defined to the Oracle server.

Syntax

```
UTL_RAW.CONVERT (
   r            IN RAW,
   to_charset   IN VARCHAR2,
   from_charset IN VARCHAR2)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–27 CONVERT Function Parameters

Parameter	Description
r	RAW byte-string to be converted.
to_charset	Name of Globalization Support character set to which r is converted.
from_charset	Name of Globalization Support character set in which r is supplied.

Return Values

Table 229–28 CONVERT Function Return Values

Return	Description
RAW	Byte string r converted according to the specified character sets.

Exceptions

Table 229–29 CONVERT Function Exceptions

Error	Description
VALUE_ERROR	Either: - r missing, NULL, or 0 length - from_charset or to_charset missing, NULL, or 0 length - from_charset or to_charset names invalid or unsupported

COPIES Function

This function returns n copies of r concatenated together.

Syntax

```
UTL_RAW.COPIES (
   r IN RAW,
   n IN NUMBER)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–30 COPIES Function Parameters

Parameters	Description
r	RAW to be copied
n	Number of times to copy the RAW (must be positive).

Return Values

This returns the RAW copied n times.

Exceptions

Table 229–31 COPIES Function Exceptions

Error	Description
VALUE_ERROR	Either: - r is missing, NULL or 0 length - n < 1 - Length of result exceeds maximum length of a RAW

LENGTH Function

This function returns the length in bytes of a `RAW` `r`.

Syntax

```
UTL_RAW.LENGTH (
   r  IN RAW)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–32 LENGTH Function Parameters

Parameter	Description
`r`	The `RAW` byte stream to be measured.

Return Values

Table 229–33 LENGTH Function Return Values

Return	Description
`NUMBER`	The current length of the `RAW`.

OVERLAY Function

This function overlays the specified portion of target RAW with overlay_str RAW, starting from byte position pos of target and proceeding for len bytes.

Syntax

```
UTL_RAW.OVERLAY (
   overlay_str IN RAW,
   target      IN RAW,
   pos         IN BINARY_INTEGER DEFAULT 1,
   len         IN BINARY_INTEGER DEFAULT NULL,
   pad         IN RAW            DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–34 OVERLAY Function Parameters

Parameters	Description
overlay_str	Byte-string used to overlay target.
target	Byte-string which is to be overlaid.
pos	Position in target (numbered from 1) to start overlay.
len	The number of target bytes to overlay.
pad	Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length.

Defaults and Optional Parameters

Table 229–35 OVERLAY Function Optional Parameters

Optional Parameter	Description
pos	1
len	To the length of overlay_str
pad	x'00'

Return Values

Table 229–36 OVERLAY Function Return Values

Return	Description
RAW	The target byte_string overlaid as specified.

Usage Notes

If overlay_str has less than len bytes, then it is extended to len bytes using the pad byte. If overlay_str exceeds len bytes, then the extra bytes in overlay_str are ignored. If len bytes beginning at position pos of target exceeds the length of target, then target is extended to contain the entire length of overlay_str.

If len is specified, it must be greater than or equal to 0. If pos is specified, it must be greater than or equal to 1. If pos exceeds the length of target, then target is padded with pad bytes to position pos, and target is further extended with overlay_str bytes.

Exceptions

Table 229–37 OVERLAY Function Exceptions

Error	Description
VALUE_ERROR	Either: - Overlay_str is NULL or has 0 length - Target is missing or undefined - Length of target exceeds maximum length of a RAW - len < 0 - pos < 1

REVERSE Function

This function reverses a byte sequence in RAW r from end to end. For example, x'0102F3' would be reversed to x'F30201', and 'xyz' would be reversed to 'zyx'.The result length is the same as the input RAW length.

Syntax

```
UTL_RAW.REVERSE (
   r IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–38 REVERSE Function Parameters

Parameter	Description
r	RAW to reverse.

Return Values

Table 229–39 REVERSE Function Return Values

Return	Description
RAW	Containing the "reverse" of r.

Exceptions

Table 229–40 REVERSE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length.

SUBSTR Function

This function returns `len` bytes, starting at `pos` from `RAW r`.

Syntax

```
UTL_RAW.SUBSTR (
   r   IN RAW,
   pos IN BINARY_INTEGER,
   len IN BINARY_INTEGER DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–41 SUBSTR Function Parameters

Parameter	Description
`r`	The `RAW` byte-string from which a portion is extracted.
`pos`	The byte position in `r` at which to begin extraction.
`len`	The number of bytes from `pos` to extract from `r` (optional).

Defaults and Optional Parameters

Table 229–42 SUBSTR Function Exceptions

Optional Parameter	Description
`len`	Position `pos` through to the end of `r`.

Return Values

Table 229–43 SUBSTR Function Return Values

Return	Description
`portion of r`	Beginning at `pos` for `len` bytes long.
`NULL`	`r` input parameter was `NULL`.

Usage Notes

If `pos` is positive, then `SUBSTR` counts from the beginning of `r` to find the first byte. If `pos` is negative, then `SUBSTR` counts backward from the end of the `r`. The value `pos` cannot be 0.

If `len` is omitted, then `SUBSTR` returns all bytes to the end of `r`. The value `len` cannot be less than 1.

Exceptions

Table 229–44 SUBSTR Function Exceptions

Error	Description
VALUE_ERROR	VALUE_ERROR is returned if: ■ pos = 0 or > length of r ■ len < 1 or > length of r - (pos-1)

TRANSLATE Function

This function translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set. If a byte in r has a matching byte in from_set, then it is replaced by the byte in the corresponding position in to_set, or deleted.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```
UTL_RAW.TRANSLATE (
   r        IN RAW,
   from_set IN RAW,
   to_set   IN RAW)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–45 TRANSLATE Function Parameters

Parameter	Description
r	RAW source byte-string to be translated.
from_set	RAW byte-codes to be translated, if present in r.
to_set	RAW byte-codes to which corresponding from_str bytes are translated.

Return Values

Table 229–46 TRANSLATE Function Return Values

Return	Description
RAW	Translated byte-string.

Usage Notes

If to_set is shorter than from_set, then the extra from_set bytes have no translation correspondence and any bytes in r matching.

Note: Difference from TRANSLITERATE:

- Translation RAWs have no defaults.

- r bytes undefined in the to_set translation RAW are deleted.

- Result RAW may be shorter than input RAW r.

Exceptions

Table 229–47 TRANSLATE Function Exceptions

Error	Description
VALUE_ERROR	Either: - r is NULL or has 0 length - from_set is NULL or has 0 length - to_set is NULL or has 0 length

TRANSLITERATE Function

This function converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set. Successive bytes in r are looked up in the from_set, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the to_set, or the pad byte when no correspondence exists.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as r.

Syntax

```
UTL_RAW.TRANSLITERATE (
   r        IN RAW,
   to_set   IN RAW DEFAULT NULL,
   from_set IN RAW DEFAULT NULL,
   pad      IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–48 TRANSLITERATE Function Parameters

Parameter	Description
r	RAW input byte-string to be converted.
from_set	RAW byte-codes to be converted, if present in r (any length).
to_set	RAW byte-codes to which corresponding from_set bytes are converted (any length).
pad	1 byte used when to-set is shorter than the from_set.

Defaults and Optional Parameters

Table 229–49 TRANSLITERATE Function Optional Parameters

Optional Parameter	Description
from_set	x f00' through x fff'
to_set	To the NULL string and effectively extended with pad to the length of from_set as necessary.
pad	x'00'.

Return Values

Table 229–50 TRANSLITERATE Function Return Values

Return	Description
RAW	Converted byte-string.

Usage Notes

If the to_set is shorter than the from_set, then the pad byte is placed in the result RAW when a selected from_set byte has no corresponding to_set byte (as if the to_set were extended to the same length as the from_set with pad bytes).

Note: Difference from TRANSLATE:

- r bytes undefined in to_set are padded.

- Result RAW is always same length as input RAW r.

Exceptions

Table 229–51 TRANSLITERATE Function Exceptions

Error	Description
VALUE_ERROR	R is NULL or has 0 length.

XRANGE Function

This function returns a RAW containing all valid 1-byte encodings in succession, beginning with the value start_byte and ending with the value end_byte. If start_byte is greater than end_byte, then the succession of resulting bytes begins with start_byte, wraps through x fFF f to x f00 f, and ends at end_byte. If specified, start_byte and end_byte must be single-byte RAWs.

Syntax

```
UTL_RAW.XRANGE (
   start_byte IN RAW DEFAULT NULL,
   end_byte   IN RAW DEFAULT NULL)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 229–52 XRANGE Function Parameters

Parameters	Description
start_byte	Beginning byte-code value of resulting sequence.
end_byte	Ending byte-code value of resulting sequence.

Defaults and Optional Parameters

```
start_byte - x f00 f
end_byte   - x fFF f
```

Return Values

Table 229–53 XRANGE Function Return Values

Return	Description
RAW	Containing succession of 1-byte hexadecimal encodings.

230

UTL_RECOMP

The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- Using UTL_RECOMP
  - Overview
  - Operational Notes
  - Examples
- Summary of UTL_RECOMP Subprograms

Using UTL_RECOMP

- Overview
- Operational Notes
- Examples

Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to RECOMP_PARALLEL Procedure.

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

Operational Notes

- This package uses the job queue for parallel recompilation.
- This package must be run using `SQL*PLUS`.
- You must be connected `AS SYSDBA` to run this script.
- This package expects the following packages to have been created with VALID status:
  - `STANDARD` (`standard.sql`)
  - `DBMS_STANDARD` (`dbmsstdx.sql`)
  - `DBMS_JOB` (`dbmsjob.sql`)
  - `DBMS_RANDOM (dbmsrand.sql)`
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.

Examples

Recompile all objects sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL();
```

Recompile objects in schema SCOTT sequentially:

```
EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
```

Recompile all objects using 4 parallel threads:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
```

Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:

```
EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
```

Summary of UTL_RECOMP Subprograms

Table 230–1 UTL_RECOMP Package Subprograms

Subprogram	Description
RECOMP_PARALLEL Procedure on page 230-7	Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel
RECOMP_SERIAL Procedure on page 230-8	Recompiles invalid objects in a given schema or all invalid objects in the database

RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the DBA_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```
UTL_RECOMP.RECOMP_PARALLEL(
   threads  IN   PLS_INTEGER DEFAULT NULL,
   schema   IN   VARCHAR2    DEFAULT NULL,
   flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 230–2 RECOMP_PARALLEL Procedure Parameters

Parameter	Description
threads	The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.
schema	The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.
flags	Flag values are intended for internal testing and diagnosability only.

Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.

RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```
UTL_RECOMP.RECOMP_SERIAL(
   schema    IN   VARCHAR2    DEFAULT NULL,
   flags     IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 230–3 RECOMP_SERIAL Procedure Parameters

Parameter	Description
`schema`	The schema in which to recompile invalid objects. If `NULL`, all invalid objects in the database are recompiled.
`flags`	Flag values are intended for internal testing and diagnosability only.

231

UTL_REF

The UTL_REF package provides PL/SQL procedures to support reference-based operations. Unlike SQL, UTL_REF procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- Using UTL_REF
  - Overview
  - Security Model
  - Types
  - Exceptions
- Summary of UTL_REF Subprograms

Using UTL_REF

- Overview
- Security Model
- Types
- Exceptions

Overview

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

Security Model

The procedural option is needed to use this package. This package must be created under SYS (connect/as sysdba). Operations provided by this package are performed under the current calling user, not under the package owner SYS.

You can use the UTL_REF package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, UTL_REF verifies that the invoker has the appropriate privileges to access the object pointed to by the REF.

> **Note:** This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if UTL_REF is defined under user SYS, and user A invokes UTL_REF.SELECT to select an object from a reference, then user A (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, UTL_REF operates with the privileges of the client session under which the PL/SQL execution is being done.

Types

An object type is a composite datatype defined by the user or supplied as a library type. You can create the object type `employee_type` using the following syntax:

```
CREATE TYPE employee_type AS OBJECT (
   name    VARCHAR2(20),
   id      NUMBER,

member function GET_ID
    (name VARCHAR2)
   RETURN MEMBER);
```

The object type `employee_type` is a user-defined type that contains two attributes, `name` and `id`, and a member function, `GET_ID`().

You can create an object table using the following SQL syntax:

```
CREATE TABLE employee_table OF employee_type;
```

Exceptions

Exceptions can be returned during execution of UTL_REF functions for various reasons. For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.
- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.
- You do not have the privilege to select or modify the object. The caller of the UTL_REF subprogram must have the proper privilege on the object that is being selected or modified.

Table 231–1 UTL_REF Exceptions

Exceptions	Description
errnum == 942	Insufficient privileges.
errnum == 1031	Insufficient privileges.
errnum == 8177	Unable to serialize, if in a serializable transaction.
errnum == 60	Deadlock detected.
errnum == 1403	No data found (if the REF is NULL, and so on.).

The UTL_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

Summary of UTL_REF Subprograms

Table 231–2 UTL_REF Package Subprograms

Subprogram	Description
DELETE_OBJECT Procedure on page 231-8	Deletes an object given a reference
LOCK_OBJECT Procedure on page 231-10	Locks an object given a reference
SELECT_OBJECT Procedure on page 231-11	Selects an object given a reference
UPDATE_OBJECT Procedure on page 231-12	Updates an object given a reference

DELETE_OBJECT Procedure

This procedure deletes an object given a reference. The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (
   reference IN REF "<typename>");
```

Parameters

Table 231–3 DELETE_OBJECT Procedure Parameters

Parameter	Description
reference	Reference of the object to delete.

Exceptions

May be raised.

Examples

The following example illustrates usage of the UTL_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address_t and others...

```
CREATE OR REPLACE TYPE Person_t (
   name    VARCHAR2(64),
   gender  CHAR(1),
   address Address_t,
   MEMBER PROCEDURE setAddress(addr IN Address_t)
);

CREATE OR REPLACE TYPE BODY Person_t (
   MEMBER PROCEDURE setAddress(addr IN Address_t) IS
   BEGIN
      address := addr;
   END;
);

CREATE OR REPLACE TYPE Employee_t (
```

Under Person_t: Simulate implementation of inheritance using a REF to Person_t and delegation of setAddress to it.

```
   thePerson  REF Person_t,
   empno      NUMBER(5),
   deptREF    Department_t,
   mgrREF     Employee_t,
   reminders  StringArray_t,
```

```
   MEMBER PROCEDURE setAddress(addr IN Address_t),
   MEMBER procedure addReminder(reminder VARCHAR2);
);

CREATE TYPE BODY Employee_t (
   MEMBER PROCEDURE setAddress(addr IN Address_t) IS
      myMgr Employee_t;
      meAsPerson Person_t;
   BEGIN
```

Update the address by delegating the responsibility to `thePerson`. Lock the Person object from the reference, and also select it:

```
      UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
      meAsPerson.setAddress(addr);
```

Delegate to `thePerson`:

```
        UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
        if mgr is NOT NULL THEN
```

Give the manager a reminder:

```
         UTL_REF.LOCK_OBJECT(mgr);
         UTL_REF.SELECT_OBJECT(mgr, myMgr);
         myMgr.addReminder
         ('Update address in the employee directory for' ||
         thePerson.name || ', new address: ' || addr.asString);
         UTL_REF.UPDATE_OBJECT(mgr, myMgr);
      END IF;
   EXCEPTION
      WHEN OTHERS THEN
      errnum := SQLCODE;
      errmsg := SUBSTR(SQLERRM, 1, 200);
```

LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
  INTO object
  FROM object_table t
  WHERE REF(t) = reference
  FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```
UTL_REF.LOCK_OBJECT (
   reference IN REF "<typename>");

UTL_REF.LOCK_OBJECT (
   reference IN REF "<typename>",
   object    IN OUT "<typename>");
```

Parameters

Table 231–4 LOCK_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference of the object to lock.
`object`	The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.

Exceptions

May be raised.

SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.SELECT_OBJECT (
   reference IN REF "<typename>",
   object    IN OUT "<typename>");
```

Parameters

Table 231–5 SELECT_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference to the object to select or retrieve.
`object`	The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.

Exceptions

May be raised.

UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated with the value contained in the PL/SQL variable 'object'. The semantic of this subprogram is similar to the following SQL statement:

```
UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.UPDATE_OBJECT (
   reference IN REF "<typename>",
   object    IN     "<typename>");
```

Parameters

Table 231–6 UPDATE_OBJECT Procedure Parameters

Parameter	Description
`reference`	Reference of the object to update.
`object`	The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.

Exceptions

May be raised.

232

UTL_SMTP

The `UTL_SMTP` package is designed for sending electronic mails (emails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

> **See Also:** How to use the SMTP package to send email in *Oracle Database Advanced Application Developer's Guide*

This chapter contains the following topics:

- Using UTL_SMTP
  - Overview
  - Security Model
  - Types
  - Reply Codes
  - Exceptions
  - Rules and Limits
  - Examples
- Summary of UTL_SMTP Subprograms

Using UTL_SMTP

- Overview
- Security Model
- Types
- Reply Codes
- Exceptions
- Rules and Limits
- Examples

Overview

The protocol consists of a set of commands for an email client to dispatch emails to a SMTP server. The UTL_SMTP package provides interfaces to the SMTP commands. For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and will raise an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using UTL_SMTP, all text data (in other words, those in VARCHAR2) will be converted to US7ASCII before it is sent over the wire to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command may be transferred in full 8 bits, but the rest of the SMTP command and response should be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte VARCHAR2 data to RAW and use the WRITE_RAW_DATA subprogram to send multibyte data using 8-bit MIME encoding.

UTL_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail).You must format the message appropriately. In addition, UTL_SMTP does not have the functionality to implement an SMTP server for an email clients to send emails using SMTP.

Security Model

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

---

Types

- CONNECTION Record Type
- REPLY, REPLIES Record Types

CONNECTION Record Type

This is a PL/SQL record type used to represent an SMTP connection.

Syntax

```
TYPE connection IS RECORD (
    host              VARCHAR2(255),      -- remote host name
    port              PLS_INTEGER,        -- remote port number
    tx_timeout        PLS_INTEGER,        -- Transfer time out (in seconds)
    private_tcp_con   utl_tcp.connection, -- private, for implementation use
    private_state     PLS_INTEGER         -- private, for implementation use
);
```

Fields

Table 232–1 CONNECTION Record Type Fields

Field	Description
`host`	The name of the remote host when connection is established. `NULL` when no connection is established.
`port`	The port number of the remote SMTP server connected. `NULL` when no connection is established.
`tx_timeout`	The time in seconds that the `UTL_SMTP` package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent into the network without being blocked. `0` indicates not to wait at all. `NULL` indicates to wait forever.
`private_tcp_con`	Private, for implementation use only. You should not modify this field.
`private_state`	Private, for implementation use only. You should not modify this field.

Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the `OPEN_CONNECTION Functions`. Changing the values of these fields has no effect on the connection. The fields `private_xxx` are for implementation use only. You should not modify these fields.

REPLY, REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

Syntax

```
TYPE reply IS RECORD (
  code    PLS_INTEGER,       -- 3-digit reply code
  text    VARCHAR2(508)      -- text message
);
TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;   -- multiple reply lines
```

Fields

Table 232–2 REPLY, REPLIES Record Type Fields

Field	Description
`code`	The 3-digit reply code.
`text`	The text message of the reply.

Reply Codes

The following is a list of the SMTP reply codes.

Table 232–3 SMTP Reply Codes

Reply Code	Meaning
211	System status, or system help reply
214	Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]
220	<domain> Service ready
221	<domain> Service closing transmission channel
250	Requested mail action okay, completed
251	User not local; will forward to <forward-path>
252	OK, pending messages for node <node> started. Cannot VRFY user (for example, info is not local), but will take message for this user and attempt delivery.
253	OK, <messages> pending messages for node <node> started
354	Start mail input; end with <CRLF>.<CRLF>
355	Octet-offset is the transaction offset
421	<domain> Service not available, closing transmission channel (This may be a reply to any command if the service knows it must shut down.)
450	Requested mail action not taken: mailbox unavailable [for example, mailbox busy]
451	Requested action terminated: local error in processing
452	Requested action not taken: insufficient system storage
453	You have no mail.
454	TLS not available due to temporary reason. Encryption required for requested authentication mechanism.
458	Unable to queue messages for node <node>
459	Node <node> not allowed: reason
500	Syntax error, command unrecognized (This may include errors such as command line too long.)
501	Syntax error in parameters or arguments
502	Command not implemented
503	Bad sequence of commands
504	Command parameter not implemented
521	<Machine> does not accept mail.
530	Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.
534	Authentication mechanism is too weak.
538	Encryption required for requested authentication mechanism.

Table 232–3 (Cont.) SMTP Reply Codes

Reply Code	Meaning
550	Requested action not taken: mailbox unavailable [for, mailbox not found, no access]
551	User not local; please try <forward-path>
552	Requested mail action terminated: exceeded storage allocation
553	Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]
554	Transaction failed

Exceptions

The table lists the exceptions that can be raised by the interface of the UTL_SMTP package. The network error is transferred to a reply code of 421- service not available.

Table 232–4 UTL_SMTP Exceptions

INVALID_OPERATION	Raised when an invalid operation is made. In other words, calling API other than the WRITE_DATA Procedure, theWRITE_RAW_DATA Procedure or theCLOSE_DATA Function and Procedure after theOPEN_DATA Function and Procedure is called, or calling WRITE_DATA, WRITE_RAW_DATA or CLOSE_DATA without first calling OPEN_DATA.
TRANSIENT_ERROR	Raised when receiving a reply code in 400 range.
PERMANENT_ERROR	Raised when receiving a reply code in 500 range.

Rules and Limits

No limitation or range-checking is imposed by the API. However, you should be aware of the following size limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

Table 232–5 SMTP Size Limitation

Element	Size Limitation
`user`	The maximum total length of a user name is 64 characters.
`domain`	The maximum total length of a domain name or number is 64 characters.
`path`	The maximum total length of a reverse-path or forward-path is 256 characters (including the punctuation and element separators).
`command line`	The maximum total length of a command line including the command word and the `<CRLF>` is 512 characters.
`reply line`	The maximum total length of a reply line including the reply code and the `<CRLF>` is 512 characters.
`text line`	The maximum total length of a text line including the `<CRLF>` is 1000 characters (but not counting the leading dot duplicated for transparency).
`recipients buffer`	The maximum total number of recipients that must be buffered is 100 recipients.

Examples

The following example illustrates how UTL_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```
DECLARE
  c UTL_SMTP.CONNECTION;

  PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
  BEGIN
    UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
  END;

BEGIN
  c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
  UTL_SMTP.HELO(c, 'foo.com');
  UTL_SMTP.MAIL(c, 'sender@foo.com');
  UTL_SMTP.RCPT(c, 'recipient@foo.com');
  UTL_SMTP.OPEN_DATA(c);
  send_header('From',    '"Sender" <sender@foo.com>');
  send_header('To',      '"Recipient" <recipient@foo.com>');
  send_header('Subject', 'Hello');
  UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
  UTL_SMTP.CLOSE_DATA(c);
  UTL_SMTP.QUIT(c);
EXCEPTION
  WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
    BEGIN
      UTL_SMTP.QUIT(c);
    EXCEPTION
      WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
        NULL; -- When the SMTP server is down or unavailable, we don't have
              -- a connection to the server. The QUIT call will raise an
              -- exception that we can ignore.
    END;
    raise_application_error(-20000,
      'Failed to send mail due to the following error: ' || sqlerrm);
END;
```

Summary of UTL_SMTP Subprograms

Table 232–6 UTL_SMTP Package Subprograms

Subprogram	Description
CLOSE_CONNECTION Procedure on page 232-13	Closes the SMTP connection, causing the current SMTP operation to abort
CLOSE_DATA Function and Procedure on page 232-14	Closes the data session
COMMAND Function and Procedure on page 232-15	Performs a generic SMTP command
COMMAND_REPLIES Function on page 232-16	Performs initial handshaking with SMTP server after connecting
DATA Function and Procedure on page 232-17	Performs initial handshaking with SMTP server after connecting, with extended information returned
EHLO Function and Procedure on page 232-18	Performs initial handshaking with SMTP server after connecting, with extended information returned
HELO Function and Procedure on page 232-19	Performs initial handshaking with SMTP server after connecting
HELP Function on page 232-20	Sends `HELP` command
MAIL Function and Procedure on page 232-21	Initiates a mail transaction with the server, the destination is a mailbox
NOOP Function and Procedure on page 232-22	The null command
OPEN_CONNECTION Functions on page 232-23	Opens a connection to an SMTP server
OPEN_DATA Function and Procedure on page 232-25	Sends the `DATA` command
QUIT Function and Procedure on page 232-26	Terminates an SMTP session and disconnects from the server
RCPT Function on page 232-27	Specifies the recipient of an e-mail message
RSET Function and Procedure on page 232-28	Terminates the current mail transaction
VRFY Function on page 232-29	Verifies the validity of a destination e-mail address
WRITE_DATA Procedure on page 232-30	Writes a portion of the e-mail message
WRITE_RAW_DATA Procedure on page 232-32	Writes a portion of the e-mail message with `RAW` data

CLOSE_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to abort. Use this procedure only to abort an email in the middle of the data session. To end the SMTP connection properly, use the QUIT Function and Procedure.

Syntax

```
UTL_SMTP.CLOSE_CONNECTION (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 232–7 CLOSE_CONNECTION Procedure Parameters

Parameter	Description
c	The SMTP connection.

CLOSE_DATA Function and Procedure

The CLOSE_DATA call ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (
   c     IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.CLOSE_DATA (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 232–8 CLOSE_DATA Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 232–9 CLOSE_DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

CLOSE_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

COMMAND Function and Procedure

This function/procedure performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.COMMAND (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL);
```

Parameters

Table 232–10 COMMAND Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
cmd	The SMTP command to send to the server.
arg	The optional argument to the SMTP argument. A space will be inserted between cmd and arg.

Return Values

Table 232–11 COMMAND Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This function is used to invoke generic SMTP commands. Use COMMAND if only a single reply line is expected. Use COMMAND_REPLIES if multiple reply lines are expected.

For COMMAND, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

COMMAND_REPLIES Function

This functions performs a generic SMTP command.

Syntax

```
UTL_SMTP.COMMAND_REPLIES (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 232–12 COMMAND_REPLIES Function Parameters

Parameter	Description
`c`	The SMTP connection.
`cmd`	The SMTP command to send to the server.
`arg`	The optional argument to the SMTP argument. A space will be inserted between `cmd` and `arg`.

Return Values

Table 232–13 COMMAND_REPLIES Function Return Values

Return Value	Description
`replies`	Reply of the command (see REPLY, REPLIES Record Types).

Usage Notes

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

DATA Function and Procedure

This function/procedure specifies the body of an e-mail message.

Syntax

```
UTL_SMTP.DATA (
   c     IN OUT NOCOPY connection
   body  IN  VARCHAR2 CHARACTER SET ANY_CS)
RETURN reply;

UTL_SMTP.DATA (
   c     IN OUT NOCOPY connection
   body  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 232–14 DATA Function and Procedure Parameters

Parameter	Description
c	The SMTP Connection.
body	The text of the message to be sent, including headers, in [RFC822] format.

Return Values

Table 232–15 DATA Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of <CR><LF>.<CR><LF> (single period) in body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The DATA call should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command will not be returned to the caller.

EHLO Function and Procedure

This function/procedure performs initial handshaking with SMTP server after connecting, with extended information returned.

Syntax

```
UTL_SMTP.EHLO (
   c       IN OUT NOCOPY connection,
   domain  IN)
RETURN replies;

UTL_SMTP.EHLO (
   c       IN OUT NOCOPY connection,
   domain  IN);
```

Parameters

Table 232–16 EHLO Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
domain	The domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 232–17 EHLO Function and Procedure Return Values

Return Value	Description
replies	Reply of the command (see REPLY, REPLIES Record Types).

Usage Notes

The EHLO interface is identical to HELO except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with HELO, each line of text returned by the server begins with status code 250.

Related Functions

HELO

HELO Function and Procedure

This function/procedure performs initial handshaking with SMTP server after connecting.

Syntax

```
UTL_SMTP.HELO (
   c       IN OUT NOCOPY   connection,
   domain  IN              VARCHAR2)
RETURN reply;

UTL_SMTP.HELO (
   c       IN OUT NOCOPY   connection,
   domain  IN              VARCHAR2);
```

Parameters

Table 232–18 HELO Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
domain	The domain name of the local (sending) host. Used for identification purposes.

Return Values

Table 232–19 HELO Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to OPEN_CONNECTION Functions before calling this routine.

The expected response from the server is a message beginning with status code 250.

Related Functions

EHLO

HELP Function

This function sends the `HELP` command.

Syntax

```
UTL_SMTP.HELP (
   c         IN OUT NOCOPY   connection,
   command   IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 232–20 HELP Function Parameters

Parameter	Description
`c`	The SMTP connection.
`command`	The command to get the help message.

Return Values

Table 232–21 HELP Function Return Values

Return Value	Description
`replies`	Reply of the command (see REPLY, REPLIES Record Types).

MAIL Function and Procedure

This function/procedure initiates a mail transaction with the server. The destination is a mailbox.

Syntax

```
UTL_SMTP.MAIL (
   c           IN OUT NOCOPY   connection,
   sender      IN              VARCHAR2,
   parameters  IN              VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.MAIL (
   c           IN OUT NOCOPY   connection,
   sender      IN              VARCHAR2,
   parameters  IN              VARCHAR2 DEFAULT NULL);
```

Parameters

Table 232–22 MAIL Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
sender	The e-mail address of the user sending the message.
parameters	The additional parameters to MAIL command as defined in Section 6 of [RFC1869]. It should follow the format of "XXX=XXX (XXX=XXX ....)".

Return Values

Table 232–23 MAIL Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to RCPT and DATA to complete the transaction. The connection to the SMTP server must be open and a HELO or EHLO command must have already been sent.

The expected response from the server is a message beginning with status code 250.

NOOP Function and Procedure

The null command.

Syntax

```
UTL_SMTP.NOOP (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.NOOP (
   c  IN OUT NOCOPY connection);
```

Parameter

Table 232–24 NOOP Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 232–25 NOOP Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with OPEN_CONNECTION. The NOOP command can be used to verify that the server is still connected and is listening properly.

This command will always reply with a single line beginning with status code 250.

OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```
UTL_SMTP.OPEN_CONNECTION (
   host        IN  VARCHAR2,
   port        IN  PLS_INTEGER DEFAULT 25,
   c           OUT connection,
   tx_timeout  IN  PLS_INTEGER DEFAULT NULL)
RETURN reply;

UTL_SMTP.OPEN_CONNECTION (
   host        IN  VARCHAR2,
   port        IN  PLS_INTEGER DEFAULT 25,
   tx_timeout  IN  PLS_INTEGER DEFAULT NULL)
RETURN connection;
```

Parameters

Table 232–26 OPEN_CONNECTION Functions Parameters

Parameter	Description
host	The name of the SMTP server host
port	The port number on which SMTP server is listening (usually 25).
c	The SMTP connection.
tx_timeout	The time in seconds that the UTL_SMTP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.

Return Values

Table 232–27 OPEN_CONNECTION Functions Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN_CONNECTION that returns UTL_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If a user is interested in examining the reply, he or she can invoke the version of OPEN_CONNECTION that returns REPLY.

- `tx_timeout` is intended to govern both the read operations and the write operations. However, an implementation restriction prevents `tx_timeout` from governing write operations in the current release.

OPEN_DATA Function and Procedure

OPEN_DATA sends the DATA command after which you can use WRITE_DATA and WRITE_RAW_DATA to write a portion of the e-mail message.

Syntax

```
UTL_SMTP.OPEN_DATA (
   c     IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA (
   c     IN OUT NOCOPY connection);
```

Parameters

Table 232–28 OPEN_DATA Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.
data	The portion of the text of the message to be sent, including headers, in [RFC822] format.

Return Values

Table 232–29 OPEN_DATA Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

OPEN_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

QUIT Function and Procedure

This function terminates an SMTP session and disconnects from the server.

Syntax

```
UTL_SMTP.QUIT (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.QUIT (
   c  IN OUT NOCOPY connection);
```

Parameter

Table 232–30 QUIT Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 232–31 QUIT Function and Procedure Function Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The QUIT command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by OPEN_CONNECTION which must have been called before executing this command. If a mail transaction is in progress when QUIT is issued, it is abandoned in the same manner as RSET.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields REMOTE_HOST and REMOTE_PORT of c are reset.

Related Functions

RSET

RCPT Function

This function/procedure specifies the recipient of an e-mail message.

Syntax

```
UTL_SMTP.RCPT (
   c           IN OUT NOCOPY     connection,
   recipient   IN                VARCHAR2,
   parameters  IN                VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT (
   c           IN OUT NOCOPY     connection,
   recipient   IN                VARCHAR2,
   parameters  IN                VARCHAR2 DEFAULT NULL);
```

Table 232–32 RCPT Function and Procedure Parameters

Parameter	Description
`c`	The SMTP connection.
`recipient`	The e-mail address of the user to which the message is being sent.
`parameters`	The additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It should follow the format of "XXX=XXX (XXX=XXX ....)".

Return Values

Table 232–33 RCPT Function and Procedure Function Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to `MAIL`, and the connection to the mail server must have been opened and initialized by prior calls to `OPEN_CONNECTION` and `HELO` or `EHLO` respectively.

The expected response from the server is a message beginning with status code 250 or 251.

RSET Function and Procedure

This function terminates the current mail transaction.

Syntax

```
UTL_SMTP.RSET (
   c  IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET (
   c  IN OUT NOCOPY connection);
```

Parameters

Table 232–34 RSET Function and Procedure Parameters

Parameter	Description
c	The SMTP connection.

Return Values

Table 232–35 RSET Function and Procedure Return Values

Return Value	Description
reply	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

This command allows the client to abandon a mail message it was in the process of composing. No mail will be sent. The client can call RSET at any time after the connection to the SMTP server has been opened by means of OPEN_CONNECTION until DATA or OPEN_DATA is called. Once the email data has been sent, it will be too late to prevent the email from being sent.

The server will always respond to RSET with a message beginning with status code 250.

Related Functions

QUIT

VRFY Function

This function verifies the validity of a destination e-mail address.

Syntax

```
UTL_SMTP.VRFY (
   c          IN OUT NOCOPY connection
   recipient  IN VARCHAR2)
RETURN reply;
```

Parameters

Table 232–36 VRFY Function Parameters

Parameter	Description
`c`	The SMTP connection.
`recipient`	The e-mail address to be verified.

Return Values

Table 232–37 VRFY Function Return Values

Return Value	Description
`reply`	Reply of the command (see REPLY, REPLIES Record Types). In cases where there are multiple replies, the last reply will be returned.

Usage Notes

The server attempts to resolve the destination address `recipient`. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of `OPEN_CONNECTION` and `HELO` or `EHLO` before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

WRITE_DATA Procedure

Use WRITE_DATA to write a portion of the e-mail message. A repeat call to WRITE_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_DATA (
   c     IN OUT NOCOPY connection,
   data  IN VARCHAR2 CHARACTER SET ANY_CS);
```

Parameters

Table 232–38 WRITE_DATA Procedure Parameters

Parameter	Description
c	The SMTP connection.
data	The portion of the text of the message to be sent, including headers, in [RFC822] format.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

Notice that this conversion is not bullet-proof. Consider this code fragment:

```
UTL_SMTP.WRITE_DATA('some message.' || chr(13) || chr(10));
UTL_SMTP.WRITE_DATA('.' || chr(13) || chr(10));
```

Since the sequence <CR><LF>.<CR><LF> is split between two calls to WRITE_DATA, the implementation of WRITE_DATA will not detect the presence of the data-terminator sequence, and therefore, will not perform the translation. It will be the responsibility of the user to handle such a situation, or it may result in premature termination of the message data.

WRITE_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

Text (VARCHAR2) data sent using WRITE_DATA is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension

is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.

WRITE_RAW_DATA Procedure

Use WRITE_RAW_DATA to write a portion of the e-mail message. A repeat call to WRITE_RAW_DATA appends data to the e-mail message.

Syntax

```
UTL_SMTP.WRITE_RAW_DATA (
   c     IN OUT NOCOPY connection
   data  IN RAW);
```

Parameters

Table 232–39 WRITE_RAW_DATA Procedure Parameters

Parameter	Description
c	The SMTP connection.
data	The portion of the text of the message to be sent, including headers, in [RFC822] format.

Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other APIs will result in an INVALID_OPERATION exception being raised.

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine will terminate the message with a <CR><LF>.<CR><LF> sequence (a single period at the beginning of a line), as required by RFC821. It will also translate any sequence of <CR><LF>.<CR><LF> (single period) in the body to <CR><LF>..<CR><LF> (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

Notice that this conversion is not bullet-proof. Consider this code fragment:

```
UTL_SMTP.WRITE_DATA('some message.' || chr(13) || chr(10));
UTL_SMTP.WRITE_DATA('.' || chr(13) || chr(10));
```

Since the sequence <CR><LF>.<CR><LF> is split between two calls to WRITE_DATA, the implementation of WRITE_DATA will not detect the presence of the data-terminator sequence, and therefore, will not perform the translation. It will be the responsibility of the user to handle such a situation, or it may result in premature termination of the message data.

XXX_DATA should be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

Text (VARCHAR2) data sent using WRITE_DATA is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a '?' character. If 8BITMIME extension

is negotiated with the SMTP server using the EHLO subprogram, multibyte VARCHAR2 data can be sent by first converting the text to RAW using the UTL_RAW package, and then sending the RAW data using WRITE_RAW_DATA.

UTL_SPADV

The UTL_SPADV package, one of a set of Oracle Streams packages, provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment. This package uses the Oracle Streams Performance Advisor to gather statistics.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about this package and the Oracle Streams Performance Advisor

This chapter contains the following topic:

- Using UTL_SPADV
  - Overview
  - Operational Notes
- Summary of UTL_SPADV Subprograms

Using UTL_SPADV

- Overview
- Operational Notes

Overview

This package enables you to collect and analyze statistics about the performance or Oracle Streams components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Streams performance.

When this package is used on an Oracle Database 11*g* Release 2 (11.2) database, it can monitor Oracle Database 10*g* Release 2 (10.2) and later databases. It cannot monitor databases prior to release 10.2.

See Also: *Oracle Streams Concepts and Administration*

Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Streams administrator and run the `utlspadv.sql` script in the rdbms/admin directory in `ORACLE_HOME`.

The `utlspadv.sql` script creates the following tables:

- STREAMS$_PA_COMPONENT Table
- STREAMS$_PA_COMPONENT_LINK Table
- STREAMS$_PA_COMPONENT_PROP Table
- STREAMS$_PA_COMPONENT_STAT Table
- STREAMS$_PA_CONTROL Table
- STREAMS$_PA_DATABASE Table
- STREAMS$_PA_DATABASE_PROP Table
- STREAMS$_PA_MONITORING Table
- STREAMS$_PA_PATH_BOTTLENECK Table
- STREAMS$_PA_PATH_STAT Table
- STREAMS$_PA_SHOW_COMP_STAT Table
- STREAMS$_PA_SHOW_PATH_STAT Table

The Oracle Streams Performance Advisor populates these tables when it is run.

See Also: *Oracle Streams Concepts and Administration*

STREAMS$_PA_COMPONENT Table

The `STREAMS$_PA_COMPONENT` table displays information about the Oracle Streams components at each database.

Table 233–1 STREAMS$_PA_COMPONENT Table

Column	Datatype	NULL	Description
`COMPONENT_ID`	`NUMBER`	`NOT NULL`	Identification number assigned to the component by the Oracle Streams Performance Advisor
`COMPONENT_NAME`	`VARCHAR2(194)`		Name of the component
`COMPONENT_DB`	`VARCHAR2(128)`		Name of the database that contains the component

Table 233–1 (Cont.) STREAMS$_PA_COMPONENT Table

Column	Datatype	NULL	Description
COMPONENT_TYPE	VARCHAR2(20)		Type of the component The following types are possible: ■ CAPTURE for a capture process ■ PROPAGATION SENDER for a propagation sender ■ PROPAGATION RECEIVER for a propagation receiver ■ APPLY for an apply process ■ QUEUE for a queue
COMPONENT_CHANGED_TIME	DATE		Time when the component was last changed

STREAMS$_PA_COMPONENT_LINK Table

The STREAMS$_PA_COMPONENT_LINK table displays information about how information flows between Oracle Streams components.

Table 233–2 STREAMS$_PA_COMPONENT_LINK Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER	NOT NULL	Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
SOURCE_COMPONENT_ID	NUMBER	NOT NULL	Source component ID for the path The path starts with this component.
DESTINATION_COMPONENT_ID	NUMBER	NOT NULL	Destination component ID for the path The path ends with this component.
POSITION	NUMBER		Position of the component in the path

STREAMS$_PA_COMPONENT_PROP Table

The STREAMS$_PA_COMPONENT_PROP table displays information about capture processes and apply processes necessary for analysis by the Streams Performance Advisor.

Table 233–3 STREAMS$_PA_COMPONENT_PROP Table

Column	Datatype	NULL	Description
COMPONENT_ID	NUMBER	NOT NULL	Identification number assigned to the component by the Oracle Streams Performance Advisor
PROP_NAME	VARCHAR2(30)		Property name For a capture process, the component properties include the following: ■ SOURCE_DATABASE - The source database for the changes captured by the capture process ■ PARALLELISM - The setting for the parallelism capture process parameter ■ OPTIMIZATION_MODE - Indicates whether the capture process uses combined capture and apply (greater than zero) or does not use combined capture and apply (0) For an apply process, the component properties include the following: ■ SOURCE_DATABASE - The source database for the messages applied by the apply process ■ PARALLELISM - The setting for the parallelism apply process parameter ■ APPLY_CAPTURED - Indicates whether the apply process applies captured messages (YES) persistent messages (NO) ■ MESSAGE_DELIVERY_MODE - Either buffered or persistent
PROP_VALUE	VARCHAR2(30)		Property value

STREAMS$_PA_COMPONENT_STAT Table

The STREAMS$_PA_COMPONENT_STAT table displays performance statistics and session statistics about each Oracle Streams component.

Table 233–4 STREAMS$_PA_COMPONENT_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was run for the advisor run ID
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic
SUB_COMPONENT_TYPE	VARCHAR2(64)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: ■ LOGMINER READER for a builder server of a capture process ■ LOGMINER PREPARER for a preparer server of a capture process ■ LOGMINER BUILDER for a reader server of a capture process ■ CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: ■ PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database ■ APPLY READER for a reader server of an apply process ■ APPLY COORDINATOR for a coordinator process of an apply process ■ APPLY SERVER for a reader server of an apply process
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V$SESSION view for information about the session.

Table 233–4 (Cont.) STREAMS$_PA_COMPONENT_STAT Table

Column	Datatype	NULL	Description
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V$SESSION view for information about the session.

STREAMS$_PA_CONTROL Table

The STREAMS$_PA_CONTROL table displays the parameters set for the COLLECT_STATS procedure in this package. The parameters control the monitoring behavior.

Table 233–5 STREAMS$_PA_CONTROL Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
PARAM_NAME	VARCHAR2(30)		The name of the parameter
PARAM_VALUE	VARCHAR2(4000)		The value set for the parameter
PARAM_UNIT	VARCHAR2(30)		The unit of the parameter

STREAMS$_PA_DATABASE Table

The STREAMS$_PA_DATABASE table displays information about each database that contains Oracle Streams components.

Table 233–6 STREAMS$_PA_DATABASE Table

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Streams Performance Advisor
LAST_QUERIED	DATE		The time when the Performance Advisor successfully collected information from a database in its last run
ERROR_NUMBER	NUMBER		The error number of the error encountered when the database was last queried
ERROR_MESSAGE	VARCHAR2(4000)		The error message of the error encountered when the database was last queried

STREAMS$_PA_DATABASE_PROP Table

The STREAMS$_PA_DATABASE_PROP table displays Oracle Streams database property information necessary for analysis by the Streams Performance Advisor.

Table 233–7 STREAMS$_PA_DATABASE_PROP Table

Column	Datatype	NULL	Description
GLOBAL_NAME	VARCHAR2(128)	NOT NULL	Global name of the database analyzed by the Oracle Streams Performance Advisor
PROP_NAME	VARCHAR2(30)		Property name The database properties include the following: ■ VERSION ■ COMPATIBILITY ■ MANAGEMENT_PACK_ACCESS ■ DB_UNIQUE_NAME
PROP_VALUE	VARCHAR2(30)		Property value

STREAMS$_PA_MONITORING Table

The STREAMS$_PA_MONITORING table displays information about each monitoring job running in a database.

Table 233–8 STREAMS$_PA_MONITORING Table

Column	Datatype	NULL	Description
JOB_NAME	VARCHAR2(30)	NOT NULL	Name of the monitoring job
CLIENT_NAME	VARCHAR2(30)		Name of the client that submitted the job **See Also:** "Full Monitoring Job Names" on page 233-25
QUERY_USER_NAME	VARCHAR2(30)		User granted privileges to view the monitoring results
SHOW_STATS_TABLE	VARCHAR2(30)		Name of the table used by the SHOW_STATS procedure to display statistics
STARTED_TIME	TIMESTAMP		Time the monitoring job started
STOPPED_TIME	TIMESTAMP		Time the monitoring job last stopped
ALTERED_TIME	TIMESTAMP		Time the monitoring job was last altered
STATE	VARCHAR2(30)		State of the monitoring job, either ENABLED or STOPPED

STREAMS$_PA_PATH_BOTTLENECK Table

The STREAMS$_PA_PATH_BOTTLENECK table displays information about Oracle Streams components that might be slowing down the flow of messages.

Table 233–9 STREAMS$_PA_PATH_BOTTLENECK Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run

Table 233–9 (Cont.) STREAMS$_PA_PATH_BOTTLENECK Table

Column	Datatype	NULL	Description
ADVISOR_RUN_REASON	VARCHAR2(4000)		Reason for the bottleneck
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
TOP_SESSION_ID	NUMBER		Session ID of the top component. Query the V$SESSION view for information about the session.
TOP_SESSION_SERIAL#	NUMBER		Session serial number of the top component. Query the V$SESSION view for information about the session.
ACTION_NAME	VARCHAR2(32)		Action name for the top session
BOTTLENECK_IDENTIFIED	VARCHAR2(30)		Whether a bottleneck was identified

STREAMS$_PA_PATH_STAT Table

The STREAMS$_PA_PATH_STAT table displays performance statistics about each stream path.

Table 233–10 STREAMS$_PA_PATH_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was run for the advisor run ID
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
PATH_KEY	VARCHAR2(4000)		Unique key assigned to the path by the Oracle Streams Performance Advisor
STATISTIC_TIME	DATE		Time when the statistic was recorded
STATISTIC_NAME	VARCHAR2(64)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(64)		Unit of measurement for the statistic

STREAMS$_PA_SHOW_COMP_STAT Table

The STREAMS$_PA_SHOW_COMP_STAT table displays statistics for Oracle Streams components.

Table 233–11 STREAMS$_PA_SHOW_COMP_STAT Table

Column	Datatype	NULL	Description
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
POSITION	NUMBER		Position of the component in the path
COMPONENT_ID	NUMBER		Identification number assigned to the component by the Oracle Streams Performance Advisor
COMPONENT_NAME	VARCHAR2(194)		Name of the component
COMPONENT_TYPE	VARCHAR2(30)		Type of the component The following types are possible: ■ CAPTURE for a capture process ■ PROPAGATION SENDER for a propagation sender ■ PROPAGATION RECEIVER for a propagation receiver ■ APPLY for an apply process ■ QUEUE for a queue

Table 233–11 (Cont.) STREAMS$_PA_SHOW_COMP_STAT Table

Column	Datatype	NULL	Description
SUB_COMPONENT_TYPE	VARCHAR2(30)		Type of the subcomponent Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible: ■ LOGMINER READER for a builder server of a capture process ■ LOGMINER PREPARER for a preparer server of a capture process ■ LOGMINER BUILDER for a reader server of a capture process ■ CAPTURE SESSION for a capture process session The following apply process subcomponent types are possible: ■ PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database ■ APPLY READER for a reader server of an apply process ■ APPLY COORDINATOR for a coordinator process of an apply process ■ APPLY SERVER for a reader server of an apply process
SESSION_ID	NUMBER		Identification number of the session for the component. Query the V$SESSION view for information about the session.
SESSION_SERIAL#	NUMBER		Session serial number of the session for the component. Query the V$SESSION view for information about the session.
STATISTIC_ALIAS	VARCHAR2(30)		Name of the statistic
STATISTIC_NAME	VARCHAR2(128)		Name of the statistic
STATISTIC_VALUE	NUMBER		Value recorded for the statistic
STATISTIC_UNIT	VARCHAR2(128)		Unit of measurement for the statistic

STREAMS$_PA_SHOW_PATH_STAT Table

The STREAMS$_PA_SHOW_PATH_STAT table displays statistics for the stream paths in an Oracle Streams configuration. A monitoring job uses this table as the default table for the statistics collected for stream paths.

Table 233–12 STREAMS$_PA_SHOW_PATH_STAT Table

Column	Datatype	NULL	Description
PATH_ID	NUMBER		Identification number assigned to the path by the Oracle Streams Performance Advisor
ADVISOR_RUN_ID	NUMBER		Identification number of the Oracle Streams Performance Advisor run
ADVISOR_RUN_TIME	DATE		Time when the Oracle Streams Performance Advisor was last run
SETTING	VARCHAR2(2000)		Setting for the Oracle Streams Performance Advisor Run
STATISTICS	VARCHAR2(4000)		Component-level statistics
SESSION_STATISTICS	VARCHAR2(4000)		Session-level statistics
OPTIMIZATION	NUMBER		Whether the path uses the combined capture and apply optimization 0 (zero) means that the path does not use the combined capture and apply optimization. 1 means that the path uses the combined capture and apply optimization.

Summary of UTL_SPADV Subprograms

Table 233–13 DBMS_STREAMS Package Subprograms

Subprogram	Description
ALTER_MONITORING Procedure on page 233-15	Alters the monitoring job submitted by the current user.
COLLECT_STATS Procedure on page 233-17	Uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.
IS_MONITORING Function on page 233-19	Checks whether a monitoring job is currently running.
SHOW_STATS Procedure on page 233-20	Generates output that includes the statistics gathered by the `COLLECT_STATS` procedure.
START_MONITORING Procedure on page 233-23	Starts a monitoring job.
STOP_MONITORING Procedure on page 233-26	Stops a monitoring job.

ALTER_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

Syntax

```
UTL_SPADV.ALTER_MONITORING(
   interval                      IN NUMBER  DEFAULT NULL,
   top_event_threshold           IN NUMBER  DEFAULT NULL,
   bottleneck_idle_threshold     IN NUMBER  DEFAULT NULL,
   bottleneck_flowctrl_threshold IN NUMBER  DEFAULT NULL,
   retention_time                IN NUMBER  DEFAULT NULL);
```

Parameters

Table 233–14 ALTER_MONITORING Procedure Parameters

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. If NULL, then the current value is not changed.
top_event_threshold	A percentage that determines whether or not a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected. If NULL, then the current value is not changed.
bottleneck_idle_threshold	A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.
bottleneck_flowctrl_threshold	A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.
retention_time	The number of hours to retain monitoring results. If NULL, then the current value is not changed.

Exceptions

Table 233–15 ALTER_MONITORING Procedure Exceptions

Exception	Description
ORA-20113	no active monitoring job found

COLLECT_STATS Procedure

This procedure uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

Note: This procedure commits.

See Also: *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.COLLECT_STATS(
   interval                      IN NUMBER  DEFAULT 60,
   num_runs                      IN NUMBER  DEFAULT 10,
   comp_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_COMP_STAT',
   path_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
   top_event_threshold           IN NUMBER  DEFAULT 15,
   bottleneck_idle_threshold     IN NUMBER  DEFAULT 50,
   bottleneck_flowctrl_threshold IN NUMBER  DEFAULT 50);
```

Parameters

Table 233–16 COLLECT_STATS Procedure Parameters

Parameter	Description
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.
num_runs	The number of times that the Oracle Streams Performance Advisor is run by the procedure.
comp_stat_table	The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as *[schema_name.]object_name*. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS$_ADVISOR_COMP_STAT. See "Usage Notes" on page 233-18 for more information about this parameter.
path_stat_table	The name of the table that stores the statistics collected for stream paths. Specify the table name as *[schema_name.]object_name*. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS$_ADVISOR_PATH_STAT. See "Usage Notes" on page 233-18 for more information about this parameter.

Table 233–16 (Cont.) COLLECT_STATS Procedure Parameters

Parameter	Description
top_event_threshold	A percentage that determines whether or not a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.
bottleneck_idle_threshold	A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
bottleneck_flowctrl_threshold	A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.

Usage Notes

The table specified in the path_stat_table parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the comp_stat_table parameter. The SHOW_STATS procedure in this package shows only the statistics stored in the table specified in the path_stat_table parameter.

IS_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns `TRUE` if a monitoring job is currently running or `FALSE` if a monitoring job is not currently running.

A monitoring job is submitted using the `START_MONITORING` procedure.

See Also: "START_MONITORING Procedure" on page 233-23

Syntax

```
UTL_SPADV.IS_MONITORING(
   job_name    IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
   client_name IN VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 233–17 IS_MONITORING Function Parameters

Parameter	Description
`job_name`	The name of the job for which to check.
`client_name`	The name of the client that submitted the job.

SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the COLLECT_STATS and START_MONITORING procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

Note: This procedure does not commit.

See Also:

- "COLLECT_STATS Procedure" on page 233-17
- "START_MONITORING Procedure" on page 233-23
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.SHOW_STATS(
   path_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
   path_id           IN NUMBER    DEFAULT NULL,
   bgn_run_id        IN NUMBER    DEFAULT -1,
   end_run_id        IN NUMBER    DEFAULT -10,
   show_path_id      IN BOOLEAN   DEFAULT TRUE,
   show_run_id       IN BOOLEAN   DEFAULT TRUE,
   show_run_time     IN BOOLEAN   DEFAULT TRUE,
   show_optimization IN BOOLEAN   DEFAULT TRUE,
   show_setting      IN BOOLEAN   DEFAULT FALSE,
   show_stat         IN BOOLEAN   DEFAULT TRUE,
   show_sess         IN BOOLEAN   DEFAULT FALSE,
   show_legend       IN BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 233–18 SHOW_STATS Procedure Parameters

Parameter	Description
path_stat_table	The name of the table that contains the stream path statistics. Specify the table name as *[schema_name.]object_name*. If the schema is not specified, then the current user is the default. When you gather statistics using the COLLECT_STATS procedure, this table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS$_ADVISOR_PATH_STAT. When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS$_PA_MONITORING view. The default table for a monitoring job is STREAMS$_PA_SHOW_PATH_STAT.
path_id	A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.

Table 233–18 (Cont.) SHOW_STATS Procedure Parameters

Parameter	Description
bgn_run_id	The first Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 233-21 for more information about this parameter.
end_run_id	The last Oracle Streams Performance Advisor run ID to show in the range of runs. See "Usage Notes" on page 233-21 for more information about this parameter.
show_path_id	If TRUE, then the path ID for each stream path is included in the output. If FALSE, then the path ID for each stream path is not included in the output.
show_run_id	If TRUE, then the Oracle Streams Performance Advisor run ID is included in the output. If FALSE, then the Oracle Streams Performance Advisor run ID is not included in the output.
show_run_time	If TRUE, then the Oracle Streams Performance Advisor run time is included in the output. If FALSE, then the Oracle Streams Performance Advisor run time is not included in the output.
show_optimization	If TRUE, then path output includes information pertaining to the combined capture and apply optimization. If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.
show_setting	If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the top_event_threshold, bottleneck_idle_threshold, and bottleneck_flowctrl_threshold parameters in the COLLECT_STATS procedure. If FALSE, then the settings for the threshold parameters are not included in the output.
show_stat	If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes. If FALSE, then the component-level and subcomponent-level statistics are not included in the output.
show_sess	If TRUE, then the session-level statistics are included in the output. Session-level statistics include IDLE, FLOW CONTROL, and EVENT statistics. If FALSE, then the session-level statistics are not included in the output.
show_legend	If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output. If FALSE, then the legend is not included in the output.

Usage Notes

Use the bgn_run_id and end_run_id together to specify the range of Oracle Streams Performance Advisor runs that you want to display. Positive numbers show

statistics from the an earlier run forward. Negative numbers show statistics from the a a later run backward.

For example, if `bgn_run_id` is set to `1` and `end_run_id` is set to `10`, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if `bgn_run_id` is set to `-1` and `end_run_id` is set to `-10`, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

> **See Also:** *Oracle Streams Concepts and Administration* for information about the combined capture and apply optimization

START_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the COLLECT_STATS procedure to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

Note: This procedure commits.

See Also:

- "COLLECT_STATS Procedure" on page 233-17
- *Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

Syntax

```
UTL_SPADV.START_MONITORING(
   job_name                      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
   client_name                   IN VARCHAR2  DEFAULT NULL,
   query_user_name               IN VARCHAR2  DEFAULT NULL,
   interval                      IN NUMBER    DEFAULT 60,
   top_event_threshold           IN NUMBER    DEFAULT 15,
   bottleneck_idle_threshold     IN NUMBER    DEFAULT 50,
   bottleneck_flowctrl_threshold IN NUMBER    DEFAULT 50,
   retention_time                IN NUMBER    DEFAULT 24);
```

Parameters

Table 233–19 START_MONITORING Procedure Parameters

Parameter	Description
job_name	The name of the monitoring job to create.
client_name	The name of the client.
query_user_name	The user who will query the result tables. This procedure grants privileges to the specified user to enable the user to query the result tables.
interval	The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. The specified interval is used for the interval parameter in the COLLECT_STATS procedure.
top_event_threshold	A percentage that determines whether or not a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.

Table 233–19 (Cont.) START_MONITORING Procedure Parameters

Parameter	Description
bottleneck_idle_threshold	A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.
bottleneck_flowctrl_threshold	A percentage that determines whether or not an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.
retention_time	The number of hours to retain monitoring results.

Exceptions

Table 233–20 START_MONITORING Procedure Exceptions

Exception	Description
ORA-20111	cannot start monitoring due to active EM monitoring job Stop the Enterprise Manager (EM) monitoring job, and run the START_MONITORING procedure again.
ORA-20112	cannot start monitoring due to active Streams monitoring job Stop the Streams monitoring job, and run the START_MONITORING procedure again.

Usage Notes

The following are usage notes for the START_MONITORING procedure:

- Requirements for the User Running the Procedure
- Full Monitoring Job Names
- Restrictions on Monitoring Jobs

Requirements for the User Running the Procedure

The user who runs the START_MONITORING procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Streams components.
- The user must have been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure, and each database link must connect to a user at the remote database that has been granted privileges using the DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE procedure.

Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

Setting for client_name Parameter	Setting for job_name parameter	Full Monitoring Job Name
NULL	STREAMS$_MONITORING_JOB	STREAMS$_MONITORING_JOB
EM	STREAMS$_MONITORING_JOB	EMSTREAMS$_MONITORING_JOB
strm	STREAMS$_MONITORING_JOB	strmSTREAMS$_MONITORING_JOB
strm	mjob1	strmmjob1

Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

STOP_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

Syntax

```
UTL_SPADV.STOP_MONITORING(
   purge IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 233–21 STOP_MONITORING Procedure Parameters

Parameter	Description
purge	If TRUE, then the procedure purges information about the monitoring job from the result tables. If FALSE, then the procedure retains information about the monitoring job in the result tables.

234

UTL_TCP

With the `UTL_TCP` package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

- Using UTL_TCP
  - Overview
  - Security Model
  - Types
  - Exceptions
  - Rules and Limits
  - Examples
- Summary of UTL_TCP Subprograms

Using UTL_TCP

- Overview
- Security Model
- Types
- Exceptions
- Rules and Limits
- Examples

Overview

The UTL_TCP package provides TCP/IP client-side access functionality in PL/SQL.

Security Model

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note: For more information, see Managing Fine-grained Access to External Network Services in Oracle Database Security Guide

Types

- CONNECTION Type
- CRLF

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.

Syntax

```
TYPE connection IS RECORD (
    remote_host    VARCHAR2(255),
    remote_port    PLS_INTEGER,
    local_host     VARCHAR2(255),
    local_port     PLS_INTEGER,
    charset        VARCHAR2(30),
    newline        VARCHAR2(2),
    tx_timeout     PLS_INTEGER,
    private_sd     PLS_INTEGER);
```

Fields

Table 234–1 Connection Record Type Fields

Field	Description
`remote_host`	The name of the remote host when connection is established. `NULL` when no connection is established.
`remote_port`	The port number of the remote host connected. NULL when no connection is established.
`local_host`	The name of the local host used to establish the connection. `NULL` when no connection is established.
`local_port`	The port number of the local host used to establish the connection. `NULL` when no connection is established.
`charset`	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database will be converted to and from the on-the-wire character set as they are sent and received on the network.
`newline`	The newline character sequence. This newline character sequence is appended to the text line sent by `WRITE_LINE` API.
`tx_timeout`	A time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using `OPEN_CONNECTION`. Changing the values of those fields

has no effect on the connection. The fields `private_XXXX` are for implementation use only. You should not modify the values.

In the current release of the `UTL_TCP` package, the parameters `local_host` and `local_port` are ignored when `open_connection` makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The `local_host` and `local_port` fields will not be set in the connection record returned by the function.

Time out on write operations is not supported in the current release of the `UTL_TCP` package.

CRLF

The character sequence carriage-return line-feed. It is the newline sequence commonly used many communication standards.

Syntax

```
CRLF CONSTANT VARCHAR2(2 CHAR);
```

Usage Notes

This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for `WRITE_LINE`, specified when a connection is opened. While such protocols use `<CR><LF>` to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

Exceptions

The exceptions raised by the TCP/IP package are listed in Table 234–2.

Table 234–2 TCP/IP Exceptions

Exception	Description
BUFFER_TOO_SMALL	Buffer is too small for input that requires look-ahead.
END_OF_INPUT	Raised when no more data is available to read from the connection.
NETWORK_ERROR	Generic network error.
BAD_ARGUMENT	Bad argument passed in an API call (for example, a negative buffer size).
TRANSFER_TIMEOUT	No data is read and a read time out occurred.
PARTIAL_MULTIBYTE_CHAR	No complete character is read and a partial multibyte character is found at the end of the input.

Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.

Examples

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```
DECLARE
  c  utl_tcp.connection;  -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                               remote_port =>  80,
                               charset     => 'US7ASCII');  -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');    -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE));  -- read result
    END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL; -- end of input
  END;
  utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```
PROCEDURE send_mail (sender    IN VARCHAR2,
                     recipient IN VARCHAR2,
                   message   IN VARCHAR2)
IS
    mailhost   VARCHAR2(30) := 'mailhost.mydomain.com';
    smtp_error  EXCEPTION;
    mail_conn   utl_tcp.connection;
    PROCEDURE smtp_command(command IN VARCHAR2,
                           ok      IN VARCHAR2 DEFAULT '250')
    IS
        response varchar2(3);
        len pls_integer;
    BEGIN
        len := utl_tcp.write_line(mail_conn, command);
        response := substr(utl_tcp.get_line(mail_conn), 1, 3);
        IF (response <> ok) THEN
            RAISE smtp_error;
        END IF;
    END;

BEGIN
    mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                         remote_port => 25,
                                         charset     => 'US7ASCII');
    smtp_command('HELO ' || mailhost);
    smtp_command('MAIL FROM: ' || sender);
    smtp_command('RCPT TO: ' || recipient);
    smtp_command('DATA', '354');
    smtp_command(message);
```

```
    smtp_command('QUIT', '221');
    utl_tcp.close_connection(mail_conn);
EXCEPTION
    WHEN OTHERS THEN
        -- Handle the error
END;
```

Summary of UTL_TCP Subprograms

Table 234–3 UTL_TCP Package Subprograms

Subprogram	Description
AVAILABLE Function on page 234-12	Determines the number of bytes available for reading from a TCP/IP connection
CLOSE_ALL_ CONNECTIONS Procedure on page 234-14	Closes all open TCP/IP connections
CLOSE_CONNECTION Procedure on page 234-15	Closes an open TCP/IP connection
FLUSH Procedure on page 234-16	Transmits all data in the output buffer, if a buffer is used, to the server immediately
GET_LINE Function on page 234-17	Returns the line of data read
GET_LINE_NCHAR Function on page 234-18	Returns the line of data read in NCHAR form
GET_RAW Function on page 234-19	Return the data read instead of the amount of data read
GET_TEXT Function on page 234-20	Returns the text data read
GET_TEXT_NCHAR Function on page 234-21	Returns the text data read in NCHAR form
OPEN_CONNECTION Function on page 234-22	Opens a TCP/IP connection to a specified service
READ_LINE Function on page 234-24	Receives a text line from a service on an open connection
READ_RAW Function on page 234-26	Receives binary data from a service on an open connection
READ_TEXT Function on page 234-27	Receives text data from a service on an open connection
WRITE_LINE Function on page 234-29	Transmits a text line to a service on an open connection
WRITE_RAW Function on page 234-30	Transmits a binary message to a service on an open connection
WRITE_TEXT Function on page 234-31	Transmits a text message to a service on an open connection

AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```
UTL_TCP.AVAILABLE (
   c        IN OUT NOCOPY connection,
   timeout  IN PLS_INTEGER DEFAULT 0)
RETURN PLS_INTEGER;
```

Parameters

Table 234–4 AVAILABLE Function Parameters

Parameter	Description
c	The TCP connection to determine the amount of data that is available to be read from.
timeout	A time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Users may use this API to determine if data is available to be read before calling the read API so that the program will not be blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read will result in the END_OF_INPUT exception.

The following example illustrates using this function in a portable manner:

```
DECLARE
   c   utl_tcp.connection
   data VARCHAR2(256);
   len  PLS_INTEGER;
BEGIN
   c := utl_tcp.open_connection(...);
   LOOP
      IF (utl_tcp.available(c) > 0) THEN
         len := utl_tcp.read_text(c, data, 256);
      ELSE
         ---do some other things
        . . . .
      END IF
```

```
   END LOOP;
END;
```

CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

```
UTL_TCP.CLOSE_ALL_CONNECTIONS;
```

Usage Notes

This call is provided to close all connections before a PL/SQL program avoid dangling connections.

CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

```
UTL_TCP.CLOSE_CONNECTION (
   c IN OUT NOCOPY connection);
```

Parameters

Table 234–5 CLOSE_CONNECTION Procedure Parameters

Parameter	Description
c	The TCP connection to close.

Usage Notes

Connection must have been opened by a previous call to `OPEN_CONNECTION`. The fields `remote_host, remote_port, local_host, local_port` and `charset` of c will be reset after the connection is closed.

An open connection must be closed explicitly. An open connection will remain open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

FLUSH Procedure

This procedure transmits all data in the output buffer, if a buffer is used, to the server immediately.

Syntax

```
UTL_TCP.FLUSH (
   c IN OUT NOCOPY connection);
```

Parameters

Table 234–6 FLUSH Procedure Parameters

Parameter	Description
c	The TCP connection to send data to.

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

GET_LINE Function

This function returns the line of data read.

Syntax

```
UTL_TCP.GET_LINE (
   c           IN OUT NOCOPY connection,
   remove_crlf IN            BOOLEAN DEFAULT FALSE,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 234–7 GET_LINE Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```
UTL_TCP.GET_LINE_NCHAR (
   c           IN OUT NOCOPY connection,
   remove_crlf IN            BOOLEAN DEFAULT FALSE,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN NVARCHAR2;
```

Parameters

Table 234–8 GET_LINE_NCHAR Function Parameters

Parameter	Description
`c`	The TCP connection to receive data from.
`remove_crlf`	If `TRUE`, the trailing CR/LF character(s) are removed from the received message.
`peek`	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to `TRUE` and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to `OPEN_CONNECTION`.
- See `READ_LINE` for the read time out, character set conversion, buffer size, and multibyte character issues.

GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```
UTL_TCP.GET_RAW (
   c     IN OUT NOCOPY connection,
   len   IN            PLS_INTEGER DEFAULT 1,
   peek  IN            BOOLEAN     DEFAULT FALSE)
 RETURN RAW;
```

Parameters

Table 234–9 GET_RAW Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

GET_TEXT Function

This function returns the text data read.

Syntax

```
UTL_TCP.GET_TEXT (
   c    IN OUT NOCOPY connection,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
 RETURN VARCHAR2;
```

Parameters

Table 234–10 GET_TEXT Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```
UTL_TCP.GET_TEXT_NCHAR (
   c    IN OUT NOCOPY connection,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
 RETURN NVARCHAR2;
```

Parameters

Table 234–11 GET_TEXT_NCHAR Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
len	The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```
UTL_TCP.OPEN_CONNECTION  (
   remote_host      IN VARCHAR2,
   remote_port      IN PLS_INTEGER,
   local_host       IN VARCHAR2 DEFAULT NULL,
   local_port       IN PLS_INTEGER DEFAULT NULL,
   in_buffer_size   IN PLS_INTEGER DEFAULT NULL,
   out_buffer_size  IN PLS_INTEGER DEFAULT NULL,
   charset          IN VARCHAR2 DEFAULT NULL,
   newline          IN VARCHAR2 DEFAULT CRLF,
   tx_timeout       IN PLS_INTEGER DEFAULT NULL)
  RETURN connection;
```

Parameters

Table 234–12 OPEN_CONNECTION Function Parameters

Parameter	Description
remote_host	The name of the host providing the service. When remote_host is NULL, it connects to the local host.
remote_port	The port number on which the service is listening for connections.
local_host	The name of the host providing the service. NULL means don't care.
local_port	The port number on which the service is listening for connections. NULL means don't care.
in_buffer_size	The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the network condition. A 0 value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.
out_buffer_size	The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A 0 value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.
charset	The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database will be converted to and from the on-the-wire character set as they are sent and received on the network using READ_TEXT, READ_LINE, WRITE_TEXT and WRITE_LINE. Set this parameter to NULL when no conversion is needed.

Table 234–12 (Cont.) OPEN_CONNECTION Function Parameters

Parameter	Description
newline	The newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.
tx_timeout	A time in seconds that the UTL_TCP package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.

Return Values

A connection to the targeted TCP/IP service

Usage Notes

- Note that connections opened by this UTL_TCP package can remain open and be passed from one database call to another in a shared server configuration. However, the connection must be closed explicitly. The connection will remain open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.
- In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields will not be set in the connection record returned by the function.
- tx_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx_timeout from governing write operations in the current release.

READ_LINE Function

This function receives a text line from a service on an open connection. A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

Syntax

```
UTL_TCP.READ_LINE (
   c           IN OUT NOCOPY connection,
   data        IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   peek        IN            BOOLEAN DEFAULT FALSE)
 RETURN PLS_INTEGER;
```

Parameters

Table 234–13 READ_LINE Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
data	The data received.
remove_crlf	If TRUE, the trailing CR/LF character(s) are removed from the received message.
peek	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages will be converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the READ_RAW function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and

read time out occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```
UTL_TCP.READ_RAW (
   c     IN OUT NOCOPY connection,
   data  IN OUT NOCOPY RAW,
   len   IN            PLS_INTEGER DEFAULT 1,
   peek  IN            BOOLEAN     DEFAULT FALSE)
 RETURN PLS_INTEGER;
```

Parameters

Table 234–14 READ_RAW Function Parameters

Parameter	Description
`c`	The TCP connection to receive data from.
`data (IN OUT COPY)`	The data received.
`len`	The number of bytes of data to receive.
`peek`	Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to `TRUE` and set up an input buffer before the connection is opened. The amount of data you can peeked at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the `transfer_timeout` exception is raised. The exception can be handled and the read operation can be retried later.

READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

```
UTL_TCP.READ_TEXT (
   c    IN OUT NOCOPY connection,
   data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
   len  IN            PLS_INTEGER DEFAULT 1,
   peek IN            BOOLEAN     DEFAULT FALSE)
RETURN PLS_INTEGER;
```

Parameters

Table 234–15 READ_TEXT Function Parameters

Parameter	Description
c	The TCP connection to receive data from.
data	The data received.
len	The number of characters of data to receive.
peek	Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages will be converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a VARCHAR2 buffer is specified in terms of bytes, while the parameter len refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the VARCHAR2 buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, this function waits for each data packet to be ready to read until time out occurs. If it occurs, this function stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the `partial_multibyte_char` exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the `READ_RAW` function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, the `transfer_timeout` exception is raised instead. The exception can be handled and the read operation can be retried later.

WRITE_LINE Function

This function transmits a text line to a service on an open connection. The `newline` character sequence will be appended to the message before it is transmitted.

Syntax

```
UTL_TCP.WRITE_LINE (
   c    IN OUT NOCOPY connection,
   data IN            VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)
  RETURN PLS_INTEGER;
```

Parameters

Table 234–16 WRITE_LINE Function Parameters

Parameter	Description
`c`	The TCP connection to send data to.
`data`	The buffer containing the data to be sent.

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to `OPEN_CONNECTION`. Text messages will be converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```
UTL_TCP.WRITE_RAW (
   c    IN OUT NOCOPY connection,
   data IN            RAW,
   len  IN            PLS_INTEGER DEFAULT NULL)
 RETURN PLS_INTEGER;
```

Parameters

Table 234–17 WRITE_RAW Function Parameters

Parameter	Description
c	The TCP connection to send data to.
data	The buffer containing the data to be sent.
len	The number of bytes of data to transmit. When len is NULL, the whole length of data is written.

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```
UTL_TCP.WRITE_TEXT (
   c    IN OUT NOCOPY connection,
   data IN            VARCHAR2 CHARACTER SET ANY_CS,
   len  IN            PLS_INTEGER DEFAULT NULL)
 RETURN num_chars PLS_INTEGER;
```

Parameters

Table 234–18 WRITE_TEXT Function Parameters

Parameter	Description
c	The TCP connection to send data to.
data	The buffer containing the data to be sent.
len	The number of characters of data to transmit. When len is NULL, the whole length of data is written. The actual amount of data written may be less because of network condition.

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Text messages will be converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.

235

UTL_URL

The UTL_URL package has two functions: ESCAPE and UNESCAPE.

See Also: Chapter 221, "UTL_HTTP"

This chapter contains the following topics:

- Using UTL_URL
  - Overview
  - Exceptions
  - Examples
- Summary of UTL_URL Subprograms

Using UTL_URL

- Overview
- Exceptions
- Examples

Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP). For example, the URL for Oracle's Web site is:

```
http://www.oracle.com
```

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the *unreserved characters*. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign ($), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the *reserved characters*. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent ('), left parenthesis (( ), right parenthesis ( ))

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), percentage sign (%), and comma (,)

The UTL_URL package has two functions that provide escape and unescape mechanisms for URL characters. Use the escape function to escape a URL before the URL is used fetch a Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

```
http://www.w3.org/TR/html
```

Exceptions

Table 235–1 lists the exceptions that can be raised when the UTL_URL package API is invoked.

Table 235–1 UTL_URL Exceptions

Exception	Error Code	Reason
BAD_URL	29262	The URL contains badly formed escape code sequences
BAD_FIXED_WIDTH_CHARSET	29274	Fixed-width multibyte character set is not allowed as a URL character set.

Examples

You can implement the `x-www-form-urlencoded` encoding using the `UTL_URL.ESCAPE` function as follows:

```
CREATE OR REPLACE FUNCTION form_url_encode (
   data    IN VARCHAR2,
   charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the `form-URL-encode scheme`, the following function implements the decording scheme:

```
CREATE OR REPLACE FUNCTION form_url_decode(
   data    IN VARCHAR2,
   charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
  RETURN utl_url.unescape(
     replace(data, '+', ' '),
     charset);
END;
```

Summary of UTL_URL Subprograms

Table 235–2 UTL_URL Package Subprograms

Subprogram	Description
ESCAPE Function on page 235-7	Returns a URL with illegal characters (and optionally reserved characters) escaped using the `%2-digit-hex-code` format
UNESCAPE Function on page 235-9	Unescapes the escape character sequences to their original forms in a URL. Convert the `%XX` escape character sequences to the original characters

ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the `%2-digit-hex-code` format.

Syntax

```
UTL_URL.ESCAPE (
   url                  IN VARCHAR2 CHARACTER SET ANY_CS,
   escape_reserved_chars IN BOOLEAN  DEFAULT  FALSE,
   url_charset          IN VARCHAR2 DEFAULT  utl_http.body_charset)
 RETURN VARCHAR2;
```

Parameters

Table 235–3 ESCAPE Function Parameters

Parameter	Description
`url`	The original URL
`escape_reserved_chars`	Indicates whether the URL reserved characters should be escaped. If set to `TRUE`, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is `FALSE`.
`url_charset`	When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If `url_charset` is `NULL`, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the `UTL_HTTP` package, whose default value is `ISO-8859-1`. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- `A` through `Z`, `a` through `z`, and `0` through `9`
- Hyphen (`-`), underscore (_), period (`.`), exclamation point (`!`), tilde (`~`), asterisk (`*`), accent (`'`), left parenthesis (`(`), right parenthesis (`)`)

The reserved characters consist of:

- Semi-colon (`;`) slash (`/`), question mark (`?`), colon (`:`), at sign (`@`), ampersand (`&`), equals sign (`=`), plus sign (`+`), dollar sign (`$`), and comma (`,`)

Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair `$logon=scott/tiger` into the query string of a URL, escape the `$` and `/` separately as `%24logon=scott%2Ftiger` and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

```
http://foo.com/a%20url%20with%20space.html
```

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with `escape_reserved_chars` set to `TRUE`) and then concatenate it with the rest of the URL. For example:

```
url := 'http://www.acme.com/search?check=' || utl_url.escape
('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (`?`), dollar sign (`$`), and space characters in `'Is the use of the "$" sign okay?'` but not the `?` after `search` in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using `US7ASCII` so that a space is escaped as `%20` (hex code of a space in ASCII) instead of `%40` (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the `%XX` escape character sequences to the original characters.

Syntax

```
UTL_URL.UNESCAPE (
   url            IN VARCHAR2 CHARACTER SET ANY_CS,
   url_charset    IN VARCHAR2 DEFAULT utl_http.body_charset)
                  RETURN VARCHAR2;
```

Parameters

Table 235–4 UNESCAPE Function Parameters

Parameter	Description
`url`	The URL to unescape
`url_charset`	After a character is unescaped, the character is assumed to be in the `source_charset` character set and it will be converted from the `source_charset` to the database character set before the URL is returned. If `source_charset` is `NULL`, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the `UTL_HTTP` package, whose default value is "ISO-8859-1". The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using `US7ASCII` so that `%20` is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a `?` (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.

236

WPG_DOCLOAD

The WPG_DOCLOAD package provides an interface to download files, BLOBs and BFILEs.

> **See Also:** For more information about implementation of this package:
>
> - *Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server*
> - *Oracle Fusion Middleware User's Guide for mod_plsql*

The chapter contains the following topics:

- Using WPG_DOCLOAD
  - Constants
- Summary of WPG_DOCLOAD Subprograms

Using WPG_DOCLOAD

- Constants

Constants

- NAME_COL_LEN
- MIMET_COL_LEN
- MAX_DOCTABLE_NAME_LEN

NAME_COL_LEN

The `NAME` column in your document table must be the same as the value of `name_col_len`.

```
name_col_len CONSTANT pls_integer := 64;
```

MIMET_COL_LEN

The `MIME_TYPE` column in your document table must be the same as the value of `mimet_col_len`.

```
mimet_col_len CONSTANT pls_integer := 48;
```

MAX_DOCTABLE_NAME_LEN

The name length of your document table must be less than `max_doctable_name_len`.

```
max_doctable_name_len CONSTANT pls_integer := 256;
```

Summary of WPG_DOCLOAD Subprograms

Table 236–1 WPG_DOCLOAD Package Subprograms

Subprogram	Description
DOWNLOAD_FILE Procedures on page 236-5	Downloads files, `BLOBS` and `BFILES`

DOWNLOAD_FILE Procedures

There are three versions of this procedure:

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

Syntax

```
WPG_DOCLOAD.DOWNLOAD_FILE(
   p_filename      IN             VARCHAR2,
   p_bcaching      IN             BOOLEAN DEFAULT TRUE);

WPG_DOCLOAD.DOWNLOAD_FILE(
   p_blob          IN OUT NOCOPY  BLOB);

WPG_DOCLOAD.DOWNLOAD_FILE(
   p_bfile         IN OUT         BFILE);
```

Parameters

Table 236–2 DOWNLOAD_FILE Procedure Parameters

Parameter	Description
`p_filename`	The file to download from the document table.
`p_blob`	The `BLOB` to download.
`p_bfile`	The `BFILE` to download (see Usage Notes).
`p_bcaching`	Whether browser caching is enabled (see Usage Notes).

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status message to the browser indicating that the browser should display the cached copy. However, because a document URL and a document do not necessarily have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may be undesirable to have the cached copy of a document displayed. In those cases, the `p_bcaching` parameter should be set to FALSE to indicate to the gateway to ignore the 'If-Modified-Since' header, and download the document.
- `p_bfile` and `p_blob` are declared as `IN OUT` because the locator is initially opened to check for file accessibility and existence. The open operation can only be performed if the locator is writable and readable.

237

ANYDATA TYPE

An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

- Using ANYDATA TYPE
  - Restrictions
  - Operational Notes
- Summary of ANYDATA Subprograms

Using ANYDATA TYPE

- Restrictions
- Operational Notes

Restrictions

Persistent storage of `ANYDATA` instances whose type contains embedded LOBs other than `BFILE`s is not currently supported.

Operational Notes

- Construction
- Access

Construction

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

```
STATIC FUNCTION ConvertBDouble(dbl IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBfile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(fl IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(invIN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNchar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NVARCHAR2) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTZ(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLTZ(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return
ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
```

The second way to construct an ANYDATA is a piece by piece approach. The BEGINCREATE Static Procedure call begins the construction process and ENDCREATE Member Procedure call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using SET* calls. For piece by piece access of the attributes of objects and elements of collections, the PIECEWISE Member Procedure should be invoked prior to GET* calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The BEGINCREATE call automatically begins the construction in a piece-wise mode. There is no need to call PIECEWISE immediately after BEGINCREATE. ENDCREATE should be called to finish the construction process (before which any access calls can be made).

Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return NULL if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a WHERE clause which uses GETTYPENAME and choose the type you are interested in (say "SYS.NUMBER"). Each of

these functions returns the value of a specified datatype inside a SYS.ANYDATA wrapper.

```
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
   DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFloat(self IN ANYDATA) return BINARY_FLOAT
   DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
   TIMEZONE,
MEMBER FUNCTION AccessTimestampTZ(self IN ANYDATA) return TIMESTAMP WITH
   TIMEZONE,
MEMBER FUNCTION AccessURowid(self IN ANYDATA) return UROWID DETERMINISTIC
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
```

Summary of ANYDATA Subprograms

Table 237–1 ANYDATA Type Subprograms

Subprogram	Description
BEGINCREATE Static Procedure on page 237-7	Begins creation process on a new `ANYDATA`
ENDCREATE Member Procedure on page 237-8	Ends creation of an `ANYDATA`
GET* Member Functions on page 237-9	Gets the current data value (which should be of appropriate type)
GETTYPE Member Function on page 237-12	Gets the Type of the `ANYDATA`
GETTYPENAME Member Function on page 237-13	Get the fully qualified type name for the `ANYDATA`
PIECEWISE Member Procedure on page 237-14	Sets the `MODE` of access of the current data value to be an attribute at a time (if the data value is of `TYPECODE_OBJECT`)
SET* Member Procedures on page 237-15	Sets the current data value.

BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```
STATIC PROCEDURE BeginCreate(
   dtype          IN OUT NOCOPY AnyType,
   adata          OUT NOCOPY ANYDATA);
```

Parameters

Table 237–2 BEGINCREATE Procedure Parameters

Parameter	Description
dtype	The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)
adata	ANYDATA being constructed.

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call PIECEWISE immediately after this call. The construction process begins in a piece-wise manner automatically.

ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE EndCreate(
   self         IN OUT NOCOPY ANYDATA);
```

Parameters

Table 237–3 ENDCREATE Procedure Parameter

Parameter	Description
self	An ANYDATA.

GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE with which we are accessing (depending on whether we have invoked the PIECEWISE call).

If PIECEWISE has NOT been called, we are accessing the ANYDATA in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, we are accessing the ANYDATA piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GetBDouble(
   self         IN ANYDATA,
   dbl          OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
   self         IN ANYDATA,
   b            OUT NOCOPY BFILE)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
   self         IN ANYDATA,
   fl           OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
   self         IN ANYDATA,
   b            OUT NOCOPY BLOB)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetChar(
   self         IN ANYDATA,
   c            OUT NOCOPY CHAR)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetClob(
   self         IN ANYDATA,
   c            OUT NOCOPY CLOB)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetCollection(
   self         IN ANYDATA,
   col          OUT NOCOPY "<collection_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetDate(
   self         IN ANYDATA,
   dat          OUT NOCOPY DATE)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN         PLS_INTEGER;
```

```
MEMBER FUNCTION GetIntervalYM(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNchar(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCHAR)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNClob(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCLOB)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetNumber(
   self         IN ANYDATA,
   num          OUT NOCOPY NUMBER)
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
   self         IN ANYDATA,
   nc           OUT NOCOPY NVARCHAR2)
 RETURN         PLS_INTEGER;

MEMBER FUNCTION GetObject(
   self         IN ANYDATA,
   obj          OUT NOCOPY "<object_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRaw(
   self         IN ANYDATA,
   r            OUT NOCOPY RAW)
   RETURN       PLS_INTEGER;

MMEMBER FUNCTION GetRef(
   self         IN ANYDATA,
   rf           OUT NOCOPY REF "<object_type>")
   RETURN       PLS_INTEGER;

MEMBER FUNCTION GetTimestamp(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampTZ(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLTZ(
   self         IN ANYDATA,
   ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
   self         IN ANYDATA,
   c            OUT NOCOPY VARCHAR)
   RETURN       PLS_INTEGER;
```

```
MEMBER FUNCTION GetVarchar2(
   self         IN ANYDATA,
   c            OUT NOCOPY VARCHAR2)
   RETURN       PLS_INTEGER;
```

Parameters

Table 237–4 GET* Function Parameter

Parameter	Description
self	An ANYDATA.
num	The number to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.

GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

```
MEMBER FUNCTION GETTYPE(
   self          IN ANYDATA,
   typ           OUT NOCOPY AnyType)
   RETURN        PLS_INTEGER;
```

Parameters

Table 237–5 GETTYPE Function Parameter

Parameter	Description
self	An ANYDATA.
typ	The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.

Return Values

The typecode corresponding to the type of the ANYDATA.

GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return *schema_name.type_name*, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME(
   self         IN ANYDATA)
   RETURN       VARCHAR2;
```

Parameters

Table 237–6 GETTYPENAME Function Parameter

Parameter	Description
self	An ANYDATA.

Return Values

Type name of the ANYDATA.

PIECEWISE Member Procedure

This procedure sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to SET* and GET* will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
   self         IN OUT NOCOPY ANYDATA);
```

Parameters

Table 237–7 PIECEWISE Procedure Parameters

Parameter	Description
self	The current data value.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS
- DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an OBJECT or COLLECTION type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

SET* Member Procedures

Sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
   self        IN OUT NOCOPY ANYDATA,
   dbl         IN BINARY_DOUBLE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
   self        IN OUT NOCOPY ANYDATA,
   b           IN BFILE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
   self        IN OUT NOCOPY ANYDATA,
   fl          IN            BINARY_FLOAT,
   last_elem   IN            boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
   self        IN OUT NOCOPY ANYDATA,
   b           IN BLOB,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
   self        IN OUT NOCOPY ANYDATA,
   c           IN CHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
   self        IN OUT NOCOPY ANYDATA,
   c           IN CLOB,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
   self        IN OUT NOCOPY ANYDATA,
   col         IN "<collectyion_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
   self        IN OUT NOCOPY ANYDATA,
   dat         IN DATE,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
   self        IN OUT NOCOPY ANYDATA,
   inv         IN INTERVAL DAY TO SECOND,
   last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
   self        IN OUT NOCOPY ANYDATA,
   inv         IN INTERVAL YEAR TO MONTH,
   last_elem   IN boolean DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETNCHAR(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NCHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NClob,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
   self        IN OUT NOCOPY ANYDATA,
   num         IN NUMBER,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
   self        IN OUT NOCOPY ANYDATA,
   nc          IN NVarchar2,
   last_elem   IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETOBJECT(
   self        IN OUT NOCOPY ANYDATA,
   obj         IN "<object_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
   self        IN OUT NOCOPY ANYDATA,
   r           IN RAW,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
   self        IN OUT NOCOPY ANYDATA,
   rf          IN REF "<object_type>",
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
   self       IN OUT NOCOPY ANYDATA,
   ts         IN TIMESTAMP,
   last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(self IN OUT NOCOPY ANYDATA,
   ts          IN TIMESTAMP WITH TIME ZONE,
   last_elem   IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
   self IN OUT NOCOPY ANYDATA,
   ts IN TIMESTAMP WITH LOCAL TIME ZONE,
   last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
   self        IN OUT NOCOPY ANYDATA,
   c           IN VARCHAR,
   last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
   self        IN OUT NOCOPY ANYDATA,
   c           IN VARCHAR2,
   last_elem   IN boolean DEFAULT FALSE);
```

Parameters

Table 237–8 SET Procedure Parameters*

Parameter	Description
self	An ANYDATA.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

Usage Notes

When BEGINCREATE is called, construction has already begun in a piece-wise fashion. Subsequent calls to SET* will set the successive attribute values.

If the ANYDATA is a standalone collection, the SET* call will set the successive collection elements.

238

ANYDATASET TYPE

An ANYDATASET TYPE contains a description of a given type plus a set of data instances of that type. An ANYDATASET can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

- Construction
- Summary of ANYDATASET TYPE Subprograms

Construction

The ANYDATASET needs to be constructed value by value, sequentially.

For each data instance (of the type of the ANYDATASET), the ADDINSTANCE function must be invoked. This adds a new data instance to the ANYDATASET. Subsequently, SET* can be called to set each value in its entirety.

The MODE of construction/access can be changed to attribute/collection element wise by making calls to PIECEWISE.

- If the type of the ANYDATASET is TYPECODE_OBJECT, individual attributes will be set with subsequent SET* calls. Likewise on access.
- If the type of the current data value is a collection type individual collection elements will be set with subsequent SET* calls. Likewise on access. This call is very similar to ANYDATA.PIECEWISE call defined for the type ANYDATA.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

ENDCREATE should be called to finish the construction process (before which no access calls can be made).

Summary of ANYDATASET TYPE Subprograms

Table 238–1 ANYDATASET Type Subprograms

Subprogram	Description
ADDINSTANCE Member Procedure on page 238-4	Adds a new data instance to an ANYDATASET.
BEGINCREATE Static Procedure on page 238-5	Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.
ENDCREATE Member Procedure on page 238-6	Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.
GET* Member Functions on page 238-7	Gets the current data value (which should be of appropriate type).
GETCOUNT Member Function on page 238-10	Gets the number of data instances in an ANYDATASET.
GETINSTANCE Member Function on page 238-11	Gets the next instance in an ANYDATASET.
GETTYPE Member Function on page 238-12	Gets the ANYTYPE describing the type of the data instances in an ANYDATASET. current data value (which should be of appropriate type).
GETTYPENAME Member Function on page 238-13	Gets the AnyType describing the type of the data instances in an ANYDATASET.
PIECEWISE Member Procedure on page 238-14	Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).
SET* Member Procedures on page 238-15	Sets the current data value.

ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

```
MEMBER PROCEDURE AddInstance(
   self          IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 238–2 ADDINSTANCE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

```
DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.
```

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.

BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Syntax

```
STATIC PROCEDURE BeginCreate(
   typecode     IN PLS_INTEGER,
   rtype        IN OUT NOCOPY AnyType,
   aset         OUT NOCOPY ANYDATASET);
```

Parameters

Table 238–3 BEGINCREATE Procedure Parameter

Parameter	Description
typecode	The typecode for the type of the ANYDATASET.
dtype	The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.
aset	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)

ENDCREATE Member Procedure

This procedure ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
   self              IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 238–4 ENDCREATE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE with which you are accessing it (depending on how we have invoked the PIECEWISE call). If PIECEWISE has not been called, we are accessing the instance in its entirety and the type of the data value should match the type of the ANYDATASET.

If PIECEWISE has been called, we are accessing the instance piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

```
MEMBER FUNCTION GETBDOUBLE(
   self        IN ANYDATASET,
   dbl         OUT NOCOPY BINARY_DOUBLE)
   RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
   self        IN ANYDATASET,
   fl          OUT NOCOPY BINARY_FLOAT)
   RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
   self        IN ANYDATASET,
   b           OUT NOCOPY BFILE)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
   self        IN ANYDATASET,
   b           OUT NOCOPY BLOB)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
   self        IN ANYDATASET,
   c           OUT NOCOPY CHAR)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
   self        IN ANYDATASET,
   c           OUT NOCOPY CLOB)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETCOLLECTION(
   self        IN ANYDATASET,
   col         OUT NOCOPY "<collection_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETDATE(
   self        IN ANYDATASET,
   dat         OUT NOCOPY DATE)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
   self        IN ANYDATASET,
   inv         IN OUT NOCOPY INTERVAL DAY TO SECOND)
 RETURN PLS_INTEGER;
```

```
MEMBER FUNCTION GETINTERVALYM(
   self        IN ANYDATASET,
   inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCHAR(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NCHAR)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCLOB(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NCLOB)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
   self        IN ANYDATASET,
   num         OUT NOCOPY NUMBER)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
   self        IN ANYDATASET,
   nc          OUT NOCOPY NVARCHAR2)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
   self        IN ANYDATASET,
   obj         OUT NOCOPY "<object_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETRAW(
   self        IN ANYDATASET,
   r           OUT NOCOPY RAW)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETREF(
   self        IN ANYDATASET,
   rf          OUT NOCOPY REF "<object_type>")
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP(
   self        IN ANYDATASET,
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPLTZ(
   self        IN ANYDATASET,
   ts          OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
 RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPTZ(
   self        IN ANYDATASET,
   ts          OUT NOCOPY TIMESTAMP WITH TIME ZONE)
 RETURN PLS_INTEGER,

MEMBER FUNCTION GETUROWID(
   self        IN ANYDATASET,
   rid         OUT NOCOPY UROWID)
 RETURN PLS_INTEGER
```

```
MEMBER FUNCTION GETVARCHAR(
   self        IN ANYDATASET,
   c           OUT NOCOPY VARCHAR)
   RETURN      PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2(
   self        IN ANYDATASET,
   c           OUT NOCOPY VARCHAR2)
   RETURN      PLS_INTEGER;
```

Parameters

Table 238–5 GET* Procedure Parameters

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information., that is to be obtained.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERs: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GetCount(
   self        IN ANYDATASET)
   RETURN      PLS_INTEGER;
```

Parameter

Table 238–6 GETCOUNT Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

The number of data instances.

GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed. After this function has been called, the GET* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

Syntax

```
MEMBER FUNCTION GETINSTANCE(
   self           IN OUT NOCOPY ANYDATASET)
   RETURN         PLS_INTEGER;
```

Parameters

Table 238–7 GETINSTANCE Function Parameter

Parameter	Description
self	The ANYDATASET being accessed.

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

DBMS_TYPES.NO_DATA signifies the end of the ANYDATASET (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.

GETTYPE Member Function

Gets the AnyType describing the type of the data instances in an ANYDATASET.

Syntax

```
MEMBER FUNCTION GETTYPE(
   self           IN ANYDATASET,
   typ            OUT NOCOPY AnyType)
   RETURN         PLS_INTEGER;
```

Parameters

Table 238–8 GETTYPE Function Parameter

Parameter	Description
self	The ANYDATASET.
typ	The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.

Return Values

The typecode corresponding to the type of the ANYDATA.

GETTYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return *schema_name.type_name*. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```
MEMBER FUNCTION GETTYPENAME(
   self           IN ANYDATASET)
   RETURN         VARCHAR2;
```

Parameter

Table 238–9 GETTYPENAME Function Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Return Values

Type name of the ANYDATASET.

PIECEWISE Member Procedure

This procedure sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of construction, access of the data value to be a collection element at a time (if the data value is of a collection TYPE). Once this call has been made, subsequent SET* and GET* calls will sequentially obtain individual attributes or collection elements.

Syntax

```
MEMBER PROCEDURE PIECEWISE(
   self         IN OUT NOCOPY ANYDATASET);
```

Parameters

Table 238–10 PIECEWISE Procedure Parameter

Parameter	Description
self	The ANYDATASET being constructed.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters.

DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an object or collectyon type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

SET* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the MODE with which we are constructing (depending on how we have invoked the PIECEWISE call). The type of the current data should be the type of the ANYDATASET if PIECEWISE has NOT been called. The type should be the type of the attribute at the current position if PIECEWISE has been called.

Syntax

```
MEMBER PROCEDURE SETBDOUBLE(
   self              IN OUT NOCOPY ANYDATASET,
   dbl               IN BINARY_DOUBLE,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
   self              IN OUT NOCOPY ANYDATASET,
   fl                IN BINARY_FLOAT,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
   self              IN OUT NOCOPY ANYDATASET,
   b                 IN BFILE,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
   self              IN OUT NOCOPY ANYDATASET,
   b                 IN BLOB,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN CHAR,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN CLOB,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
   self              IN OUT NOCOPY ANYDATASET,
   col               IN "<collection_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
   self              IN OUT NOCOPY ANYDATASET,
   dat               IN DATE,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
   self              IN OUT NOCOPY ANYDATASET,
   inv               IN INTERVAL DAY TO SECOND,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
   self              IN OUT NOCOPY ANYDATASET,
```

```
   inv               IN INTERVAL YEAR TO MONTH,
   last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   nc                IN NCHAR,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(

s
elf              IN OUT NOCOPY ANYDATASET,
  nc                IN NClob,
  last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
   self              IN OUT NOCOPY ANYDATASET,
   num               IN NUMBER,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
   self             IN OUT NOCOPY ANYDATASET,
   nc               IN NVarchar2,
   last_elem        IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
   self              IN OUT NOCOPY ANYDATASET,
   obj               IN "<object_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
   self              IN OUT NOCOPY ANYDATASET,
   r                 IN RAW,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
   self              IN OUT NOCOPY ANYDATASET,
   rf                IN REF "<object_type>",
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
   self              IN OUT NOCOPY ANYDATASET,
   ts                IN TIMESTAMP,
   last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
   self             IN OUT NOCOPY ANYDATASET,
   ts               IN TIMESTAMP WITH LOCAL TIME ZONE,
   last_elem        IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(
   self             IN OUT NOCOPY ANYDATASET,
   ts               IN TIMESTAMP WITH TIME ZONE,
   last_elem        IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
   self              IN OUT NOCOPY ANYDATASET,
   rid               IN UROWID,
   last_elem IN BOOLEAN DEFAULT FALSE);
```

```
MEMBER PROCEDURE SETVARCHAR(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN VARCHAR,
   last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
   self              IN OUT NOCOPY ANYDATASET,
   c                 IN VARCHAR2,
   last_elem BOOLEAN DEFAULT FALSE);
```

Parameters

Table 238–11 SET* Procedure Parameters

Parameter	Description
self	The ANYDATASET being accessed.
num	The number, and associated information, that is to be set.
last_elem	Relevant only if PIECEWISE has been already called (for a collection). Set to TRUE if it is the last element of the collection, FALSE otherwise.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

239

ANYTYPE TYPE

An `ANYTYPE TYPE` can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the `CREATE TYPE` statement. Only new transient types can be constructed using the `ANYTYPE` interfaces.

This chapter discusses the following:

- Summary of ANYTYPE Subprograms

Summary of ANYTYPE Subprograms

Table 239–1 ANYTYPE Type Subprograms

Subprogram	Description
BEGINCREATE Static Procedure on page 239-3	Creates a new instance of `ANYTYPE` which can be used to create a transient type description.
SETINFO Member Procedure on page 239-4	Sets any additional information required for constructing a `COLLECTION` or builtin type.
ADDATTR Member Procedure on page 239-6	Adds an attribute to an `ANYTYPE` (of typecode `DBMS_TYPES.TYPECODE_OBJECT`).
ENDCREATE Member Procedure on page 239-7	Ends creation of a transient `ANYTYPE`. Other creation functions cannot be called after this call.
GETPERSISTENT Static Function on page 239-8	Returns an `ANYTYPE` corresponding to a persistent type created earlier using the `CREATE TYPE` SQL statement.
GETINFO Member Function on page 239-9	Gets the type information for the `ANYTYPE`.
GETATTRELEMINFO Member Function on page 239-10	Gets the type information for an attribute of the type (if it is of `TYPECODE_OBJECT`). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```
STATIC PROCEDURE BEGINCREATE(
   typecode       IN          PLS_INTEGER,
   atype          OUT NOCOPY  ANYTYPE);
```

Parameters

Table 239–2 BEGINCREATE Procedure Parameters

Parameter	Description
typecode	Use a constant from DBMS_TYPES package. Typecodes for user-defined type: ■ DBMS_TYPES.TYPECODE_OBJECT ■ DBMS_TYPES.TYPECODE_VARRAY or ■ DBMS_TYPES.TYPECODE_TABLE Typecodes for builtin types: ■ DBMS_TYPES.TYPECODE_NUMBER, and similar types.
atype	ANYTYPE for a transient type

SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

```
MEMBER PROCEDURE SETINFO(
   self          IN OUT NOCOPY ANYTYPE,
   prec          IN PLS_INTEGER,
   scale         IN PLS_INTEGER,
   len           IN PLS_INTEGER,
   csid          IN PLS_INTEGER,
   csfrm         IN PLS_INTEGER,
   atype         IN ANYTYPE DEFAULT NULL,
   elem_tc       IN PLS_INTEGER DEFAULT NULL,
   elem_count    IN PLS_INTEGER DEFAULT 0);
```

Parameters

Table 239–3 SETINFO Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed.
prec	Optional.Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional.Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	Required if typecode represents types requiring character information such as CHAR, VARCHAR, VARCHAR2, or CFILE.
csfrm	Required if typecode represents types requiring character information such as CHAR, VARCHAR, VARCHAR2, or CFILE.
atype	Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others.. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.

The Following Parameters Are Required For Collection Types

Table 239–4 SETINFO Procedure Parameters - Collection Types

Parameter	Description
elem_tc	Must be of the collection element's typecode (from DBMS_TYPES package).
elem_count	Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if *self* represents a VARRAY.

Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)

- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

```
MEMBER PROCEDURE ADDATTR(
   self          IN OUT NOCOPY ANYTYPE,
   aname         IN VARCHAR2,
   typecode      IN PLS_INTEGER,
   prec          IN PLS_INTEGER,
   scale         IN PLS_INTEGER,
   len           IN PLS_INTEGER,
   csid          IN PLS_INTEGER,
   csfrm         IN PLS_INTEGER,
   attr_type     IN ANYTYPE DEFAULT NULL);
```

Parameters

Table 239–5 ADDATTR Procedure Parameters

Parameter	Description
self	The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.
aname	Optional. Attribute's name. Could be NULL.
typecode	Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).
prec	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
scale	Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.
len	Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.
csid	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, VARCHAR2, CFILE.
csfrm	Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, VARCHAR2, CFILE.
attr_type	Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

Syntax

```
MEMBER PROCEDURE ENDCREATE(
   self           IN OUT NOCOPY ANYTYPE);
```

Parameter

Table 239–6 ENDCREATE Procedure Parameter

Parameter	Description
self	The transient ANYTYPE that is being constructed.

GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

Syntax

```
STATIC FUNCTION GETPERSISTENT(
   schema_name      IN VARCHAR2,
   type_name        IN VARCHAR2,
   version          IN VARCHAR2 DEFAULT NULL)
   RETURN           ANYTYPE;
```

Parameters

Table 239–7 GETPERSISTENT Function Parameters

Parameter	Description
schema_name	Schema name of the type.
type_name	Type name.
version	Type version.

Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

```
MEMBER FUNCTION GETINFO (
   self        IN ANYTYPE,
   prec        OUT PLS_INTEGER,
   scale       OUT PLS_INTEGER,
   len         OUT PLS_INTEGER,
   csid        OUT PLS_INTEGER,
   csfrm       OUT PLS_INTEGER,
   schema_name OUT VARCHAR2,
   type_name   OUT VARCHAR2,
   version     OUT varchar2,
   count       OUT PLS_INTEGER)
   RETURN      PLS_INTEGER;
```

Parameters

Table 239–8 GETINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
prec	If typecode represents a number. Gives precision and scale. Ignored otherwise.
scale	If typecode represents a number. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE.
csid	If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE.
schema_name	Type's schema (if persistent).
type_name	Type's typename.
version	Type's version.
count	If *self* is a VARRAY, this gives the VARRAY count. If self is of TYPECODE_OBJECT, this gives the number of attributes.

Return Values

The typecode of *self*.

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the *self* parameter is of a collection type.

Syntax

```
MEMBER FUNCTION GETATTRELEMINFO (
   self           IN ANYTYPE,
   pos            IN PLS_INTEGER,
   prec           OUT PLS_INTEGER,
   scale          OUT PLS_INTEGER,
   len            OUT PLS_INTEGER,
   csid           OUT PLS_INTEGER,
   csfrm          OUT PLS_INTEGER,
   attr_elt_type  OUT ANYTYPE
   aname          OUT VARRCHAR2)
   RETURN         PLS_INTEGER;
```

Parameters

Table 239–9 GETATTRELEMINFO Function Parameters

Parameter	Description
self	The ANYTYPE.
pos	If self is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise.
prec	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
scale	If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.
len	If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.
csid, csfrm	If typecode represents a type requiring character information such as: CHAR, VARCHAR, VARCHAR2, CFILE. Gives character set ID, character set form.
attr_elt_type	If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the *attr_elt_type*.
aname	Attribute name (if it is an attribute of an object type, NULL otherwise).

Return Values

The typecode of the attribute or collection element.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).

240

Oracle Streams AQ TYPEs

This chapter describes the types used with Oracle Streams Advanced Queuing (AQ) packages for PL/SQL, `DBMS_AQ`, and `DBMS_AQADM`.

> **See Also:** *Oracle Streams Advanced Queuing User's Guide* for information about using Oracle Streams AQ.

This chapter contains the following topics:

- Summary of Types

Summary of Types

- AQ$_AGENT Type
- AQ$_AGENT_LIST_T Type
- AQ$_DESCRIPTOR Type
- AQ$_NTFN_DESCRIPTOR Type
- AQ$_POST_INFO Type
- AQ$_POST_INFO_LIST Type
- AQ$_PURGE_OPTIONS_T Type
- AQ$_RECIPIENT_LIST_T Type
- AQ$_REG_INFO Type
- AQ$_REG_INFO_LIST Type
- AQ$_SUBSCRIBER_LIST_T Type
- DEQUEUE_OPTIONS_T Type
- ENQUEUE_OPTIONS_T Type
- SYS.MSG_PROP_T Type
- MESSAGE_PROPERTIES_T Type
- MESSAGE_PROPERTIES_ARRAY_T Type
- MSGID_ARRAY_T Type

AQ$_AGENT Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_AGENT IS OBJECT (
   name       VARCHAR2(30),
   address    VARCHAR2(1024),
   protocol   NUMBER  DEFAULT 0);
```

Attributes

Table 240–1 AQ$_AGENT Attributes

Attribute	Description
`name`	Name of a producer or consumer of a message. The name must follow object name guidelines in the *Oracle Database SQL Language Reference* with regard to reserved characters.
`address`	Protocol-specific address of the recipient. If the protocol is `0`, then the address is of the form [*schema.*]*queue*[@*dblink*].
	For example, a queue named `emp_messages` in the `HR` queue at the site `dbs1.net` has the address: hr.emp_messages@dbs1.net
`protocol`	Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Streams AQ.

AQ$_AGENT_LIST_T Type

This type identifies the list of agents for which `DBMS_AQ.LISTEN` listens.

See Also: "AQ$_AGENT Type" on page 240-3

Syntax

```
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY INTEGER;
```

AQ$_DESCRIPTOR Type

This type specifies the Oracle Streams AQ descriptor received by the AQ PL/SQL callbacks upon notification.

See Also: "MESSAGE_PROPERTIES_T Type" on page 240-24

Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (
   queue_name      VARCHAR2(61),
   consumer_name   VARCHAR2(30),
   msg_id          RAW(16),
   msg_prop        MSG_PROP_T,
   gen_desc        AQ$_NTFN_DESCRIPTOR,
   msgid_array     SYS.AQ$_NTFN_MSGID_ARRAY,
   ntfnsRecdInGrp  NUMBER);
```

Attributes

Table 240–2 AQ$_DESCRIPTOR Attributes

Attribute	Description
queue_name	Name of the queue in which the message was enqueued which resulted in the notification
consumer_name	Name of the consumer for the multiconsumer queue
msg_id	Identification number of the message
msg_prop	Message properties specified by the MSG_PROP_T type
gen_desc	Indicates the timeout specifications
msgid_array	Group notification message ID list
ntfnsRecdInGrp	Notifications received in group

AQ$_NTFN_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(
   ntfn_flags   NUMBER)
```

Attributes

Table 240–3 AQ$_DESCRIPTOR Attributes

Attribute	Description
`ntfn_flags`	Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.

AQ$_NTFN_MSGID_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value 2^{30} which is the max varray size.

Syntax

```
TYPE SYS.AQ$_NTFN_MSGID_ARRAY
   AS VARRAY(1073741824)OF RAW(16);
```

AQ$_POST_INFO Type

Specifies anonymous subscriptions to which you want to post messages.

Syntax

```
TYPE SYS.AQ$_POST_INFO IS OBJECT (
   name        VARCHAR2(128),
   namespace   NUMBER,
   payload     RAW(2000)  DEFAULT NULL);
```

Attributes

Table 240–4 AQ$_POST_INFO Attributes

Attribute	Description
`name`	Name of the anonymous subscription to which you want to post
`namespace`	To receive notifications from other applications through `DBMS_AQ.POST` or `OCISubscriptionPost()`, the namespace must be `DBMS_AQ.NAMESPACE_ANONYMOUS`
`payload`	The payload to be posted to the anonymous subscription

AQ$_POST_INFO_LIST Type

Identifies the list of anonymous subscriptions to which you want to post messages.

See Also: AQ$_POST_INFO Type on page 240-8

Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

AQ$_PURGE_OPTIONS_T Type

This type specifies the options available for purging a queue table.

See Also: PURGE_QUEUE_TABLE Procedure on page 22-42.

Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is RECORD (
   block           BOOLEAN       DEFAULT FALSE
   delivery_mode   PLS_INTEGER   DEFAULT PERSISTENT);
```

Table 240–5 AQ$_PURGE_OPTIONS_T Type Attributes

Attribute	Description
`block`	`TRUE/FALSE`. ■ If `block` is `TRUE`, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if `block` is `TRUE`. ■ The default for `block` is `FALSE`. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.
`delivery_mode`	Kind of messages to purge, either `DBMS_AQ.BUFFERED` or `DBMS_AQ.PERSISTENT`

AQ$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeues.

See Also: "AQ$_AGENT Type" on page 240-3

Syntax

```
TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY_INTEGER;
```

AQ$_REG_INFO Type

This type identifies a producer or a consumer of a message.

Syntax

```
TYPE SYS.AQ$_REG_INFO IS OBJECT (
   name                              VARCHAR2(128),
   namespace                         NUMBER,
   callback                          VARCHAR2(4000),
   context                           RAW(2000)  DEFAULT NULL,
   qosflags                          NUMBER,
   timeout                           NUMBER
   ntfn_grouping_class               NUMBER,
   ntfn_grouping_value               NUMBER    DEFAULT 600,
   ntfn_grouping_type                NUMBER,
   ntfn_grouping_start_time          TIMESTAMP WITH TIME ZONE,
   ntfn_grouping_repeat_count   NUMBER);
```

Attributes

Table 240–6 AQ$_REG_INFO Type Attributes

Attribute	Description
`name`	Specifies the name of the subscription. The subscription name is of the form *`schema.queue`* if the registration is for a single consumer queue or *`schema.queue:consumer_name`* if the registration is for a multiconsumer queues.
`namespace`	Specifies the namespace of the subscription. To receive notification from Oracle Streams AQ queues, the namespace must be `DBMS_AQ.NAMESPACE_AQ`. To receive notifications from other applications through `DBMS_AQ.POST` or `OCISubscriptionPost()`, the namespace must be `DBMS_AQ.NAMESPACE_ANONYMOUS`.
`callback`	Specifies the action to be performed on message notification. For HTTP notifications, use `http://www.company.com:8080`. For e-mail notifications, use `mailto://xyz@company.com`. For raw message payload for the `PLSQLCALLBACK` procedure, use `plsql://`*`schema.procedure`*`?PR=0`. For user-defined type message payload converted to XML for the `PLSQLCALLBACK` procedure, use `plsql://`*`schema.procedure`*`?PR=1`
`context`	Specifies the context that is to be passed to the callback function
`qosflags`	Can be set to one or more of the following values to specify the notification quality of service: ■ `NTFN_QOS_RELIABLE`- This value specifies that reliable notification is required. Reliable notifications persist across instance and database restarts. ■ `NTFN_QOS_PAYLOAD` - This value specifies that payload delivery is required. It is supported only for client notification and only for `RAW` queues. ■ `NTFN_QOS_PURGE_ON_NTFN` - This value specifies that the registration is to be purged automatically when the first notification is delivered to this registration location.

Table 240–6 (Cont.) AQ$_REG_INFO Type Attributes

Attribute	Description
ntfn_grouping_class	Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If ntfn_grouping_class is 0, all other notification grouping attributes must be 0. ▪ NTFN_GROUPING_CLASS_TIME - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.
ntfn_grouping_value	Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until ntfn_grouping_repeat_count is exhausted.
ntfn_grouping_type	▪ NTFN_GROUPING_TYPE_SUMMARY - Summary of all notifications that occurred in the time interval. (Default) ▪ NTFN_GROUPING_TYPE_LAST - Last notification that occurred in the interval.
ntfn_grouping_start_time	Notification grouping start time. Notification grouping can start from a user-specified time that should a valid timestamp with time zone. If ntfn_grouping_start_time is not specified when using grouping, the default is to current timestamp with time zone
ntfn_grouping_repeat_count	Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntfn_grouping_repeat_count, if not specified, will default to ▪ NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.

Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

Table 240–7 shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. Table 240–8 shows the actions performed when XML presentation is specified.

Table 240–7 Actions Performed for Nonpersistent Queues When RAW Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
RAW	OCI callback receives the RAW data in the payload.	Not supported	PL/SQL callback receives the RAW data in the payload.
Oracle object type	Not supported	Not supported	Not supported

Table 240–8 Actions Performed for Nonpersistent Queues When XML Presentation Specified

Queue Payload Type	OCI Callback	E-mail	PL/SQL Callback
`RAW`	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.
`Oracle object type`	OCI callback receives the XML data in the payload.	XML data is formatted as a SOAP message and e-mailed to the registered e-mail address.	PL/SQL callback receives the XML data in the payload.

AQ$_REG_INFO_LIST Type

Identifies the list of registrations to a queue.

See Also: "AQ$_REG_INFO Type" on page 240-12

Syntax

```
TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;
```

AQ$_SUBSCRIBER_LIST_T Type

Identifies the list of subscribers that subscribe to a queue.

See Also: "AQ$_AGENT Type" on page 240-3

Syntax

```
TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT
   INDEX BY BINARY_INTEGER;
```

DEQUEUE_OPTIONS_T Type

Specifies the options available for the dequeue operation.

Syntax

```
TYPE DEQUEUE_OPTIONS_T IS RECORD (
   consumer_name     VARCHAR2(30)    DEFAULT NULL,
   dequeue_mode      BINARY_INTEGER  DEFAULT REMOVE,
   navigation        BINARY_INTEGER  DEFAULT NEXT_MESSAGE,
   visibility        BINARY_INTEGER  DEFAULT ON_COMMIT,
   wait              BINARY_INTEGER  DEFAULT FOREVER,
   msgid             RAW(16)         DEFAULT NULL,
   correlation       VARCHAR2(128)   DEFAULT NULL,
   deq_condition     VARCHAR2(4000)  DEFAULT NULL,
   signature         aq$_sig_prop    DEFAULT NULL,
   transformation    VARCHAR2(61)    DEFAULT NULL,
   delivery_mode     PLS_INTEGER     DEFAULT PERSISTENT);
```

Attributes

Table 240–9 DEQUEUE_OPTIONS_T Attributes

Attribute	Description
consumer_name	Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL. For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through dbms_aqadm.enable_db_access procedure call.
dequeue_mode	Specifies the locking behavior associated with the dequeue. Possible settings are: BROWSE: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement. LOCKED: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement. REMOVE: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties. REMOVE_NODATA: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties.

Table 240–9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
navigation	Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are: NEXT_MESSAGE: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default. NEXT_TRANSACTION: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue. FIRST_MESSAGE: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue. FIRST_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups. NEXT_MESSAGE_MULTI_GROUP: indicates that a call to DBMS_AQ.DEQUEUE_ARRAY will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the ARRAY_SIZE limit. Refer to the TRANSACTION_GROUP attribute for the message to distinguish between transaction groups.
visibility	Specifies whether the new message is dequeued as part of the current transaction.The visibility parameter is ignored when using the BROWSE dequeue mode. Possible settings are: ON_COMMIT: The dequeue will be part of the current transaction. This setting is the default. IMMEDIATE: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.
wait	Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are: FOREVER: Wait forever. This setting is the default. NO_WAIT: Do not wait. number: Wait time in seconds.
msgid	Specifies the message identifier of the message to be dequeued.
correlation	Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.

Table 240–9 (Cont.) DEQUEUE_OPTIONS_T Attributes

Attribute	Description
deq_condition	A conditional expression based on the message properties, the message data properties, and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Message properties include priority, corrid and other columns in the queue table To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The deq_condition parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.
signature	Currently not implemented
transformation	Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.
delivery_mode	The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be BUFFERED or PERSISTENT or PERSISTENT_OR_BUFFERED. The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.

ENQUEUE_OPTIONS_T Type

Specifies the options available for the enqueue operation.

Syntax

```
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
   visibility            BINARY_INTEGER  DEFAULT ON_COMMIT,
   relative_msgid        RAW(16)         DEFAULT NULL,
   sequence_deviation    BINARY_INTEGER  DEFAULT NULL,
   transformation        VARCHAR2(61)    DEFAULT NULL,
   delivery_mode         PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

Attributes

Table 240–10 ENQUEUE_OPTIONS_T Attributes

Attribute	Description
`visibility`	Specifies the transactional behavior of the enqueue request. Possible settings are: `ON_COMMIT`: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default. `IMMEDIATE`: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueuing to a non-persistent queue.
`relative_msgid`	Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if `BEFORE` is specified in `sequence_deviation`. This parameter is ignored if sequence deviation is not specified.
`sequence_deviation`	Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are: `BEFORE`: The message is enqueued ahead of the message specified by `relative_msgid`. `TOP`: The message is enqueued ahead of any other messages.
`transformation`	Specifies a transformation that will be applied before enqueuing the message. The return type of the transformation function must match the type of the queue.
`delivery_mode`	The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the dequeue options. It can be `BUFFERED` or `PERSISTENT`. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.

SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

Syntax

```
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
   priority         NUMBER,
   delay            NUMBER,
   expiration       NUMBER,
   correlation      VARCHAR2(128),
   attempts         NUMBER,
   exception_queue  VARCHAR2(51),
   enqueue_time     DATE,
   state            NUMBER,
   sender_id        aq$_agent,
   original_msgid   RAW(16),
   delivery_mode    NUMBER);
```

Parameters

Table 240–11 SYS.MSG_PROP_T Type Attributes

Parameter	Description
`priority`	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
`delay`	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by `msgid` overrides the delay specification. A message enqueued with delay set is in the `WAITING` state, and when the delay expires, the message goes to the `READY` state. `DELAY` processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: `NO_DELAY`: The message is available for immediate dequeuing number: The number of seconds to delay the message
`expiration`	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: `NEVER`: The message does not expire number: The number of seconds message remains in `READY` state. If the message is not dequeued before it expires, then it is moved to the exception queue in the `EXPIRED` state.
`correlation`	Returns the identifier supplied by the producer of the message at enqueue time.
`attempts`	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.

Table 240–11 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
exception_queue	Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases: ■ RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. ■ A message was not dequeued before the expiration time elapsed. ■ Message propagation to the specified destination queue failed with one of the following errors: * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.
enqueue_time	Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.
state	Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow: ■ DBMS_AQ.READY: The message is ready to be processed. ■ DBMS_AQ.WAITING: The message delay has not yet been reached. ■ DBMS_AQ.PROCESSED: The message has been processed and is retained. ■ DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 240–11 (Cont.) SYS.MSG_PROP_T Type Attributes

Parameter	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Streams AQ for propagating messages.
delivery_mode	DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.

MESSAGE_PROPERTIES_T Type

This type is defined inside the DBMS_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

See Also: AQ$_RECIPIENT_LIST_T Type on page 240-11

Syntax

```
TYPE message_properties_t IS RECORD (
   priority               BINARY_INTEGER  NOT NULL DEFAULT 1,
   delay                  BINARY_INTEGER  NOT NULL DEFAULT NO_DELAY,
   expiration             BINARY_INTEGER  NOT NULL DEFAULT NEVER,
   correlation            VARCHAR2(128)   DEFAULT NULL,
   attempts               BINARY_INTEGER,
   recipient_list         AQ$_RECIPIENT_LIST_T,
   exception_queue        VARCHAR2(61)    DEFAULT NULL,
   enqueue_time           DATE,
   state                  BINARY_INTEGER,
   sender_id              SYS.AQ$_AGENT   DEFAULT NULL,
   original_msgid         RAW(16)         DEFAULT NULL,
   signature              aq$_sig_prop    DEFAULT NULL,
   transaction_group      VARCHAR2(30)    DEFAULT NULL,
   user_property          SYS.ANYDATA     DEFAULT NULL
   delivery_mode          PLS_INTEGER     NOT NULL DEFAULT DBMS_AQ.PERSISTENT);
```

Attributes

Table 240–12 MESSAGE_PROPERTIES_T Attributes

Attribute	Description
priority	Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.
delay	Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. DELAY processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message

Table 240–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
`expiration`	Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: `NEVER`: The message does not expire number: The number of seconds message remains in `READY` state. If the message is not dequeued before it expires, then it is moved to the exception queue in the `EXPIRED` state.
`correlation`	Returns the identifier supplied by the producer of the message at enqueue time.
`attempts`	Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.
`recipient_list`	This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time. For type definition, see the "AQ$_AGENT Type" on page 240-3.

Table 240–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
exception_queue	Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases: ■ RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation. For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented. ■ A message was not dequeued before the expiration time elapsed. ■ Message propagation to the specified destination queue failed with one of the following errors: * There were no recipients for the multiconsumer destination queue. * Recipients were specified for a single-consumer destination queue. * Destination queue was an exception queue * There was an error when applying transformation. The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.
enqueue_time	Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.
state	Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow: ■ DBMS_AQ.READY: The message is ready to be processed. ■ DBMS_AQ.WAITING: The message delay has not yet been reached. ■ DBMS_AQ.PROCESSED: The message has been processed and is retained. ■ DBMSAQ.EXPIRED: The message has been moved to the exception queue.

Table 240–12 (Cont.) MESSAGE_PROPERTIES_T Attributes

Attribute	Description
sender_id	The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]
original_msgid	This parameter is used by Oracle Streams AQ for propagating messages.
signature	Currently not implemented
transaction_group	Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the DBMS_AQ.DEQUEUE_ARRAY. This attribute cannot be used to set the transaction group of a message through DBMS_AQ.ENQUEUE or DBMS_AQ.ENQUEUE_ARRAY calls.
user_property	This optional attribute is used to store additional information about the payload.
delivery_mode	The message publisher specifies the delivery mode in the message_properties. This can be DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT. Array enqueue is only supported for buffered messages with an array size of '1'.

MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message properties. Each element in the `payload_array` should have a corresponding element in the `MESSAGE_PROPERTIES_ARRAY_T VARRAY`.

See Also: "MESSAGE_PROPERTIES_T Type" on page 240-24

Syntax

```
TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647)
   OF MESSAGE_PROPERTIES_T;
```

MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

Syntax

```
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```

241

DBFS Content Interface Types

This chapter describes public types defined to support the DBMS_DBFS_CONTENT interface.

This chapter contains the following topics:

- Using Content Types
  - Overview
  - Security Model
- Data Structures

Using Content Types

- Overview
- Security Model

Overview

The type definitions described in this chapter support the DBMS_DBFS_CONTENT interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) by way of the `DBFS_ROLE`. This role can be granted to users as needed.

Data Structures

Types that support the DBMS_DBFS_CONTENT interface include both Object and Table types.

Object Types

- DBMS_DBFS_CONTENT_CONTEXT_T Object Type
- DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type
- DBMS_DBFS_CONTENT_PROPERTY_T Object Type

Table Types

- DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type
- DBMS_DBFS_CONTENT_PROPERTIES_T Table Type
- DBMS_DBFS_CONTENT_RAW_T Table Type

DBMS_DBFS_CONTENT_CONTEXT_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing `asof` queries, and whether or not the item(s) are `read_only`. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
    AUTHID DEFINER
AS OBJECT (
    principal     VARCHAR2(32),
    acl           VARCHAR2(1024),
    owner         VARCHAR2(32),
    asof          TIMESTAMP,
    read_only     INTEGER);
```

Fields

Table 241–1 DBMS_DBFS_CONTENT_CONTEXT_T Fields

Field	Description
`principal`	File system user
`acl`	Access control list
`owner`	Path item owner
`asof`	Timestamp
`read_only`	Nonzero if the path item is read-only

DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type

This type describes a type to assist in listing the contents of a directory.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
    AUTHID DEFINER
AS OBJECT (
    path          VARCHAR2(1024),
    item_name     VARCHAR2(256),
    item_type     INTEGER);
```

Fields

Table 241–2 DBMS_DBFS_CONTENT_LIST_ITEM_T Fields

Field	Description
`path`	Path to the path item
`item_name`	Name of the path item
`item_type`	Type of path item. (See DBMS_DBFS_CONTENT Constants - Path Name Types

DBMS_DBFS_CONTENT_PROPERTY_T Object Type

This type describes a single (`name`, `value`, `typecode`) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the `DBMS_DBFS_CONTENT` interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
    AUTHID DEFINER
AS OBJECT (
    propname     VARCHAR2(32),
    propvalue    VARCHAR2(1024),
    typecode     INTEGER);
```

Fields

Table 241–3 DBMS_DBFS_CONTENT_PROPERTY_T Fields

Field	Description
`prop_name`	Name of property
`prop_value`	Value of property
`typecode`	Property type (See Constants in DBMS_TYPES)

DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

This type is a variable-sized array of DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS
    TABLE OF dbms_dbfs_content_list_item_t;
```

DBMS_DBFS_CONTENT_PROPERTIES_T Table Type

This type is a variable-sized array of property tuples of DBMS_DBFS_CONTENT_PROPERTY_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS
    TABLE OF dbms_dbfs_content_property_t;
```

DBMS_DBFS_CONTENT_RAW_T Table Type

This type is an array of `RAW`. It is to enable `RAW` data transport for batch interfaces in the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS
    TABLE OF RAW(32767);
```

242

Database URI TYPEs

Oracle supports the `UriType` family of types that can be used to store and query Uri-refs inside the database. The `UriType` itself is an abstract object type and the `HTTPURITYPE`, `XDBURITYPE` and `DBURITYPE` are subtypes of it.

You can create a `UriType` column and store instances of the `DBURITYPE`, `XDBURITYPE` or the `HTTPURITYPE` inside of it. You can also define your own subtypes of the `UriType` to handle different URL protocols.

Oracle also provides a `UriFactory` package that can be used as a factory method to automatically generate various instances of these `UriTypes` by scanning the prefix, such as `http://` or `/oradb`. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix `gopher://` to be handled by your subtype. The `UriFactory` will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- Summary of URITYPE Supertype Subprograms
- Summary of HTTPURITYPE Subtype Subprograms
- Summary of DBURITYPE Subtype Subprogams
- Summary of XDBURITYPE Subtype Subprograms
- Summary of URIFACTORY Package Subprograms

See Also:

- *Oracle XML DB Developer's Guide*

Summary of URITYPE Supertype Subprograms

The `UriType` is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

Table 242–1 URITYPE Type Subprograms

Method	Description
GETBLOB on page 242-3	Returns the `BLOB` located at the address specified by the URL.
GETCLOB on page 242-4	Returns the `CLOB` located at the address specified by the URL.
GETCONTENTTYPE on page 242-5	Returns the URL, in escaped format, stored inside the `UriType` instance.
GETEXTERNALURL on page 242-6	Returns the URL, in escaped format, stored inside the `UriType` instance.
GETURL on page 242-7	Returns the URL, in non-escaped format, stored inside the `UriType` instance.
GETXML on page 242-8	Returns the `XMLType` located at the address specified by the URL.

GETBLOB

This function returns the BLOB located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getBlob() RETURN BLOB;	This function returns the BLOB located at the address specified by the URL.
MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL and the content type.
FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error

GETCLOB

This function returns the CLOB located at the address specified by the URL. This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getClob() RETURN clob;	This function returns the CLOB located at the address specified by the URL.
MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;	This function returns the CLOB located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `UriType` instance. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` function does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the `getExternalUrl` function or the `getUrl` function to get to the URL value instead of using the attribute present in the `UriType` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the `XMLType` located at the address specified by the URL. This function can be overridden in the subtype instances. The options are described in the following table.

Syntax	Description
`MEMBER FUNCTION getXML()` `RETURN XMLType;`	This function returns the `XMLType` located at the address specified by the URL.

`MEMBER FUNCTION getXML(`
`content OUT VARCHAR2)`
`RETURN XMLType;`
	This function returns the `XMLType` located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
`content`	`(OUT)`	Content type of the document to which URI is pointing.

Summary of HTTPURITYPE Subtype Subprograms

The HTTPURITYPE is a subtype of the UriType that provides support for the HTTP protocol. This uses the UTL_HTTP package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.

Table 242–2 HTTPURITYPE Type Subprorgams

Method	Description
CREATEURI on page 242-10	Creates an instance of HTTPURITYPE from the given URI.
GETBLOB on page 242-11	Returns the BLOB located at the address specified by the URL.
GETCLOB on page 242-12	Returns the CLOB located at the address specified by the URL.
GETCONTENTTYPE on page 242-13	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 242-14	Returns the URL, in escaped format, stored inside the UriType instance.
GETURL on page 242-7	Returns the URL, in non-escaped format, stored inside the UriType instance.
GETXML on page 242-16	Returns the XMLType located at the address specified by the URL
HTTPURITYPE on page 242-17	Creates an instance of HTTPURITYPE from the given URI.

CREATEURI

This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN HTTPURITYPE;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL; escaped format.

GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

Syntax	Description
MEMBER FUNCTION getBlob() RETURN blob;	This function returns the BLOB located at the address specified by the HTTP URL.
MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;	This function returns the BLOB located at the address specified by the HTTP URL and the content type.
FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

Syntax	Description
MEMBER FUNCTION getClob() RETURN clob;	Returns the CLOB located at the address specified by the HTTP URL.
MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;	Returns the CLOB located at the address specified by the HTTP URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

Returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `HTTPURITYPE` instance. The subtype instances override this member function. The `HTTPURITYPE` function does not store the prefix `http://`, but generates it for the external URL.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `HTTPURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the `XMLType` located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

Syntax	Description
`MEMBER FUNCTION getXML()` `RETURN XMLType;`	This function returns the `XMLType` located at the address specified by the URL.

`MEMBER FUNCTION getXML(`
`content OUT VARCHAR2)`
`RETURN XMLType;`
	This function returns the `XMLType` located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
`content`	`(OUT)`	Content type of the document to which URI is pointing.

HTTPURITYPE

This constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

```
CONSTRUCTOR FUNCTION HTTPURITYPE(
   url IN varchar2);
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

Summary of DBURITYPE Subtype Subprogams

The DBURITYPE is a subtype of the UriType that provides support for DBUri-refs. A DBUri-ref is an intra-database URL that can be used to reference any row or row-column data in the database. The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and view further contain the rows and columns inside them.

Table 242–3 DBURITYPE Type Subprograms

Method	Description
CREATEURI on page 242-19	Constructs a DBURITYPE instance.
DBURITYPE on page 242-20	Creates an instance of DBURITYPE from the given URI.
GETBLOB on page 242-21	Returns the BLOB located at the address specified by the DBURITYPE instance.
GETCLOB on page 242-22	Returns the CLOB located at the address specified by the DBURITYPE instance.
GETCONTENTTYPE on page 242-23	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 242-24	Returns the URL, in escaped format, stored inside the DBURITYPE instance.
GETURL on page 242-25	Returns the URL, in non-escaped format, stored inside the DBURITYPE instance.
GETXML on page 242-26	Returns the XMLType located at the address specified by the URL

CREATEURI

This static function constructs a DBURITYPE instance. Parses the URL given and creates a DBURITYPE instance.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN DBURITYPE;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid DBURITYPE.

DBURITYPE

This constructs a DBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION DBURITYPE(
   url IN varchar2);
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid DBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.

GETBLOB

This function returns the BLOB located at the address specified by the URL. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getBlob() RETURN blob;	This function returns the BLOB located at the address specified by the URL.
MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;	This function returns the BLOB located at the address specified by the URL and the content type.
FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located at the address specified by the DBURITYPE instance. If a temporary CLOB is returned, it must be freed. The document returned may be an XML document or a text document. When the DBUri-ref identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getClob() RETURN clob;	Returns the CLOB located at the address specified by the DBURITYPE instance.
MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;	Returns the CLOB located at the address specified by the DBURITYPE instance and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `DBURITYPE` instance. The `DBUri` servlet URL that processes the `DBURITYPE` has to be appended before using the escaped URL in Web pages.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getXML() RETURN XMLType;	This function returns the XMLType located at the address specified by the URL.
MEMBER FUNCTION getXML(content OUT VARCHAR2) RETURN XMLType;	This function returns the XMLType located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

Summary of XDBURITYPE Subtype Subprograms

XDBURITYPE is a new subtype of URIType. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URIType column in a table. The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

Table 242–4 XDBURITYPE Type Subprograms

Method	Description
CREATEURI on page 242-28	Returns the UriType corresponding to the specified URL.
GETBLOB on page 242-29	Returns the BLOB corresponding to the contents of the document specified by the XDBURITYPE instance.
GETCLOB on page 242-22	Returns the CLOB corresponding to the contents of the document specified by the XDBURITYPE instance.
GETCONTENTTYPE on page 242-31	Returns the content type of the document pointed to by the URI.
GETEXTERNALURL on page 242-24	Returns the URL, in escaped format, stored inside the XDBURITYPE instance.
GETURL on page 242-25	Returns the URL, in non-escaped format, stored inside the XDBURITYPE instance.
GETXML on page 242-34	Returns the XMLType corresponding to the contents of the document specified by the URL.
XDBURITYPE on page 242-35	Creates an instance of XDBURITYPE from the given URI.

CREATEURI

This static function constructs a XDBURITYPE instance. Parses the URL given and creates a XDBURITYPE instance.

Syntax

```
STATIC FUNCTION createUri(
   url IN varchar2)
RETURN XDBURITYPE
```

Parameter	IN / OUT	Description
url	(IN)	The URL string, in escaped format, containing a valid XDBURITYPE.

GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getBlob() RETURN blob;	This function returns the BLOB located at the address specified by the URL.
MEMBER FUNCTION getBlob(content OUT VARCHAR2) RETURN blob;	This function returns the BLOB located at the address specified by the URL and the content type.
FUNCTION getBlob(csid IN NUMBER) RETURN BLOB;	This function returns the BLOB located at the address specified by the URL in the specified character set.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.
csid	(IN)	Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.

GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getClob() RETURN clob;	Returns the CLOB located at the address specified by the XDBUirType instance.
MEMBER FUNCTION getClob(content OUT VARCHAR2) RETURN clob;	Returns the CLOB located at the address specified by the XDBUirType instance and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as `VARCHAR2`.

Syntax

```
MEMBER FUNCTION getContentType()
RETURN VARCHAR2;
```

GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getExternalUrl()
RETURN varchar2;
```

GETURL

This function returns the URL, in non-escaped format, stored inside the `XDBURITYPE` instance.

Syntax

```
MEMBER FUNCTION getUrl()
RETURN varchar2;
```

GETXML

This function returns the XMLType located at the address specified by the URL. The options are described in the following table.

Syntax	Description
MEMBER FUNCTION getXML() RETURN XMLType;	This function returns the XMLType located at the address specified by the URL.
MEMBER FUNCTION getXML(content OUT VARCHAR2) RETURN XMLType;	This function returns the XMLType located at the address specified by the URL and the content type.

Parameter	IN / OUT	Description
content	(OUT)	Content type of the document to which URI is pointing.

XDBURITYPE

This constructs a XDBURITYPE instance.

Syntax

```
CONSTRUCTOR FUNCTION XDBURITYPE(
   url     IN   VARCHAR2,
   flags   IN   RAW := NULL)
 RETURN self AS RESULT;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string containing a valid XDBUirType. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.
flags	(IN)	Possible values are: ■ 1 - Expand all XInclude elements before returning the result contents. If any XInclude element cannot be successfully resolved according to the XInclude fallback semantics, then an error is raised. ■ 2 - Indicates that any errors during document retrieval should be suppressed ■ 3 - Both flag bits (1, 2) are enabled

Summary of URIFACTORY Package Subprograms

The `UriFactory` package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The `UriFactory` package also provides the ability to register new subtypes of the `UriType` to handle various other protocols. For example, you can invent a new protocol `ecom://` and define a subtype of the `UriType` to handle that protocol and register it with `UriFactory`. After that any factory method would generate the new subtype instance if it sees the `ecom://` prefix.

Table 242–5 URIFACTORY Type Subprograms

Method	Description
GETURI on page 242-37	Returns the correct URL handler for the given URL string.
ESCAPEURI on page 242-38	Returns a URL in escaped format.
UNESCAPEURI on page 242-39	Returns a URL in unescaped format.
REGISTERURLHANDLER on page 242-40	Registers a particular type name for handling a particular URL.
UNREGISTERURLHANDLER on page 242-41	Unregisters a URL handler.

GETURI

This factory method returns the correct URI handler for the given URI string. It returns a subtype instance of the `UriType` that can handle the protocol. By default, it always creates an `XDBURITYPE` instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the REGISTERURLHANDLER function. If the prefix matches, GETURI would then use that subtype.

Syntax

```
FUNCTION getUri(
   url IN Varchar2)
RETURN UriType;
```

Parameter	IN / OUT	Description
`uri`	`(IN)`	The URL string, in escaped format, containing a valid HTTP URL.

ESCAPEURI

This function returns a URL in escaped format. The subtype instances override this member function to provide additional semantics. For instance, the `HTTPURITYPE` does not store the prefix `http://` in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the GETEXTERNALURL function or the GETURI function to get to the URL value instead of using the attribute present in the `UriType`.

Syntax

```
MEMBER FUNCTION escapeUri()
RETURN varchar2;
```

Parameter	IN / OUT	Description
`url`	`(IN)`	The URL string to be returned in escaped format.

UNESCAPEURI

This function returns a URL in unescaped format. This function is the reverse of the ESCAPEURI function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a VARCHAR2, the characters would be converted into the equivalent characters as defined by the database character set.

Syntax

```
FUNCTION unescapeUri()
RETURN varchar2;
```

Parameter	IN / OUT	Description
url	(IN)	The URL string to be returned in unescaped format.

REGISTERURLHANDLER

Registers a particular type name for handling a particular URL. The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUri` static member function. This function is called by the GETURI function to generate an instance of the type. The `stripprefix` parameter indicates that the prefix must be stripped off before calling this function.

Syntax

```
PROCEDURE registerUrlHandler(
   prefix IN varchar2,
   schemaName IN varchar2,
   typename IN varchar2,
   ignoreCase IN boolean := true,
   stripprefix IN boolean := true);
```

Parameter	IN / OUT	Description
`prefix`	`(IN)`	The prefix to handle; for example, `http://`.
`schemaName`	`(IN)`	Name of the schema where the type resides; case sensitive.
`typename`	`(IN)`	The name of the type to handle the URL; case sensitive.
`ignoreCase`	`(IN)`	Ignore case when matching prefixes.
`stripprefix`	`(IN)`	Strip prefix before generating the instance of the type.

UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as `http://`.

Syntax

```
PROCEDURE unregisterUrlHandler(
   prefix IN varchar2);
```

Parameter	IN / OUT	Description
`prefix`	`(IN)`	The prefix to be unregistered.

243

Expression Filter Types

The Expression Filter feature provides a set of predefined types and public synonyms for these types. Most of these types are used for configuring index parameters with the Expression Filter procedural APIs. The `EXF$TABLE_ALIAS` type is used to support expressions defined on one or more database tables.

> **See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- Summary of Expression Filter Types

Summary of Expression Filter Types

Table 243–1 describes the Expression Filter object types.

All the values and names passed to the types defined in this chapter are not case sensitive. To preserve the case, enclose the values with double quotation marks.

Table 243–1 Expression Filter Object Types

Object Type Name	Description
EXF$ATTRIBUTE	Specifies the stored and indexed attributes for the Expression Filter indexes
EXF$ATTRIBUTE_LIST	Specifies a list of stored and indexed attributes when configuring index parameters
EXF$INDEXOPER	Specifies a list of common operators in predicates with a stored or an indexed attribute
EXF$TABLE_ALIAS	Indicates a special form of elementary attribute used to manage expressions defined on one or more database tables
EXF$TEXT	Associates preferences to a text attribute in an attribute set or an event structure
EXF$XPATH_TAG	Configures an XML element or an XML attribute for indexing a set of XPath predicates
EXF$XPATH_TAGS	Specifies a list of XML tags when configuring the Expression Filter index parameters

EXF$ATTRIBUTE

The EXF$ATTRIBUTE type is used to handle stored and indexed attributes for the Expression Filter indexes.

Syntax

```
CREATE or REPLACE TYPE EXF$ATTRIBUTE AS OBJECT attr_name    VARCHAR2(350),
                                               attr_oper    EXF$INDEXOPER,
                                               attr_indexed VARCHAR2(5);
```

Attributes

Table 243–2 EXF$ATTRIBUTE Attributes

Attribute	Description
attr_name	The arithmetic expression that constitutes the stored or indexed attribute
attr_oper	The list of common operators in the predicates with the attribute. Default value: EXF$INDEXOPER('all')
attr_indexed	TRUE if the attribute is indexed, else FALSE. Default value: FALSE.

Usage Notes

- The EXF$ATTRIBUTE type is used to specify the stored and indexed attributes for an Expression Filter index using the DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS procedure. When values for attr_oper and attr_indexed fields are omitted during EXF$ATTRIBUTE instantiation, it is considered a stored attribute with a default value for common operators (EXF$INDEXOPER('all')).

Examples

A stored attribute with no preference on the list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)')
```

An indexed attribute is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
               attr_indexed => 'TRUE')
```

An indexed attribute with a list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
               attr_oper => exf$indexoper('=','<','>','>=','<='),
               attr_indexed => 'TRUE')
```

EXF$ATTRIBUTE_LIST

The EXF$ATTRIBUTE_LIST type specifies a list of stored and indexed attributes while configuring the index parameters.

Syntax

```
CREATE or REPLACE TYPE EXF$ATTRIBUTE_LIST as VARRAY(490) of exf$attribute;
```

Attributes

None.

Usage Notes

- Also see the DEFAULT_INDEX_PARAMETERS Procedure for more information

Examples

A list of stored and indexed attributes can be represented as follows:

```
exf$attribute_list (
       exf$attribute (attr_name => 'Model',
                      attr_oper => exf$indexoper('='),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'Price',
                      attr_oper => exf$indexoper('all'),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'HorsePower(Model, Year)',
                      attr_oper => exf$indexoper('=','<','>','>=','<='),
                      attr_indexed => 'FALSE')
    )
```

EXF$INDEXOPER

The EXF$INDEXOPER type specifies the list of common operators in predicates with a stored or an indexed attribute.

Syntax

```
CREATE or REPLACE TYPE EXFSYS.EXF$INDEXOPER as VARRAY(20) of VARCHAR2(15);
```

The values for the EXF$INDEXOPER array are expected to be from the list in the following table:

Value	Predicate Description
=	Equality predicates
>	Greater than predicates
<	Less than predicates
>=	Greater than or equal to predicates
<=	Less than or equal to predicates
!= or <> or ^=	Not equal to predicates
IS NULL	IS NULL predicates
IS NOT NULL	IS NOT NULL predicates
ALL	All the operators listed in this table starting with the equality predicate through the IS NOT NULL predicate
NVL	Predicates with NVL (equality) operator
LIKE	Predicates with LIKE operator
BETWEEN	BETWEEN predicates

Attributes

None.

Usage Notes

- A value of ALL for one of the EXF$INDEXOPER items implies that all the simple operators (=,>,<,>=,<=,!=, IS NULL, IS NOT NULL) are common in the predicates with an attribute. This value can be used along with one or more complex operators (NVL, LIKE and BETWEEN).
- A predicate with a BETWEEN operator is treated as two predicates with binary operators, one with '>=' operator and another with '<=' operator. By default, only one of these operators is indexed, and the other operator is evaluated by value substitution. However, if predicates with the BETWEEN operator are common for an attribute (stored or indexed), both the binary operators resulting from the BETWEEN operator can be indexed by specifying BETWEEN in the EXF$INDEXOPER VARRAY. However, because this uses additional space in the predicate table, this operator should be used only when majority of predicates with an attribute use the BETWEEN operator.
- When the LIKE operator is chosen as one of the common operators for an attribute, LIKE predicates on that attributes are indexed. Indexing a LIKE operator is beneficial only if the VARCHAR2 constant on the right-hand side of the

predicate does not lead with a wild-card character. For example, indexing a `LIKE` operator will filter the following predicates efficiently:

```
company LIKE 'General%'
company LIKE 'Proctor%'
```

But, the following predicates are evaluated as sparse predicates in the last stage:

```
company LIKE '%Electric'
company LIKE "%Gamble'
```

Examples

An attribute with a list of common operators is represented as follows:

```
exf$attribute (attr_name => 'HorsePower(Model, Year)',
               attr_oper => exf$indexoper('=','<','>','>=','<=', 'between'),
               attr_indexed => 'TRUE')
```

EXF$TABLE_ALIAS

A EXF$TABLE_ALIAS type is a special form of elementary attribute that can be included in the attribute set. These attributes manage expressions defined on one or more database tables.

Syntax

```
CREATE or REPLACE TYPE EXF$TABLE_ALIAS AS OBJECT table_name VARCHAR2(70);
```

Attributes

Table 243–3 EXF$TABLE_ALIAS Attribute

Attribute	Description
table_name	Name of the table with a possible schema extension

Usage Notes

- The concept of a table alias attribute is captured in the Expression Filter dictionary and the corresponding attribute in the attribute set's object type is created with a VARCHAR2 datatype. (Also see Oracle Database Rules Manager and Expression Filter Developer's Guide and ADD_ELEMENTARY_ATTRIBUTE Procedures.)

Examples

For a set of expressions defined on database tables, the corresponding table alias attributes are configured as follows:

```
BEGIN
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                                attr_set  => 'HRAttrSet',
                                attr_name => 'EMP',
                                tab_alias => exf$table_alias('SCOTT.EMP'));
  DBMS_EXPFIL.ADD_ELEMENTARY_ATTRIBUTE (
                                attr_set  => 'HRAttrSet',
                                attr_name => 'DEPT',
                                tab_alias => exf$table_alias('DEPT'));
END;
/
```

The Expression column using the previous attribute set can store expressions of form EMP.JOB = 'Clerk' and EMP.NAME = 'Joe', where JOB and NAME are the names of the columns in the SCOTT.EMP table.

EXF$TEXT

A EXF$TEXT type associates preferences to a text attribute in an attribute set or an event structure.

Syntax

```
CREATE or REPLACE TYPE EXFSYS.EXF$TEXT AS OBJECT(preferences VARCHAR2(1000));
```

Attributes

Table 243–4 EXF$TEXT Attribute

Attribute	Description
preferences	Text preference specification, such as LEXER, CLASSIFIER, and WORDLIST

Usage Notes

- The EXF$TEXT attribute is used to specify the preferences for a text attribute at the time of creation. The preferences specified through the instance of EXF$TEXT type are used in creation of the CTXRULE index for the text predicates. The syntax for the text preference specification is similar to the PARAMETERS clause specified for a CTXRULE Indextype. [See CREATE INDEX syntax for CTXRULE Indextype in *Oracle Text Reference*, Release 10g Release 2.]

Examples

A text predicate with a LEXER and WORDLIST preferences can be created using the following instance of EXF$TEXT object as follows:

```
EXF$TEXT ('LEXER insrpt_lexer WORDLIST insrpt_wordlist');
```

EXF$XPATH_TAG

The EXF$XPATH_TAG type configures an XML element or an XML attribute for indexing a set of XPath predicates.

Syntax

```
CREATE or REPLACE TYPE EXF$XPATH_TAG AS OBJECT tag_name    VARCHAR2(350),
                                               tag_indexed VARCHAR2(5),
                                               tag_type    VARCHAR2(30);
```

Attributes

Table 243–5 EXF$XPATH_TAG Attributes

Attribute	Description
tag_name	Name of the XML element or attribute. The name for an XML attribute is formatted as: <ElementName>@<AttributeName>. Optionally, the element name can be prefixed with its namespace URL as in <Namespace URL>:<ElementName>@<AttributeName>.
tag_indexed	TRUE if XML tag is indexed; otherwise FALSE. Default: TRUE if the tag is a positional filter. FALSE if the tag is a value filter.
tag_type	Datatype for the value in the case of value filter. NULL for positional filters.

Usage Notes

- EXF$XPATH_TAG type configures an XML element or an attribute as a positional or a value filter for an Expression Filter index (see the section on index tuning for XPath predicates in *Oracle Database Rules Manager and Expression Filter Developer's Guide*). An instance of the EXF$XPATH_TAG type with NULL value for tag_type configures the XML tag as a positional filter. In the current release, the only other possible values for the tag_type attribute are strings (CHAR or VARCHAR) and such tags are configured as value filters. By default, all positional filters are indexed and the value filters are not indexed. This behavior can be overridden by setting a TRUE or FALSE value for the tag_indexed attribute accordingly.

Examples

An XML element can be configured as a positional filter and be indexed using the following instance of the EXF$XPATH_TAG type.

```
exf$xpath_tag(tag_name    => 'stereo',       --- XML element
              tag_indexed => 'TRUE',         --- indexed predicate group
              tag_type    => null)           --- positional filter
```

An XML attribute can be configured as a value filter and be indexed using the following type instance.

```
exf$xpath_tag(tag_name    => 'stereo@make',  --- XML attribute
              tag_indexed => 'TRUE',         --- indexed predicate group
              tag_type    => 'VARCHAR(15)')  --- value filter
```

The following commands configure the two filters shown previously using the namespace URL for the corresponding elements.

```
exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo',
```

```
                tag_indexed => 'TRUE', --- indexed predicate group
                tag_type => null)      --- positional filter

exf$xpath_tag(tag_name => 'http://www.auto.com/car.xsd:stereo@make'
                tag_indexed => 'TRUE',     --- indexed predicate group
                tag_type => 'VARCHAR(15)') --- value filter
```

EXF$XPATH_TAGS

The EXF$XPATH_TAGS type specifies a list of XML tags while configuring the Expression Filter index parameters.

Syntax

```
CREATE or REPLACE TYPE EXF$XPATH_TAGS as VARRAY(490) of EXF$XPATH_TAG;
```

Attributes

None.

Usage Notes

- EXF$XPATH_TAGS type specifies a list of XML tags while configuring the Expression Filter index parameters. (See DEFAULT_INDEX_PARAMETERS Procedure.)

Examples

A list of XML tags configured as positional and value filters can be represented as follows:

```
exf$xpath_tags(
           exf$xpath_tag(tag_name    => 'stereo@make',  --- XML attribute
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(15)'), --- value filter
           exf$xpath_tag(tag_name    => 'stereo',       --- XML element
                         tag_indexed => 'FALSE',
                         tag_type    => null),          --- positional filter
           exf$xpath_tag(tag_name    => 'memory',       --- XML element
                         tag_indexed => 'TRUE',
                         tag_type    => 'VARCHAR(10)')  --- value filter
         )
```

244

JMS Types

PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues. The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueuing or to interpret a dequeued JMS message.

This chapter contains these topics:

- Using JMS Types
  - Overview
  - Java Versus PL/SQL Data Types
  - More on Bytes, Stream and Map Messages
  - Upcasting and Downcasting Between General and Specific Messages
  - JMS Types Error Reporting
  - Oracle JMS Type Constants
  - CONVERT_JMS_SELECTOR
- Summary of JMS Types

Using JMS Types

- Overview
- Java Versus PL/SQL Data Types
- More on Bytes, Stream and Map Messages
- Upcasting and Downcasting Between General and Specific Messages
- JMS Types Error Reporting
- Oracle JMS Type Constants
- JMS Types Error Reporting
- Oracle JMS Type Constants
- CONVERT_JMS_SELECTOR

Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Streams AQ offers such member functions for the following JMS ADTs:

- `aq$_jms_header`
- `aq$_jms_message`
- `aq$_jms_text_message`
- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

In addition to these populating and interpreting member functions, Oracle Streams AQ offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Streams AQ rules

Java Versus PL/SQL Data Types

Data types do not map one-to-one between PL/SQL and Java.

Some Java types, such as `BYTE` and `SHORT`, are not present in PL/SQL. PL/SQL type `INT` was chosen to represent these types. If a PL/SQL `INT` value intended to hold a Java `BYTE` or `SHORT` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving `TEXT` data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `BYTE ARRAY` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

> **See Also:** JMS specification 3.11.3, Conversion Provided by StreamMessage and MapMessage

New JMS Support in Oracle Database 10*g*

In Oracle Database 10*g*, a new `AQ$_JMS_VALUE` ADT has been added in the `SYS` schema for OJMS PL/SQL users. It is specifically used to implement the `read_object` procedure of `aq$_jms_stream_message` and `get_object` procedure of `aq$_jms_map_message`, to mimic the Java general object class `Object`. `AQ$_JMS_VALUE` ADT can represent any data type that JMS `StreamMessage` and `MapMessage` can hold.

The collection ADT `AQ$_JMS_NAMEARRAY` was added for the `getNames` method of `MapMessage`. It holds an array of names.

In this release the ADT `AQ$_JMS_EXCEPTION` was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of `AQ$_MAP_MESSAGE`, `AQ$_JMS_STREAM_MESSAGE`, and `AQ$_JMS_BYTES_MESSAGE` types. These types have some common functionalities that are different from `AQ$_JMS_TEXT_MESSAGE` type. This section discusses these common functionalities.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Streams AQ Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.

Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

Initialize the Jserv Static Variable

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

Note: It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

Get the Payload Data Back to PL/SQL

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

Garbage Collect the Static Variable

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

Use a Message Store: A Static Variable Collection

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.

Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages

1. Call `prepare` for a message.

   This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.

   For `aq$_jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- Map messages

  The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- Stream and bytes messages

  The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream. Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

  Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the Jserv static variable.

  The `prepare` procedure, on the other hand, overwrites the message payload in the Jserv static variable with the payload in the PL/SQL ADT.

  Oracle provides member function `get_mode` for users to query the mode.

Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using Java `ObjectOutputStream` and bytes messages are encoded using Java `DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support `utf-8` encoding.

Note: All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.

Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either `RAW` or `BLOB` in the database. In this release Oracle Streams AQ provides the following member functions to set and get these payloads as raw bytes without interpreting them:

```
set_bytes(payload IN BLOB)
set_bytes(payload IN RAW)
get_bytes(payload OUT BLOB)
get_bytes(payload OUT RAW)
```

These functions were provided for bytes messages in Oracle9*i* Release 2 (9.2).

Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Streams AQ queue. Oracle Streams AQ supports retrieving and populating of `aq$_jms_message` by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an `aq$_jms_message`, you must first downcast it to a specific message type according to its `message_type` field

To populate an `aq$_jms_message`, you must first populate a specific message and upcast it to `aq$_jms_message`. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

JMS Types Error Reporting

Table 244–1 lists Oracle JMS types related errors.

Table 244–1 Oracle JMS Types Errors

ORA error number	dbms_jms_plsql package constants	Explanation
ORA-24190	ERROR_DATA_OVERFLOW	The payload data exceeds the size that an out parameter can hold. For example, the get_text procedure with a VARCHAR2 parameter of aq$_jms_text_message or get_bytes procedure with a RAW parameter of aq$_jms_bytes_message.
ORA-24191	ERROR_PROP_NAME_EXIST	Setting a property that is previous set
ORA-24192	ERROR_PROP_NAME_NULL	Occurs when setting a property with null property name.
ORA-24193	ERROR_EXCEED_RANGE	PL/SQL number type exceeds the valid range of the respective Java type. For example set_byte_property, set_short_property of aq$_jms_head ADT; set_byte and set_short of aq$_jms_map_message ADT; write_byte and write_short of aq$_jms_stream_message and aq$_jms_bytes_message ADT.
ORA-24194	ERROR_TYPE_MISMATCH	The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.
ORA-24195	ERROR_MAP_TOO_LARGE	The size of the map exceeds the aq$_jms_namearray ADT capacity. The current size limit is 1024. You can use the get_names function with offset and length parameters to retrieve the name array in multiple small chunks.
ORA-24196	ERROR_WRONG_MODE	The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.
ORA-24197	ERROR_JAVA_EXCEPTION	ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the get_exception static procedure of aq$_jms_map_message, aq$_jms_bytes_message, and aq$_jms_stream_message to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT aq$_jms_exception is created to represent the exception information on the PL/SQL side.
ORA-24198	ERROR_INVALID_ID	An invalid operation ID is being provided to access a message.
ORA-24199	ERROR_STORE_OVERFLOW	The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the clean procedure after using one message. The clean procedure frees the message slot for use by other messages attempting access.

Oracle JMS Type Constants

This section lists some useful constants when dealing with message type functions.

DBMS_AQ Package Constants

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

```
JMS_TEXT_MESSAGE   CONSTANT BINARY_INTEGER;
JMS_BYTES_MESSAGE  CONSTANT BINARY_INTEGER;
JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
JMS_MAP_MESSAGE    CONSTANT BINARY_INTEGER;
JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;
```

SYS.DBMS_JMS_PLSQL Package Constants

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10*g*.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the get_mode function:

```
MESSAGE_ACCESS_READONLY  CONSTANT PLS_INTEGER;
MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;
```

These constants specify the ADT type of an Oracle Streams AQ queue. They are useful during the conversion of JMS selectors to Oracle Streams AQ rules:

```
DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;
```

These constants specify the type of data that can be held by a aq$_jms_value type. They are useful when interpreting the aq$_jms_value returned by the get_object method of AQ$_JMS_MAP_MESSAGE or read_object method of AQ$_JMS_STREAM_MESSAGE:

```
DATA_TYPE_BYTE           CONSTANT PLS_INTEGER;
DATA_TYPE_SHORT          CONSTANT PLS_INTEGER;
DATA_TYPE_INTEGER        CONSTANT PLS_INTEGER;
DATA_TYPE_LONG           CONSTANT PLS_INTEGER;
DATA_TYPE_FLOAT          CONSTANT PLS_INTEGER;
DATA_TYPE_DOUBLE         CONSTANT PLS_INTEGER;
DATA_TYPE_BOOLEAN        CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER      CONSTANT PLS_INTEGER;
DATA_TYPE_STRING         CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES          CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE  CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;
```

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

```
ERROR_DATA_OVERFLOW   CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL  CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE    CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH   CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE   CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE      CONSTANT PLS_INTEGER := -24196;
```

```
ERROR_JAVA_EXCEPTION  CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID      CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW  CONSTANT PLS_INTEGER := -24199;
```

CONVERT_JMS_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Streams AQ rules. These rules can be used in `ADD_SUBSCRIBER` operations as subscriber rules or in `DEQUEUE` operations as dequeue conditions. These procedures are in the `SYS.dbms_jms_plsql` package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is `dbms_jms_plsql.DESTPLOAD_JMSTYPE` and also assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2
```

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: `dest_pload_type`. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if this parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if `dest_pload_type` parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.

Syntax

```
Function convert_jms_selector(
   selector IN VARCHAR2,
   dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2
```

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a `dest_pload_type` parameter and a `compliant` parameter. The conversion of a JMS selector to an Oracle Streams AQ rule happens only if the `dest_pload_type` parameter is `SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE` or `SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA`. The function returns exactly the same `VARCHAR2` value as the selector parameter if the `dest_pload_type`

parameter is `SYS.dbms_jms_plsql.DESTPLOAD_USERADT`. The function returns null if the `dest_pload_type` parameter is none of these three constants.

The `compliant` parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

Syntax

```
Function convert_jms_selector(
   selector         IN  VARCHAR2,
   dest_pload_type  IN  PLS_INTEGER,
   compliant        IN  BOOLEAN )
```

Returns

The converted Oracle Streams AQ rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Summary of JMS Types

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
- SYS.AQ$_JMS_NAMESARRAY Type
- SYS.AQ$_JMS_VALUE Type
- SYS.AQ$_JMS_EXCEPTION Type

SYS.AQ$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- CONSTRUCT Static Functions
- Cast Methods
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE AQ$_JMS_MESSAGE AS OBJECT(

MEMBER PROCEDURE get_bytes    (payload  OUT BLOB));
```

CONSTRUCT Static Functions

There are six CONSTRUCT static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq$_jms_message
Creates an instance of aq$_jms_message, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created aq$_jms_message instance depends on the mtype parameter passed to the construct method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The mtype parameter must be one of the following constants described in "Oracle JMS Type Constants" on page 244-11:

```
DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE
```

STATIC FUNCTION construct (text_msg IN aq$_jms_text_message) RETURN aq$_jms_message
Creates an aq$_jms_message from an aq$_jms_text_message.

STATIC FUNCTION construct (bytes_msg IN aq$_jms_bytes_message) RETURN aq$_

jms_message;
Creates an aq$_jms_message from an aq$_jms_bytes_message.

STATIC FUNCTION construct (stream_msg IN aq$_jms_stream_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_stream_message.

STATIC FUNCTION construct (map_msg IN aq$_jms_map_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_map_message.

STATIC FUNCTION construct (object_msg IN aq$_jms_object_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_object_message.

Cast Methods

cast_to_bytes_msg RETURN aq$_jms_bytes_message
Casts an aq$_jms_message to an aq$_jms_bytes_message. Returns an aq$_jms_bytes_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE.

cast_to_map_msg RETURN aq$_jms_map_message
Casts an aq$_jms_message to an aq$_jms_map_message. Returns an aq$_jms_map_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.

cast_to_object_msg RETURN aq$_jms_object_message
Casts an aq$_jms_message to an aq$_jms_object_message. Returns an aq$_jms_object_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.

cast_to_stream_msg RETURN aq$_jms_stream_message
Casts an aq$_jms_message to an aq$_jms_stream_message. Returns an aq$_jms_stream_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.

cast_to_text_msg RETURN aq$_jms_text_message
Casts an aq$_jms_message to an aq$_jms_text_message. Returns an aq$_jms_text_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text and corresponds to `JMSType`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID`.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID`.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID`.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq`.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN VARCHAR
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value` in an internal representation (a `NUMBER` type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `byte` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because the `INT` datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If it is not null, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If it is not null, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB),
Sets the payload, a `CLOB` value, to an internal representation.

set_bytes (payload IN RAW)
Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload IN BLOB)
Sets the payload, a `BLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a `CLOB` variable payload.

get_bytes (payload OUT RAW)
Puts the internal representation of the payload into a `RAW` variable payload.

get_bytes (payload OUT BLOB)
Puts the internal representation of the payload into a `BLOB` variable payload.

SYS.AQ$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a `TextMessage` in an Oracle Streams AQ queue.

This section contains these topics:

MEMBER PROCEDURE set_text            (payload  IN  CLOB),
MEMBER PROCEDURE get_text            (payload  OUT VARCHAR2),
MEMBER PROCEDURE get_text            (payload  OUT CLOB));
```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_text_message
Creates an empty `aq$_jms_text_message`.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN INT
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR)
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a `VARCHAR2` value, to an internal representation.

set_text (payload IN CLOB)
Sets the payload, a `CLOB` value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a `VARCHAR2` variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a `CLOB` variable payload.

SYS.AQ$_JMS_BYTES_MESSAGE Type

This type is the ADT used to store a `BytesMessage` in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE AQ$_JMS_BYTES_MESSAGE AS OBJECT(
 header     aq$_jms_header,
 bytes_len  INT,
 bytes_raw  raw(2000),
 bytes_lob  blob,
 STATIC FUNCTION construct RETURN aq$_jms_bytes_message,
 MEMBER PROCEDURE set_replyto  (replyto IN sys.aq$_agent),

MEMBER PROCEDURE write_utf         (id IN PLS_INTEGER, value IN CLOB));
```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_bytes_message
Creates an empty `aq$_jms_bytes_message`.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload in RAW)
Sets the payload, a `RAW` value, to an internal representation.

set_bytes (payload in BLOB)
Sets the payload, a `BLOB` value, to an internal representation.

get_bytes (payload out RAW)
Puts the internal representation of the payload into a `RAW` variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of `RAW` in PL/SQL).

get_bytes (payload out BLOB)
Puts the internal representation of the payload into a `BLOB` variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_bytes_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to the `aq$_jms_bytes_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session

memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare procedures to set the message access mode to MESSAGE_ACCESS_READONLY. Write-only and read-only modes affect only the payload functions of AQ$_JMS_BYTES_MESSAGE. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)

Closes and cleans up the DataInputStream or DataOutputStream at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all

Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER

Returns the current mode of this message. The return value is either SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY or SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN

Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter id is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER

Reads a BYTE value from the bytes message and returns the BYTE value read. Null is returned if the end of the stream has been reached. Because there is no BYTE type in PL/SQL, Oracle Database uses PLS_INTEGER to represent a BYTE. Although PL/SQL users get a PLS_INTEGER, they are guaranteed that the value is in the Java BYTE value range. If this value is issued with a write_byte function, then there will not be an out of range error. Parameter id is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER

Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR
Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN INT
Reads an `INT` from the bytes message and returns the `INT` read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Although PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)
Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)
Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBounds exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBounds exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an `INT` to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

SYS.AQ$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a `MapMessage` in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE aq$_jms_map_message AS object(
 header     aq$_jms_header,
 bytes_len  int,
 bytes_raw  raw(2000),
 bytes_lob  blob,
 STATIC FUNCTION  construct   RETURN aq$_jms_map_message,
 MEMBER PROCEDURE set_replyto  (replyto IN sys.aq$_agent),
 MEMBER PROCEDURE set_type     (type    IN VARCHAR),
 MEMBER FUNCTION get_replyto  RETURN sys.aq$_agent,
 MEMBER FUNCTION get_type     RETURN VARCHAR,
 MEMBER PROCEDURE set_userid   (userid   IN VARCHAR),
 MEMBER PROCEDURE set_appid    (appid    IN VARCHAR),
 MEMBER PROCEDURE set_groupid  (groupid  IN VARCHAR),
 MEMBER PROCEDURE set_groupseq (groupseq IN INT),
 MEMBER FUNCTION get_userid   RETURN VARCHAR,
 MEMBER FUNCTION get_appid    RETURN VARCHAR,
 MEMBER FUNCTION get_groupid  RETURN VARCHAR,
 MEMBER FUNCTION get_groupseq RETURN INT,

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_map_message
Creates an empty `aq$_jms_map_message` object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)
Sets the internal payload as a RAW variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a RAW variable without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as a BLOB variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a BLOB variable without interpreting it.

get_bytes (payload OUT RAW)
Puts the internal payload into a `RAW` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a `BLOB` variable without any interpretation. The payload of `aq$_jms_map_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in `aq$_jms_map_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_map_message`. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)
Sets the Boolean value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the `BYTE` value with the specified name in the map. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW))
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN INT,

length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)
Sets the byte array value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN INT, length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset … offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)
Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)
Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)
This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)
Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, `PLS_INTEGER` is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN CLOB))
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the `BYTE` value with the specified name. If there is no item by this name, then null is returned. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a byte. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `set_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY BLOB)
Retrieves the byte array value with the specified name. If there is no item by this name, then null is returned. Because the size of the array might be larger than the limit of PL/SQL `RAW` type, a `BLOB` is always returned here. The `BLOB` returned is a copy, which means it can be modified without affecting the message payload. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR
Retrieves and returns the character value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE PRECISION
Retrieves and returns the double value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT
Retrieves the float value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the `INT` value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type

of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER
Retrieves the long value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the short value with the specified name. If there is no item by this name, then null is returned. Because there is no `short` type in PL/SQL, `INT` is used to represent a `short`. Although the PL/SQL users get an `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)
Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_names (id IN PLS_INTEGER) RETURN aq$_jms_namearray
Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

get_names (id IN PLS_INTEGER, names OUT aq$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.

The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval [offset, offset+length-1] and interval [0, size-1] where size is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message.

Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned.Users can use the `type` attribute of this ADT to interpret the data. See

the map in the AQ$_JMS_VALUE ADT for the correspondence among dbms_jms_plsql package constants, Java data type and AQ$_JMS_VALUE attribute. Note this member procedure might bring additional overhead compared to other get member procedures or functions. It is used only if the user does not know the data type of the fields within a message before hand. Otherwise it is a good idea to use a specific get member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Indicates that an item exists in this map message by returning TRUE. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

SYS.AQ$_JMS_STREAM_MESSAGE Type

This type is the ADT used to store a `StreamMessage` in an Oracle Streams AQ queue.

This section contains these topics:

- CONSTRUCT Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```
TYPE aq$_jms_stream_message AS object(
 header     aq$_jms_header,

```

CONSTRUCT Function

STATIC FUNCTION construct RETURN aq$_jms_stream_message
Creates an empty `aq$_jms_stream_message` object.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the `replyto` parameter, which corresponds to `JMSReplyTo` in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to `JMSType` in JMS.

get_replyto RETURN sys.aq$_agent
Returns `replyto`, which corresponds to `JMSReplyTo`.

get_type RETURN VARCHAR
Returns `type`, which corresponds to `JMSType`.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

set_appid (appid IN VARCHAR)
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

set_groupid (groupid IN VARCHAR)
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

set_groupseq (groupseq IN INT)
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

get_userid RETURN VARCHAR
Returns `userid`, which corresponds to `JMSXUserID`.

get_appid RETURN VARCHAR
Returns `appid`, which corresponds to `JMSXAppID`.

get_groupid RETURN VARCHAR
Returns `groupid`, which corresponds to `JMSXGroupID`.

get_groupseq RETURN NUMBER
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the `INT` datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. In PL/SQL and Oracle Database, the `NUMBER` datatype is 38 bits. In Java, the `long` datatype is 64 bits. Therefore, no range check is needed.Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `short` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a `BOOLEAN` property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `BYTE` property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a `DOUBLE` property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a `FLOAT` property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `Integer` property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a `long` property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a `short` property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a `STRING` property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function gets a payload as a `BLOB` variable without interpreting it.

set_bytes (payload IN RAW)
Sets the internal payload as the RAW variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as the `BLOB` variable without any interpretation. The payload of type `aq$_jms_stream_message` is stored as either `RAW` or `BLOB` in the database. This member function sets a payload as a `BLOB` variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in `aq$_jms_stream_message` and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER
Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or SYS.`dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN
Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_bytes (id IN PLS_INTEGER) RETURN BLOB
Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)
Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_char (id IN PLS_INTEGER) RETURN CHAR
Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION
Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_float (id IN PLS_INTEGER) RETURN FLOAT
Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_long (id IN PLS_INTEGER) RETURN NUMBER
Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER
Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `write_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type

is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_string RETURN CLOB
Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)
Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT `AQ$_JMS_VALUE`. Users can use the type attribute of this ADT to interpret the data. See Table 244–2 on page 244-57 for the correspondence among `dbms_jms_plsql` package constants, Java data type and `AQ$_JMS_VALUE` attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the data type of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function.

Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)
Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_byte (id IN PLS_INTEGER, value IN INT)
Writes a byte to the stream message. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter `offset` is the initial offset within the byte array, and parameter `length` is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java `IndexOutOfBounds` exception is thrown in the Java stored procedure. The index starts from 0.

Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an `INT` to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the stream message. Because there is no short type in PL/SQL, `INT` is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

SYS.AQ$_JMS_OBJECT_MESSAGE Type

This type is the ADT used to store an `ObjectMessage` in an Oracle Streams AQ queue.

Syntax

```
TYPE aq$_jms_object_message AS object(
  header     aq$_jms_header,
  bytes_len  int,
  bytes_raw  raw(2000),
  bytes_lob  blob);
```

SYS.AQ$_JMS_NAMESARRAY Type

This type represents the name array returned by the `get_names` procedure of `aq$_jms_map_message`. The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_NAMESARRAY AS VARRAY(1024) OF VARCHAR(100);
```

Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,
   offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

SYS.AQ$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`. The `type` field in this ADT is used to decide which type of data this object is really holding. Table 244–2 lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value` which effectively holds the data.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(
 type      number(2),
 num_val   number,
 char_val  char(1),
 text_val  clob,
 bytes_val blob);
```

Table 244–2 AQ$_JMS_VALUE Type Fields and Java Fields

Type	Java Type	aq$_jms_value Data Field
DBMS_JMS_PLSQL.DATA_TYPE_BYTE	byte	num_val
DBMS_JMS_PLSQL.DATA_TYPE_SHORT	short	num_val
DBMS_JMS_PLSQL.DATA_TYPE_INTEGER	int	num_val
DBMS_JMS_PLSQL.DATA_TYPE_LONG	long	num_val
DBMS_JMS_PLSQL.DATA_TYPE_FLOAT	float	num_val
DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE	double	num_val
DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN	boolean	num_val: 0 FALSE, 1 TRUE
DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER	char	char_val
DBMS_JMS_PLSQL.DATA_TYPE_STRING	java.lang.String	text_val
DBMS_JMS_PLSQL.DATA_TYPE_BYTES	byte[]	bytes_val

SYS.AQ$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side. The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.

Syntax

```
CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
   id          number, -- Reserved and not used. Right now always return 0.
   exp_name    varchar(200),
   err_msg     varchar(500),
   stack       varchar(4000));
```

245

Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types. In Oracle Streams, LCRs are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Oracle Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueuing, and dequeuing LCRs manually.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about LCRs

This chapter contains these topics:

- Summary of Logical Change Record Types
- Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

Summary of Logical Change Record Types

Table 245–1 Logical Change Record (LCR) Types

Type	Description
"LCR$_DDL_RECORD Type" on page 245-3	Represents a data definition language (DDL) change to a database object
"LCR$_ROW_RECORD Type" on page 245-11	Represents a data manipulation language (DML) change to a database object
"LCR$_ROW_LIST Type" on page 245-41	Identifies a list of column values for a row in a table
"LCR$_ROW_UNIT Type" on page 245-42	Identifies the value for a column in a row

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS_APPLY_ADM
- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM

LCR$_DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- LCR$_DDL_RECORD Constructor
- Summary of LCR$_DDL_RECORD Subprograms, which also include the subprograms described in "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" on page 245-32

Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

LCR$_DDL_RECORD Constructor

Creates a `SYS.LCR$_DDL_RECORD` object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
   source_database_name  IN  VARCHAR2,
   command_type          IN  VARCHAR2,
   object_owner          IN  VARCHAR2,
   object_name           IN  VARCHAR2,
   object_type           IN  VARCHAR2,
   ddl_text              IN  CLOB,
   logon_user            IN  VARCHAR2,
   current_schema        IN  VARCHAR2,
   base_table_owner      IN  VARCHAR2,
   base_table_name       IN  VARCHAR2,
   tag                   IN  RAW       DEFAULT NULL,
   transaction_id        IN  VARCHAR2  DEFAULT NULL,
   scn                   IN  NUMBER    DEFAULT NULL,
   edition_name          IN  VARCHAR2  DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;
```

LCR$_DDL_RECORD Constructor Function Parameters

Table 245–2 Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
source_database_name	The database where the DDL statement occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then the function specifies DBS1.NET automatically. Set this parameter to a non-NULL value.
command_type	The type of command executed in the DDL statement. Set this parameter to a non-NULL value. **See Also:** The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types The following command types *are not supported* in DDL LCRs: ALTER MATERIALIZED VIEW ALTER MATERIALIZED VIEW LOG ALTER SUMMARY CREATE SCHEMA CREATE MATERIALIZED VIEW CREATE MATERIALIZED VIEW LOG CREATE SUMMARY DROP MATERIALIZED VIEW DROP MATERIALIZED VIEW LOG DROP SUMMARY RENAME The snapshot equivalents of the materialized view command types are also not supported.
object_owner	The user who owns the object on which the DDL statement was executed
object_name	The database object on which the DDL statement was executed
object_type	The type of object on which the DDL statement was executed. The following are valid object types: CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW LINK represents a database link. NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.

Table 245–2 (Cont.) Constructor Function Parameters for LCR$_DDL_RECORD

Parameter	Description
ddl_text	The text of the DDL statement. Set this parameter to a non-NULL value.
logon_user	The user whose session executed the DDL statement
current_schema	The schema that is used if no schema is specified explicitly for the modified database objects in ddl_text. If a schema is specified in ddl_text that differs from the one specified for current_schema, then the function uses the schema specified in ddl_text. Set this parameter to a non-NULL value.
base_table_owner	If the DDL statement is a table related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_owner specifies the owner of the table involved. Otherwise, base_table_owner is NULL.
base_table_name	If the DDL statement is a table related DDL (such as CREATE TABLE and ALTER TABLE), or if the DDL statement involves a table (such as creating a trigger on a table), then base_table_name specifies the name of the table involved. Otherwise, base_table_name is NULL.
tag	A binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record for a captured LCR was written to the redo log. The SCN value is meaningless for a user-created LCR.
edition_name	The name of the edition in which the DDL statement was executed.

Summary of LCR$_DDL_RECORD Subprograms

Table 245–3 LCR$_DDL_RECORD Type Subprograms

Subprogram	Description
"EXECUTE Member Procedure" on page 245-6	Executes the LCR under the security domain of the current user
"GET_BASE_TABLE_NAME Member Function" on page 245-6	Gets the base (dependent) table name
"GET_BASE_TABLE_OWNER Member Function" on page 245-6	Gets the base (dependent) table owner
"GET_CURRENT_SCHEMA Member Function" on page 245-7	Gets the default schema (user) name
"GET_DDL_TEXT Member Procedure" on page 245-7	Gets the DDL text in a CLOB
"GET_EDITION_NAME Member Function" on page 245-7	Gets the name of the edition in which the DDL statement was executed
"GET_LOGON_USER Member Function" on page 245-8	Gets the logon user name

Table 245–3 (Cont.) LCR$_DDL_RECORD Type Subprograms

Subprogram	Description
"GET_OBJECT_TYPE Member Function" on page 245-8	Gets the type of the object involved for the DDL
"SET_BASE_TABLE_NAME Member Procedure" on page 245-8	Sets the base (dependent) table name
"SET_BASE_TABLE_OWNER Member Procedure" on page 245-8	Sets the base (dependent) table owner
"SET_CURRENT_SCHEMA Member Procedure" on page 245-8	Sets the default schema (user) name
"SET_DDL_TEXT Member Procedure" on page 245-9	Sets the DDL text
"SET_LOGON_USER Member Procedure" on page 245-9	Sets the logon user name
"SET_OBJECT_TYPE Member Procedure" on page 245-9	Sets the object type
Common Subprograms	See "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" on page 245-32 for a list of subprograms common to the `SYS.LCR$_ROW_RECORD` and `SYS.LCR$_DDL_RECORD` types

EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

> **Note:** The `EXECUTE` member procedure can be invoked only in an apply handler for an Oracle Streams apply process.

Syntax

```
MEMBER PROCEDURE EXECUTE();
```

GET_BASE_TABLE_NAME Member Function

Gets the base (dependent) table name.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;
```

GET_BASE_TABLE_OWNER Member Function

Gets the base (dependent) table owner.

Syntax

```
MEMBER FUNCTION GET_BASE_TABLE_OWNER()
RETURN VARCHAR2;
```

GET_CURRENT_SCHEMA Member Function

Gets the current schema name.

Syntax

```
MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;
```

GET_DDL_TEXT Member Procedure

Gets the DDL text in a CLOB.

The following is an example of a PL/SQL procedure that uses this procedure to get the DDL text in a DDL LCR:

```
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
  ddl_text   CLOB;
BEGIN
  DBMS_OUTPUT.PUT_LINE( '  ----------------------------------------' );
  DBMS_OUTPUT.PUT_LINE( '  Displaying DDL text in a DDL LCR: ' );
  DBMS_OUTPUT.PUT_LINE( '  ----------------------------------------' );
  DBMS_LOB.CREATETEMPORARY(ddl_text, true);
  ddl_lcr.GET_DDL_TEXT(ddl_text);
  DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
  DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/
```

Note: GET_DDL_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

Syntax

```
MEMBER FUNCTION GET_DDL_TEXT(
  ddl_text  IN/OUT  CLOB);
```

Parameter

Table 245–4 GET_DDL_TEXT Procedure Parameter

Parameter	Description
ddl_text	The DDL text in the DDL LCR

GET_EDITION_NAME Member Function

Gets the name of the edition in which the DDL statement was executed.

See Also: *Oracle Database Advanced Application Developer's Guide*

Syntax

```
MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;
```

GET_LOGON_USER Member Function

Gets the logon user name.

Syntax

```
MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;
```

GET_OBJECT_TYPE Member Function

Gets the type of the object involved for the DDL.

Syntax

```
MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;
```

SET_BASE_TABLE_NAME Member Procedure

Sets the base (dependent) table name.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_NAME(
   base_table_name  IN  VARCHAR2);
```

Parameter

Table 245–5 SET_BASE_TABLE_NAME Procedure Parameter

Parameter	Description
base_table_name	The name of the base table

SET_BASE_TABLE_OWNER Member Procedure

Sets the base (dependent) table owner.

Syntax

```
MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
   base_table_owner  IN  VARCHAR2);
```

Parameter

Table 245–6 SET_BASE_TABLE_OWNER Procedure Parameter

Parameter	Description
base_table_owner	The name of the base owner

SET_CURRENT_SCHEMA Member Procedure

Sets the default schema (user) name.

Syntax

```
MEMBER PROCEDURE SET_CURRENT_SCHEMA(
   current_schema  IN  VARCHAR2);
```

Parameter

Table 245–7 SET_CURRENT_SCHEMA Procedure Parameter

Parameter	Description
current_schema	The name of the schema to set as the current schema. Set this parameter to a non-NULL value.

SET_DDL_TEXT Member Procedure

Sets the DDL text.

Syntax

```
MEMBER PROCEDURE SET_DDL_TEXT(
   ddl_text  IN  CLOB);
```

Parameter

Table 245–8 SET_DDL_TEXT Procedure Parameter

Parameter	Description
ddl_text	The DDL text. Set this parameter to a non-NULL value.

SET_LOGON_USER Member Procedure

Sets the logon user name.

Syntax

```
MEMBER PROCEDURE SET_LOGON_USER(
   logon_user  IN  VARCHAR2);
```

Parameter

Table 245–9 SET_LOGON_USER Procedure Parameter

Parameter	Description
logon_user	The name of the schema to set as the logon user

SET_OBJECT_TYPE Member Procedure

Sets the object type.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_TYPE(
   object_type  IN  VARCHAR2);
```

Parameter

Table 245–10 SET_OBJECT_TYPE Procedure Parameter

Parameter	Description
object_type	The object type. The following are valid object types: CLUSTER FUNCTION INDEX LINK OUTLINE PACKAGE PACKAGE BODY PROCEDURE SEQUENCE SYNONYM TABLE TRIGGER TYPE USER VIEW LINK represents a database link. NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.

LCR$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the `LCR$_ROW_LIST` type.

If you create or modify a row logical change record (row LCR), then make sure the `command_type` attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This section contains information about the constructor for DDL LCRs and information about the member subprograms for this type:

- LCR$_ROW_RECORD Constructor
- Summary of LCR$_ROW_RECORD Subprograms, which also include the subprograms described in Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD on page 245-32

Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

See Also: "LCR$_ROW_LIST Type" on page 245-41

LCR$_ROW_RECORD Constructor

Creates a `SYS.LCR$_ROW_RECORD` object with the specified information.

```
STATIC FUNCTION CONSTRUCT(
   source_database_name  IN  VARCHAR2,
   command_type          IN  VARCHAR2,
   object_owner          IN  VARCHAR2,
   object_name           IN  VARCHAR2,
   tag                   IN  RAW                DEFAULT NULL,
   transaction_id        IN  VARCHAR2           DEFAULT NULL,
   scn                   IN  NUMBER             DEFAULT NULL,
   old_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
   new_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```

LCR$_ROW_RECORD Constructor Function Parameters

Table 245–11 Constructor Function Parameters for LCR$_ROW_RECORD

Parameter	Description
source_database_name	The database where the row change occurred. If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then the function specifies DBS1.NET automatically. Set this parameter to a non-NULL value.
command_type	The type of command executed in the DML statement. Set this parameter to a non-NULL value. Valid values are the following: INSERT UPDATE DELETE LOB ERASE LOB WRITE LOB TRIM If INSERT, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection. If UPDATE, then ensure that the LCR has a new_values collection that is not empty and an old_values collection that is not empty. If DELETE, then ensure that the LCR has a NULL or empty new_values collection and an old_values collection that is not empty. If LOB ERASE, LOB WRITE, or LOB TRIM, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.
object_owner	The user who owns the table on which the row change occurred. Set this parameter to a non-NULL value.
object_name	The table on which the DML statement was executed. Set this parameter to a non-NULL value.
tag	A binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used. **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags
transaction_id	The identifier of the transaction
scn	The SCN at the time when the change record was written to the redo log. The SCN value is meaningless for a user-created LCR.
old_values	The column values for the row before the DML change. If the DML statement is an UPDATE or a DELETE statement, then this parameter contains the values of columns in the row before the DML statement. If the DML statement is an INSERT statement, then there are no old values.

Table 245–11 (Cont.) Constructor Function Parameters for LCR$_ROW_RECORD

Parameter	Description
new_values	The column values for the row after the DML change. If the DML statement is an UPDATE or an INSERT statement, then this parameter contains the values of columns in the row after the DML statement. If the DML statement is a DELETE statement, then there are no new values. If the LCR reflects a LOB operation, then this parameter contains the supplementally logged columns and any relevant LOB information.

Summary of LCR$_ROW_RECORD Subprograms

Table 245–12 LCR$_ROW_RECORD Type Subprograms

Subprogram	Description
"ADD_COLUMN Member Procedure" on page 245-14	Adds the value as old or new, depending on the value type specified, for the column
"CONVERT_LONG_TO_LOB_CHUNK Member Procedure" on page 245-15	Converts LONG data in a row LCR into fixed width CLOB, or converts LONG RAW data in a row LCR into a BLOB
"DELETE_COLUMN Member Procedure" on page 245-16	Deletes the old value, the new value, or both, for the specified column, depending on the value type specified
"EXECUTE Member Procedure" on page 245-16	Executes the LCR under the security domain of the current user
"GET_LOB_INFORMATION Member Function" on page 245-17	Gets the LOB information for the column
"GET_LOB_OFFSET Member Function" on page 245-18	Gets the LOB offset for the specified column
"GET_LOB_OPERATION_SIZE Member Function" on page 245-19	Gets the operation size for the LOB column
"GET_LONG_INFORMATION Member Function" on page 245-19	Gets the LONG information for the column
"GET_ROW_TEXT Member Procedure" on page 245-20	Gets the SQL statement for the change that is encapsulated in the LCR
"GET_VALUE Member Function" on page 245-21	Gets the old or new value for the specified column, depending on the value type specified
"GET_VALUES Member Function" on page 245-21	Gets a list of old or new values, depending on the value type specified
"GET_WHERE_CLAUSE Member Procedure" on page 245-22	Gets a WHERE clause for the change that is encapsulated in the row LCR
"GET_XML_INFORMATION Member Function" on page 245-23	Gets the XML information for the specified column
"KEEP_COLUMNS Member Procedure" on page 245-24	Keeps a list of columns a row LCR
"RENAME_COLUMN Member Procedure" on page 245-24	Renames a column in an LCR
"SET_LOB_INFORMATION Member Procedure" on page 245-25	Sets LOB information for the column

Table 245–12 (Cont.) LCR$_ROW_RECORD Type Subprograms

Subprogram	Description
"SET_LOB_OFFSET Member Procedure" on page 245-26	Sets the LOB offset for the specified column
"SET_LOB_OPERATION_SIZE Member Procedure" on page 245-26	Sets the operation size for the LOB column
"SET_VALUE Member Procedure" on page 245-27	Overwrites the value of the specified column
"SET_VALUES Member Procedure" on page 245-29	Replaces the existing old or new values for the LCR, depending on the value type specified
"SET_XML_INFORMATION Member Procedure" on page 245-30	Sets the XML information for the column
Common Subprograms	See Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD on page 245-32 for a list of subprograms common to the `SYS.LCR$_ROW_RECORD` and `SYS.LCR$_DDL_RECORD` types

ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

Note: To set a column value that already exists, run `SET_VALUE`.

See Also: "SET_VALUE Member Procedure" on page 245-27

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lobs` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `10.2.0` or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

Syntax

```
MEMBER PROCEDURE ADD_COLUMN(
   value_type    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA);
```

Parameters

Table 245–13 ADD_COLUMN Procedure Parameters

Parameter	Description
`value_type`	The type of value to add for the column. Specify `old` to add the old value of the column. Specify `new` to add the new value of the column.
`column_name`	The column name. This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.
`column_value`	The value of the column. If `NULL`, then this procedure raises an error. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified. A `NULL` column value can be specified by encapsulating the `NULL` value in an `ANYDATA` wrapper.

CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts `LONG` data in a row LCR into a `CLOB`, or converts `LONG RAW` data in a row LCR into a `BLOB`.

This procedure can change the operation code from `LONG WRITE` to `LOB WRITE` for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- `LONG` data can be sent as a part of a row LCR with one of the following operation codes: `INSERT`, `UPDATE`, or `LONG_WRITE`. Because `LONG` data can be sent in multiple pieces, make sure that this method is invoked on either none or all `LONG` pieces.

- LOB to LONG conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

See Also: *Oracle Streams Replication Administrator's Guide*

Syntax

```
MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK();
```

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.

Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
   column_name  IN  VARCHAR2,
   value_type   IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 245–14 DELETE_COLUMN Procedure Parameters

Parameter	Description
column_name	The column name. An error is raised if the column does not exist in the LCR.
value_type	The type of value to delete for the column. Specify old to delete the old value of the column. Specify new to delete the new value of the column. If * is specified, then the procedure deletes both the old and new values.

EXECUTE Member Procedure

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR is in a queue and was last enqueued by an Oracle Streams apply process, an application, or a user.
- The LCR has been constructed using the LCR$_ROW_RECORD constructor function but has not been enqueued.
- The LCR is in the error queue.

Note: Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lobs` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with `VARCHAR2` and `RAW` data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with `assemble_lobs` set to `FALSE` attempts to execute a row LCR that contains a LOB locator.
- A DML or error handler configured with `assemble_lobs` set to `TRUE` attempts to execute a row LCR that contains one or more LOB values represented with `VARCHAR2` or `RAW` data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```
MEMBER PROCEDURE EXECUTE(
   conflict_resolution  IN  BOOLEAN);
```

Parameters

Table 245–15 EXECUTE Procedure Parameters

Parameter	Description
`conflict_resolution`	If `TRUE`, then any conflict resolution defined for the table using the `SET_UPDATE_CONFLICT_HANDLER` procedure in the `DBMS_APPLY_ADM` package is used to resolve conflicts resulting from the execution of the LCR. If `FALSE`, then conflict resolution is not used. An error is raised if this parameter is not specified or is set to `NULL`.

GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LOB        CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LOB         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LOB       CONSTANT NUMBER := 3;
DBMS_LCR.EMPTY_LOB        CONSTANT NUMBER := 4;
DBMS_LCR.LOB_CHUNK        CONSTANT NUMBER := 5;
DBMS_LCR.LAST_LOB_CHUNK   CONSTANT NUMBER := 6;
```

Returns `NULL` if the specified column does not exist.

If the command type of the row LCR is `UPDATE`, then specifying `'Y'` for the `use_old` parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LOB_INFORMATION(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2,
  use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 245–16 GET_LOB_INFORMATION Function Parameters

Parameter	Description
value_type	The type of value to return for the column, either old or new
column_name	The name of the column
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_LOB_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- The command type is LOB ERASE or LOB WRITE

Otherwise, returns NULL.

Syntax

```
GET_LOB_OFFSET(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 245–17 GET_LOB_OFFSET Procedure Parameters

Parameter	Description
value_type	The type of value to return for the column. Currently, only new can be specified.
column_name	The name of the LOB column

GET_LOB_OPERATION_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:

- The value exists for the column
- The column value is an out-of-line LOB
- The command type is LOB ERASE or LOB TRIM
- The information is DBMS_LCR.LAST_LOB_CHUNK

Otherwise, returns NULL.

Syntax

```
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2)
RETURN NUMBER,
```

Parameters

Table 245–18 GET_LOB_OPERATION_SIZE Function Parameters

Parameter	Description
value_type	The type of value to return for the column. Currently, only new can be specified.
column_name	The name of the LOB column

GET_LONG_INFORMATION Member Function

Gets the LONG information for the column.

The return value can be one of the following:

```
DBMS_LCR.NOT_A_LONG        CONSTANT NUMBER := 1;
DBMS_LCR.NULL_LONG         CONSTANT NUMBER := 2;
DBMS_LCR.INLINE_LONG       CONSTANT NUMBER := 3;
DBMS_LCR.LONG_CHUNK        CONSTANT NUMBER := 4;
DBMS_LCR.LAST_LONG_CHUNK   CONSTANT NUMBER := 5;
```

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```
MEMBER FUNCTION GET_LONG_INFORMATION(
  value_type   IN  VARCHAR2,
  column_name  IN  VARCHAR2,
  use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

Parameters

Table 245–19 GET_LONG_INFORMATION Function Parameters

Parameter	Description
value_type	The type of value to return for the column, either old or new
column_name	The name of the column
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_ROW_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method perform SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the SQL statement in a CLOB data type.

```
MEMBER PROCEDURE GET_ROW_TEXT(
   row_text  IN/OUT  CLOB);
```

The following procedure returns the SQL statement with bind variables in a CLOB data type.

```
MEMBER PROCEDURE GET_ROW_TEXT(
   row_text         OUT     CLOB,
   variable_list    IN/OUT  LCR$_ROW_LIST,
   bind_var_syntax  IN      VARCHAR2  DEFAULT ':');
```

See Also: "LCR$_ROW_LIST Type" on page 245-41

Parameters

Table 245–20 GET_ROW_TEXT Procedure Parameters

Parameter	Description
row_text	The SQL statement for the change that is encapsulated in the LCR.
variable_list	The values for the bind variables in the order of the bind variables.
bind_var_syntax	The syntax for the bind variables. One of the following values is valid: ▪ Specify :, the default, for bind values to be in the form :1, :2, and so on. ▪ Specify ? for bind values to be in the form ?.

GET_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of a column.

Syntax

```
MEMBER FUNCTION GET_VALUE(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2,
   use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN ANYDATA;
```

Parameters

Table 245–21 GET_VALUE Function Parameters

Parameter	Description
value_type	The type of value to return for the column. Specify old to get the old value for the column. Specify new to get the new value for the column.
column_name	The column name. If the column is present and has a NULL value, then the function returns an ANYDATA instance containing a NULL value. If the column value is absent, then the function returns a NULL.
use_old	If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function returns NULL if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the values of all columns.

Syntax

```
MEMBER FUNCTION GET_VALUES(
   value_type  IN  VARCHAR2,
   use_old     IN  VARCHAR2  DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;
```

Parameters

Table 245–22 GET_VALUES Function Parameters

Parameter	Description
value_type	The type of values to return. Specify old to return a list of old values. Specify new to return a list of new values.

Table 245–22 (Cont.) GET_VALUES Function Parameters

Parameter	Description
use_old	If Y and value_type is new, then the function returns a list of all new values in the LCR. If a new value does not exist in the list, then the function returns the corresponding old value. Therefore, the returned list contains all existing new values and old values for the new values that do not exist. If N and value_type is new, then the function returns a list of all new values in the LCR without returning any old values. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.

GET_WHERE_CLAUSE Member Procedure

Gets a WHERE clause for the change that is encapsulated in the row LCR.

Use the WHERE clause returned by GET_WHERE_CLAUSE instead of using the ROWID, because the ROWID is not ANSI compatible. The generated WHERE clause might not match the WHERE clause in the original DML operation.

The ROWID of an INSERT statement is the ROWID of the new row created by the INSERT. The WHERE clause generated for an INSERT operation identifies the new row. Hence, the generated WHERE clause includes all of the new values inserted.

For example, consider the following insert into the hr.departments table:

```
INSERT INTO hr.departments (
   department_id, department_name, manager_id, location_id)
   VALUES (10, 'HR', 20, 40);
```

The generated WHERE clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated WHERE clause is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND
      "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The ROWID of an UPDATE statement is the ROWID of the row that was updated. The WHERE clause generated for an UPDATE operation identifies the row after the UPDATE was executed. The generated WHERE clause is based on the old and new values of the UPDATE.

For example, consider the following update to the hr.departments table:

```
UPDATE hr.departments SET department_name='Management'
 WHERE department_name='Administration' AND location_id = 20 AND
       manager_id = 30 AND department_id = 10;
```

The values of the row after the UPDATE are 10, 'Management', 30, and 20. Hence, the generated WHERE clause to identify the row is the following:

```
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
      "MANAGER_ID" = 30 AND "LOCATION_ID" = 20
```

Notice that the new value is used for "DEPARTMENT_NAME", because the new value is the value of the column after the UPDATE. For the rest of the columns, the old values are used.

The ROWID of a DELETE operation is the row that existed before it was deleted. The generated WHERE clause consists of all the old column values present in the DELETE operation.

LOB columns do not appear in generated WHERE clauses. The generated WHERE clause is not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the WHERE clause of a SQL statement in a CLOB data type.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
   where_clause  IN/OUT  CLOB);
```

The following procedure returns the WHERE clause of a SQL statement with bind variables in a CLOB data type.

```
MEMBER PROCEDURE GET_WHERE_CLAUSE(
   where_clause     OUT     CLOB,
   variable_list    IN/OUT  LCR$_ROW_LIST,
   bind_var_syntax  IN      VARCHAR2  DEFAULT ':');
```

See Also:

- "LCR$_ROW_LIST Type" on page 245-41
- *Oracle Streams Concepts and Administration*

Parameters

Table 245–23 GET_WHERE_CLAUSE Procedure Parameters

Parameter	Description
where_clause	The WHERE clause of the SQL statement for the change that is encapsulated in the LCR.
variable_list	The values for the bind variables in the order of the bind variables.
bind_var_syntax	The syntax for the bind variables. One of the following values is valid: ■ Specify :, the default, for bind values to be in the form :1, :2, and so on. ■ Specify ? for bind values to be in the form ?.

GET_XML_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

```
DBMS_LCR.NOT_XML   CONSTANT NUMBER := 1;
DBMS_LCR.XML_DOC   CONSTANT NUMBER := 2;
DBMS_LCR.XML_DIFF  CONSTANT NUMBER := 3;
```

DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_

LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

Syntax

```
MEMBER FUNCTION GET_XML_INFORMATION(
   column_name  IN  VARCHAR2)
RETURN NUMBER,
```

Parameter

Table 245–24 GET_XML_INFORMATION Function Parameter

Parameter	Description
column_name	The column name

KEEP_COLUMNS Member Procedure

This procedure keeps a list of columns a row LCR. The procedure deletes columns that are not in the list from the row LCR.

Syntax

```
MEMBER PROCEDURE KEEP_COLUMNS(
   column_list  IN  VARCHAR2,
   value_type   IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 245–25 KEEP_COLUMNS Procedure Parameters

Parameter	Description
column_list	The names of the columns kept for the row LCR. Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR.
value_type	The type of value for which to keep the columns. Specify old to keep the old values of the columns. An error is raised if the old values do not exist in the LCR. Specify new to keep the new values of the columns. An error is raised if the new values do not exist in the LCR. If * is specified, then the procedure keeps both the old and the new columns.

RENAME_COLUMN Member Procedure

Renames a column in a row LCR.

Syntax

```
MEMBER PROCEDURE RENAME_COLUMN(
   from_column_name  IN  VARCHAR2,
   to_column_name    IN  VARCHAR2,
   value_type        IN  VARCHAR2  DEFAULT '*');
```

Parameters

Table 245–26 RENAME_COLUMN Procedure Parameters

Parameter	Description
from_column_name	The existing column name
to_column_name	The new column name. An error is raised if a column with the specified name already exists.
value_type	The type of value for which to rename the column. Specify old to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify new to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If * is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.

SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

Note: When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_INFORMATION(
  value_type       IN  VARCHAR2,
  column_name      IN  VARCHAR2,
  lob_information  IN  NUMBER);
```

Parameters

Table 245–27 SET_LOB_INFORMATION Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column, either old or new. Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.
column_name	The name of the column. An exception is raised if the column value does not exist. You might need to set this parameter for non-LOB columns.
lob_information	Specify one of the following values: DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1; DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2; DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3; DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4; DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5; DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

> **Note:** When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OFFSET(
   value_type   IN  VARCHAR2,
   column_name  IN  VARCHAR2,
   lob_offset   IN  NUMBER);
```

Parameters

Table 245–28 SET_LOB_OFFSET Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column. Currently, only new can be specified.
column_name	The column name. An error is raised if the column value does not exist in the LCR.
lob_offset	The LOB offset number. Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.

SET_LOB_OPERATION_SIZE Member Procedure

Sets the operation size for the LOB column in the number of characters for CLOB columns and bytes for BLOB columns.

> **Note:** When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
  value_type          IN  VARCHAR2,
  column_name         IN  VARCHAR2,
  lob_operation_size  IN  NUMBER);
```

Parameters

Table 245–29 SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
value_type	The type of value to set for the column. Currently, only new can be specified.
column_name	The name of the LOB column. An exception is raised if the column value does not exist in the LCR.

Table 245–29 (Cont.) SET_LOB_OPERATION_SIZE Procedure Parameters

Parameter	Description
lob_operation_size	If lob_information for the LOB is or will be DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. Otherwise, set to NULL.

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

Note: To add a column to a row LCR, run ADD_COLUMN.

See Also: "ADD_COLUMN Member Procedure" on page 245-14

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If assemble_lobs is set to FALSE for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the column_value parameter in the member procedure. The SET_VALUE member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `10.2.0` or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a `LONG` or `LONG RAW` column.

Considerations for XMLType Columns

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value an `XMLType` column, specify the `XMLType` for the `column_value` parameter. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` column is represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be `11.1.0` or higher to process row LCRs with `XMLType` columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

Syntax

```
MEMBER PROCEDURE SET_VALUE(
   value_type    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA);
```

Parameters

Table 245–30 SET_VALUE Procedure Parameters

Parameter	Description
`value_type`	The type of value to set. Specify `old` to set the old value of the column. Specify `new` to set the new value of the column.

Table 245–30 (Cont.) SET_VALUE Procedure Parameters

Parameter	Description
column_name	The column name. An error is raised if the specified column_value does not exist in the LCR for the specified column_type.
column_value	The new value of the column. If NULL is specified, then this procedure raises an error. To set the value to NULL, encapsulate the NULL in an ANYDATA instance. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns.

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), you can use this member procedure in the handler procedure on a row LCR that contains one or more LOB columns. If assemble_lobs is set to FALSE for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on LONG or LONG RAW columns.

Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType and LOB columns in the LCR are always assembled

using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value of one or more XMLType columns in a row LCR, specify an XMLType for each XMLType column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType columns are represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

Syntax

```
MEMBER PROCEDURE SET_VALUES(
   value_type  IN  VARCHAR2,
   value_list  IN  SYS.LCR$_ROW_LIST);
```

Parameters

Table 245–31 SET_VALUES Procedure Parameters

Parameter	Description
value_type	The type of values to replace. Specify old to replace the old values. Specify new to replace the new values.
value_list	List of values to replace the existing list. Use a NULL or an empty list to remove all values. If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify one or more LOB locators for LOB columns.

SET_XML_INFORMATION Member Procedure

Sets the XML information for the column.

Syntax

```
MEMBER PROCEDURE SET_XML_INFORMATION(
   column_name      IN  VARCHAR2,
   xml_information  IN  NUMBER);
```

Parameters

Table 245–32 SET_XML_INFORMATION Procedure Parameters

Parameter	Description
column_name	The name of the column. An exception is raised if the column value does not exist in the LCR.

xml_information	Specify one of the following values:
	`DBMS_LCR.NOT_XML CONSTANT NUMBER := 1;`
	`DBMS_LCR.XML_DOC CONSTANT NUMBER := 2;`
	`DBMS_LCR.XML_DIFF CONSTANT NUMBER := 3;`
	DBMS_LCR.NOT_XML indicates that the column is not an XMLType column. DBMS_LCR.XML_DOC indicates that the column contains an XML document. DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

The following functions and procedures are common to both the `LCR$_DDL_RECORD` and `LCR$_ROW_RECORD` type.

> **See Also:** For descriptions of the subprograms for these types that are exclusive to each type:
>
> - "Summary of LCR$_DDL_RECORD Subprograms" on page 245-5
> - "Summary of LCR$_ROW_RECORD Subprograms" on page 245-13

Table 245–33 Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
"GET_COMMAND_TYPE Member Function" on page 245-33	Gets the command type of the logical change record (LCR)
"GET_COMMIT_SCN Member Function" on page 245-33	Gets the commit system change number (SCN) of the transaction to which the current LCR belongs
"GET_COMMIT_TIME" on page 245-33	Gets the commit time of the transaction to which the current LCR belongs
"GET_COMPATIBLE Member Function" on page 245-34	Gets the minimal database compatibility required to support the LCR
"GET_EXTRA_ATTRIBUTE Member Function" on page 245-35	Gets the value for the specified extra attribute in the LCR
"GET_OBJECT_NAME Member Function" on page 245-36	Gets the name of the object that is changed by the LCR
"GET_OBJECT_OWNER Member Function" on page 245-36	Gets the owner of the object that is changed by the LCR
"GET_SCN Member Function" on page 245-36	Gets the system change number (SCN) of the LCR
"GET_SOURCE_DATABASE_NAME Member Function" on page 245-36	Gets the source database name.
"GET_SOURCE_TIME Member Function" on page 245-36	Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.
"GET_TAG Member Function" on page 245-36	Gets the tag for the LCR
"GET_THREAD_NUMBER Member Function" on page 245-37	Gets the thread number of the database instance that made the change that is encapsulated in the LCR
"GET_TRANSACTION_ID Member Function" on page 245-37	Gets the transaction identifier of the LCR
"IS_NULL_TAG Member Function" on page 245-37	Returns `Y` if the tag for the LCR is `NULL`, or returns `N` if the tag for the LCR is not `NULL`
"SET_COMMAND_TYPE Member Procedure" on page 245-37	Sets the command type in the LCR
"SET_EXTRA_ATTRIBUTE Member Procedure" on page 245-38	Sets the value for the specified extra attribute in the LCR

Table 245–33 (Cont.) Summary of Common Subprograms for DDL and Row LCR Types

Subprogram	Description
"SET_OBJECT_NAME Member Procedure" on page 245-39	Sets the name of the object that is changed by the LCR
"SET_OBJECT_OWNER Member Procedure" on page 245-39	Sets the owner of the object that is changed by the LCR
"SET_SOURCE_DATABASE_NAME Member Procedure" on page 245-39	Sets the source database name of the object that is changed by the LCR
"SET_TAG Member Procedure" on page 245-40	Sets the tag for the LCR

GET_COMMAND_TYPE Member Function

Gets the command type of the LCR.

> **See Also:** The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER FUNCTION GET_COMMAND_TYPE()
RETURN VARCHAR2;
```

GET_COMMIT_SCN Member Function

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns `NULL`.

Syntax

```
MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;
```

GET_COMMIT_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns `NULL`.

Syntax

```
MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;
```

GET_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

The return value for this function can be one of the following:

Return Value	COMPATIBLE Initialization Parameter Equivalent
DBMS_STREAMS.COMPATIBLE_9_2	9.2.0
DBMS_STREAMS.COMPATIBLE_10_1	10.1.0
DBMS_STREAMS.COMPATIBLE_10_2	10.2.0
DBMS_STREAMS.COMPATIBLE_11_1	11.1.0
DBMS_STREAMS.COMPATIBLE_11_2	11.2.0

DDL LCRs always return DBMS_STREAMS.COMPATIBLE_9_2.

You can use the following functions in the DBMS_STREAMS package for constant compatibility return values:

- The COMPATIBLE_9_2 function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.
- The COMPATIBLE_10_1 function returns DBMS_STREAMS.COMPATIBLE_10_1 constant.
- The COMPATIBLE_10_2 function returns DBMS_STREAMS.COMPATIBLE_10_2 constant.
- The COMPATIBLE_11_1 function returns DBMS_STREAMS.COMPATIBLE_11_1 constant.
- The COMPATIBLE_11_2 function returns DBMS_STREAMS.COMPATIBLE_11_2 constant.
- The MAX_COMPATIBLE function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the GET_COMPATIBLE member function for an LCR in rule conditions and apply handlers.

Note: You can determine which database objects in a database are not supported by Oracle Streams by querying the DBA_STREAMS_UNSUPPORTED data dictionary view.

See Also:

- *Oracle Streams Concepts and Administration* for examples of rules that discard changes that are not supported by Oracle Streams
- Chapter 140, "DBMS_STREAMS" and Chapter 141, "DBMS_STREAMS_ADM"
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

Syntax

```
MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
```

GET_EXTRA_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an ANYDATA instance. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

> **See Also:** "INCLUDE_EXTRA_ATTRIBUTE Procedure" on page 30-30

Syntax

```
MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
   attribute_name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 245–34 GET_EXTRA_ATTRIBUTE Function Parameter

Parameter	Description
attribute_name	The name of the extra attribute to return. Valid names are: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. An error is raised if the specified attribute_name is not valid. If no value exists for the specified extra attribute, then the function returns a NULL. **See Also:** *Oracle Database PL/SQL Language Reference* for more information about the current user

GET_OBJECT_NAME Member Function

Gets the name of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;
```

GET_OBJECT_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER FUNCTION GET_OBJECT_OWNER()
RETURN VARCHAR2;
```

GET_SCN Member Function

Gets the system change number (SCN) of the LCR.

Syntax

```
MEMBER FUNCTION GET_SCN()
RETURN NUMBER;
```

GET_SOURCE_DATABASE_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

Syntax

```
MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;
```

GET_SOURCE_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

```
MEMBER FUNCTION GET_SOURCE_TIME()
RETURN DATE;
```

GET_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER FUNCTION GET_TAG()
RETURN RAW;
```

GET_THREAD_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

> **See Also:** *Oracle Real Application Clusters Administration and Deployment Guide*

Syntax

```
MEMBER FUNCTION GET_THREAD_NUMBER()
RETURN NUMBER;
```

GET_TRANSACTION_ID Member Function

Gets the transaction identifier of the LCR.

Syntax

```
MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;
```

IS_NULL_TAG Member Function

Returns `Y` if the tag for the LCR is `NULL`, or returns `N` if the tag for the LCR is not `NULL`.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER FUNCTION IS_NULL_TAG()
RETURN VARCHAR2;
```

SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing `INSERT` to `GRANT` would raise an error.

> **See Also:**
>
> - The description of the `command_type` parameter in "LCR$_DDL_RECORD Constructor Function Parameters" on page 245-4
> - The description of the command_type parameter in "LCR$_ROW_RECORD Type" on page 245-11
> - The "SQL Command Codes" table in the *Oracle Call Interface Programmer's Guide* for a complete list of command types

Syntax

```
MEMBER PROCEDURE SET_COMMAND_TYPE(
   command_type  IN  VARCHAR2);
```

Parameter

Table 245–35 SET_COMMAND_TYPE Procedure Parameter

Parameter	Description
command_type	The command type. Set this parameter to a non-NULL value.

SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

> **See Also:** "INCLUDE_EXTRA_ATTRIBUTE Procedure" on page 30-30

Syntax

```
MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  ANYDATA);
```

Parameters

Table 245–36 SET_EXTRA_ATTRIBUTE Procedure Parameter

Parameter	Description
attribute_name	The name of the extra attribute to set. Valid names are: ■ row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2. ■ serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER. ■ session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER. ■ thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER. ■ tx_name The name of the transaction that includes the LCR. The type is VARCHAR2. ■ username The name of the current user who performed the change captured in the LCR. The type is VARCHAR2. An error is raised if the specified attribute_name is not valid. **See Also:** *Oracle Database PL/SQL Language Reference* for more information about the current user

Table 245–36 (Cont.) SET_EXTRA_ATTRIBUTE Procedure Parameter

Parameter	Description
attribute_value	The value to which the specified extra attribute is set. If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance.

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_NAME(
   object_name  IN  VARCHAR2);
```

Parameter

Table 245–37 SET_OBJECT_NAME Procedure Parameter

Parameter	Description
object_name	The name of the object

SET_OBJECT_OWNER Member Procedure

Sets the owner of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_OBJECT_OWNER(
   object_owner  IN  VARCHAR2);
```

Parameter

Table 245–38 SET_OBJECT_OWNER Procedure Parameter

Parameter	Description
object_owner	The schema that contains the object

SET_SOURCE_DATABASE_NAME Member Procedure

Sets the source database name of the object that is changed by the LCR.

Syntax

```
MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
   source_database_name  IN  VARCHAR2);
```

Parameter

Table 245–39 SET_SOURCE_DATABASE_NAME Procedure Parameter

Parameter	Description
source_database_name	The source database of the change. If you do not include the domain name, then the procedure appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is .NET, then the procedure specifies DBS1.NET automatically. Set this parameter to a non-NULL value.

SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
MEMBER PROCEDURE SET_TAG(
   tag  IN  RAW);
```

Parameter

Table 245–40 SET_TAG Procedure Parameter

Parameter	Description
tag	The binary tag for the LCR. The size limit for a tag value is two kilobytes.

LCR$_ROW_LIST Type

Identifies a list of column values for a row in a table.

This type uses the `LCR$_ROW_UNIT` type and is used in the `LCR$_ROW_RECORD` type.

See Also:

- "LCR$_ROW_UNIT Type" on page 245-42
- "LCR$_ROW_RECORD Type" on page 245-11

Syntax

```
CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/
```

LCR$_ROW_UNIT Type

Identifies the value for a column in a row.

This type is used in the LCR$_ROW_LIST type.

See Also: "LCR$_ROW_LIST Type" on page 245-41

Syntax

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT (
  column_name         VARCHAR2(4000),
  data                ANYDATA,
  lob_information     NUMBER,
  lob_offset          NUMBER,
  lob_operation_size  NUMBER
  long_information    NUMBER);
/
```

Attributes

Table 245–41 LCR$_ROW_UNIT Attributes

Attribute	Description
column_name	The name of the column
data	The data contained in the column
lob_information	Contains the LOB information for the column and contains one of the following values: DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1; DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2; DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3; DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4; DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5; DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;
lob_offset	The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns. Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.
lob_operation_size	If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.
long_information	Contains the LONG information for the column and contains one of the following values: DBMS_LCR.not_a_long CONSTANT NUMBER := 1; DBMS_LCR.null_long CONSTANT NUMBER := 2; DBMS_LCR.inline_long CONSTANT NUMBER := 3; DBMS_LCR.long_chunk CONSTANT NUMBER := 4; DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5;

246

Oracle Multimedia ORDAudio TYPE

The `Oracle Multimedia ORDAudio` object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. `Oracle Multimedia ORDAudio` can store and retrieve audio data of any data format. `Oracle Multimedia ORDAudio` can extract metadata from audio data of a variety of popular audio formats. `Oracle Multimedia ORDAudio` can also extract application attributes and store them in the `comments` attribute of the object in XML form.

- Documentation of ORDAudio

Documentation of ORDAudio

For a complete description of this type within the context of Oracle Multimedia, see `ORDAudio` in the *Oracle Multimedia Reference*.

247

Oracle Multimedia ORDDicom TYPE

The `Oracle Multimedia ORDDicom` object type supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other objects. These include objects such as single frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

`Oracle Multimedia ORDDicom` provides methods to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM objects. `Oracle Multimedia ORDDicom` also provides methods to check DICOM objects for conformance based on a set of user-specified conformance rules, and to make DICOM objects anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

- Documentation of ORDDicom

Documentation of ORDDicom

For a complete description of this type within the context of Oracle Multimedia, see `ORDDicom` in the *Oracle Multimedia DICOM Developer's Guide*.

248

Oracle Multimedia ORDDoc TYPE

The `Oracle Multimedia ORDDoc` object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. `Oracle Multimedia` can store and retrieve media data of any data format. `Oracle Multimedia ORDDoc` data type can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. However, you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

- Documentation of ORDDoc

Documentation of ORDDoc

For a complete description of this type within the context of Oracle Multimedia, see `ORDDoc` in the *Oracle Multimedia Reference*.

249

Oracle Multimedia ORDImage TYPE

The `Oracle Multimedia ORDImage` object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. `Oracle Multimedia ORDImage` can store and retrieve image data of any data format. `Oracle Multimedia ORDImage` can process (cut, scale, and generate thumbnails) of images, convert the format of images, extract properties of images of a variety of popular data formats, and extract and embed application metadata in images.

- Documentation of ORDImage

Documentation of ORDImage

For a complete description of this type within the context of Oracle Multimedia, see `ORDImage` in the *Oracle Multimedia Reference*.

250

Oracle Multimedia SQL/MM Still Image TYPES

Oracle Multimedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

The following object relational types for images and image characteristics are included in this support:

```
SI_StillImage
SI_AverageColor
SI_Color
SI_ColorHistogram
SI_FeatureList
SI_PositionalColor
SI_Texture
```

- Documentation of SQL/MM Still Image

Documentation of SQL/MM Still Image

For a complete description of this type within the context of Oracle Multimedia, see `SQL/MM Still Image` in the *Oracle Multimedia Reference*.

251

Oracle Multimedia ORDVideo TYPE

The `Oracle Multimedia ORDVideo` object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor's name, producer's name, and so on, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. `Oracle Multimedia ORDVideo` can store and retrieve video data of any data format. `Oracle Multimedia ORDVideo` can extract metadata from video data of a variety of popular video formats. `Oracle Multimedia ORDVideo` can also extract application attributes and store them in the `comments` attribute of the object in XML form.

- Documentation of ORDVideo

Documentation of ORDVideo

For a complete description of this type within the context of Oracle Multimedia, see `ORDVideo` in the *Oracle Multimedia Reference*.

252

MGD_ID Package Types

The MGD_ID Package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The MGD_ID Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification). The MGD_ID Package contains several predefined types.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for more information.

This chapter contains the following topics:

- Summary of Types
- Summary of MGD_ID Subprograms

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that the you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

Summary of Types

Table 252–1 describes the MGD_ID Package object types.

Table 252–1 MGD_ID Package Object Types

Object Type Name	Description
MGD_ID_COMPONENT Object Type	Datatype that specifies the name and value pair attributes that define a component
MGD_ID_COMPONENT_VARRAY Object Type	Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object
MGD_ID Object Type	Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components

MGD_ID_COMPONENT Object Type

The MGD_ID_COMPONENT type is a datatype that specifies the name and value pair attributes that define a component.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT as object (name  VARCHAR2(256),
                                                   value VARCHAR2(1024));
```

Attributes

Table 252–2 MGD_ID_COMPONENT Attributes

Attribute	Description
name	Name of component
value	Value of the component as a character

Usage Notes

None.

Examples

See the MGD_ID Constructor Function for an example.

MGD_ID_COMPONENT_VARRAY Object Type

The `MGD_ID_COMPONENT_VARRAY` type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_
COMPONENT;
```

Attributes

None.

Usage Notes

None.

Examples

See the MGD_ID Constructor Function for an example.

MGD_ID Object Type

The MGD_ID type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

Syntax

```
CREATE OR REPLACE TYPE MGD_ID as object (category_id  VARCHAR2(256),
                                         components   MGD_ID_COMPONENT_VARRAY);
```

Attributes

Table 252–3 MGD_ID Object Type Attributes

Attribute	Description
category_id	Category identifier for the code category of this code
components	List of components as name-value attributes

Methods

Table 252–5 describes the methods of the MGD_ID object type.

Table 252–4 MGD_ID Methods

Method	Description
MGD_ID constructor function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT function	Returns the string representation of the MGD_ID in the specified format
GET_COMPONENT function	Returns the string value of the specified MGD_ID component
TO_STRING function	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
TRANSLATE function	Returns the result of the conversion of the identifier from one format to the specified format

Usage Notes

None.

Examples

See the Summary of MGD_ID Subprograms section and the section about using the Identity Code package in *Oracle Database Advanced Application Developer's Guide* for examples.

Summary of MGD_ID Subprograms

Table 252–5 describes the subprograms in the MGD_ID object type.

All the values and names passed to the procedures defined in the MGD_ID object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 252–5 MGD_ID Object Type Subprograms

Subprogram	Description
MGD_ID Constructor Function	Creates an MGD_ID object based on the parameters passed in and returns self as a result
FORMAT Function	Returns the string representation of the MGD_ID object in the specified format
GET_COMPONENT Function	Returns the string value of the specified MGD_ID component
TO_STRING Function	Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object
TRANSLATE Function	Returns the result of the conversion of the identifier from one format to the specified format

MGD_ID Constructor Function

This constructor function constructs an identity code type object, MGD_ID. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs an MGD_ID object type based on the category ID and a list of components.

```
constructor function MGD_ID (
       category_id      IN VARCHAR2,
       components       IN MGD_ID_COMPONENT_VARRAY)
       RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```
constructor function MGD_ID (
       category_id        VARCHAR2,
       identifier         VARCHAR2,
       parameter_list      VARCHAR2)
       RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, and a list of components.

```
constructor function MGD_ID (
       category_name      VARCHAR2,
       category_version   VARCHAR2,
       components         MGD_ID_COMPONENT_VARRAY)
       RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```
constructor function MGD_ID (
       category_name      VARCHAR2,
       category_version   VARCHAR2,
       identifier         VARCHAR2,
       parameter_list      VARCHAR2)
       RETURN SELF AS RESULT DETERMINISTIC;
```

Parameters

Table 252–6 MGD_ID Constructor Function Parameters

Parameter	Description
category_id	Category identifier
components	List of component name value pairs
category_name	Category name, such as EPC
category_version	Category version. If NULL, the latest version for the specified category name will be used.

Table 252–6 (Cont.) MGD_ID Constructor Function Parameters

Parameter	Description
identifier	Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY. Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96

Usage Notes

- Use MGD_ID_UTL.EPC_ENCODING_CATEGORY_ID as category_id.
- If the category is not already registered, an error is raised.
- If the bit_length parameter is NULL, the bit_length is 8* the length of bit_encoding.
- If the component list does not contain all required components, an exception MGD_ID_UTL.e_LackComponent will be thrown.

Examples

The following examples construct identity code type objects.

Construct an MGD_ID object (SGTIN-64) passing in the category ID and a list of components.

```
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
              MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
              )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor11.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('itemref', '030241'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
```

```
.
.
.
```

Constructs an MGD_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
              'urn:epc:id:sgtin:0037000.030241.1041970',
              'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor22.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('companyprefixlength', '7'),
                                    MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

Construct an MGD_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.

```
--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
              MGD_ID_COMPONENT_VARRAY(
               MGD_ID_COMPONENT('companyprefix','0037000'),
               MGD_ID_COMPONENT('itemref','030241'),
               MGD_ID_COMPONENT('serial','1041970'),
               MGD_ID_COMPONENT('schemes','SGTIN-64')
              )
             ) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor33.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('itemref', '030241'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64')))
.
.
.
```

Constructs an MGD_ID object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor44.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
              'urn:epc:id:sgtin:0037000.030241.1041970',
              'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @constructor4.sql
.
.
.
MGD_ID('1', MGD_ID_COMPONENT_VARRAY(MGD_ID_COMPONENT('filter', '3'),
                                    MGD_ID_COMPONENT('schemes', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('companyprefixlength', '7'),
                                    MGD_ID_COMPONENT('companyprefix', '0037000'),
                                    MGD_ID_COMPONENT('scheme', 'SGTIN-64'),
                                    MGD_ID_COMPONENT('serial', '1041970'),
                                    MGD_ID_COMPONENT('itemref', '030241')))
.
.
.
```

FORMAT Function

This function returns the string representation of the MGD_ID object in the specified format.

Syntax

```
function FORMAT (parameter_list  IN VARCHAR2,
                 output_format   IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 252–7 FORMAT Function Parameters

Parameter	Description
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96
output_format	One of the supported output formats into which an MGD_ID component is formatted: ■ BINARY ■ LEGACY ■ TAG_ENCODING ■ PURE_IDENTITY ■ ONS_HOSTNAME

Usage Notes

None.

Examples

See the example for the GET_COMPONENT Function.

GET_COMPONENT Function

This function returns the value of the specified MGD_ID component.

Syntax

```
function GET_COMPONENT (
              component_name  IN  VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 252–8 GET_COMPONENT Function Parameter

Parameter	Description
component_name	Name of component

Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:

```
--Contents of get_components.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id  MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    ---------------
    --PURE_IDENTIT
    ---------------
    dbms_output.put_line('..Testing constructor with pure identity');
    ------------------------------------------------------------------------
    -- PURE_IDENTITY representation can be translated to BINARY and
    -- TAG_ENCODING ONLY when BOTH scheme and filer are provided.
    ------------------------------------------------------------------------
    id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970',
'scheme=SGTIN-64;filter=3');
    dbms_output.put_line(id.to_string);
    dbms_output.put_line('filter         = ' || id.get_component('filter'));
    dbms_output.put_line('company prefix = ' || id.get_component('companyprefix'));
    dbms_output.put_line('itemref        = ' || id.get_component('itemref'));
    dbms_output.put_line('serial         = ' || id.get_component('serial'));
    dbms_output.put_line('BINARY format  = ' || id.format(NULL, 'BINARY'));
    dbms_output.put_line('PURE_IDENTITY format  = ' || id.format(NULL, 'PURE_IDENTITY'));
    dbms_output.put_line('TAG_ENCODING format   = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
```

```

TO_STRING Function

This function returns the semicolon (;) separated component name value pairs of the MGD_ID object.

Syntax

```
function TO_STRING
  RETURN VARCHAR2;
```

Parameters

None.

Usage Notes

None.

Examples

The following example converts the MGD_ID object into a string value:

```
-- Contents of tostring3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('..Testing to_string');
   id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
      DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
      DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
connect / as sysdba;
drop user mgduser cascade;

PL/SQL procedure successfully completed.
.
.
```

TRANSLATE Function

This static function translates between different representations directly without first constructing an MGD_ID object. This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

```
function TRANSLATE (
              category_name    IN VARCHAR2,
              identifier       IN VARCHAR2,
              parameter_list   IN VARCHAR2,
              output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

```
function TRANSLATE (
              category_name    IN VARCHAR2,
              category_version IN VARCHAR2,
              identifier       IN VARCHAR2,
              parameter_list   IN VARCHAR2,
              output_format    IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 252–9 TRANSLATE Function Parameters

Parameter	Description
category_name	Name of category
category_version	Category version. If NULL, the latest version of the specified category name will be used.
identifier	EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.
parameter_list	List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96

Table 252–9 (Cont.) TRANSLATE Function Parameters

Parameter	Description
output_format	One of the supported output formats into which an MGD_ID component shall be converted: ■ BINARY ■ LEGACY ■ TAG_ENCODING ■ PURE_IDENTITY ■ ONS_HOSTNAME

Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the parameter_list parameter.

Examples

The following examples translates one GID-96 representation into another:

```
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
  dbms_output.put_line(

Rule TYPEs

This chapter describes the types used with rules, rule sets, and evaluation contexts.

See Also:

- Chapter 123, "DBMS_RULE"
- Chapter 124, "DBMS_RULE_ADM"

This chapter contains the following topic:

- Summary of Rule Types

Summary of Rule Types

Table 253–1 Rule Types

Type	Description
"RE$ATTRIBUTE_VALUE Type" on page 253-4	Specifies the value of a variable attribute
"RE$ATTRIBUTE_VALUE_LIST Type" on page 253-5	Identifies a list of attribute values
"RE$COLUMN_VALUE Type" on page 253-6	Specifies the value of a table column
"RE$COLUMN_VALUE_LIST Type" on page 253-7	Identifies a list of column values
"RE$NAME_ARRAY Type" on page 253-8	Identifies a list of names
"RE$NAME_ARRAY Type" on page 253-8	Identifies a list of name-value pairs
"RE$NV_LIST Type" on page 253-10	Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule
"RE$NV_NODE Type" on page 253-12	Identifies a name-value pair
"RE$RULE_HIT Type" on page 253-13	Specifies a rule found as a result of evaluation
"RE$RULE_HIT_LIST Type" on page 253-14	Identifies a list of rules found as a result of evaluation
"RE$TABLE_ALIAS Type" on page 253-15	Provides the table corresponding to an alias used in a rule evaluation context
"RE$TABLE_ALIAS_LIST Type" on page 253-16	Identifies a list of table aliases used in a rule evaluation context
"RE$TABLE_VALUE Type" on page 253-17	Specifies the value of a table row using a `ROWID`
"RE$TABLE_VALUE_LIST Type" on page 253-18	Identifies a list of table values
"RE$VARIABLE_TYPE Type" on page 253-19	Provides the type of a variable used in a rule evaluation context
"RE$VARIABLE_TYPE_LIST Type" on page 253-21	Identifies a list of variables and their types used in a rule evaluation context
"RE$VARIABLE_VALUE Type" on page 253-22	Specifies the value of a variable
"RE$VARIABLE_VALUE_LIST Type" on page 253-23	Identifies a list of variable values

Rule types are used with the following Oracle-supplied PL/SQL packages:

- `DBMS_RULE`
- `DBMS_RULE_ADM`

You can use the DBMS_RULE_ADM package to create and administer rules, rule sets, and evaluation contexts, and you can use the DBMS_RULE package to evaluate rules.

When you use Oracle Streams, rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Oracle Streams packages use rules:

- DBMS_APPLY_ADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_STREAMS_AUTH

See Also: *Oracle Streams Concepts and Administration*

RE$ATTRIBUTE_VALUE Type

Specifies the value of a variable attribute.

> **Note:** Enclose the variable name and attribute name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE (
   variable_name    VARCHAR2(32),
   attribute_name   VARCHAR2(4000),
   attribute_value  ANYDATA);
```

Attributes

Table 253–2 RE$ATTRIBUTE_VALUE Attributes

Attribute	Description
`variable_name`	Specifies the variable used in a rule
`attribute_name`	Specifies the attribute name. The attribute name can be a multi-component name, such as `a1.b2.c3`.
`attribute_value`	Specifies the attribute value

RE$ATTRIBUTE_VALUE_LIST Type

Identifies a list of attribute values.

Syntax

```
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```

RE$COLUMN_VALUE Type

Specifies the value of a table column.

> **Note:** Enclose the column name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE (
   table_alias   VARCHAR2(32),
   column_name   VARCHAR2(4000),
   column_value  ANYDATA);
```

Attributes

Table 253–3 RE$COLUMN_VALUE Attributes

Attribute	Description
`table_alias`	Specifies the alias used for the table in a rule
`column_name`	Specifies the column name
`column_value`	Specifies the column value

RE$COLUMN_VALUE_LIST Type

Identifies a list of column values.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

RE$NAME_ARRAY Type

Identifies a list of names.

Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

RE$NV_ARRAY Type

Identifies a list of name-value pairs.

Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```

RE$NV_LIST Type

Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
   actx_list  SYS.RE$NV_ARRAY);
```

Attributes

Table 253–4 RE$NV_LIST Attributes

Attribute	Description
actx_list	The list of name-value pairs

RE$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE$NV_LIST type:

- ADD_PAIR Member Procedure
- GET_ALL_NAMES Member Function
- GET_VALUE Member Function
- REMOVE_PAIR Member Procedure

ADD_PAIR Member Procedure

Adds a name-value pair to the list of name-value pairs.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE ADD_PAIR(
   name   IN  VARCHAR2,
   value  IN  ANYDATA);
```

Parameters

Table 253–5 ADD_PAIR Procedure Parameters

Parameter	Description
name	The name in the name-value pair being added to the list. If the name already exists in the list, then this procedure raises an error.
value	The value in the name-value pair being added to the list

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.

Syntax

```
MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;
```

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER FUNCTION GET_VALUE(
   name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 253–6 GET_VALUE Procedure Parameters

Parameter	Description
name	The name whose value to return

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE REMOVE_PAIR(
   name  IN  VARCHAR2);
```

Parameters

Table 253–7 REMOVE_PAIR Procedure Parameters

Parameter	Description
name	The name of the pair to remove

RE$NV_NODE Type

Identifies a name-value pair.

> **Note:** Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$NV_NODE (
   nvn_name   VARCHAR2(30),
   nvn_value  ANYDATA);
```

Attributes

Table 253–8 RE$NV_NODE Attributes

Attribute	Description
nvn_name	Specifies the name in the name-value pair
nvn_value	Specifies the value in the name-value pair

RE$RULE_HIT Type

Specifies a rule found as a result of an evaluation.

See Also:

- "CREATE_RULE Procedure" on page 124-14
- "ALTER_RULE Procedure" on page 124-10

Syntax

```
TYPE SYS.RE$RULE_HIT (
   rule_name            VARCHAR2(65),
   rule_action_context  RE$NV_LIST);
```

Attributes

Table 253–9 RE$RULE_HIT Attributes

Attribute	Description
`rule_name`	The rule name in the form *`schema_name.rule_name`*. For example, a rule named `employee_rule` in the `hr` schema is returned in the form `"hr"."employee_rule"`.
`rule_action_context`	The rule action context as specified in the `CREATE_RULE` or `ALTER_RULE` procedure of the `DBMS_RULE_ADM` package

RE$RULE_HIT_LIST Type

Identifies a list of rules found as a result of an evaluation.

Syntax

```
TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;
```

RE$TABLE_ALIAS Type

Provides the table corresponding to an alias used in a rule evaluation context. A specified table name must satisfy the schema object naming rules.

Note: Enclose the table name in double quotation marks (") if the name contains special characters.

See Also: *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
   table_alias  VARCHAR2(32),
   table_name   VARCHAR2(194));
```

Attributes

Table 253–10 RE$TABLE_ALIAS Attributes

Attribute	Description
`table_alias`	The alias used for the table in a rule
`table_name`	The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following: *`schema_name.table_name`* *`table_name`* For example, if the *`schema_name`* is `hr` and the *`table_name`* is `employees`, then enter the following: `hr.employees`

RE$TABLE_ALIAS_LIST Type

Identifies a list of table aliases used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;
```

RE$TABLE_VALUE Type

Specifies the value of a table row using a `ROWID`.

Syntax

```
TYPE SYS.RE$TABLE_VALUE(
   table_alias  VARCHAR2(32),
   table_rowid  VARCHAR2(18));
```

Attributes

Table 253–11 RE$TABLE_VALUE Attributes

Attribute	Description
`table_alias`	Specifies the alias used for the table in a rule
`table_rowid`	Specifies the rowid for the table row

RE$TABLE_VALUE_LIST Type

Identifies a list of table values.

Note: Each table alias in the list in the list must be unique.

Syntax

```
TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;
```

RE$VARIABLE_TYPE Type

Provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

> **Note:** Enclose the variable name in double quotation marks (") if the name contains special characters.

See Also: *Oracle Database SQL Language Reference* for information about schema object naming rules

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE (
   variable_name             VARCHAR2(32),
   variable_type             VARCHAR2(4000),
   variable_value_function   VARCHAR2(228),
   variable_method_function  VARCHAR2(228));
```

Attributes

Table 253–12 RE$VARIABLE_TYPE Attributes

Attribute	Description
`variable_name`	The variable name used in a rule
`variable_type`	The type that is resolved in the evaluation context schema. Any valid Oracle built-in data type, user-defined type, or Oracle-supplied type can be specified. See the *Oracle Database SQL Language Reference* for more information about these types.
`variable_value_function`	A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the "Usage Notes" for more information.
`variable_method_function`	Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the "Usage Notes" for more information.

Usage Notes

The functions for both the for the `variable_value_function` parameter and `variable_method_function` parameter have the following format:

`schema_name.package_name.function_name@dblink`

Any of the following parts of the format can be omitted: *schema_name*, *package_name*, and *@dblink*.

For example, if the *schema_name* is hr, the *package_name* is var_pac, the *function_name* is func_value, and the *dblink* is dbs1.net, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

Signature for variable_value_function

The function must have the following signature:

```
FUNCTION variable_value_function_name(
  evaluation_context_schema  IN VARCHAR2,
  evaluation_context_name    IN VARCHAR2,
  variable_name              IN VARCHAR2,
  event_context              IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```

Signature for variable_method_function

This function must have the following signature:

```
FUNCTION variable_method_function_name(
  evaluation_context_schema  IN VARCHAR2,
  evaluation_context_name    IN VARCHAR2,
  variable_value             IN SYS.RE$VARIABLE_VALUE,
  method_name                IN VARCHAR2,
  event_context              IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

RE$VARIABLE_TYPE_LIST Type

Identifies a list of variables and their types used in a rule evaluation context.

Syntax

```
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

RE$VARIABLE_VALUE Type

Specifies the value of a variable.

> **Note:** Enclose the variable name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE (
   variable_name  VARCHAR2(32),
   variable_data  ANYDATA);
```

Attributes

Table 253–13 RE$VARIABLE_VALUE Attributes

Attribute	Description
`variable_name`	Specifies the variable name used in a rule
`variable_data`	Specifies the data for the variable value

RE$VARIABLE_VALUE_LIST Type

Identifies a list of variable values.

Syntax

```
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```

254

Rules Manager Types

Rules Manager contains one predefined type and a public synonym for this type.

> **See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topics:

- Summary of Rule Manager Types

Summary of Rule Manager Types

Table 254–1 describes the Rules Manager object type.

Table 254–1 Rules Manager Object Types

Object Type Name	Description
RLM$EVENTIDS Object Type	Specifies a list of event identifiers to the `CONSUME_PRIM_EVENTS` procedure

RLM$EVENTIDS Object Type

The RLM$EVENTIDS defines a table of VARCHAR2 values.

Syntax

```
CREATE OR REPLACE TYPE RLM$EVENTIDS is table of VARCHAR2(38);
```

Attributes

None.

Usage Notes

- RLM$EVENTIDS type passes a list of event identifiers to the CONSUME_PRIM_EVENTS procedure. These event identifiers are ROWIDs for the corresponding events in the database and their values are available through the arguments of the action callback procedure and rule class results view columns, when the rule class is configured for RULE consumption policy

Examples

The following commands show the body of the action callback procedure for a rule class configured for RULE consumption policy. This demonstrates the use of RLM$EVENTDIDS type to consume the events before executing the action for the matched rules.

```
CREATE OR REPLACE PROCEDURE PromoAction (
      Flt        AddFlight,
      Flt_EvtId  ROWID,    --- rowid for the fligt primitive event
      Car        AddRentalCar,
      Car_EvtId  ROWID,
      rlm$rule   TravelPromotions%ROWTYPE) is
 evtcnsmd   NUMBER;
BEGIN
 evtcnsmd := dbms_rlmgr.consume_prim_events(
              rule_class   => 'TravelPromotions',
              event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));

 IF (evtcnsmd = 1) THEN
   -- consume operation was successful; perform the action ---
   OfferPromotion (Flt.CustId, rlm$rule.PromoType, rlm$rule.OfferedBy);
 END IF;
END;
/
```

255

UTL Streams Types

`UTL Streams Types` describes abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the '`SYS`' schema. The streams may be referenced by `PUBLIC` and are described in the following sections.

See Also: For more information, see A.

This chapter contains the following topics:

- Summary of UTL Binary Streams Types

Summary of UTL Binary Streams Types

Table 255–1 UTL Binary Streams Types

Type	Description
UTL_BINARYINPUTSTREAM Type on page 255-3	Reads bytes and closes a stream.
UTL_BINARYOUTPUTSTREAM Type on page 255-4	Writes bytes and closes a stream.
UTL_CHARACTERINPUTSTREAM Type on page 255-5	Reads chars and closes a stream.
UTL_CHARACTEROUTPUTSTREAM Type on page 255-6	Writes chars and closes a stream.

UTL_BINARYINPUTSTREAM Type

This type is similar to `java.io.InputStream` in that it can only read and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT (

   MEMBER FUNCTION available (
        self    IN OUT NOCOPY  Utl_BinaryInputStream)
     RETURN INTEGER,

   MEMBER FUNCTION read (                                    -- #1
      self      IN OUT NOCOPY  Utl_BinaryInputStream,
      numBytes  IN             INTEGER DEFAULT 1)
    RETURN RAW,

  MEMBER PROCEDURE read (                                    -- #2
     self       IN OUT NOCOPY   Utl_BinaryInputStream,
     bytes      IN OUT NOCOPY  RAW,
     numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE read (                                    -- #3
     self       IN OUT NOCOPY   Utl_BinaryInputStream,
     bytes      IN OUT NOCOPY   RAW,
     offset     IN INTEGER,
     numBytes   IN OUT          INTEGER),

  member function close (
     self       In Out Nocopy   Utl_BinaryInputStream)

 ) NOT FINAL;
```

Attributes

Table 255–2 UTL_BINARYINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	■ #1 - Reads the number of bytes specified by numBytes (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned. ■ #2 - Reads the number of bytes specified in numBytes into the parameter bytes. Additionally, the actual number of bytes read is returned in parameter numBytes. If this parameter is set to 0 then there are no more bytes to be read. ■ #3 - Reads the number of bytes specified in numBytes into the parameter bytes, beginning at the offset specified by parameter offset. The actual number of bytes read is returned in parameter numBytes. If this value is 0, then there are no additional bytes to be read.
CLOSE	Releases all resources held on the node to support the stream

UTL_BINARYOUTPUTSTREAM Type

This type is similar to `java.io.OutputStream` in that it can only write and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT (

  MEMBER FUNCTION write (                                  -- #1
       self       IN OUT NOCOPY   sys.utl_BinaryOutputStream,
       bytes      IN              RAW,
       numBytes   IN              INTEGER DEFAULT 1)
  RETURN INTEGER,

  MEMBER PROCEDURE write (                                  -- #2
       self       IN OUT NOCOPY  sys.utl_BinaryOutputStream,
       bytes      IN NOCOPY      RAW,
       numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE write (                                  -- #3
       self       IN OUT NOCOPY  utl_BinaryOutputStream,
       bytes      IN NOCOPY      RAW,
       offset     IN             INTEGER,
       numBytes   IN OUT         INTEGER),

  MEMBER PROCEDURE flush (
       self       IN OUT NOCOPY  utl_BinaryOutputStream),

  MEMBER PROCEDURE close (
       self       IN OUT NOCOPY utl_BinaryOutputStream)

 ) NOT FINAL;
```

Attributes

Table 255–3 UTL_BINARYOUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
`WRITE`	■ #1 - Writes the number of bytes specified by `numBytes` (default is 1) from `RAW` into the stream. The actual number of bytes written is returned. ■ #2 - Writes the number of bytes specified in parameter `numBytes` from parameter bytes to the stream. The actual number of bytes written is returned in parameter `numBytes`. ■ #3 - Writes the number of bytes specified by `numBytes` to the stream, beginning at the offset specified by parameter offset. The actual number of bytes written is returned in parameter `numBytes`.
`FLUSH`	Insures that any buffered bytes are copied to the node destination
`CLOSE`	Frees all resources associated with the stream

UTL_CHARACTERINPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (

   MEMBER FUNCTION available (
       self       IN OUT NOCOPY   utl_CharacterInputStream)
    RETURN INTEGER,

   MEMBER FUNCTION read (                                  -- #1
       self       IN OUT NOCOPY   utl_CharacterInputStream,
       numChars   IN              INTEGER DEFAULT 1,
       lineFeed   IN              BOOLEAN DEFAULT FALSE)
    RETURN VARCHAR2,

  MEMBER PROCEDURE read (                                  -- #2
       self      IN OUT NOCOPY    utl_CharacterInputStream,
       chars     IN OUT NOCOPY    VARCHAR2,
       numChars  IN OUT           INTEGER,
       lineFeed  IN BOOLEAN DEFAULT FALSE),

  MEMBER PROCEDURE read (                                  -- #3
       self      IN  OUT NOCOPY   utl_CharacterInputStream,
       chars     IN OUT NOCOPY    VARCHAR2,
       offset    IN               INTEGER,
       numChars  IN OUT           INTEGER,
       lineFeed  IN               BOOLEAN DEFAULT FALSE),

   MEMBER PROCEDURE close (
      self       IN OUT NOCOPY    utl_CharacterInputStream)

 ) NOT FINAL;
```

Attributes

Table 255–4 UTL_CHARACTERINPUTSTREAM Type Member Subprograms

Member Subprogram	Description
AVAILABLE	Returns the number of bytes available to be read
READ	■ #1 - Returns the number of characters remaining to be read ■ #2 - Reads the number of characters specified by `numChars` (default value is 1) and returns the characters as a `VARCHAR2`. If the value of `lineFeed` is true (default value is `FALSE`) then the reading stops if a linefeed character is found. If there are no remaining characters a value of `NULL` is returned. ■ #3 - Reads reads the number of characters specified by parameter `numChars` into the parameter chars. Additionally, the actual number of characters read is returned in parameter `numChars`. If this value is 0, then there are no more characters to be read. If the value of `lineFeed` is `TRUE` (default is `FALSE`), then reading stops if a linefeed character is encountered.
CLOSE	Releases all resources held by the stream

UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to `java.io.Reader` in that it can only read characters (chars) and close a stream.

Syntax

```
CREATE OR REPLACE TYPE utl_CharacterOutputStream  AS OBJECT (

 MEMBER FUNCTION write (                                  -- #1
     self      IN OUT NOCOPY   utl_CharacterOutputStream,
     chars     IN              VARCHAR2,
     numChars  IN              INTEGER DEFAULT 1,
     lineFeed  IN              BOOLEAN DEFAULT FALSE)
  RETURN INTEGER,

 MEMBER PROCEDURE write (                                  -- #2
     self      IN OUT NOCOPY   utl_CharacterOutputStream,
     chars     IN OUT NOCOPY   VARCHAR2,
     numChars  IN OUT          INTEGER,
     lineFeed  IN              BOOLEAN DEFAULT FALSE),

 member procedure write (                                  -- #3
     self     IN OUT NOCOPY    utl_CharacterOutputStream,
     chars    IN  NOCOPY       varchar2,
     offset   IN               integer,
     numChars IN OUT           integer,
    lineFeed  IN               boolean default false),

 MEMBER PROCEDURE flush (
     self     IN OUT NOCOPY    utl_CharacterOutputStream),

MEMBER PROCEDURE close (
     self     IN OUT NOCOPY utl_CharacterOutputStream)

 ) NOT FINAL;
```

Attributes

Table 255–5 UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
`WRITE`	■ #1 - Writes the number of characters specified by `numChars` (default is 1) from parameter chars into the stream and returns the actual number of characters written. If the value of `lineFeed` is TRUE (default is `FALSE`) a `lineFeed` character is inserted after the last character. ■ #2 - writes the number of characters specified by parameter `numChars`, from parameter `chars` into the stream. The actual number of characters written is returned in parameter `numChars`. If the value of `lineFeed` is true (default is `FALSE`) a `lineFeed` character is inserted after the last character. ■ #3 - Writes the number of characters specified by parameter `numChars`, from parameter `chars`, beginning at `offset` specified by parameter offset. The actual number of characters written is returned in parameter `numChars`. If the value of `lineFeed` is true (default is `FALSE`) a `lineFeed` character is inserted after the last character .
`FLUSH`	Copies all characters that may be contained within buffers to the node value

Table 255–5 (Cont.) UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms

Member Subprogram	Description
CLOSE	Releases all resources held by the stream

256

XMLTYPE

`XMLType` is a system-defined opaque type for handling XML data. It as predefined member functions on it to extract XML nodes and fragments.

You can create columns of `XMLType` and insert XML documents into it. You can also generate XML documents as `XMLType` instances dynamically using the `SYS_XMLGEN` and `SYS_XMLAGG SQL` functions.

This chapter contains the following topics:

- Summary of XMLType Subprograms

See Also:

- *Oracle XML DB Developer's Guide*

Summary of XMLType Subprograms

Table 256–1 summarizes functions and procedures of the `XMLType`.

Table 256–1 XMLTYPE Subprograms

Method	Description
CREATENONSCHEMABASEDXML on page 256-4	Creates a non schema based XML from the input schema based instance.
CREATESCHEMABASEDXML on page 256-5	Creates a schema based `XMLType` instance from the non-schema based instance using the input schema URL.
CREATEXML on page 6	Static function for creating and returning an `XMLType` instance.
EXISTSNODE on page 256-8	Takes a `XMLType` instance and a `XPath` and returns 1 or 0 indicating if applying the `XPath` returns a non-empty set of nodes.
EXTRACT on page 256-9	Takes a `XMLType` instance and an `XPath`, applies the XPath expression and returns the results as an `XMLType`.
GETBLOBVAL on page 256-10	Returns the value of the `XMLType` instance as a `BLOB`
GETCLOBVAL on page 256-11	Returns the value of the `XMLType` instance as a `CLOB`.
GETNAMESPACE on page 256-12	Returns the namespace for the top level element in a schema based document.
GETNUMBERVAL on page 256-13	Returns the value of the `XMLType` instance as a `NUMBER`. This is only valid if the input `XMLType` instance contains a simple text node and is convertible to a number.
GETROOTELEMENT on page 256-14	Returns the root element of the input instance. Returns `NULL` if the instance is a fragment
GETSCHEMAURL on page 256-15	Returns the XML schema URL if the input is an XML Schema based.
GETSTRINGVAL on page 256-16	Returns the value of the `XMLType` instance as a string.
ISFRAGMENT on page 256-17	Checks if the input `XMLType` instance is a fragment or not. A fragment is a XML instance, which has more than one root element.
ISSCHEMABASED on page 256-18	Returns 1 or 0 indicating if the input `XMLType` instance is a schema based one or not.
ISSCHEMAVALID on page 256-19	Checks if the input instance is schema valid according to the given schema URL.
ISSCHEMAVALIDATED on page 256-20	Checks if the instance has been validated against the schema.
SCHEMAVALIDATE on page 256-21	Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.
SETSCHEMAVALIDATED on page 256-22	Sets the schema valid flag to avoid costly schema validation.
TOOBJECT on page 256-23	Converts the `XMLType` instance to an object type.
TRANSFORM on page 256-24	Takes an `XMLType` instance and an associated stylesheet (which is also an `XMLType` instance), applies the stylesheet and returns the result as XML.

Table 256–1 (Cont.) XMLTYPE Subprograms

Method	Description
XMLTYPE on page 256-25	Constructs an instance of the `XMLType` datatype. The constructor can take in the XML as a `CLOB`, `VARCHAR2` or take in a object type.

CREATENONSCHEMABASEDXML

Member function. Creates a non-schema based XML document from a schema based instance.

Syntax

```
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```

CREATESCHEMABASEDXML

Member function. Creates a schema based `XMLType` instance from a non-schema based `XMLType` value. It uses either the supplied `SCHEMA` URL, or the `SCHEMALOCATION` attribute of the instance.

Syntax

```
MEMBER FUNCTION createSchemaBasedXML(
schema IN varchar2 := NULL)
return XMLType deterministic;
```

Parameter	Description
`schema`	Optional XMLSchema URL used to convert the value to the specified schema..

CREATEXML

Static function for creating and returning an XMLType instance. The string and clob parameters used to pass in the date must contain well-formed and valid XML documents. The options are described in the following table.

Syntax	Description

`STATIC FUNCTION createXML(`
`  xmlData IN varchar2)`
`RETURN XMLType deterministic;`
	Creates the XMLType instance from a string.

`STATIC FUNCTION createXML(`
`  xmlData IN clob)`
`RETURN XMLType  deterministic;`
	Creates the XMLType instance from a CLOB.

`STATIC FUNCTION createXML (`
`  xmlData IN clob,`
`  schema IN varchar2,`
`  validated IN number := 0,`
`  wellformed IN number := 0 )`
`RETURN XMLType deterministic;`
	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.

`STATIC FUNCTION createXML (`
`  xmlData IN varchar2,`
`  schema IN varchar2,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`RETURN XMLType deterministic;`
	This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.

`STATIC FUNCTION createXML (`
`  xmlData IN "<ADT_1>",`
`  schema IN varchar2 := NULL,`
`  element IN varchar2 := NULL,`
`  validated IN NUMBER := 0)`
`RETURN XMLType deterministic;`
	Creates an XML instance from an instance of an user-defined type.

`STATIC FUNCTION createXML (`
`  xmlData IN SYS_REFCURSOR,`
`  schema in varchar2 := NULL,`
`  element in varchar2 := NULL,`
`  validated in number := 0)`
`RETURN XMLType deterministic;`
	Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.

Syntax	Description
STATIC FUNCTION createXML (xmlData IN AnyData, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN sys.XMLType deterministic parallel_enable	Creates an XML instance from ANYDATA. If the ANYDATAinstance contains an ADT, the XMLTypereturned is the same as would be returned for a call directly on the ADT. If the ANYDATAcontains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.
STATIC FUNCTION createXML (xmlData IN blob, csid IN number, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic	Creates an XML instance from a BLOB.
STATIC FUNCTION createXML (xmlData IN bfile, csid IN number, Schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic	Creates an XML instance from a BFILE.

Parameter	Description
xmlData	The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.
schema	Optional Schema URL to be used to make the input conform to the given schema.
validated	Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)
wellformed	Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)
element	Optional element name in the case of the ADT_1 or REF CURSOR constructors. (Default is NULL)
CSID	The character set id of input XML data.

EXISTSNODE

Member function. Checks if the node exists. If the XPath string is `NULL` or the document is empty, then a value of 0 is returned, otherwise returns 1. The options are described in the following table.

Syntax	Description

`MEMBER FUNCTION existsNode(`
`  xpath IN varchar2)`
`RETURN number deterministic;`
	Given an XPath expression, checks if the XPath applied over the document can return any valid nodes.

`MEMBER FUNCTION existsNode(`
`  xpath in varchar2,`
`  nsmap in varchar2)`
`RETURN number deterministic;`
	This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not.

Parameter	Description
`xpath`	The XPath expression to test.
`nsmap`	Optional namespace mapping.

EXTRACT

Member function. Extracts an `XMLType` fragment and returns an `XMLType` instance containing the result node(s). If the XPath does not result in any nodes, then returns `NULL`. The options are described in the following table.

Syntax	Description

`MEMBER FUNCTION extract(`
`  xpath IN varchar2)`
`RETURN XMLType deterministic;`
	Given an XPath expression, applies the XPath to the document and returns the fragment as an `XMLType`.

`MEMBER FUNCTION extract(`
`  xpath IN varchar2,`
`  nsmap IN varchar2)`
`RETURN XMLType deterministic;`
	This member function applies the XPath expression and namespace mapping, over the XML data to return a `XMLType` instance containing the resultant fragment.

Parameter	Description
`xpath`	The XPath expression to apply.
`nsmap`	Optional prefix to namespace mapping information.

GETBLOBVAL

Member function. Returns a `BLOB` containing the serialized XML representation; if the returns is a temporary `BLOB`, then it must be freed after use.

Syntax

```
MEMBER FUNCTION getBlobVal()
RETURN Blob deterministic;
```

GETCLOBVAL

Member function. Returns a CLOB containing the serialized XML representation; if the returns is a temporary CLOB, then it must be freed after use.

Syntax

```
MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
```

GETNAMESPACE

Member function. Returns the namespace of the top level element in the instance. Returns `NULL` if the input is a fragment or is a non-schema based instance.

Syntax

```
MEMBER FUNCTION getNamespace
return varchar2 deterministic;
```

GETNUMBERVAL

Member function. Returns a numeric value, formatted from the text value pointed to by the `XMLType` instance. The `XMLType` must point to a valid text node that contains a numerical value. The options are described in the following table.

Syntax

```
MEMBER FUNCTION getNumberVal()
RETURN number deterministic;
```

GETROOTELEMENT

Member function. Gets the root element of the `XMLType` instance. Returns `NULL` if the instance is a fragment.

Syntax

```
MEMBER FUNCTION getRootElement
return varchar2 deterministic;
```

GETSCHEMAURL

Member function. Returns the XML Schema URL corresponding to the `XMLType` instance, if the `XMLType` instance is a schema-based document. Otherwise returns `NULL`.

Syntax

```
MEMBER FUNCTION getSchemaURL
return varchar2 deterministic;
```

GETSTRINGVAL

Member function. Returns the document as a string. Returns s string containing the seralized XML representation, or in case of text nodes, the text itself. If the XML document is bigger than the maximum size of the `VARCHAR2`, which is 4000, then an error is raised at run time.

Syntax

```
MEMBER FUNCTION getStringVal()
RETURN varchar2 deterministic;
```

ISFRAGMENT

Determines if the `XMLType` instance corresponds to a well-formed document, or a fragment. Returns 1 or 0 indicating if the `XMLType` instance contains a fragment or a well-formed document.

Syntax

```
MEMBER FUNCTION isFragment()
RETURN number deterministic;
```

ISSCHEMABASED

Member function. Determines whether the `XMLType` instance is schema-based or not. Returns 1 or 0 depending on whether the `XMLType` instance is schema-based.

Syntax

```
MEMBER FUNCTION isSchemaBased
return number deterministic;
```

ISSCHEMAVALID

Member function. Checks if the input instance is conformant to a specified schema. Does not change the validation status of the XML instance. If a XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the `XMLType` instance's own schema.

Syntax

```
member function isSchemaValid(
schurl IN VARCHAR2 := NULL,
elem IN VARCHAR2 := NULL)
return NUMBER deterministic;
```

Parameter	IN / OUT	Description
`schurl`	`(IN)`	The URL of the XML Schema against which to check conformance.
`elem`	`(IN)`	Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.

ISSCHEMAVALIDATED

Member function. Returns the validation status of the `XMLType` instance -- tells if a schema based instance has been actually validated against its schema. Returns 1 if the instance has been validated against the schema, 0 otherwise.

Syntax

```
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```

SCHEMAVALIDATE

Member procedure. Validates the XML instance against its schema if it hasn't already been done. For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

Syntax

```
MEMBER PROCEDURE schemaValidate(
   self IF OUT NOCOPY XMLType);
```

Parameter	IN / OUT	Description
`self`	`(OUT)`	XML instance being validated against the schema.

SETSCHEMAVALIDATED

Member function. Sets the `VALIDATION` state of the input XML instance.

Syntax

```
MEMBER PROCEDURE setSchemaValidated(
self IF OUT NOCOPY XMLType,
   flag IN BINARY_INTEGER := 1);
```

Parameter	IN / OUT	Description
`self`	`(OUT)`	XML instance.
`flag`	`(IN)`	0 - `NOT VALIDATED`; 1 - `VALIDATED` (Default)

TOOBJECT

Member procedure. Converts the XML value to an object type using the XMLSCHEMA mapping, if available. If a SCHEMA is not supplied or the input is a non-schema based XML, the procedure uses cannonical mapping between elements and object type attributes.

See Also:

- An in-depth discussion of this topic inside *Oracle XML DB Developer's Guide*

Syntax

```
MEMBER PROCEDURE toObject(
SELF in XMLType,
object OUT "<ADT_1>",
schema in varchar2 := NULL,
element in varchar2 := NULL);
```

Parameter	IN / OUT	Description
SELF	(IN)	Instance to be converted. Implicit if used as a member procedure.
object	(IN)	Converted object. An object instance of the required type may be passed in to this function
schema	(IN)	Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema.
element	(IN)	Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter.

TRANSFORM

Member function. This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs. If any of the arguments other than the parammap is NULL, then a NULL is returned.

Syntax

```
MEMBER FUNCTION transform(
xsl IN XMLType,
parammap in varchar2 := NULL)
RETURN XMLType deterministic;
```

Parameter	IN / OUT	Description
xsl	(IN)	The XSL stylesheet describing the transformation
parammap	(IN)	Top level parameters to the XSL - string of name=value pairs

XMLTYPE

XMLType constructor. The options are described in the following table.

Syntax	Description
constructor function XMLType(xmlData IN clob, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN Number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.
constructor function XMLType(xmlData IN varchar2, schema IN varchar2 := NULL, validated IN number := 0, wellformed IN number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance using the specified schema and xml data parameters.
constructor function XMLType (xmlData IN "w<ADT_1>", schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance from the specified object type parameter.
constructor function XMLType(xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) return self as result deterministic;	This constructor function creates an optionally schema-based XMLType instance from the specified REF CURSOR parameter.
constructor function XMLType(xmlData IN AnyData, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN number := 0) return self as result deterministic parallel_enable	This constructor function creates an optionally schema-based XMLType instance from the specified ANYDATA parameter. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is "ANYDATA" if it is not.

Syntax	Description

`constructor function XMLType(`
`  xmlData IN blob, csid IN number,`
`  schema IN varchar2 := NULL,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`return self as result deterministic`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified `BLOB` parameter.

`constructor function XMLType(`
`  xmlData IN bfile,`
`  csid IN number,`
`  schema IN varchar2 := NULL,`
`  validated IN number := 0,`
`  wellformed IN number := 0)`
`return self as result deterministic`
	This constructor function creates an optionally schema-based `XMLType` instance from the specified `BFILE` parameter.

Parameter	Description
`xmlData`	The data in the form of a `BFILE`, `BLOB`, `CLOB`, `REF`s, `VARCHAR2` or object type.
`schema`	Optional Schema URL to be used to make the input conform to the given schema.
`validated`	Indicates that the instance is valid to the given XML Schema.
`wellformed`	Indicates that the input is well formed. If set, then the database would not do well formed check on the input instance.
`element`	Optional element name in the case of the `ADT_1` or `REF CURSOR` constructors. (Default is `NULL`)
`CSID`	The character set id of input XML data.

XDBHandler Type Subprograms, 166-8
XDBHandlerList Type Subprograms, 166-7
XDBLink Type Subprograms, 166-10
XDBPath Type Subprograms, 166-9
XDBRepositoryEvent Type Subprograms, 166-6

XDBUriType, 242-27
XDBURITYPE function, 242-35
XDBUriType subtype, 242-27
  CREATEURI function, 242-28
  GETBLOB function, 242-29
  GETCLOB function, 242-30
  GETCONTENTTYPE function, 242-31
  GETEXTERNALURL function, 242-32
  GETURL function, 242-33
  GETXML function, 242-34
  methods, 242-27
  XDBURITYPE function, 242-35
XDBZ Constants, 165-3
XFORM_BIN_CAT procedure, 47-55
XFORM_BIN_NUM procedure, 47-57
XFORM_CLIP procedure, 47-60
XFORM_COL_REM procedure, 47-62
XFORM_EXPR_NUM procedure, 47-63
XFORM_EXPR_STR procedure, 47-65
XFORM_MISS_CAT procedure, 47-66
XFORM_MISS_NUM procedure, 47-67
XFORM_NORM_LIN procedure, 47-68
XFORM_STACK procedure, 47-70
XML tags
  specifying list of
    configuring index parameters, 243-11
XML_TO_LCR Function, 88-37
XMLINDEXADDPATH Function, 161-5
XMLINDEXREMOVEPATH Function, 161-6
XMLType
  CREATENONSCHEMABASEDXML function, 256-4
  CREATESCHEMABASEDXML function, 256-5
  CREATEXML function, 256-6
  description, 256-1
  EXISTSNODE function, 256-8
  EXTRACT function, 256-9
  GETBLOBVAL function, 256-10
  GETCLOBVAL function, 256-11
  GETNUMBERVAL function, 256-13
  GETROOTELEMENT function, 256-14
  GETSCHEMAURL function, 256-15
  GETSTRINGVAL function, 256-16
  ISFRAGMENT function, 256-17
  ISSCHEMABASED function, 256-18
  ISSCHEMAVALID function, 256-19
  ISSCHEMAVALIDATED function, 256-20
  NAMESPACE function, 256-12
  SCHEMAVALIDATE procedure, 256-21
  SETSCHEMAVALIDATED procedure, 256-22
  TOOBJECT procedure, 256-23
  TRANSFORM function, 256-24
  XMLTYPE function, 256-25
XMLTYPE function, 256-25
XPath parameters
  adding to attribute list, 62-17
  dropping from attribute list, 62-17
XPath predicates
  indexing set of
    configuring XML element or XML attribute, 243-9
XPINDEX_PARAMETERS procedure, 62-30

XRANGE function, 229-38
