- If the LOB was archived, but the data was left in the RDBMS, cached is set to TRUE. Cached is set to FALSE if the data was removed after the put, and NULL if state is DBMS_LOB.DBFS_LINK_NEVER.

GETCONTENTTYPE Functions

This procedure returns the content type string previously set by means of the SETCONTENTTYPE Procedure.

Syntax

```
DBMS_LOB.GETCONTENTTYPE (
   lob_loc  IN BLOB)
 RETURN VARCHAR2;

DBMS_LOB.GETCONTENTTYPE (
   lob_loc  IN CLOB CHARACTER SET ANY_CS)
 RETURN VARCHAR2;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(getcontenttype, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 79–55 GETCONTENTTYPE Function Parameters

Parameter	Description
lob_loc	LOB whose content type is to be retrieved

Return Values

The returned content type.

Exceptions

Table 79–56 GETCONTENTTYPE Function Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

GET_STORAGE_LIMIT Function

This function returns the LOB storage limit for the specified LOB.

Syntax

```
DBMS_LOB.GET_STORAGE_LIMIT (
   lob_loc  IN CLOB CHARACTER SET ANY_CS)
 RETURN INTEGER;

DBMS_LOB.GET_STORAGE_LIMIT (
   lob_loc  IN BLOB)
 RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(get_storage_limit, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 79–57 GET_STORAGE_LIMIT Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Return Value

The value returned from this function is the maximum allowable size for specified LOB locator. For BLOBs, the return value depends on the block size of the tablespace the LOB resides in and is calculated as (2^{32})-1 (4294967295) times the block size of the tablespace. For CLOBs/NCLOBs, the value returned is the(2^{32})-1 (4294967295) times the block size of the tablespace divided by the character width of the CLOB/NCLOB.

Usage

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for details on LOB storage limits

GETCHUNKSIZE Functions

When creating the table, you can specify the chunking factor, a multiple of tablespace blocks in bytes. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value.

This function returns the amount of space used in the LOB chunk to store the LOB value.

Syntax

```
DBMS_LOB.GETCHUNKSIZE (
   lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.GETCHUNKSIZE (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(getchunksize, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 79–58 GETCHUNKSIZE Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Return Values

The value returned for BLOBs is in terms of bytes. The value returned for CLOBs is in terms of characters.

Usage Notes

With regard to basic LOB files, performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the WRITE until you have enough for a chunk, instead of issuing several WRITE calls for the same chunk.

These tactics of performance improvement do not apply to SecureFiles.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

Exceptions

Table 79–59 GETCHUNKSIZE Procedure Exceptions

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

GETLENGTH Functions

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a BFILE includes the EOF, if it exists. Any 0-byte or space filler in the LOB caused by previous ERASE or WRITE operations is also included in the length count. The length of an empty internal LOB is 0.

Syntax

```
DBMS_LOB.GETLENGTH (
   lob_loc    IN  BLOB)
  RETURN INTEGER;

DBMS_LOB.GETLENGTH (
   lob_loc    IN  CLOB   CHARACTER SET ANY_CS)
  RETURN INTEGER;

DBMS_LOB.GETLENGTH (
   file_loc    IN  BFILE)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 79–60 GETLENGTH Function Parameter

Parameter	Description
file_loc	The file locator for the LOB whose length is to be returned.

Return Values

The length of the LOB in bytes or characters as an INTEGER. NULL is returned if the input LOB is NULL or if the input lob_loc is NULL. An error is returned in the following cases for BFILEs:

- lob_loc does not have the necessary directory and operating system privileges
- lob_loc cannot be read because of an operating system read error

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

Exceptions

Table 79–61 GETLENGHTH Procedure Exceptions

Exception	Description
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

GETOPTIONS Functions

This function obtains settings corresponding to the `option_type` field for a particular `LOB`.

Syntax

```
DBMS_LOB.GETOPTIONS (
   lob_loc             IN     BLOB,
   option_types        IN     PLS_INTEGER)
 RETURN PLS_INTEGER;

DBMS_LOB.GETOPTIONS (
  lob_loc             IN     CLOB HARACTER SET ANY_CS,
  option_types        IN     PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

Table 79–62 GETOPTIONS Function Parameter

Parameter	Description
`lob_loc`	Locator for the `LOB` to be examined. For more information, see Operational Notes.
`option_type`	See DBMS_LOB Constants - Option Types on page 79-5

Return Values

The return values are a combination of `COMPRESS_ON`, `ENCRYPT_ON` and `DEDUPLICATE_ON` (see DBMS_LOB Constants - Option Values on page 79-5) depending on which option types (see DBMS_LOB Constants - Option Types on page 79-5) are passed in.

Exceptions

Table 79–63 GETOPTIONS Procedure Exceptions

Exception	Description
`INVALID_ARGVAL`	A parameter value was invalid
`QUERY_WRITE`	Cannot perform operation during a query
`BUFFERING_ENABLED`	Cannot perform operation with LOB buffering enabled
`SECUREFILE_BADLOB`	A non-`SECUREFILE` LOB was used in a `SECUREFILE` LOB only call

Usage Notes

You cannot turn compression or deduplication on or off for a SecureFile column that does not have those features on. The GetOptions Functions and SETOPTIONS Procedures work on individual SecureFiles. You can turn off a feature on a particular SecureFile and turn on a feature that has already been turned off by SetOptions, but you cannot turn on an option that has not been given to the SecureFile when the table was created.

INSTR Functions

This function returns the matching position of the *nth* occurrence of the pattern in the LOB, starting from the offset you specify.

Syntax

```
DBMS_LOB.INSTR (
   lob_loc    IN   BLOB,
   pattern    IN   RAW,
   offset     IN   INTEGER := 1,
   nth        IN   INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.INSTR (
   lob_loc    IN   CLOB      CHARACTER SET ANY_CS,
   pattern    IN   VARCHAR2  CHARACTER SET lob_loc%CHARSET,
   offset     IN   INTEGER := 1,
   nth        IN   INTEGER := 1)
  RETURN INTEGER;

DBMS_LOB.INSTR (
   file_loc   IN   BFILE,
   pattern    IN   RAW,
   offset     IN   INTEGER := 1,
   nth        IN   INTEGER := 1)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 79–64 INSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be examined. For more information, see Operational Notes.
file_loc	The file locator for the LOB to be examined.
pattern	Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs.The maximum size of the pattern is 16383 bytes.
offset	Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1)
nth	Occurrence number, starting at 1.

Return Values

Table 79–65 INSTR Function Return Values

Return	Description
INTEGER	Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found.

Table 79–65 (Cont.) INSTR Function Return Values

Return	Description
NULL	Either: -any one or more of the IN parameters was NULL or INVALID. -offset < 1 or offset > LOBMAXSIZE. -nth < 1. -nth > LOBMAXSIZE.

Usage Notes

The form of the VARCHAR2 buffer (the pattern parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.

Exceptions

Table 79–66 INSTR Function Exceptions for BFILES

Exception	Description
UNOPENED_FILE	File was not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

See Also:

- "SUBSTR Functions" on page 79-75
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

ISOPEN Functions

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

Syntax

```
DBMS_LOB.ISOPEN (
   lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;

DBMS_LOB.ISOPEN (
   file_loc IN BFILE)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(isopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 79–67 ISOPEN Function Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
file_loc	File locator.

Return Values

The return value is 1 if the LOB is open, 0 otherwise.

Usage Notes

For BFILES, openness is associated with the locator. If the input locator was never passed to OPEN, the BFILE is not considered to be opened by this locator. However, a different locator may have opened the BFILE. More than one OPEN can be performed on the same BFILE using different locators.

For internal LOBs, openness is associated with the LOB, not with the locator. If locator1 opened the LOB, then locator2 also sees the LOB as open. For internal LOBs, ISOPEN requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.

For external LOBs (BFILEs), ISOPEN also requires a round-trip, because that's where the state is kept.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

ISTEMPORARY Functions

This function determines whether a LOB instance is temporary.

Syntax

```
DBMS_LOB.ISTEMPORARY (
   lob_loc IN BLOB)
  RETURN INTEGER;

DBMS_LOB.ISTEMPORARY (
   lob_loc IN CLOB CHARACTER SET ANY_CS)
  RETURN INTEGER;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 79–68 ISTEMPORARY Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.

Return Values

The return value is 1 if the LOB is temporary is open, 0 otherwise.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

LOADBLOBFROMFILE Procedure

This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as LOADFROMFILE, and returns the new offsets.

Syntax

```
DBMS_LOB.LOADBLOBFROMFILE (
   dest_lob    IN OUT NOCOPY BLOB,
   src_bfile   IN            BFILE,
   amount      IN            INTEGER,
   dest_offset IN OUT        INTEGER,
   src_offset  IN OUT        INTEGER);
```

Parameters

Table 79–69 LOADBLOBFROMFILE Procedure Parameters

Parameter	Description
dest_lob	BLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. You can also use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.
dest_offset	(IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.

Usage Notes

- You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in bytes for BLOBs.
- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).
- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely

affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- LOADFROMFILE gets the destination LOB prior to the load unless the load covers the entire LOB.

Constants and Defaults

There is no easy way to omit parameters. You must either declare a variable for IN/OUT parameter or provide a default value for the IN parameter. Here is a summary of the constants and the defaults that can be used.

Table 79–70 Suggested Values of the Parameter

Parameter	Default Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning

Constants defined in DBMSLOB.SQL

```
lobmaxsize                      CONSTANT INTEGER        := DBMS_LOB.LOBMAXSIZE;
```

Exceptions

Table 79–71 LOADBLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the BLOB

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

Syntax

```
DBMS_LOB.LOADCLOBFROMFILE (
   dest_lob       IN OUT NOCOPY   NOCOPY CLOB CHARACTER SET ANY_CS,
   src_bfile      IN              BFILE,
   amount         IN              INTEGER,
   dest_offset    IN OUT          INTEGER,
   src_offset     IN OUT          INTEGER,
   bfile_csid     IN              NUMBER,
   lang_context   IN OUT          INTEGER,
   warning        OUT             INTEGER);
```

Parameters

Table 79–72 LOADCLOBFROMFILE Procedure Parameters

Parameter	Description
dest_lob	CLOB/NCLOB locator of the target for the load.
src_bfile	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE. Use DBMS_LOB.LOBMAXSIZE of load until the end of the BFILE.
dest_offset	(IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character.
src_offset	(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read . (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.
bfile_csid	Character set id of the source (BFILE) file.
lang_context	(IN) Language context, such as shift status, for the current load. (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call

Table 79–72 (Cont.) LOADCLOBFROMFILE Procedure Parameters

Parameter	Description
warning	(OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, '?') is used in place. The message is defined the constant value DBMS_LOB.WARN_INCONVERTIBLE_CHAR.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of CLOB and national character set in the case of NCLOB.
- csid=0 indicates the default behavior that uses database csid for CLOB and national csid for NCLOB in the place of source csid. Conversion is still necessary if it is of varying width
- It is not mandatory that you wrap the LOB operation inside the OPEN/CLOSE operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

  If you do not wrap the LOB operation inside the OPEN/CLOSE, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

The source BFILE can contain data in the Unicode character set. The Unicode standard defines many encoding schemes that provide mappings from Unicode characters to sequences of bytes. Table 79–73, " Supported Unicode Encoding Schemes" lists Unicode encodings schemes supported by this subprogram.

Table 79–73 Supported Unicode Encoding Schemes

Encoding Scheme	Oracle Name	bfile_csid Value
UTF-8	AL32UTF8	873
UTF-16BE	AL16UTF16	2000

Table 79–73 (Cont.) Supported Unicode Encoding Schemes

Encoding Scheme	Oracle Name	bfile_csid Value
UTF-16LE	AL16UTF16LE	2002
CESU-8	UTF8	871
UTF-EBCDIC	UTFE	872
UTF-16	UTF16	1000

All three UTF-16 encoding schemes encode Unicode characters as 2-byte unsigned integers. Integers can be stored in big-endian or in little-endian byte order. The UTF-16BE encoding scheme defines big-endian data. The UTF-16LE scheme defines little-endian data. The UTF-16 scheme requires that the source BFILE contains the Byte Order Mark (BOM) character in the first two bytes to define the byte order. The BOM code is 0xFEFF. If the code is stored as {0xFE, 0xFF}, the data is interpreted as big-endian. If it is stored as {0xFF, 0xFE}, the data is interpreted as little-endian.

In UTF-8 and in CESU-8 encodings the Byte Order Mark is stored as {0xEF, 0xBB, 0xBF}. With any of the Unicode encodings, the corresponding BOM sequence at the beginning of the file is recognized and not loaded into the destination LOB.

Constants

Here is a summary of the constants and the suggested values that can be used.

Table 79–74 Suggested Values of the Parameter

Parameter	Suggested Value	Description
amount	DBMS_LOB.LOBMAXSIZE (IN)	Load the entire file
dest_offset	1 (IN)	start from the beginning
src_offset	1 (IN)	start from the beginning
csid	0 (IN)	default csid, use destination csid
lang_context	0 (IN)	default language context
warning	0 (OUT)	no warning message, everything is ok

Constants defined in DBMSLOB.SQL

```
lobmaxsize                CONSTANT INTEGER       := 18446744073709551615;
warn_inconvertible_char   CONSTANT INTEGER       := 1;
default_csid              CONSTANT INTEGER       := 0;
default_lang_ctx          CONSTANT INTEGER       := 0;
no_warning                CONSTANT INTEGER       := 0;
```

Exceptions

Table 79–75 LOADCLOBFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.

Table 79–75 (Cont.) LOADCLOBFROMFILE Procedure Exceptions

Exception	Description
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the CLOB

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

LOADFROMFILE Procedure

This procedure copies all, or a part of, a source external LOB (BFILE) to a destination internal LOB.

Syntax

```
DBMS_LOB.LOADFROMFILE (
   dest_lob    IN OUT NOCOPY BLOB,
   src_file    IN            BFILE,
   amount      IN            INTEGER,
   dest_offset IN            INTEGER  := 1,
   src_offset  IN            INTEGER  := 1);
```

Parameters

Table 79–76 LOADFROMFILE Procedure Parameters

Parameter	Description
dest_lob	LOB locator of the target for the load.
src_file	BFILE locator of the source for the load.
amount	Number of bytes to load from the BFILE.
dest_offset	Offset in bytes or characters in the destination LOB (origin: 1) for the start of the load.
src_offset	Offset in bytes in the source BFILE (origin: 1) for the start of the load.

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is either in bytes or characters for BLOBs and CLOBs respectively.

> **Note:** The input BFILE must have been opened prior to using this procedure. No character set conversions are performed implicitly when binary BFILE data is loaded into a CLOB. The BFILE data must already be in the same character set as the CLOB in the database. No error checking is performed to verify this.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE.

Note: If the character set is varying width, UTF-8 for example, the LOB value is stored in the fixed-width UCS2 format. Therefore, if you are using DBMS_LOB.LOADFROMFILE, the data in the BFILE should be in the UCS2 character set instead of the UTF-8 character set. However, you should use sql*loader instead of LOADFROMFILE to load data into a CLOB or NCLOB because sql*loader provides the necessary character set conversions.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

Exceptions

Table 79–77 LOADFROMFILE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of the input parameters are NULL or INVALID.
INVALID_ARGVAL	Either: - src_offset or dest_offset < 1. - src_offset or dest_offset > LOBMAXSIZE. - amount < 1. - amount > LOBMAXSIZE.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

MOVE_TO_DBFS_LINK Procedures

This procedure writes the specifiedSecureFile data to the DBFS store.

Syntax

```
DBMS_LOB.MOVE_TO_DBFS_LINK (
  lob_loc       IN OUT BLOB,
  policy_data   IN     RAW(1024),
  flags         IN     BINARY INTEGER DEFAULT DBFS_LINK_NOCACHE);

DBMS_LOB.MOVE_TO_DBFS_LINK (
  lob_loc       IN OUT CLOB CHARACTER SET ANY_CS,
  policy_data   IN     RAW(1024),
  flags         IN     BINARY INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

Parameters

Table 79–78 MOVE_TO_DBFS_LINK Procedure Parameters

Parameter	Description
lob_loc	LOB to be archived
policy_data	Archive Manager specific data that specifies any archive policies that should be followed
flags	Either DBFS_LINK_CACHE or DBFS_LINK_NOCACHE. If DBFS_LINK_CACHE is specified, the LOB data continues to be stored in the RDBMS as well as being written to the archive store. DBFS_LINK_NOCACHE specifies that the LOB data should be deleted from the RDBMS once written to the archive.

Exceptions

Table 79–79 MOVE_TO_DBFS_LINK Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

Usage Notes

- If the LOB is already archived, the procedure silently returns as if the put was successful. In that case, if DBFS_LINK_NOCACHE is specified, or flags is defaulted, the LOB data is removed from the RDBMS.
- Calling this procedure multiple times on the same LOB with the same flags has no effect.
- Calling the procedure on a LOB that is already archived causes the LOB to be cached (DBFS_LINK_CACHE) or removed (DBFS_LINK_NOCACHE) according to the flag setting.

OPEN Procedures

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

Syntax

```
DBMS_LOB.OPEN (
   lob_loc   IN OUT NOCOPY BLOB,
   open_mode IN            BINARY_INTEGER);

DBMS_LOB.OPEN (
   lob_loc   IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   open_mode IN            BINARY_INTEGER);

DBMS_LOB.OPEN (
   file_loc  IN OUT NOCOPY BFILE,
   open_mode IN            BINARY_INTEGER := file_readonly);
```

Parameters

Table 79–80 OPEN Procedure Parameters

Parameter	Description
lob_loc	LOB locator. For more information, see Operational Notes.
open_mode	Mode in which to open. For BLOB and CLOB types, the mode can be either: LOB_READONLY or LOB_READWRITE. For BFILE types, the mode must be FILE_READONLY.

Usage Notes

Note: If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external LOBs (BFILEs), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit or rollback the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

READ Procedures

This procedure reads a piece of a LOB, and returns the specified amount into the buffer parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the amount parameter. If the input offset points past the End of LOB, then amount is set to 0, and a NO_DATA_FOUND exception is raised.

Syntax

```
DBMS_LOB.READ (
   lob_loc   IN             BLOB,
   amount    IN OUT  NOCOPY INTEGER,
   offset    IN             INTEGER,
   buffer    OUT            RAW);

DBMS_LOB.READ (
   lob_loc   IN             CLOB CHARACTER SET ANY_CS,
   amount    IN OUT  NOCOPY INTEGER,
   offset    IN             INTEGER,
   buffer    OUT            VARCHAR2 CHARACTER SET lob_loc%CHARSET);

DBMS_LOB.READ (
   file_loc   IN             BFILE,
   amount    IN OUT   NOCOPY INTEGER,
   offset    IN              INTEGER,
   buffer    OUT             RAW);
```

Parameters

Table 79–81 READ Procedure Parameters

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see Operational Notes.
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to read, or number that were read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).
buffer	Output buffer for the read operation.

Exceptions

Table 79–82 lists exceptions that apply to any LOB instance. Table 79–83 lists exceptions that apply only to BFILEs.

Table 79–82 READ Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of lob_loc, amount, or offset parameters are NULL.

Table 79–82 (Cont.) READ Procedure Exceptions

Exception	Description
INVALID_ARGVAL	Either: - amount < 1 - amount > MAXBUFSIZE - offset < 1 - offset > LOBMAXSIZE - amount is greater, in bytes or characters, than the capacity of buffer.
NO_DATA_FOUND	End of the LOB is reached, and there are no more bytes or characters to read from the LOB: amount has a value of 0.

Table 79–83 READ Procedure Exceptions for BFILEs

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.
- When calling DBMS_LOB.READ from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.
- READ get s the LOB, if necessary, before the read.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

SET_DBFS_LINK Procedures

This function links the specified SecureFile to the specified path name. It does not copy the data to the path.

Syntax

```
DBMS_LOB.SET_DBFS_LINK (
  lob_loc        IN OUT BLOB,
  archive_id     IN     RAW(1024));

DBMS_LOB.SET_DBFS_LINK(
  lob_loc_dst    IN OUT CLOB CHARACTER SET ANY_CS,
  archive_id     IN     RAW(1024));
```

Parameters

Table 79–84 SET_DBFS_LINK Procedure Parameters

Parameter	Description
lob_loc	LOB for which to store the reference value
archive_id	Archive ID as returned by calling either of the GET_DBFS_LINK Functions Functions

Exceptions

Table 79–85 SET_DBFS_LINK Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

SETCONTENTTYPE Procedure

This procedure sets the content type string for the data in the LOB.

Syntax

```
DBMS_LOB.SETCONTENTTYPE (
   lob_loc      IN OUT NOCOPY BLOB,
   contenttype  IN            VARCHAR2);

DBMS_LOB.SETCONTENTTYPE (
   lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   contenttype IN            VARCHAR2);
```

Parameters

Table 79–86 SETCONTENTTYPE Procedure Parameters

Parameter	Description
lob_loc	LOB to be assigned the content type
contenttype	String to be assigned

Exceptions

Table 79–87 SETCONTENTTYPE Procedure Exceptions

Exception	Description
SECUREFILE_BADLOB	lob_loc is not a SECUREFILE

Usage Notes

To clear an existing contenttype associated with a SECUREFILE, invoke SETCONTENTTYPE with contenttype set to empty string.

SETOPTIONS Procedures

This procedure enables/disables CSCE features on a per-LOB basis, overriding the default LOB column settings.

Syntax

```
DBMS_LOB.SETOPTIONS (
   lob_loc             IN     BLOB,
   option_types        IN     PLS_INTEGER,
   options             IN     PLS_INTEGER);

DBMS_LOB.SETOPTIONS (
  lob_loc             IN     CLOB CHARACTER SET ANY_CS,
  option_types        IN     PLS_INTEGER,
  options             IN     PLS_INTEGER);
```

Parameters

Table 79–88 SETOPTIONS Procedure Parameter

Parameter	Description
`lob_loc`	Locator for the `LOB` to be examined. For more information, see Operational Notes.
`option_type`	See DBMS_LOB Constants - Option Types on page 79-5
`options`	See DBMS_LOB Constants - Option Values on page 79-5

Exceptions

Table 79–89 SETOPTIONS Procedure Exceptions

Exception	Description
`SECUREFILE_BADLOB`	Unsupported object type for the operation
`INVALID_ARGVAL`	A parameter value was invalid
`QUERY_WRITE`	Cannot perform operation during a query
`BUFFERING_ENABLED`	Cannot perform operation with LOB buffering enabled

Usage Notes

- `DBMS_LOB.SETOPTIONS` cannot be used to enable or disable encryption on individual LOBs.
- You cannot turn compression or deduplication on or off for a SecureFile column that does not have those features on. The GETOPTIONS Functions and SetOptions Procedures work on individual SecureFiles. You can turn off a feature on a particular SecureFile and turn on a feature that has already been turned off by SetOptions, but you cannot turn on an option that has not been given to the SecureFile when the table was created.

SUBSTR Functions

This function returns amount bytes or characters of a LOB, starting from an absolute offset from the beginning of the LOB.

For fixed-width n-byte CLOBs, if the input amount for SUBSTR is greater than (32767/n), then SUBSTR returns a character buffer of length (32767/n), or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, n is the maximum byte-width used for characters in the CLOB.

Syntax

```
DBMS_LOB.SUBSTR (
   lob_loc     IN    BLOB,
   amount      IN    INTEGER := 32767,
   offset      IN    INTEGER := 1)
  RETURN RAW;

DBMS_LOB.SUBSTR (
   lob_loc     IN    CLOB   CHARACTER SET ANY_CS,
   amount      IN    INTEGER := 32767,
   offset      IN    INTEGER := 1)
  RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;

DBMS_LOB.SUBSTR (
   file_loc     IN    BFILE,
   amount      IN    INTEGER := 32767,
   offset      IN    INTEGER := 1)
  RETURN RAW;
```

Pragmas

```
pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 79–90 SUBSTR Function Parameters

Parameter	Description
lob_loc	Locator for the LOB to be read. For more information, see Operational Notes.
file_loc	The file locator for the LOB to be examined.
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to be read.
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).

Return Values

Table 79–91 SUBSTR Function Return Values

Return	Description
RAW	Function overloading that has a BLOB or BFILE in parameter.
VARCHAR2	CLOB version.

Table 79–91 (Cont.) SUBSTR Function Return Values

Return	Description
NULL	Either: - any input parameter is NULL - amount < 1 - amount > 32767 - offset < 1 - offset > LOBMAXSIZE

Exceptions

Table 79–92 SUBSTR Function Exceptions for BFILE operations

Exception	Description
UNOPENED_FILE	File is not opened using the input locator.
NOEXIST_DIRECTORY	Directory does not exist.
NOPRIV_DIRECTORY	You do not have privileges for the directory.
INVALID_DIRECTORY	Directory has been invalidated after the file was opened.
INVALID_OPERATION	File does not exist, or you do not have access privileges on the file.
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.
- When calling DBMS_LOB.SUBSTR from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.
- SUBSTR get s the LOB, if necessary, before read.

See Also:

- "INSTR Functions" on page 79-55
- "READ Procedures" on page 79-70
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

TRIM Procedures

This procedure trims the value of the internal LOB to the length you specify in the newlen parameter. Specify the length in bytes for BLOBs, and specify the length in characters for CLOBs.

> **Note:** The TRIM procedure decreases the length of the LOB to the value specified in the newlen parameter.

If you attempt to TRIM an empty LOB, then nothing occurs, and TRIM returns no error. If the new length that you specify in newlen is greater than the size of the LOB, then an exception is raised.

Syntax

```
DBMS_LOB.TRIM (
   lob_loc         IN OUT  NOCOPY BLOB,
   newlen          IN              INTEGER);

DBMS_LOB.TRIM (
   lob_loc         IN OUT  NOCOPY CLOB CHARACTER SET ANY_CS,
   newlen          IN              INTEGER);
```

Parameters

Table 79–93 TRIM Procedure Parameters

Parameter	Description
lob_loc	Locator for the internal LOB whose length is to be trimmed. For more information, see Operational Notes.
newlen	New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs.

Exceptions

Table 79–94 TRIM Procedure Exceptions

Exception	Description
VALUE_ERROR	lob_loc is NULL.
INVALID_ARGVAL	Either: - new_len < 0 - new_len > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close

it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- TRIM gets the LOB, if necessary, before altering the length of the LOB, unless the new length specified is '0'

See Also:

- "ERASE Procedures" on page 79-34
- "WRITEAPPEND Procedures" on page 79-81
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

WRITE Procedures

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the buffer parameter.

WRITE replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

Syntax

```
DBMS_LOB.WRITE (
   lob_loc  IN OUT NOCOPY  BLOB,
   amount   IN             INTEGER,
   offset   IN             INTEGER,
   buffer   IN             RAW);

DBMS_LOB.WRITE (
   lob_loc  IN OUT  NOCOPY CLOB   CHARACTER SET ANY_CS,
   amount   IN             INTEGER,
   offset   IN             INTEGER,
   buffer   IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 79–95 WRITE Procedure Parameters

Parameter	Description
lob_loc	Locator for the internal LOB to be written to. For more information, see Operational Notes
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to write
offset	Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1) for the write operation.
buffer	Input buffer for the write

Exceptions

Table 79–96 WRITE Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of lob_loc, amount, or offset parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: - amount < 1 - amount > MAXBUFSIZE - offset < 1 - offset > LOBMAXSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Table 79–96 (Cont.) WRITE Procedure Exceptions

Exception	Description
SECUREFILE_OUTOFBOUNDS	Attempted to perform a write operation past the end of a LOB having FRAGMENT_* on it

Usage Notes

- There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data currently in the LOB, then zero-byte fillers or spaces are inserted in the BLOB or CLOB respectively.
- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.
- When calling DBMS_LOB.WRITE from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.
- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- WRITE gets the LOB, if necessary, before writing the LOB, unless the write is specified to overwrite the entire LOB.

See Also:

- "APPEND Procedures" on page 79-19
- "COPY Procedures" on page 79-29
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

WRITEAPPEND Procedures

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the buffer parameter.

Syntax

```
DBMS_LOB.WRITEAPPEND (
   lob_loc IN OUT NOCOPY BLOB,
   amount  IN            INTEGER,
   buffer  IN            RAW);

DBMS_LOB.WRITEAPPEND (
   lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
   amount  IN            INTEGER,
   buffer  IN            VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 79–97 WRITEAPPEND Procedure Parameters

Parameter	Description
lob_loc	Locator for the internal LOB to be written to. For more information, see Operational Notes
amount	Number of bytes (for BLOBs) or characters (for CLOBs) to write
buffer	Input buffer for the write

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

Exceptions

Table 79–98 WRITEAPPEND Procedure Exceptions

Exception	Description
VALUE_ERROR	Any of lob_loc, amount, or offset parameters are NULL, out of range, or INVALID.
INVALID_ARGVAL	Either: - amount < 1 - amount > MAXBUFSIZE
QUERY_WRITE	Cannot perform a LOB write inside a query or PDML slave
BUFFERING_ENABLED	Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB

Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

- When calling DBMS_LOB.WRITEAPPEND from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.
- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit or rollback the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
- WRITEAPPEND gets the LOB, if necessary, before appending to the LOB.

80

DBMS_LOCK

The DBMS_LOCK package provides an interface to Oracle Lock Management services. You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

> **See Also:** For more information, and an example of how to use the DBMS_LOCK package, see "About User Locks" in *Oracle Database Advanced Application Developer's Guide*

This chapter contains the following topics:

- Using DBMS_LOCK
  - Overview
  - Security Model
  - Constants
  - Rules and Limits
  - Operational Notes
- Summary of DBMS_LOCK Subprograms

Using DBMS_LOCK

- Overview
- Security Model
- Constants
- Rules and Limits
- Operational Notes

Overview

Some uses of user locks:

- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

Security Model

There might be operating system-specific limits on the maximum number of total locks available. This *must* be considered when using locks or making this package available to other users. Consider granting the `EXECUTE` privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant `EXECUTE` privilege to specific users. An example of a cover package is documented in the `DBMS_LOCK.SQL` package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.

Constants

The DBMS_LOCK package uses the constants shown in Table 80–1.

Table 80–1 DBMS_LOCK Constants

Name	Alternate Name(s)	Type	Value	OEM Abbreviation	Description
NL_MODE	NuL1	INTEGER	1	-	-
SS_MODE	Sub Shared	INTEGER	2	ULRS	This can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object.
SX_MODE	■ Sub eXclusive ■ Row Exclusive Mode	INTEGER	3	ULRX	This can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object.
S_MODE	■ Shared ■ Row Exclusive Mode ■ Intended Exclusive	INTEGER	4	ULRSX	-
SSX_MODE	■ Shared Sub eXclusive ■ Share Row Exclusive Mode	INTEGER	5	-	This indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks.
X_MODE	Exclusive	INTEGER	6	ULX	-

These are the various lock modes (nl -> "NuLl", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

Rules and Limits

When another process holds "held", an attempt to get "get" does the following:

Table 80–2 Lock Compatibility

HELD MODE	GET NL	GET SS	GET SX	GET S	GET SSX	GET X
NL	Success	Success	Success	Success	Success	Success
SS	Success	Success	Success	Success	Success	Fail
SX	Success	Success	Success	Fail	Fail	Fail
S	Success	Success	Fail	Success	Fail	Fail
SSX	Success	Success	Fail	Fail	Fail	Fail
X	Success	Fail	Fail	Fail	Fail	Fail

```
maxwait  constant integer := 32767;
```

The constant `maxwait` waits forever.

Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views. User locks are automatically released when a session terminates.The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

`DBMS_LOCK` is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

Summary of DBMS_LOCK Subprograms

Table 80–3 DBMS_LOCK Package Subprograms

Subprogram	Description
ALLOCATE_UNIQUE Procedure on page 80-9	Allocates a unique lock ID to a named lock.
CONVERT Function on page 80-11	Converts a lock from one mode to another.
RELEASE Function on page 80-12	Releases a lock.
REQUEST Function on page 80-13	Requests a lock of a specific mode.
SLEEP Procedure on page 80-14	Puts a procedure to sleep for a specific time.

ALLOCATE_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) a specifiedlock name. Lock identifiers are used to enable applications to coordinate their use of locks. This is provided because it may be easier for applications to coordinate their use of locks based on lock names rather than lock numbers.

Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (
   lockname         IN  VARCHAR2,
   lockhandle       OUT VARCHAR2,
   expiration_secs  IN  INTEGER   DEFAULT 864000);
```

Parameters

Table 80–4 ALLOCATE_UNIQUE Procedure Parameters

Parameter	Description
lockname	Name of the lock for which you want to generate a unique ID. Do not use lock names beginning with ORA$; these are reserved for products supplied by Oracle.
lockhandle	Returns the handle to the lock ID generated by ALLOCATE_UNIQUE. You can use this handle in subsequent calls to REQUEST, CONVERT, and RELEASE. A handle is returned instead of the actual lock ID to reduce the chance that a programming error accidentally creates an incorrect, but valid, lock ID. This provides better isolation between different applications that are using this package. LOCKHANDLE can be up to VARCHAR2 (128). All sessions using a lock handle returned by ALLOCATE_UNIQUE with the same lock name are referring to the same lock. Therefore, do not pass lock handles from one session to another.
expiration_specs	Number of seconds to wait after the last ALLOCATE_UNIQUE has been performed on a specified lock, before permitting that lock to be deleted from the DBMS_LOCK_ALLOCATED table. The default waiting period is 10 days. You should not delete locks from this table. Subsequent calls to ALLOCATE_UNIQUE may delete expired locks to recover space.

Usage Notes

If you choose to identify locks by name, you can use ALLOCATE_UNIQUE to generate a unique lock identification number for these named locks.

The first session to call ALLOCATE_UNIQUE with a new lock name causes a unique lock ID to be generated and stored in the dbms_lock_allocated table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least expiration_secs (defaults to 10 days) past the last call to ALLOCATE_UNIQUE with the specified lock name. After this time, the row in the dbms_lock_allocated table for this lock name may be deleted in order to recover space. ALLOCATE_UNIQUE performs a commit.

Note: Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a specified name.

Exceptions

`ORA-20000,ORU-10003`: Unable to find or insert lock <`lockname`> into catalog `dbms_lock_allocated`.

CONVERT Function

This function converts a lock from one mode to another. CONVERT is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.CONVERT(
   id         IN INTEGER ||
   lockhandle IN VARCHAR2,
   lockmode   IN INTEGER,
   timeout    IN NUMBER DEFAULT MAXWAIT)
  RETURN INTEGER;
```

Parameters

Table 80–5 CONVERT Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	New mode that you want to assign to the specified lock. For the available modes and their associated integer identifiers, see Constants on page 80-5.
timeout	Number of seconds to continue trying to change the lock mode. If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout).

Return Values

Table 80–6 CONVERT Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Don't own lock specified by id or lockhandle
5	Illegal lock handle

RELEASE Function

This function explicitly releases a lock previously acquired using the REQUEST function. Locks are automatically released at the end of a session. RELEASE is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.RELEASE (
   id         IN INTEGER)
  RETURN INTEGER;

DBMS_LOCK.RELEASE (
   lockhandle IN VARCHAR2)
  RETURN INTEGER;
```

Parameters

Table 80–7 RELEASE Function Parameter

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.

Return Values

Table 80–8 RELEASE Function Return Values

Return Value	Description
0	Success
3	Parameter error
4	Do not own lock specified by id or lockhandle
5	Illegal lock handle

REQUEST Function

This function requests a lock with a specified mode. REQUEST is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.REQUEST(
   id                 IN  INTEGER ||
   lockhandle         IN  VARCHAR2,
   lockmode           IN  INTEGER DEFAULT X_MODE,
   timeout            IN  INTEGER DEFAULT MAXWAIT,
   release_on_commit  IN  BOOLEAN DEFAULT FALSE)
  RETURN INTEGER;
```

The current default values, such as X_MODE and MAXWAIT, are defined in the DBMS_LOCK package specification.

Parameters

Table 80–9 REQUEST Function Parameters

Parameter	Description
id or lockhandle	User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change.
lockmode	Mode that you are requesting for the lock. For the available modes and their associated integer identifiers, see Constants on page 80-5.
timeout	Number of seconds to continue trying to grant the lock. If the lock cannot be granted within this time period, then the call returns a value of 1 (timeout).
release_on_commit	Set this parameter to TRUE to release the lock on commit or roll-back. Otherwise, the lock is held until it is explicitly released or until the end of the session.

Return Values

Table 80–10 REQUEST Function Return Values

Return Value	Description
0	Success
1	Timeout
2	Deadlock
3	Parameter error
4	Already own lock specified by id or lockhandle
5	Illegal lock handle

SLEEP Procedure

This procedure suspends the session for a specified period of time.

Syntax

```
DBMS_LOCK.SLEEP (
   seconds  IN NUMBER);
```

Parameters

Table 80–11 SLEEP Procedure Parameters

Parameter	Description
seconds	Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.

81

DBMS_LOGMNR

The DBMS_LOGMNR package, one of a set of LogMiner packages, contains the subprograms you use to initialize the LogMiner tool and to begin and end a LogMiner session.

> **See Also:** *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

- Using DBMS_LOGMNR
  - Overview
  - Security Model
  - Constants
  - Views
  - Operational Notes
- Summary of DBMS_LOGMNR Subprograms

Using DBMS_LOGMNR

This section contains the following topics, which relate to using the `DBMS_LOGMNR` package:

- Overview
- Security Model
- Constants
- Views
- Operational Notes

Overview

Oracle LogMiner, which is part of Oracle Database, enables you to query online and archived redo log files through a SQL interface. The `DBMS_LOGMNR` package provides the majority of the tools needed to start and stop LogMiner and specify the redo log files of interest.

All changes made to user data or to the database dictionary are recorded in the Oracle redo log files so that database recovery operations can be performed. You can take advantage of the data recorded in the redo log files to accomplish other tasks, such as:

- Pinpointing when a logical corruption to a database, such as errors made at the application level, may have begun
- Determining what actions you would have to take to perform fine-grained recovery at the transaction level.
- Performance tuning and capacity planning through trend analysis.
- Track any data manipulation language (DML) and data definition language (DDL) statements executed on the database, the order in which they were executed, and who executed them.

> **See Also:** Chapter 82, "DBMS_LOGMNR_D" for information on the package subprograms that extract a LogMiner dictionary and re-create LogMiner tables in alternate tablespaces

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR package.

Constants

The DBMS_LOGMNR package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_LOGMNR.NEW.

Table 81–1 describes the constants for the ADD_LOGFILE options flag in the DBMS_LOGMNR package.

Table 81–1 Constants for ADD_LOGFILE Options Flag

Constant	Description
NEW	Implicitly calls the DBMS_LOGMNR.END_LOGMNR procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify.
ADDFILE	Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception (ORA-01289). This is the default if no options flag is specified.

Table 81–2 describes the constants for the START_LOGMNR options flag in the DBMS_LOGMNR package.

Table 81–2 Constants for START_LOGMNR Options Flag

Constant	Description
COMMITTED_DATA_ONLY	If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on). If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).
SKIP_CORRUPTION	Directs a select operation on the V$LOGMNR_CONTENTS view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the INFO column in the V$LOGMNR_CONTENTS view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the OPERATION column contains the value CORRUPTED_BLOCKS, and the STATUS column contains the value 1343.
DDL_DICT_TRACKING	If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct SQL_REDO and SQL_UNDO information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open. This option cannot be used in conjunction with the DICT_FROM_ONLINE_CATALOG option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9*i*.

Table 81–2 (Cont.) Constants for START_LOGMNR Options Flag

Constant	Description
DICT_FROM_ONLINE_CATALOG	Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed. This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files. Expect to see a value of 2 in the STATUS column of the V$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.
DICT_FROM_REDO_LOGS	If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure with the CONTINUOUS_MINE option.
NO_SQL_DELIMITER	If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.
NO_ROWID_IN_STMT	If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled. When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.
PRINT_PRETTY_SQL	If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.
CONTINUOUS_MINE	Directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You only need to specify the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. You are not required to specify any redo log files explicitly. LogMiner automatically adds and mines the (archived and online) redo log files for the data of interest. This option requires that LogMiner is connected to the same database instance that is generating the redo log files. It also requires that the database be mounted and that archiving be enabled. Beginning with Oracle Database release 10.1, the CONTINUOUS_MINE options is supported for use in an Oracle Real Application Clusters (RAC) environment.
STRING_LITERALS_IN_STMT	If set, SQL_REDO and SQL_UNDO use literals for numbers and datetime and interval column types.

Views

The DBMS_LOGMNR package uses the views listed in the section on Accessing LogMiner Operational Information in Views in *Oracle Database Utilities*.

Operational Notes

A **LogMiner session** begins with a call to `DBMS_LOGMNR.ADD_LOGFILE` or `DBMS_LOGMNR.START_LOGMNR` (the former if you plan to specify log files explicitly; the latter if you plan to use continuous mining). The session ends with a call to `DBMS_LOGMNR.END_LOGMNR`. Within a LogMiner session, you can specify the redo log files to be analyzed and the SCN or time range of interest; then you can issue SQL `SELECT` statements against the `V$LOGMNR_CONTENTS` view to retrieve the data of interest.

Summary of DBMS_LOGMNR Subprograms

Table 81–3 DBMS_LOGMNR Package Subprograms

Subprogram	Description
ADD_LOGFILE Procedure on page 81-10	Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session
COLUMN_PRESENT Function on page 81-12	Call this function for any row returned from the `V$LOGMNR_CONTENTS` view to determine if undo or redo column values exist for the column specified by the `column_name` input parameter to this function
END_LOGMNR Procedure on page 81-14	Finishes a LogMiner session
MINE_VALUE Function on page 81-15	Call this function for any row returned from the `V$LOGMNR_CONTENTS` view to retrieve the undo or redo column value of the column specified by the `column_name` input parameter to this function
REMOVE_LOGFILE Procedure on page 81-17	Removes a redo log file from the list of redo log files for LogMiner to process
START_LOGMNR Procedure on page 81-18	Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to `DBMS_LOGMNR.ADD_LOGFILE`)

ADD_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

Syntax

```
DBMS_LOGMNR.ADD_LOGFILE (
   LogFileName     IN VARCHAR2,
   options         IN BINARY_INTEGER default ADDFILE );
```

Parameters

Table 81–4 ADD_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session.
options	Does one of the following: ■ Starts a new LogMiner session and a new list of redo log files for analysis (DBMS_LOGMNR.NEW) ■ Adds a file to an existing list of redo log files for analysis (DBMS_LOGMNR.ADDFILE) See Table 81–1, " Constants for ADD_LOGFILE Options Flag".

Exceptions

Table 81–5 ADD_LOGFILE Procedure Exceptions

Exception	Description
ORA-01284	Specified file cannot be opened.
ORA-01287	Specified file is from a different database incarnation.
ORA-01289	Specified file has already been added to the list. Duplicate redo log files cannot be added.
ORA-01290	Specified file is not in the current list and therefore cannot be removed from the list.
ORA-01324	Specified file cannot be added to the list because there is a DB_ID mismatch.

Usage Notes

- Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- Unless you specify the CONTINUOUS_MINE option, the LogMiner session must be set up with a list of redo log files to be analyzed. Use the ADD_LOGFILE procedure to specify the list of redo log files to analyze.
- If you are not using the CONTINUOUS_MINE option and you want to analyze more than one redo log file, you must call the ADD_LOGFILE procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.

- Both archived and online redo log files can be mined.
- After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database RESETLOGS SCN as the first redo log file. (The database RESETLOGS SCN uniquely identifies each execution of an ALTER DATABASE OPEN RESETLOGS statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)
- To analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

COLUMN_PRESENT Function

This function is designed to be used in conjunction with the MINE_VALUE function.

If the MINE_VALUE function returns a NULL value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a NULL value.

To distinguish between these two cases, use the COLUMN_PRESENT function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

Syntax

```
DBMS_LOGMNR.COLUMN_PRESENT (
     sql_redo_undo      IN  RAW,
     column_name        IN  VARCHAR2 default '') RETURN NUMBER;
```

Parameters

Table 81–6 COLUMN_PRESENT Function Parameters

Parameter	Description
sql_redo_undo	Specifies either the REDO_VALUE or the UNDO_VALUE column in the V$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.
column_name	Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.

Return Values

Table 81–7 describes the return values for the COLUMN_PRESENT function. The COLUMN_PRESENT function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of NULL values returned by the DBMS_LOGMNR.MINE_VALUE function.

Table 81–7 Return Values for COLUMN_PRESENT Function

Return	Description
0	Specified column is not present in this row of V$LOGMNR_CONTENTS.
1	Column is present in this row of V$LOGMNR_CONTENTS.

Exceptions

Table 81–8 COLUMN_PRESENT Function Exceptions

Exception	Description
ORA-01323	Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Value specified for the column_name parameter is not a fully qualified column name.

Usage Notes

- To use the COLUMN_PRESENT function, you must have successfully started LogMiner.
- The COLUMN_PRESENT function must be invoked in the context of a select operation on the V$LOGMNR_CONTENTS view.
- The COLUMN_PRESENT function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
  - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be NULL).
  - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be NULL).

END_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a database session or when you call `DBMS_LOGMNR.ADD_LOGFILE` and specify the `NEW` option.

Syntax

```
DBMS_LOGMNR.END_LOGMNR;
```

Exceptions

Table 81–9 END_LOGMNR Procedure Exception

Exception	Description
`ORA-01307`	No LogMiner session is currently active. The `END_LOGMNR` procedure was called without adding any log files or before the `START_LOGMNR` procedure was called

MINE_VALUE Function

This function facilitates queries based on a column's data value. This function takes two arguments. The first one specifies whether to mine the redo (REDO_VALUE) or undo (UNDO_VALUE) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The MINE_VALUE function always returns a string that can be converted back to the original datatype.

Syntax

```
DBMS_LOGMNR.MINE_VALUE (
     sql_redo_undo      IN  RAW,
     column_name        IN  VARCHAR2 default '') RETURN VARCHAR2;
```

Parameters

Table 81–10 MINE_VALUE Function Parameters

Parameter	Description
sql_redo_undo	Specifies either the REDO_VALUE or the UNDO_VALUE column in the V$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.
column_name	Specifies the fully qualified name (schema.table.column) of the column for which this function will return information.

Return Values

Table 81–11 Return Values for MINE_VALUE Function

Return	Description
NULL	The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the DBMS_LOGMNR.COLUMN_PRESENT function.
NON-NULL	The column is contained within the self-describing record; the value is returned in string format.

Exceptions

Table 81–12 MINE_VALUE Function Exceptions

Exception	Description
ORA-01323	Invalid state. Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.
ORA-00904	Invalid identifier. The value specified for the column_name parameter was not a fully qualified column name.

Usage Notes

- To use the MINE_VALUE function, you must have successfully started LogMiner.
- The MINE_VALUE function must be invoked in the context of a select operation from the V$LOGMNR_CONTENTS view.

- The MINE_VALUE function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
  - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be null).
  - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be null).

REMOVE_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

> **Note:** This procedure replaces the REMOVEFILE constant that was an option on the ADD_LOGFILE procedure prior to Oracle Database 10*g*.

Syntax

```
DBMS_LOGMNR.REMOVE_LOGFILE (
   LogFileName     IN VARCHAR2);
```

Parameters

Table 81–13 REMOVE_LOGFILE Procedure Parameters

Parameter	Description
LogFileName	Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session.

Exceptions

Table 81–14 REMOVE_LOGFILE Procedure Exception

Exception	Description
ORA-01290	Cannot remove unlisted log file

Usage Notes

- Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- Even if you remove all redo log files from the list, any subsequent calls you make to the ADD_LOGFILE procedure must match the database ID and RESETLOGS SCN of the removed redo log files. Therefore, to analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.

START_LOGMNR Procedure

This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

Syntax

```
DBMS_LOGMNR.START_LOGMNR (
   startScn           IN NUMBER default 0,
   endScn             IN NUMBER default 0,
   startTime          IN DATE default '01-jan-1988',
   endTime            IN DATE default '31-dec-2110',
   DictFileName       IN VARCHAR2 default '',
   Options            IN BINARY_INTEGER default 0 );
```

Parameters

Table 81–15 START_LOGMNR Procedure Parameters

Parameter	Description
startScn	Directs LogMiner to return only redo records with an SCN greater than or equal to the startScn specified. This fails if there is no redo log file containing the specified startScn value. (You can query the FILENAME, LOW_SCN, and NEXT_SCN columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of SCN values contained in each redo log file.)
endScn	Directs LogMiner to return only redo records with an SCN less than or equal to the endScn specified. If you specify an endScn value that is beyond the value in any redo log file, then LogMiner will use the greatest endScn value in the redo log file that contains the most recent changes. (You can query the FILENAME, LOW_SCN, and NEXT_SCN columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of SCN values contained in each redo log file.)
startTime	Directs LogMiner to return only redo records with a timestamp greater than or equal to the startTime specified. This fails if there is no redo log file containing the specified startTime value. (You can query the FILENAME, LOW_TIME, and HIGH_TIME columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if startScn is specified. See the Usage Notes for additional information.
endTime	Directs LogMiner to return only redo records with a timestamp less than or equal to the endTime specified. If you specify an endTime value that is beyond the value in any redo log file, then LogMiner will use the greatest endTime in the redo log file that contains the most recent changes. You can query the FILENAME, LOW_TIME, and HIGH_TIME columns in the V$LOGMNR_LOGS view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if endScn is specified. See the Usage Notes for additional information.

Table 81–15 (Cont.) START_LOGMNR Procedure Parameters

Parameter	Description
DictFileName	Specifies the flat file that contains the LogMiner dictionary. It is used to reconstruct SQL_REDO and SQL_UNDO columns in V$LOGMNR_CONTENTS, as well as to fully translate SEG_NAME, SEG_OWNER, SEG_TYPE_NAME, TABLE_NAME, and TABLE_SPACE columns. The fully qualified path name for the LogMiner dictionary file must be specified. (This file must have been created previously through the DBMS_LOGMNR_D.BUILD procedure.) You need to specify this parameter only if neither DICT_FROM_REDO_LOGS nor DICT_FROM_ONLINE_CATALOG is specified.
options	See Table 81–2, " Constants for START_LOGMNR Options Flag".

Exceptions

Table 81–16 START_LOGMNR Procedure Exceptions

Exception	Description
ORA-01280	Internal error encountered.
ORA-01281	startScn or endScn parameter value is not a valid SCN, or endScn is less than startScn.
ORA-01282	value for the startTime parameter was greater than the value specified for the endTime parameter, or there was no redo log file that was compatible with the date range specified with the startTime and endTime parameters.
ORA-01283	Options parameter specified is invalid.
ORA-01284	LogMiner dictionary file specified in the DictFileName parameter has a full path length greater than 256 characters, or the file cannot be opened.
ORA-01285	Error reading specified file.
ORA-01291	Redo log files that are needed to satisfy the user's requested SCN or time range are missing.
ORA-01292	No log file has been specified for the current LogMiner session.
ORA-01293	Mounted database required for specified LogMiner options.
ORA-01294	Error occurred while processing information in the specified dictionary file, possible corruption.
ORA-01295	Specified LogMiner dictionary does not correspond to the database that produced the log files being analyzed.
ORA-01296	Character set mismatch between specified LogMiner dictionary and log files.
ORA-01297	Redo version mismatch between LogMiner dictionary and log files.
ORA-01299	Specified LogMiner dictionary corresponds to a different database incarnation.
ORA-01300	Writable database required for specified LogMiner options.

Usage Notes

- LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system. See *Oracle Database Utilities* and

Chapter 82, "DBMS_LOGMNR_D" in this manual for more information about the LogMiner dictionary.

- After executing the START_LOGMNR procedure, you can query the following views:
  - V$LOGMNR_CONTENTS - contains history of information in redo log files
  - V$LOGMNR_DICTIONARY - contains current information about the LogMiner dictionary file extracted to a flat file
  - V$LOGMNR_PARAMETERS - contains information about the LogMiner session

  (You can query the V$LOGMNR_LOGS view after a redo log file list has been added to the list of files that LogMiner is to mine.)
- Parameters and options are not persistent across calls to DBMS_LOGMNR.START_LOGMNR. You must specify all desired parameters and options (including SCN and time ranges) each time you call DBMS_LOGMNR.START_LOGMNR
- Be aware that specifying redo log files using a timestamp is not precise.
- The CONTINUOUS_MINE option directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You need to specify only the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. Keep the following in mind when using the CONTINUOUS_MINE option:
  - The database control file will hold information about a limited number of archived redo log files, although the number of entries can be quite large. Query the V$ARCHIVED_LOGS view to determine which redo log file entries will be found by LogMiner.

    Even if an entry is listed in the database control file (and the V$ARCHIVED_LOGS view), the archived redo log file may not be accessible by LogMiner for various reasons. For example, the archived redo log file may have been deleted or moved from its location (maybe because of a backup operation to tape), or the directory where it resides may not be not available.
  - If you specify the CONTINUOUS_MINE option and an ending time or SCN that will occur in the future (or you do not specify an end time or SCN), a query of the V$LOGMNR_CONTENTS view will not finish until the database has generated redo log files beyond the specified time or SCN. In this scenario, LogMiner will automatically add archived redo log files to the LogMiner redo log file list as they are generated. In addition, in this scenario only, LogMiner may automatically remove redo log files from the list to keep it at 50 processed redo files. This is to save PGA memory as LogMiner automatically adds redo log files to the list. If LogMiner did not perform automated removal, memory could eventually be exhausted.
  - LogMiner can mine online redo logs. However, if the CONTINUOUS_MINE option is not specified, it is possible that the database is writing to the online redo log file at the same time that LogMiner is reading the online redo log file. If a log switch occurs while LogMiner is reading an online redo log file, the database will overwrite what LogMiner is attempting to read. The data that LogMiner returns if the file it is trying to read gets overwritten by the database is unpredictable.
- Keep the following in mind regarding starting and ending times or SCN ranges:

- If you specify neither a startTime nor a startScn parameter, LogMiner will set the startScn parameter to use the lowest SCN value from the redo log file that contains the oldest changes.
- If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.
- If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.
- If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify DBMS_LOGMNR.START_LOGMNR without the CONTINUOUS_MINE option, and you specify:
  * 0 for the startTime or startScn value, then the lowest SCN in the LogMiner redo log file list will be used as the startScn
  * A nonzero number for the startTime or startScn value, then an error is returned
  * 0 or a nonzero number for the endTime or endScn value, then the highest SCN in the LogMiner redo log file list will be used as the endScn
- If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify DBMS_LOGMNR.START_LOGMNR with the CONTINUOUS_MINE option, and you specify:
  * 0 for the startTime or startScn value, then an error is returned.
  * A startTime or startScn value that is greater than any value in the database's archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the V$LOGMNR_CONTENTS view.
  * An endTime or endScn parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the V$LOGMNR_CONTENTS view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.
  * 0 for the endTime or endScn parameter value, then LogMiner includes the online redo log files when it mines. When you query the V$LOGMNR_CONTENTS view, rows will be returned from this view as changes are made to the database, and will not stop until you enter CTL+C or you terminate the PL/SQL cursor.

82

DBMS_LOGMNR_D

The DBMS_LOGMNR_D package, one of a set of LogMiner packages, contains two subprograms:

- The BUILD procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The SET_TABLESPACE procedure re-creates all LogMiner tables in an alternate tablespace.

  The **LogMiner data dictionary** consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the **LogMiner dictionary** throughout the LogMiner documentation.

  See Also: *Oracle Database Utilities* for information regarding LogMiner.

This chapter contains the following topics:

- Using DBMS_LOGMNR_D
  - Overview
  - Security Model
- Summary of DBMS_LOGMNR_D Subprograms

Using DBMS_LOGMNR_D

This section contains the following topics, which relate to using the `DBMS_LOGMNR_D` package:

- Overview
- Security Model

Overview

LogMiner requires a dictionary to translate object IDs into object names when it returns redo data to you. LogMiner gives you three options for supplying the dictionary:

- Using the online catalog
- Extracting a LogMiner dictionary to the redo log files
- Extracting a LogMiner dictionary to a flat file

Use the `BUILD` procedure to extract the LogMiner dictionary to the redo log files or a flat file. If you want to specify the online catalog as the dictionary source, you do so when you start LogMiner with the `DBMS_LOGMNR.START_LOGMNR` package.

Use the `SET_TABLESPACE` procedure if you want LogMiner tables to use a tablespace other than the default `SYSAUX` tablespace.

> **See Also:** DBMS_LOGMNR for information on the package subprograms used in running a LogMiner session.

Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR_D package.

Summary of DBMS_LOGMNR_D Subprograms

Table 82–1 DBMS_LOGMNR_D Package Subprograms

Subprogram	Description
BUILD Procedure on page 82-6	Extracts the LogMiner dictionary to either a flat file or one or more redo log files
SET_TABLESPACE Procedure on page 82-9	Re-creates all LogMiner tables in an alternate tablespace

BUILD Procedure

This procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file.

Syntax

```
DBMS_LOGMNR_D.BUILD (
     dictionary_filename  IN  VARCHAR2,
     dictionary_location  IN  VARCHAR2,
     options              IN  NUMBER);
```

Parameters

Table 82–2 BUILD Procedure Parameters

Parameter	Description
dictionary_filename	Specifies the name of the LogMiner dictionary file.
dictionary_location	Specifies the path to the LogMiner dictionary file directory.
options	Specifies that the LogMiner dictionary is written to either a flat file (STORE_IN_FLAT_FILE) or the redo log files (STORE_IN_REDO_LOGS).

Exceptions

Table 82–3 BUILD Procedure Exceptions

Exception	Description
ora-01302	Dictionary build options are missing or incorrect. This error is returned under the following conditions: ■ If the value of the OPTIONS parameter is not one of the supported values (STORE_IN_REDO_LOGS, STORE_IN_FLAT_FILE) or is not specified ■ If the STORE_IN_REDO_LOGS option is not specified and neither the dictionary_filename nor the dictionary_location parameter is specified ■ If the STORE_IN_REDO_LOGS option is specified and either the dictionary_filename or the dictionary_location parameter is specified
ora-01308	Initialization parameter UTL_FILE_DIR is not set.
ora-01336	Specified dictionary file cannot be opened. This error is returned under the following conditions: ■ The specified value for the dictionary_location does not exist. ■ The UTL_FILE_DIR initialization parameter is not set to have access to the dictionary_location ■ The dictionary file is read-only.

Usage Notes

- To extract the LogMiner dictionary to a flat file, you must supply a filename and location.

To extract the LogMiner dictionary to the redo log files, specify only the STORE_IN_REDO_LOGS option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.

The combinations of parameters used result in the following behavior:

- If you do not specify any parameters, an error is returned.
- If you specify a filename and location, without any options, the LogMiner dictionary is extracted to a flat file with that name.
- If you specify a filename and location, as well as the STORE_IN_FLAT_FILE option, the LogMiner dictionary is extracted to a flat file with the specified name.
- If you do not specify a filename and location, but do specify the STORE_IN_REDO_LOGS option, the LogMiner dictionary is extracted to the redo log files.
- If you specify a filename and location, as well as the STORE_IN_REDO_LOGS option, an error is returned.
- If you do not specify a filename and location, but do specify the STORE_IN_FLAT_FILE option, an error is returned.

- Ideally, the LogMiner dictionary file will be created after all database dictionary changes have been made and prior to the creation of any redo log files that are to be analyzed. As of Oracle9*i* release 1 (9.0.1), you can use LogMiner to dump the LogMiner dictionary to the redo log files or a flat file, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.
- Do not run the DBMS_LOGMNR_D.BUILD procedure if there are any ongoing DDL operations.
- The database must be open when you run the DBMS_LOGMNR_D.BUILD procedure.
- When extracting a LogMiner dictionary to a flat file, the procedure queries the dictionary tables of the current database and creates a text-based file containing the contents of the tables. To extract a LogMiner dictionary to a flat file, the following conditions must be met:
  - You must specify a directory for use by the PL/SQL procedure. To do so, set the initialization parameter UTL_FILE_DIR in the initialization parameter file. For example:

    ```
    UTL_FILE_DIR = /oracle/dictionary
    ```

    After setting the parameter, you must shut down and restart the database for this parameter to take effect. If you do not set this parameter, the procedure will fail.
  - You must ensure that no DDL operations occur while the LogMiner dictionary build is running. Otherwise, the LogMiner dictionary file may not contain a consistent snapshot of the database dictionary.

  Be aware that the DDL_DICT_TRACKING option to the DBMS_LOGMNR.START_LOGMNR procedure is not supported for flat file dictionaries created prior to Oracle9*i*. If you attempt to use the DDL_DICT_TRACKING option with a LogMiner database extracted to a flat file prior to Oracle9*i*, the ORA-01330 error (problem loading a required build table) is returned.
- To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:

- The DBMS_LOGMNR_D.BUILD procedure must be run on a system that is running Oracle9*i* or later.
- Archivelog mode must be enabled in order to generate usable redo log files.
- The COMPATIBLE parameter in the initialization parameter file must be set to 9.2.0 or higher.
- The database to which LogMiner is attached must be Oracle9*i* or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner offers. See *Oracle Database Utilities* for information about using supplemental logging with LogMiner.

Examples

Example 1: Extracting the LogMiner Dictionary to a Flat File

The following example extracts the LogMiner dictionary file to a flat file named dictionary.ora in a specified path (/oracle/database).

```
SQL> EXECUTE dbms_logmnr_d.build('dictionary.ora', -
     '/oracle/database/', -
     options => dbms_logmnr_d.store_in_flat_file);
```

Example 2: Extracting the LogMiner Dictionary to the Redo Log Files

The following example extracts the LogMiner dictionary to the redo log files.

```
SQL> EXECUTE dbms_logmnr_d.build( -
     options => dbms_logmnr_d.store_in_redo_logs);
```

SET_TABLESPACE Procedure

By default, all LogMiner tables are created to use the SYSAUX tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to an alternate tablespace.

Syntax

```
DBMS_LOGMNR_D.SET_TABLESPACE (
     new_tablespace        IN VARCHAR2);
```

Parameters

Table 82–4 SET_TABLESPACE Parameter

Parameter	Description
new_tablespace	A string naming a preexisting tablespace. To move all LogMiner tables to employ this tablespace, supply this parameter.

Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the SYSTEM tablespace. Oracle encourages such users to consider using the SET_TABLESPACE procedure to move the tables to the SYSAUX tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

> **See Also:** *Oracle Database Concepts* and *Oracle Database SQL Language Reference* for information about tablespaces and how to create them

Example: Using the DBMS_LOGMNR_D.SET_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the DBMS_LOGMNR_D.SET_TABLESPACE procedure.

```
SQL> CREATE TABLESPACE  logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f'
     SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;

SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
```

83

DBMS_LOGSTDBY

The DBMS_LOGSTDBY package provides subprograms for configuring and managing the logical standby database environment.

> **See Also:** *Oracle Data Guard Concepts and Administration* for more information about SQL Apply and logical standby databases

This chapter contains the following topics:

- Using DBMS_LOGSTDBY
  - Overview
  - Operational Notes
- Summary of DBMS_LOGSTDBY Subprograms

Using DBMS_LOGSTDBY

This section contains topics which relate to using the `DBMS_LOGSTDBY` package.

- Overview
- Operational Notes

Overview

The DBMS_LOGSTDBY package helps you manage the SQL Apply (logical standby database) environment. The subprograms in the DBMS_LOGSTDBY package help you to accomplish the following main objectives:

- Manage configuration parameters used by SQL Apply.

  For example, controlling how transactions are applied on the logical standby database, how much shared pool is used, and how many processes are used by SQL Apply to mine and apply the changes.
- Ensure an appropriate level of supplemental logging is enabled, and a LogMiner dictionary is built correctly for logical standby database creation.
- Provide a way to skip the application of changes to selected tables or entire schemas in the logical standby database, and specify ways to handle exceptions encountered by SQL Apply.
- Allow controlled access to tables in the logical standby database that may require maintenance.

Operational Notes

Privileges and Security

A prototype role, LOGSTDBY_ADMINISTRATOR, is created by default with RESOURCE, and EXECUTE on DBMS_LOGSTDBY privileges. If you choose to use this role, consider granting ALTER DATABASE and ALTER SESSION privileges to the role so that the grantee can start and stop SQL Apply and can enable and disable the database guard. Oracle recommends using an account with DBA privileges to perform administration tasks on logical standby databases.

The six procedures associated with skipping transactions (SKIP and UNSKIP, SKIP_ERROR and UNSKIP_ERROR, and SKIP_TRANSACTION and UNSKIP_TRANSACTION) all require DBA privileges to execute because their scope may contain wildcard schemas. Oracle recommends that where SKIP procedures are specified, these be owned by a secure account with appropriate privileges on the schemas they act on (for example, SYS).

Summary of DBMS_LOGSTDBY Subprograms

Table 83–1 DBMS_LOGSTDBY Package Subprograms

Subprogram	Description
APPLY_SET Procedure on page 83-7	Sets the values of various parameters that configure and maintain SQL Apply
APPLY_UNSET Procedure on page 83-10	Restores the default values of various parameters that configure and maintain SQL Apply
BUILD Procedure on page 83-11	Ensures supplemental logging is enabled properly and builds the LogMiner dictionary
INSTANTIATE_TABLE Procedure on page 83-12	Creates and populates a table in the standby database from a corresponding table in the primary database
IS_APPLY_SERVER Function on page 83-14	This function returns `TRUE` if it is executed from PL/SQL in the context of a logical standby apply server process. This function is used in conjunction with triggers that have the `fire_once` parameter in the `DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY` subprogram set to `FALSE` (the default is `TRUE`). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.
MAP_PRIMARY_SCN Function on page 83-15	Maps an SCN relevant to the primary database to a corresponding SCN at the logical standby database. The mapped SCN is conservative in nature, and can thus be used to flash back the logical standby database to compensate for a flashback database operation performed at the primary database.
PREPARE_FOR_NEW_PRIMARY Procedure on page 83-16	Used after a failover, this procedure ensures a local logical standby database that was not involved in the failover has not processed more redo than the new primary database and reports the set of archive redo log files that must be replaced to ensure consistency
PURGE_SESSION Procedure on page 83-18	Identifies the archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply
REBUILD Procedure on page 83-19	Records relevant metadata (including the LogMiner dictionary) in the redo stream in case a database that has recently changed its role to a primary database following a failover operation fails to do so during the failover process
SET_TABLESPACE Procedure on page 83-20	Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the `SYSAUX` tablespace.
SKIP Procedure on page 83-21	Specifies rules that control database operations that should not be applied to the logical standby database
SKIP_ERROR Procedure on page 83-29	Specifies rules regarding what action to take upon encountering errors

Table 83–1 (Cont.) DBMS_LOGSTDBY Package Subprograms

Subprogram	Description
SKIP_TRANSACTION Procedure on page 83-33	Specifies transactions that should not be applied on the logical standby database. Be careful in using this procedure, because not applying specific transactions may cause data corruption at the logical standby database.
UNSKIP Procedure on page 83-35	Deletes rules specified by the `SKIP` procedure
UNSKIP_ERROR Procedure on page 83-37	Deletes rules specified by the `SKIP_ERROR` procedure
UNSKIP_TRANSACTION Procedure on page 83-39	Deletes rules specified by the `SKIP_TRANSACTION` procedure

APPLY_SET Procedure

Use this procedure to set values of parameters that configure and manage SQL Apply in a logical standby database environment. All parameters, except for PRESERVE_COMMIT_ORDER, can be changed without having to stop SQL Apply.

Syntax

```
DBMS_LOGSTDBY.APPLY_SET (
     inname             IN VARCHAR,
     value              IN VARCHAR);
```

Parameters

Table 83–2 APPLY_SET Procedure Parameters

Parameter	Description
APPLY_SERVERS	Controls the number of APPLIER processes used to apply changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this.
EVENT_LOG_DEST	Controls where SQL Apply records the occurrence of an interesting event. It takes the following values: ■ DEST_ALL - All events will be recorded in the DBA_LOGSTDBY_EVENTS view and in the alert log. ■ DEST_EVENTS_TABLE - All events that contain information about user data will be recorded only in the DBA_LOGSTDBY_EVENTS view. This is the default value. For example, if SQL Apply receives an ORA-1403 error, the whole event is recorded in the DBA_LOGSTDBY_EVENTS view. Whereas, the alert log records only that SQL Apply stopped because of ORA-1403. No information regarding the user table or offending statement is logged in the alert log. However, if you stop the SQL Apply engine, it gets recorded in both the DBA_LOGSTDBY_EVENTS view and in the alert log. Note that this parameter affects the behavior of the following parameters: RECORD_APPLIED_DDL, RECORD_SKIP_DDL, RECORD_SKIP_ERRORS, and RECORD_UNSUPPORTED_OPERATIONS. For example, if RECORD_APPLIED_DDL is set to TRUE, but EVENT_LOG_DEST is set to DEST_EVENTS_TABLE, then the applied DDL string will only be recorded in the DBA_LOGSTDBY_EVENTS view.
LOG_AUTO_DEL_RETENTION_TARGET	This parameter setting is only meaningful if LOG_AUTO_DELETE has been set to TRUE. The value you supply for this parameter controls how long (in minutes) a remote archived log that is received from the primary database will be retained at the logical standby database once all redo records contained in the log have been applied at the logical standby database. The default value is 1440 minutes.
LOG_AUTO_DELETE	Automatically deletes archived redo log files once they have been applied on the logical standby database. Set to TRUE to enable automatic deletion of archived redo log files, and FALSE to disable automatic deletion.The default value is TRUE.

Table 83–2 (Cont.) APPLY_SET Procedure Parameters

Parameter	Description
MAX_EVENTS_RECORDED	Number of recent events that will be visible through the DBA_LOGSTDBY_EVENTS view. To record all events encountered by SQL Apply, use the DBMS_LOGSTDBY.MAX_EVENTS constant as the number value. The default value is 10,000.
MAX_SERVERS	Number of processes that SQL Apply uses to read and apply redo. The default value is 9. The maximum number allowed is 2048.
MAX_SGA	Number of megabytes from shared pool in System Global Area (SGA) that SQL Apply will use. The default value is 30 megabytes or one quarter of the value set for SHARED_POOL_SIZE, whichever is lower. The maximum size allowed is 4095 megabytes.
PREPARE_SERVERS	Controls the number of PREPARER processes used to prepare changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this.
PRESERVE_COMMIT_ORDER	TRUE: Transactions are applied to the logical standby database in the exact order in which they were committed on the primary database. This is the default parameter setting. FALSE: Transactions containing non-overlapping sets of rows may be committed in a different order than they were committed on the primary database. Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened on the primary database. See the Usage Notes for details and recommendations. You cannot modify this parameter while SQL Apply is running.
RECORD_APPLIED_DDL	Controls whether DDL statements that have been applied to the logical standby database are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. FALSE: Indicates that applied DDL statements are not recorded. This is the default parameter setting.
RECORD_SKIP_DDL	Controls whether skipped DDL statements are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.

Table 83–2 (Cont.) APPLY_SET Procedure Parameters

Parameter	Description
RECORD_SKIP_ERRORS	Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values: TRUE: Skipped errors are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting. FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.
RECORD_UNSUPPORTED_OPERATIONS	Captures information about transactions running on the primary database that will not be supported by a logical standby database. This procedure records its information as events in the DBA_LOGSTDBY_EVENTS table.

If a parameter is changed while SQL Apply is running, the change will take effect at some point in the future. In such a case, an informational row is inserted into the DBA_LOGSTDBY_EVENTS view at the time the parameter change takes effect.

Additionally, if you are modifying a parameter while SQL Apply is running on a RAC configuration, you must be connected to the same instance where SQL Apply is running.

Exceptions

Table 83–3 APPLY_SET Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- Use the APPLY_UNSET procedure to restore the default settings of a parameter.
- See *Oracle Data Guard Concepts and Administration* for help with tuning SQL Apply and for information about setting appropriate values for different parameters.

Examples

To record DDLs in the DBA_LOGSTDBY_EVENTS view and in the alert log, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('RECORD_APPLIED_DDL', TRUE);
```

APPLY_UNSET Procedure

Use the APPLY_UNSET procedure to restore the default values of the parameters that you changed with the APPLY_SET procedure.

Syntax

```
DBMS_LOGSTDBY.APPLY_UNSET (
     inname          IN VARCHAR);
```

Parameters

The parameter information for the APPLY_UNSET procedure is the same as that described for the APPLY_SET procedure. See Table 83–2 for complete parameter information.

Exceptions

Table 83–4 APPLY_UNSET Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Usage Notes

- Use the APPLY_SET procedure to specify a nondefault value for a parameter.

Examples

If you previously specified that applied DDLs show up in the DBA_LOGSTDBY_EVENTS view and the alert log, you can restore the default behavior of SQL Apply regarding applied DDL statements with the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('RECORD_APPLIED_DDL');
```

BUILD Procedure

Use this procedure on the primary database to record relevant metadata (LogMiner dictionary) information in the redo log, which will subsequently be used by SQL Apply. This procedure will enable database-wide primary- and unique-key supplemental logging, if necessary.

Syntax

```
DBMS_LOGSTDBY.BUILD;
```

Usage Notes

- Supplemental log information includes extra information in the redo logs that uniquely identifies a modified row in the logical standby database, and also includes information that helps efficient application of changes to the logical standby database.
- LogMiner dictionary information allows SQL Apply to interpret data in the redo logs.
- `DBMS_LOGSTDBY.BUILD` should be run only once for each logical standby database you want to create. You do not need to use DBMS_LOGSTDBY.BUILD for each RAC instance.

Examples

To build the LogMiner dictionary in the redo stream of the primary database and to record additional information so that a logical standby database can be instantiated, issue the following SQL statement at the primary database

```
SQL> EXECUTE DBMS_LOGSTDBY.BUILD;
```

INSTANTIATE_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database. The table requires the name of the database link (`dblink`) as an input parameter. If the table already exists in the logical standby database, it will be dropped and re-created based on the table definition at the primary database. This procedure only brings over the data associated with the table, and not the associated indexes and constraints.

Use the `INSTANTIATE_TABLE` procedure to:

- Add a table to a standby database.
- Re-create a table in a standby database.

Syntax

```
DBMS_LOGSTDBY.INSTANTIATE_TABLE (
     schema_name         IN VARCHAR2,
     table_name          IN VARCHAR2,
     dblink              IN VARCHAR2);
```

Parameters

Table 83–5 INSTANTIATE_TABLE Procedure Parameters

Parameter	Description
`schema_name`	Name of the schema
`table_name`	Name of the table to be created or re-created in the standby database
`dblink`	Name of the database link account that has privileges to read and lock the table in the primary database, as well as the `SELECT_CATALOG_ROLE` on the primary database

Exceptions

Table 83–6 INSTANTIATE_TABLE Procedure Exceptions

Exception	Description
`ORA-16103`	Logical Standby apply must be stopped to allow this operation
`ORA-16236`	Logical Standby metadata operation in progress
`ORA-16276`	Specified database link does not correspond to primary database
`ORA-16277`	Specified table is not supported by logical standby database
`ORA-16278`	Specified table has a multi-object skip rule defined

Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This table will not be synchronized with the rest of the tables being maintained by SQL Apply and SQL Apply will not start to maintain it until SQL Apply encounters redo that occurred after the table was instantiated from the primary. The SCN at which the table was instantiated from the primary database is available in the `DBA_LOGSTDBY_EVENTS` view.

- The specified table must be a table that is supported by logical standby (that is, it does not appear in the DBA_LOGSTDBY_UNSUPPORTED_TABLES view on the primary database).
- If there are any skip rules that specifically name this table (without any wildcards), those skip rules will be dropped as part of INSTANTIATE_TABLE, so that the table will be properly maintained by SQL Apply in the future. If there are skip rules that indirectly reference this table (match a skip rule with a wildcard in the schema_name or table_name, and have a TABLE, DML, or SCHEMA_DDL statement type), INSTANTIATE_TABLE will fail with an ORA-16278 error. Any multiobject skip rules that pertain to the table must be dropped or changed before re-attempting the INSTANTIATE_TABLE call.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (-
     SCHEMA_NAME => 'HR', TABLE_NAME => 'EMPLOYEES', -
     DBLINK => 'INSTANTIATE_TBL_LINK');
```

IS_APPLY_SERVER Function

This function returns `TRUE` if it is executed from PL/SQL in the context of a logical standby apply server process. This function is used in conjunction with triggers that have the `fire_once` parameter in the `DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY` subprogram set to `FALSE` (the default is `TRUE`). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.

> **See Also:** *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY` subprogram.

Syntax

```
DBMS_LOGSTDBY.IS_APPLY_SERVER
RETURN BOOLEAN;
```

Parameters

None

MAP_PRIMARY_SCN Function

Returns an SCN on the standby that predates the supplied SCN from the primary database by at least 5 minutes. This function can be used to determine a safe SCN to use in a compensating flashback database operation at the logical standby database, following a flashback database operation or a point-in-time recovery operation at the primary database.

Syntax

```
DBMS_LOGSTDBY.MAP_PRIMARY_SCN(primary_scn NUMBER) RETURN NUMBER;
```

Exceptions

Table 83–7 MAP_PRIMARY_SCN Function Exceptions

Exception	Description
ORA-20001	Primary SCN is before mapped range
ORA-20002	SCN mapping requires PRESERVE_COMMIT_ORDER to be TRUE

Usage Notes

Use this function to get a conservative SCN at the logical standby database that corresponds to an SCN at the primary database. This function is useful in the context of doing compensating flashback database operations at the logical standby following a flashback database or a point-in-time recovery operation done at the primary database.

PREPARE_FOR_NEW_PRIMARY Procedure

The PREPARE_FOR_NEW_PRIMARY procedure must be invoked at a logical standby database following a failover if that standby database was not the target of the failover operation. Such a standby database must process the exact same set of redo logs processed at the new primary database. This routine ensures that the local logical standby database has not processed more redo than the new primary database and reports the set of archive logs that must be replaced to ensure consistency. The set of replacement logs will be reported in the alert.log. These logs must be copied to the logical standby and registered using the ALTER DATABASE REGISTER LOGICAL LOGFILE statement.

Syntax

```
DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (
           FORMER_STANDBY_TYPE         IN VARCHAR2,
           DBLINK                      IN VARCHAR2);
```

Parameters

Table 83–8 PREPARE_FOR_NEW_PRIMARY Procedure Parameters

Parameter	Description
FORMER_STANDBY_TYPE	The type of standby database that was the target of the failover operation to become the new primary database. Valid values are 'PHYSICAL' if the new primary was formerly a physical standby, and 'LOGICAL' if the new primary database was formerly a logical standby database.
DBLINK	The name of a database link to the new primary database

Exceptions

Table 83–9 PREPARE_FOR_NEW_PRIMARY Procedure Exceptions

Exception	Description
ORA-16104	Invalid Logical Standby option.
ORA-16109	Failed to apply log data from previous primary.

Usage Notes

- This routine is intended only for logical standby systems.
- This routine will fail if the new primary database was formerly a logical standby database and the LogMiner dictionary build has not completed successfully.
- Log files displayed in the alert log will be referred to as *terminal logs*. Users should keep in mind that file paths are relative to the new primary database and may not resolve locally.
- Upon manual registration of the terminal logs, users should complete the process by calling either START LOGICAL STANDBY APPLY if the new primary database was formerly a physical standby database or START LOGICAL STANDBY APPLY NEW PRIMARY if the new primary database was formerly a logical standby database.
- See the alert log for more details regarding the reasons for any exception.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (  -
                FORMER_STANDBY_TYPE => 'LOGICAL',    -
                DBLINK => 'dblink_to_newprimary');
```

PURGE_SESSION Procedure

Identifies all archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply. Once identified, you can issue operating system commands to delete some or all of the unnecessary archived redo log files.

Syntax

```
DBMS_LOGSTDBY.PURGE_SESSION;
```

Exceptions

Table 83–10 PURGE_SESSION Procedure Exceptions

Exception	Description
ORA-01309	Invalid session

Usage Notes

- This procedure does not delete the archived redo log files. You must issue operating system commands to delete unneeded files.
- This procedure updates the DBA_LOGMNR_PURGED_LOG view that displays the archived redo log files that have been applied to the logical standby database.
- In Oracle Database 10*g* Release 2, metadata related to the archived redo log files (and the actual archived redo log files) are purged automatically based on the default setting of the LOG_AUTO_DELETE parameter described in the DBMS_LOGSTDBY.APPLY_SET procedure described on page 83-7.

Example

To identify and remove unnecessary files:

1. Enter the following statement on the logical standby database:

```
SQL> EXECUTE DBMS_LOGSTDBY.PURGE_SESSION;
```

2. Query the DBA_LOGMNR_PURGED_LOG view to list the archived redo log files that can be removed:

```
SQL> SELECT * FROM DBA_LOGMNR_PURGED_LOG;

FILE_NAME
   -----------------------------------
   /boston/arc_dest/arc_1_40_509538672.log
   /boston/arc_dest/arc_1_41_509538672.log
   /boston/arc_dest/arc_1_42_509538672.log
   /boston/arc_dest/arc_1_43_509538672.log
   /boston/arc_dest/arc_1_44_509538672.log
   /boston/arc_dest/arc_1_45_509538672.log
   /boston/arc_dest/arc_1_46_509538672.log
   /boston/arc_dest/arc_1_47_509538672.log
```

3. Use operating system-specific commands to delete archived redo log files from the file system.

REBUILD Procedure

This procedure is used if a database that has recently changed its role to a primary database following a failover operation fails to record relevant metadata (including the LogMiner dictionary) in the redo stream required for other logical standby databases.

Syntax

```
DBMS_LOGSTDBY.REBUILD;
```

Usage Notes

- LogMiner dictionary information is logged in the redo log files.
- The standby redo log files (if present) are archived.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.REBUILD;
```

SET_TABLESPACE Procedure

Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the SYSAUX tablespace. SQL Apply cannot be running when you invoke this procedure.

Syntax

```
DBMS_LOGSTDBY.SET_TABLESPACE(
           NEW_TABLESPACE IN VARCHAR2)
```

Parameters

Table 83–11 SET_TABLE SPACE Procedure Parameters

Parameter	Description
NEW_TABLESPACE	Name of the new tablespace where metadata tables will reside.

Exceptions

Table 83–12 SET_TABLESPACE Procedure Exceptions

Exception	Description
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16236	Logical Standby metadata operation in progress

Examples

To move metadata tables to a new tablespace named LOGSTDBY_TBS, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SET_TABLESPACE (new_tablespace => 'LOGSTDBY_TBS');
```

SKIP Procedure

The SKIP procedure can be used to define rules that will be used by SQL Apply to skip the application of certain changes to the logical standby database. For example, the SKIP procedure can be used to skip changes to a subset of tables in the logical standby database. It can also be used to specify DDL statements that should not be applied at the logical standby database or should be modified before they are applied in the logical standby database. One reason why a DDL statement may need to be modified is to accommodate a different directory structure on the logical standby database.

Syntax

```
DBMS_LOGSTDBY.SKIP (
     stmt                    IN VARCHAR2,
     schema_name             IN VARCHAR2 DEFAULT NULL,
     object_name             IN VARCHAR2 DEFAULT NULL,
     proc_name               IN VARCHAR2 DEFAULT NULL,
     use_like                IN BOOLEAN DEFAULT TRUE,
     esc                     IN CHAR1 DEFAULT NULL);
```

Parameters

Table 83–13 SKIP Procedure Parameters

Parameter	Description
stmt	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 83–14 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter. The keyword PL/SQL is used for the execution of Oracle-supplied packages which are supported for replication. See *Oracle Data Guard Concepts and Administration* for information about supported packages.
schema_name	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.
object_name	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.

Table 83–13 (Cont.) SKIP Procedure Parameters

Parameter	Description
proc_name	Name of a stored procedure to call when SQL Apply determines that a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: 'schema.package.procedure' This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement. For DDLs, SQL Apply calls the stored procedure with the following call signature: ■ IN STATEMENT VARCHAR2 -- The SQL statement that matches the filter ■ IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter ■ IN SCHEMA VARCHAR2 -- The schema_name of the filter, if applicable ■ IN NAME VARCHAR2 -- The object_name of the filter, if applicable ■ IN XIDUSN NUMBER -- Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ OUT SKIP_ACTION NUMBER -- Action to be taken by SQL Apply upon completion of this routine. Valid values are: SKIP_ACTION_APPLY -- Execute the statement SKIP_ACTION_SKIP -- Skip the statement SKIP_ACTION_ERROR -- Halt apply so the DBA can take appropriate steps (for example, take compensating action) SKIP_ACTION_REPLACE -- Execute the replacement statement supplied in the NEW_STATEMENT output parameter For PL/SQL, SQL Apply calls the stored procedure with the following call signature: ■ IN STATEMENT VARCHAR2 -- The SQL statement that matches the filter ■ IN PACKAGE_SCHEMA VARCHAR2 -- The schema of the package being skipped (for example, SYS or XDB) ■ IN PACKAGE_NAME VARCHAR2 -- The name of the package being skipped (for example, DBMS_RLS) ■ IN PROCEDURE_NAME VARCHAR2 – The name of the procedure being skipped (for example, ADD_POLICY) ■ IN CURRENT_SCHEMA VARCHAR2 – The name of the current schema in which the PL/SQL was executed on the primary ■ IN XIDUSN NUMBER – Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ IN EXIT_STATUS – 0 (Zero) if the PL/SQL succeeded on the primary, or 1

Table 83–13 (Cont.) SKIP Procedure Parameters

Parameter	Description

proc_name (cont.)	■ OUT SKIP_ACTION NUMBER -- Action to be taken by SQL Apply upon completion of this routine. Valid return values are:
	SKIP_ACTION_APPLY -- Execute the statement
	SKIP_ACTION_APPLY -- Execute the statement
	SKIP_ACTION_ERROR – Raise an error which halts apply so that the DBA can take appropriate steps
	Note 1: SKIP_ACTION_REPLACE is not supported for PL/SQL.
	Note 2: SQL Apply calls the skip handler when the procedure's exit is processed.
	Note 3: The use_like parameter must be set to FALSE for PL/SQL since wildcarding PL/SQL is not supported.
	The following example shows how to have a conditional skip rule on DBMS_RLS.DROP_POLICY:
	`Create or replace procedure sec_mgr.skip_drop_policy (`
	`statement in varchar2,`
	`pkgown in varchar2,`
	`pkgname in varchar2,`
	`procnm in varchar2,`
	`cuser in varchar2,`
	`xidusn in number,`
	`xidslt in number,`
	`xidsqn in number,`
	`exstatus in number,`
	`skip_action out number) Is`
	`Begin`
	`If 0 = exstatus Then`
	`Insert Into sec_mgr.logit Values`
	`('Success: '||pkgown||'.'||pkgname||'.'||procnm|| ' by '||cuser);`
	`If cuser != 'TESTSCHEMA' Then`
	`skip_action := DBMS_LOGSTDBY.SKIP_ACTION_APPLY;`
	`Else`
	`skip_action := DBMS_LOGSTDBY.SKIP_ACTION_SKIP;`
	`End If;`
	`End If;`
	`End skip_drop_policy;`
	`EXECUTE DBMS_LOGSTDBY.SKIP( -`
	`stmt => 'PL/SQL', -`
	`schema_name => 'SYS', -`
	`object_name => 'DBMS_RLS.DROP_POLICY', -`
	`proc_name => 'SEC_MGR.SKIP_DROP_POLICY' -`
	`use_like=> FALSE);`

use_like	Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the *Oracle Database SQL Language Reference*.

Table 83–13 (Cont.) SKIP Procedure Parameters

Parameter	Description
esc	Identifies an escape character (such as the character "/") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See*Oracle Database SQL Language Reference* for more information about pattern matching.

Usage Notes

- This procedure requires DBA privileges to execute.
- You cannot associate a stored procedure to be invoked in the context of a DML statement. For example, the following statement returns the ORA-16104: invalid Logical Standby option requested error:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'DML', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'DML_HANDLER');
```

  Also, if an event matches multiple rules either because of the use of wildcards while specifying the rule or because of a specification of overlapping rules. For example, if you specify a rule for the SCHEMA_DDL event for the HR.EMPLOYEES table, and a rule for the ALTER TABLE event for the HR.EMPLOYEES table, only one of the matching procedures will be invoked (alphabetically, by procedure). In the following code example, consider the following rules:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
     stmt => 'SCHEMA DDL', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'SCHEMA_DDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'TABLE_ALTER_HANDLER');
```

  On encountering an ALTER TABLE statement, the schema_ddl_handler procedure will be invoked because its name will be at the top of an alphabetically sorted list of procedures that are relevant to the statement.

  Collisions on a rule set because of a specification containing wildcard entries are resolved in a similar fashion. For example, the rules in the following example will result in the empddl_handler procedure being invoked upon encountering the ALTER TABLE HR.EMPLOYEES ADD COLUMN RATING NUMBER statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMP%', -
     proc_name => 'EMPDDL_HANDLER');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP( -
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'EMPLOYEE_DDL_HANDLER');
```

- Use the SKIP procedure with caution, particularly when skipping DDL statements. If a CREATE TABLE statement is skipped, for example, you must also specify other DDL statements that refer to that table in the SKIP procedure. Otherwise, the statements will fail and cause an exception. When this happens, SQL Apply stops running.
- Before calling the SKIP procedure, SQL Apply must be halted. Do this by issuing an ALTER DATABASE STOP LOGICAL STANDBY APPLY statement. Once all desired filters have been specified, issue an ALTER DATABASE START LOGICAL STANDBY APPLY IMMEDIATE statement to start SQL Apply using the new filter settings.
- See the UNSKIP procedure on page 83-35 for information about reversing (undoing) the settings of the SKIP procedure.
- For USER statements, the SCHEMA_NAME parameter will be the user and specify '%' for the OBJECT_NAME parameter.
- If the PROC_NAME parameter is supplied, it must already exist in DBA_PROCEDURES and it must execute with DEFINER rights. If the procedure is declared with INVOKER rights, the ORA-1031: insufficient privileges message will be returned.
- If the procedure returns a REPLACEMENT statement, the REPLACEMENT statement will be executed using the SYSTEM and OBJECT privileges of the owner of the procedure.
- The PL/SQL block of a SKIP procedure cannot contain transaction control statements (for example, COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction.

Skip Statement Options

Table 83–14 lists the supported values for the stmt parameter of the SKIP procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. In addition, any of the SQL statements listed in the sys.audit_actions table (shown in the right column of Table 83–14) are also valid values. Note that keywords are generally defined by database object.

Table 83–14 Supported Values for the stmt Parameter

Keyword	Associated SQL Statements
There is no keyword for this group of SQL statements.	GRANT REVOKE ANALYZE TABLE ANALYZE INDEX ANALYZE CLUSTER
CLUSTER	AUDIT CLUSTER CREATE CLUSTER DROP CLUSTER TRUNCATE CLUSTER
CONTEXT	CREATE CONTEXT DROP CONTEXT
DATABASE LINK	CREATE DATABASE LINK CREATE PUBLIC DATABASE LINK DROP DATABASE LINK DROP PUBLIC DATABASE LINK

Table 83–14 (Cont.) Supported Values for the `stmt` ***Parameter***

Keyword	Associated SQL Statements
DIMENSION	ALTER DIMENSION CREATE DIMENSION DROP DIMENSION
DIRECTORY[1]	CREATE DIRECTORY DROP DIRECTORY
DML	Includes DML statements on a table (for example: INSERT, UPDATE, and DELETE)
INDEX	ALTER INDEX CREATE INDEX DROP INDEX
NON_SCHEMA_DDL	*All DDL that does not pertain to a particular schema* **Note:** SCHEMA_NAME and OBJECT_NAME must be null
PL/SQL[2]	Execute Oracle-supplied package.
PROCEDURE[3]	ALTER FUNCTION ALTER PACKAGE ALTER PACKAGE BODY ALTER PROCEDURE CREATE FUNCTION CREATE LIBRARY CREATE PACKAGE CREATE PACKAGE BODY CREATE PROCEDURE DROP FUNCTION DROP LIBRARY DROP PACKAGE DROP PACKAGE BODY DROP PROCEDURE
PROFILE	ALTER PROFILE CREATE PROFILE DROP PROFILE
ROLE	ALTER ROLE CREATE ROLE DROP ROLE SET ROLE
ROLLBACK STATEMENT	ALTER ROLLBACK SEGMENT CREATE ROLLBACK SEGMENT DROP ROLLBACK SEGMENT
SCHEMA_DDL	*All DDL statements that create, modify, or drop schema objects (for example: tables, indexes, and columns)* **Note:** SCHEMA_NAME and OBJECT_NAME must *not* be null
SEQUENCE	ALTER SEQUENCE CREATE SEQUENCE DROP SEQUENCE
SYNONYM	CREATE PUBLIC SYNONYM CREATE SYNONYM DROP PUBLIC SYNONYM DROP SYNONYM
SYSTEM AUDIT	AUDIT *SQL_statements* NOAUDIT *SQL_statements*

Table 83–14 (Cont.) Supported Values for the `stmt` Parameter

Keyword	Associated SQL Statements
TABLE	CREATE TABLE ALTER TABLE DROP TABLE TRUNCATE TABLE
TABLESPACE	CREATE TABLESPACE DROP TABLESPACE ALTER TABLESPACE
TRIGGER	ALTER TRIGGER CREATE TRIGGER DISABLE ALL TRIGGERS DISABLE TRIGGER DROP TRIGGER ENABLE ALL TRIGGERS ENABLE TRIGGER
TYPE	ALTER TYPE ALTER TYPE BODY CREATE TYPE CREATE TYPE BODY DROP TYPE DROP TYPE BODY
USER	ALTER USER CREATE USER DROP USER
VIEW	CREATE VIEW DROP VIEW
VIEW	CREATE VIEW DROP VIEW

[1] All directory objects are owned by SYS, but for the purpose of filtering them with a skip directive the schema should be specified as '%'".

[2] See *Oracle Data Guard Concepts and Administration* for information about supported packages.

[3] Java schema objects (sources, classes, and resources) are considered the same as procedure for purposes of skipping (ignoring) SQL statements.

Exceptions

Table 83–15 DBMS_LOGSTDBY.SKIP Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: ■ Procedure used INVOKER rights ■ Procedure needs DBA privileges
ORA-16103	Logical standby apply must be stopped to allow this operation.
ORA-16104	Invalid logical standby option requested.
ORA-16203	"Unable to interpret SKIP procedure return values." Indicates that a SKIP procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the DBA_LOGSTDBY_EVENTS view.
ORA-16236	Logical standby metadata operation in progress.

Examples

Example 1 Skipping all DML and DDL changes made to a schema

The following example shows how to specify rules so that SQL Apply will skip both DDL and DML statements made to the HR schema.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'SCHEMA DDL', -
     schema_name => 'HR', -
     object_name => '%', -
     proc_name => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'DML', -
     schema_name => 'HR', -
     object_name => '%', -
     proc_name => null);
```

Example 2 Creating a procedure to handle different file system organization

For example, if the file system organization in the logical standby database is different than that in the primary database, you can write a `SKIP` procedure to handle DDL statements with file specifications transparently.

The following procedure can handle DDL statements as long as you follow a specific naming convention for the file specification string.

1. Create the `SKIP` procedure to handle tablespace DDL statements:

```
CREATE OR REPLACE PROCEDURE sys.handle_tbs_ddl (

  old_stmt  IN  VARCHAR2,
  stmt_typ  IN  VARCHAR2,
  schema    IN  VARCHAR2,
  name      IN  VARCHAR2,
  xidusn    IN  NUMBER,
  xidslt    IN  NUMBER,
  xidsqn    IN  NUMBER,
  action    OUT NUMBER,
  new_stmt  OUT VARCHAR2
) AS
BEGIN

-- All primary file specification that contains a directory
-- /usr/orcl/primary/dbs
-- should go to /usr/orcl/stdby directory specification

  new_stmt = replace(old_stmt,
                     '/usr/orcl/primary/dbs',
                     '/usr/orcl/stdby');

  action := DBMS_LOGSTDBY.SKIP_ACTION_REPLACE;

EXCEPTION
  WHEN OTHERS THEN
    action := DBMS_LOGSTDBY.SKIP_ACTION_ERROR;
    new_stmt := NULL;
END handle_tbs_ddl;
```

2. Register the `SKIP` procedure with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'TABLESPACE', -
             proc_name => 'SYS.HANDLE_TBS_DDL');
```

SKIP_ERROR Procedure

Upon encountering an error, the logical standby database uses the criteria contained in this procedure to determine a course of action. The default action when a match is found is to skip the error and continue with applying changes. However, if a procedure is supplied, then SKIP_ERROR can take other actions depending on the situation. It can do nothing, which causes SQL Apply to stop, or it can change the error message text and stop SQL Apply, or it can actually skip the error.

Syntax

```
DBMS_LOGSTDBY.SKIP_ERROR (
     stmt                      IN VARCHAR2,
     schema_name               IN VARCHAR2 DEFAULT NULL,
     object_name               IN VARCHAR2 DEFAULT NULL,
     proc_name                 IN VARCHAR2 DEFAULT NULL,
     use_like                  IN BOOLEAN  DEFAULT NULL,
     esc                       IN CHAR1    DEFAULT NULL);
```

Parameters

Table 83–16 SKIP_ERROR Procedure Parameters

Parameter	Description
stmt	Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration because keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 83–14 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.
schema_name	The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.
object_name	The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.

Table 83–16 (Cont.) SKIP_ERROR Procedure Parameters

Parameter	Description
proc_name	Name of a stored procedure to call when SQL Apply encounters an error and determines a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: '"schema"."package"."procedure"' This procedure returns an error message that directs SQL Apply to perform one of the following actions: ■ Silently skip the error and continue with SQL Apply ■ Replace the error message that would have been created with a custom one, and stop SQL Apply ■ Do nothing, causing SQL Apply to stop and the original error message to be logged SQL Apply calls the stored procedure with the following call signature: ■ IN STATEMENT VARCHAR(4000) -- The first 4K of the statement ■ IN STATEMENT_TYPE VARCHAR2 -- The stmt of the filter ■ IN SCHEMA VARCHAR2 -- The schema_name of the filter, if applicable ■ IN NAME VARCHAR2 -- The object_name of the filter, if applicable ■ IN XIDUSN NUMBER -- Transaction ID part 1 ■ IN XIDSLT NUMBER -- Transaction ID part 2 ■ IN XIDSQN NUMBER -- Transaction ID part 3 ■ IN ERROR VARCHAR(4000) -- Text of the original error to be recorded ■ OUT NEW_ERROR VARCHAR(4000) -- Null or modified error text
use_like	Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in the *Oracle Database SQL Language Reference*.
esc	Identifies an escape character (such as the characters "%" or "_") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "_" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See*Oracle Database SQL Language Reference* for more information about pattern matching.

Usage Notes

- A stored procedure provided to the SKIP_ERROR procedure is called when SQL Apply encounters an error that could shut down the application of redo logs to the standby database.
- Running this stored procedure affects the error being written in the STATUS column of the DBA_LOGSTDBY_EVENTS table. The STATUS_CODE column remains unchanged. If the stored procedure is to have no effect, that is, apply will be

stopped, then the NEW_ERROR is written to the events table. To truly have no effect, set NEW_ERROR to ERROR in the procedure.

- If the stored procedure requires that a shutdown be avoided, then you must set NEW_ERROR to NULL.
- This procedure requires DBA privileges to execute.
- For USER statements, the SCHEMA_NAME parameter will be the user and you should specify '%' for the OBJECT_NAME parameter.
- If the PROC_NAME parameter is specified, it must already exist in DBA_PROCEDURES and it must execute with DEFINERS rights. If the procedure is declared with INVOKERS rights, the ORA-1031: insufficient privileges message will be returned.
- The PL/SQL block of a SKIP_ERROR procedure cannot contain transaction control statements (for example: COMMIT, ROLLBACK, SAVEPOINT, and SET CONSTRAINT) unless the block is declared to be an autonomous transaction using the following syntax:

```
PRAGMA AUTONOMOUS_TRANSACTION
```

Exceptions

Table 83–17 SKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Insufficient privileges: ■ Procedure used INVOKER rights ■ Procedure needs DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested
ORA-16236	Logical Standby metadata operation in progress

Example 1

The following example shows how to specify rules so that SQL Apply will skip any error raised from any GRANT DDL command.

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR('GRANT')
```

Example 2

To skip errors on GRANT statements on SYS or HR schemas, define a procedure handle_error_ddl and register it. In the following example, assume that handle_error_ddl is a free-standing procedure in the SYS schema.

1. Create the error-handler procedure:

```
CREATE OR REPLACE PROCEDURE sys.handle_error_ddl (
old_stmt IN VARCHAR2,
stmt_type IN VARCHAR2,
schema IN VARCHAR2,
name IN VARCHAR2,
xidusn IN NUMBER,
xidslt IN NUMBER,
xidsqn IN NUMBER,
error IN VARCHAR2,
```

```
new_error OUT VARCHAR2
) AS
BEGIN
-- Default to what we already have
new_error := error;
-- Ignore any GRANT errors on SYS or HR schemas
IF INSTR(UPPER(old_stmt),'GRANT') > 0
THEN
IF schema IS NULL
OR (schema IS NOT NULL AND
(UPPER(schema) = 'SYS' OR UPPER(schema) = 'HR' )
THEN
new_error := NULL;
-- record the fact that we just skipped an error on 'SYS' or 'HR' schemas
-- code not shown here
END IF;
END IF;
END handle_error_ddl;
/
```

2. Register the error handler with SQL Apply:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR ( -
     statement => 'NON_SCHEMA_DDL', -
     schema_name => NULL, -
     object_name => NULL, -
     proc_name => 'SYS.HANDLE_ERROR_DDL');
```

SKIP_TRANSACTION Procedure

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

Syntax

```
DBMS_LOGSTDBY.SKIP_TRANSACTION (
     xidusn          IN NUMBER,
     xidslt          IN NUMBER,
     xidsqn          IN NUMBER);
```

Parameters

Table 83–18 SKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN NUMBER	Transaction ID undo segment number of the transaction being skipped
XIDSLT NUMBER	Transaction ID slot number of the transaction being skipped
XIDSQN NUMBER	Transaction ID sequence number of the transaction being skipped

Usage Notes

If SQL Apply stops due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want SQL Apply to ignore.

> **CAUTION: `SKIP_TRANSACTION` is an inherently dangerous operation. Do not invoke this procedure unless you have examined the transaction in question through the `V$LOGMNR_CONTENTS` view and have taken compensating actions at the logical standby database. `SKIP_TRANSACTION` is not the appropriate procedure to invoke to skip DML changes to a table.**
>
> **To skip a DML failure, use a `SKIP` procedure, such as `SKIP('DML','MySchema','MyFailed Table').` Using the `SKIP_TRANSACTION` procedure for DML transactions may skip changes for other tables, thus logically corrupting them.**

- This procedure requires DBA privileges to execute.
- Use the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.
- Also, see the ALTER DATABASE START LOGICAL STANDBY SKIP FAILED TRANSACTION statement in *Oracle Database SQL Language Reference*.

Exceptions

Table 83–19 SKIP_TRANSACTION Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Examples

To skip a DDL transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) you can register a rule as shown in the following example:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_TRANSACTION (-
     XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

UNSKIP Procedure

Use the UNSKIP procedure to delete rules specified earlier with the SKIP procedure. The parameters specified in the UNSKIP procedure must match exactly for it to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP (
     stmt                      IN VARCHAR2,
     schema_name               IN VARCHAR2 DEFAULT NULL,
     object_name               IN VARCHAR2 DEFUALT NULL);
```

Parameters

The parameter information for the UNSKIP procedure is the same as that described for the SKIP procedure. See Table 83–13 on page 83-21 for complete parameter information.

Exceptions

Table 83–20 UNSKIP Procedure Exceptions

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

CAUTION: If DML changes for a table have been skipped and not compensated for, you must follow the call to the UNSKIP procedure with a call to the INSTANTIATE_TABLE procedure to synchronize this table with those maintained by SQL Apply.

- This procedure requires DBA privileges to execute.
- Wildcards passed in the schema_name or the object_name parameter are not expanded. The wildcard character is matched at the character level. Thus, you can delete only one specified rule by invoking the UNSKIP procedure, and you will need a distinct UNSKIP procedure call to delete each rule that was previously specified.

  For example, assume you have specified the following two rules to skip applying DML statements to the HR.EMPLOYEE and HR.EMPTEMP tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMPLOYEE', -
     PROC_NAME => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMPTEMP', -
     PROC_NAME => null);
```

In the following example, the wildcard in the TABLE_NAME parameter cannot be used to delete the rules that were specified:

```
SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP (STMT => 'DML',-
     SCHEMA_NAME => 'HR', -
     OBJECT_NAME => 'EMP%');
```

In fact, this UNSKIP procedure matches neither of the rules, because the wildcard character in the TABLE_NAME parameter is not expanded. Instead, the wildcard character will be used in an exact match to find the corresponding SKIP rule.

UNSKIP_ERROR Procedure

Use the UNSKIP_ERROR procedure to delete rules specified earlier with the SKIP_ERROR procedure. The parameters specified in the UNSKIP_ERROR procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_ERROR (
     stmt                      IN VARCHAR2,
     schema_name               IN VARCHAR2 DEFAULT NULL,
     object_name               IN VARCHAR2 DEFAULT NULL);
```

Parameters

The parameter information for the UNSKIP_ERROR procedure is the same as that described for the SKIP_ERROR procedure. See Table 83–16 for complete parameter information.

Exceptions

Table 83–21 UNSKIP_ERROR Procedure Exceptions

Exception	Description
ORA-01031	Need DBA privileges
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Wildcards passed in the schema_name or the object_name parameters are not expanded. Instead, the wildcard character is treated as any other character and an exact match is made. Thus, you can delete only one specified rule by invoking the UNSKIP_ERROR procedure, and you need a distinct UNSKIP_ERROR procedure call to delete each rule that you previously specified.

  For example, assume you have specified the following two rules to handle the HR.EMPLOYEE and HR.EMPTEMP tables:

  ```
  SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML',-
       SCHEMA_NAME => 'HR', -
       OBJECT_NAME => 'EMPLOYEE', -
       PROC_NAME => 'hr_employee_handler');
  SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML',-
       SCHEMA_NAME => 'HR', -
       OBJECT_NAME => 'EMPTEMP', -
       PROC_NAME => 'hr_tempemp_handler');
  ```

  In this case, the following UNSKIP procedure cannot be used to delete the rules that you have specified:

  ```
  SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP_ERROR (STMT => 'DML',-
       SCHEMA_NAME => 'HR', -
       OBJECT_NAME => 'EMP%');
  ```

In fact, the UNSKIP procedure will match neither of the rules, because the wildcard character in the OBJECT_NAME parameter will not be expanded.

Example

To remove a handler that was previously registered with SQL Apply from getting called on encountering an error, you can issue the following statement:

```
DBMS_LOGSTDBY.UNSKIP_ERROR ( -
      statement => 'NON_SCHEMA_DDL', -
      schema_name => NULL, -
      object_name => NULL);
```

UNSKIP_TRANSACTION Procedure

Use the UNSKIP_TRANSACTION procedure to delete rules specified earlier with the SKIP_TRANSACTION procedure. The parameters specified in the UNSKIP_TRANSACTION procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

```
DBMS_LOGSTDBY.UNSKIP_TRANSACTION (
     xidusn_p         IN NUMBER,
     xidslt_p         IN NUMBER,
     xidsqn_p         IN NUMBER);
```

Parameters

Table 83–22 UNSKIP_TRANSACTION Procedure Parameters

Parameter	Description
XIDUSN	Transaction ID undo segment number of the transaction being skipped
XIDSLT	Transaction ID slot number of the transaction being skipped
XIDSQN	Transaction ID sequence number of the transaction being skipped

Exceptions

Table 83–23 UNSKIP_TRANSACTION Procedure Exceptions

Exception	Description
ORA-01031	need DBA privileges to execute this procedure
ORA-16103	Logical Standby apply must be stopped to allow this operation
ORA-16104	invalid Logical Standby option requested

Usage Notes

- This procedure requires DBA privileges to execute.
- Query the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.

Examples

To remove a rule that was originally specified to skip the application of a transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) issue the following statement:

```
SQL> DBMS_LOGSTDBY.UNSKIP_TRANSACTION (XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

84

DBMS_METADATA

The DBMS_METADATA package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

> **See Also:** *Oracle Database Utilities* for more information and for examples of using the Metadata API

This chapter contains the following topics:

- Using DBMS_METADATA
  - Overview
  - Security Model
  - Rules and Limits
- Data Structures - Object and Table Types
- Subprogram Groupings
  - Subprograms for Retrieving Multiple Objects From the Database
  - Subprograms for Submitting XML to the Database
- Summary of All DBMS_METADATA Subprograms

Using DBMS_METADATA

This section contains topics which relate to using the `DBMS_METADATA` package.

- Overview
- Security Model
- Rules and Limits

Overview

You can use the DBMS_METADATA package to retrieve metadata and also to submit XML.

- Retrieving Metadata
- Submitting XML

Retrieving Metadata

If you are retrieving metadata, you can specify:

- The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
- Optional selection criteria, such as owner or name.
- Parse items (attributes of the returned objects to be parsed and returned separately).
- Optional transformations on the output, implemented by XSLT (Extensible Stylesheet Language Transformation) scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT stylesheets stored in the database or externally.

DBMS_METADATA provides the following retrieval interfaces:

- For programmatic use: OPEN, SET_FILTER, SET_COUNT, GET_QUERY, SET_PARSE_ITEM, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, FETCH_xxx, and CLOSE retrieve multiple objects.
- For use in SQL queries and for browsing: GET_XML, GET_DDL and GET_SXML return metadata for a single named object. The GET_DEPENDENT_XML, GET_DEPENDENT_DDL, GET_GRANTED_XML, and GET_GRANTED_DDL interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

Submitting XML

If you are submitting XML, you specify:

- The type of object
- Optional transform parameters to modify the object (for example, changing the object's owner)
- Parse items (attributes of the submitted objects to be parsed and submitted separately)
- Whether to execute the operation or simply return the generated DDL

DBMS_METADATA provides a programmatic interface for submission of XML. It is comprised of the following procedures: OPENW, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, SET_PARSE_ITEM, CONVERT, PUT, and CLOSE.

Security Model

The object views of the Oracle metadata model implement security as follows:

- Nonprivileged users can see the metadata of only their own objects.
- Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to `PUBLIC`.
- If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
- If nonprivileged users are granted some form of access to an object in someone else's schema, they will be able to retrieve the grant specification through the Metadata API, but not the object's actual metadata.
- In stored procedures, functions, and definers-rights packages, roles (such as `SELECT_CATALOG_ROLE`) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of `SELECT_CATALOG_ROLE`), you must make the program invokers-rights.
- For all objects that have passwords (for example, db links, users, and roles), the following rules apply:
  - A user who has the `SELECT_CATALOG_ROLE` can see all metadata for an object except the passwords for that object.
  - The `SYS` user, users who have the `EXP_FULL_DATABASE` role, and users who own an object can see all metadata for that object, including passwords.

Rules and Limits

In an Oracle Shared Server (OSS) environment, the DBMS_METADATA package must disable session migration and connection pooling. This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the MAX_SHARED_SERVERS initialization parameter.

Data Structures - Object and Table Types

The DBMS_METADATA package defines, in the SYS schema, the following OBJECT and TABLE types.

```
CREATE TYPE sys.ku$_parsed_item AS OBJECT (
  item            VARCHAR2(30),
  value           VARCHAR2(4000),
  object_row      NUMBER )
/

CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;

CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item
/

CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;

CREATE TYPE sys.ku$_ddl AS OBJECT (
   ddlText        CLOB,
parsedItem sys.ku$_parsed_items )
/

CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;

CREATE TYPE sys.ku$_ddls IS TABLE OF sys.ku$_ddl
/

CREATE PUBLIC SYNONYM ku$_ddls FOR sys.ku$_ddls;

CREATE TYPE sys.ku$_multi_ddl AS OBJECT (
   object_row     NUMBER,
   ddls           sys.ku$_ddls )
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;

CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl;
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR
                          sys.ku$_multi_ddls;

CREATE TYPE sys.ku$_ErrorLine IS OBJECT (
   errorNumber    NUMBER,
   errorText      VARCHAR2(2000) )
/

CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;

CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine
/
CREATE PUBLIC SYNONYM ku$ErrorLines FOR sys.ku$_ErrorLines;

CREATE TYPE sys.ku$_SubmitResult AS OBJECT (
   ddl          sys.ku$_ddl,
   errorLines   sys.ku$_ErrorLines );
/
```

```
CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult
/

CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;
```

Subprogram Groupings

The DBMS_METADATA subprograms are used to retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- Table 84–1 provides a summary, in alphabetical order, of DBMS_METADATA subprograms used to retrieve multiple objects from a database.
- Table 84–2 provides a summary, in alphabetical order, of DBMS_METADATA subprograms used to submit XML metadata to a database.

Subprograms for Retrieving Multiple Objects From the Database

Table 84–1 lists the subprograms used for retrieving multiple objects from the database.

Table 84–1 DBMS_METADATA Subprograms for Retrieving Multiple Objects

Subprogram	Description
ADD_TRANSFORM Function on page 84-12	Specifies a transform that `FETCH_xxx` applies to the XML representation of the retrieved objects
CLOSE Procedure on page 84-16	Invalidates the handle returned by `OPEN` and cleans up the associated state
FETCH_xxx Functions and Procedures on page 84-19	Returns metadata for objects meeting the criteria established by `OPEN`, `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, and so on
GET_QUERY Function on page 84-26	Returns the text of the queries that are used by `FETCH_xxx`
GET_xxx Functions on page 84-22	Fetches the metadata for a specified object as XML, SXML, or DDL, using only a single call
OPEN Function on page 84-27	Specifies the type of object to be retrieved, the version of its metadata, and the object model
SET_COUNT Procedure on page 84-36	Specifies the maximum number of objects to be retrieved in a single `FETCH_xxx` call
SET_FILTER Procedure on page 84-37	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 84-47	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 84-50	Specifies parameters to the XSLT stylesheets identified by `transform_handle`

Subprograms for Submitting XML to the Database

Table 84–2 lists the subprograms used for submitting XML to the database.

Table 84–2 DBMS_METADATA Subprograms for Submitting XML

Subprogram	Description
ADD_TRANSFORM Function on page 84-12	Specifies a transform for the XML documents
CLOSE Procedure on page 84-16	Closes the context opened with `OPENW`
CONVERT Functions and Procedures on page 84-17	Converts an XML document to DDL
OPENW Function on page 84-33	Opens a write context
PUT Function on page 84-34	Submits an XML document to the database
SET_PARSE_ITEM Procedure on page 84-47	Specifies an object attribute to be parsed
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 84-50	`SET_TRANSFORM_PARAM` specifies a parameter to a transform `SET_REMAP_PARAM` specifies a remapping for a transform

Summary of All DBMS_METADATA Subprograms

Table 84–3 DBMS_METADATA Package Subprograms

Subprogram	Description
ADD_TRANSFORM Function on page 84-12	Specifies a transform that FETCH_xxx applies to the XML representation of the retrieved objects
CLOSE Procedure on page 84-16	Invalidates the handle returned by OPEN and cleans up the associated state
CONVERT Functions and Procedures on page 84-17	Converts an XML document to DDL.
FETCH_xxx Functions and Procedures on page 84-19	Returns metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on
GET_xxx Functions on page 84-22	Fetches the metadata for a specified object as XML, SXML, or DDL, using only a single call
GET_QUERY Function on page 84-26	Returns the text of the queries that are used by FETCH_xxx
OPEN Function on page 84-27	Specifies the type of object to be retrieved, the version of its metadata, and the object model
OPENW Function on page 84-33	Opens a write context
PUT Function on page 84-34	Submits an XML document to the database
SET_COUNT Procedure on page 84-36	Specifies the maximum number of objects to be retrieved in a single FETCH_xxx call
SET_FILTER Procedure on page 84-37	Specifies restrictions on the objects to be retrieved, for example, the object name or schema
SET_PARSE_ITEM Procedure on page 84-47	Enables output parsing by specifying an object attribute to be parsed and returned
SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures on page 84-50	Specifies parameters to the XSLT stylesheets identified by transform_handle

ADD_TRANSFORM Function

This function is used for both retrieval and submission:

- When this procedure is used to retrieve objects, it specifies a transform that FETCH_xxx applies to the XML representation of the retrieved objects.
- When used to submit objects, it specifies a transform that CONVERT or PUT applies to the XML representation of the submitted objects. It is possible to add more than one transform.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 84-9
- Subprograms for Submitting XML to the Database on page 84-10

Syntax

```
DBMS_METADATA.ADD_TRANSFORM (
   handle       IN NUMBER,
   name         IN VARCHAR2,
   encoding     IN VARCHAR2 DEFAULT NULL,
   object_type  IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 84–4 ADD_TRANSFORM Function Parameters

Parameters	Description
handle	The handle returned from OPEN when this transform is used to retrieve objects. Or the handle returned from OPENW when this transform is used in the submission of XML metadata.

Table 84–4 (Cont.) ADD_TRANSFORM Function Parameters

Parameters	Description
`name`	The name of the transform. If name contains a period, colon, or forward slash, it is interpreted as the URL of a user-supplied XSLT script. See *Oracle XML DB Developer's Guide.* Otherwise, name designates a transform implemented by `DBMS_METADATA`. The following transforms are defined: ■ ALTERDDL - The document is converted from ALTER_ XML format to SQL DDL. ■ ALTERXML - The document is converted from SXML difference format to ALTER_XML format. See the `DBMS_ METADATA_DIFF` PL/SQL package for more information about SXML difference format. ■ DDL - The document is transformed to DDL that creates the object. The output of this transform is *not* an XML document. ■ MODIFY - The document is modified as directed by transform and remap parameters. The output of this transform is an XML document. If no transform or remap parameters are specified, the document is unchanged. ■ MODIFYSXML - The SXML format document is modified as directed by transform and remap parameters. The output of this transform is an XML document. If no transform or remap parameters are specified, the document is unchanged. ■ SXML - The document is converted to SXML format. This transform is only valid for a subset of object types. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_ POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW. ■ SXMLDDL - The SXML format document is transformed to DDL that creates the object.
`encoding`	The name of the Globalization Support character set in which the stylesheet pointed to by name is encoded. This is only valid if name is a URL. If left NULL and the URL is external to the database, UTF-8 encoding is assumed. If left NULL and the URL is internal to the database (that is, it begins with /oradb/), then the encoding is assumed to be the database character set.

Table 84–4 (Cont.) ADD_TRANSFORM Function Parameters

Parameters	Description
object_type	The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata. 1. When you use ADD_TRANFORM to retrieve objects, the following definition of object_type applies: Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.) By default the transform applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, the following behavior can occur: ■ if object_type is omitted, the transform applies to all object types within the heterogeneous collection ■ if object_type is specified, the transform only applies to that specific object type within the collection If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type. 2. When you use ADD_TRANSFORM in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the OPENW handle. Because the OPENW handle cannot designate a heterogeneous object type, the caller would normally leave this parameter NULL in the ADD_TRANSFORM calls.

Return Values

The opaque handle that is returned is used as input to SET_TRANSFORM_PARAM and SET_REMAP_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

Usage Notes

- With no transforms added, objects are returned by default as XML documents. You call ADD_TRANSFORM to specify the XSLT stylesheets to be used to transform the returned XML documents.
- You can call ADD_TRANSFORM more than once to apply multiple transforms to XML documents. Transforms are applied in the order in which they were specified, the output of the first transform being used as input to the second, and so on.
- The output of a DDL transform is *not* an XML document. Therefore, no transform should be added after the DDL transform.
- Each transform expects a certain format XML document as input. If the input document is unspecified, metadata XML format is assumed.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. ADD_TRANSFORM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to ADD_TRANSFORM for the current OPEN context are permitted.

- `INCONSISTENT_ARGS`. The arguments are inconsistent. Possible inconsistencies include the following:
  - `encoding` is specified even though name is not a URL
  - `object_type` is not part of the collection designated by handle

CLOSE Procedure

This procedure is used for both retrieval and submission. This procedure invalidates the handle returned by OPEN (or OPENW) and cleans up the associated state.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 84-9
- Subprograms for Submitting XML to the Database on page 84-10

Syntax

```
DBMS_METADATA.CLOSE (
   handle  IN NUMBER);
```

Parameters

Table 84–5 CLOSE Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN (or OPENW).

Usage Notes

Note: The following notes apply only to object retrieval

You can prematurely terminate the stream of objects established by OPEN or (OPENW).

- If a call to FETCH_xxx returns NULL, indicating no more objects, a call to CLOSE is made transparently. In this case, you can still call CLOSE on the handle and not get an exception. (The call to CLOSE is not required.)
- If you know that only one specific object will be returned, you should explicitly call CLOSE after the single FETCH_xxx call to free resources held by the handle.

Exceptions

- INVALID_ARGVAL. The value for the handle parameter is NULL or invalid.

CONVERT Functions and Procedures

The CONVERT functions and procedures transform input XML documents. The CONVERT functions return creation DDL. The CONVERT procedures return either XML or DDL, depending on the specified transforms.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Submitting XML to the Database on page 84-10

Syntax

The CONVERT functions are as follows:

```
DBMS_METADATA.CONVERT (
   handle   IN NUMBER,
   document IN sys.XMLType)
 RETURN sys.ku$_multi_ddls;

DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN CLOB)
 RETURN sys.ku$_multi_ddls;
```

The CONVERT procedures are as follows:

```
DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN sys.XMLType,
  result   IN OUT NOCOPY CLOB);

DBMS_METADATA.CONVERT (
  handle   IN NUMBER,
  document IN CLOB,
  result   IN OUT NOCOPY CLOB);
```

Parameters

Table 84–6 CONVERT Subprogram Parameters

Parameter	Description
handle	The handle returned from OPENW.
document	The XML document containing object metadata of the type of the OPENW handle.
result	The converted document.

Return Values

Either XML or DDL, depending on the specified transforms.

Usage Notes

You can think of CONVERT as the second half of FETCH_xxx, either FETCH_DDL (for the function variants) or FETCH_CLOB (for the procedure variants). There are two differences:

- FETCH_xxx gets its XML document from the database, but CONVERT gets its XML document from the caller
- FETCH_DDL returns its results in a sys.ku$_ddls nested table, but CONVERT returns a sys.ku$_multi_ddls nested table

The transforms specified with ADD_TRANSFORM are applied in turn, and the result is returned to the caller. For the function variants, the DDL transform must be specified. If parse items were specified, they are returned in the parsedItems column. Parse items are ignored by the procedure variants.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. No transform was specified. The DDL transform was not specified (function variants only).
- INCOMPATIBLE_DOCUMENT. The version of the XML document is not compatible with this version of the software.

FETCH_xxx Functions and Procedures

These functions and procedures return metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. See "Usage Notes" on page 84-20 for the variants.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 84-9

Syntax

The FETCH functions are as follows:

```
DBMS_METADATA.FETCH_XML (
   handle  IN NUMBER)
RETURN sys.XMLType;
```

> **See Also:** *Oracle XML DB Developer's Guide* for a description of XMLType

```
DBMS_METADATA.FETCH_DDL (
   handle  IN NUMBER)
RETURN sys.ku$_ddls;

DBMS_METADATA.FETCH_CLOB (
   handle       IN NUMBER,
   cache_lob    IN BOOLEAN DEFAULT TRUE,
   lob_duration IN PLS INTEGER DEFAULT DBMS_LOB.SESSION)
RETURN CLOB;
```

The FETCH procedures are as follows:

```
DBMS_METADATA.FETCH_CLOB (
   handle  IN NUMBER,
   doc     IN OUT NOCOPY CLOB);

DBMS_METADATA.FETCH_XML_CLOB (
   handle  IN NUMBER,
   doc     IN OUT NOCOPY CLOB,
   parsed_items OUT sys.ku$_parsed_items,
   object_type_path OUT VARCHAR2);
```

Parameters

Table 84–7 FETCH_xxx Function Parameters

Parameters	Description
handle	The handle returned from OPEN.
cache_lob	TRUE=read LOB into buffer cache
lob_duration	The duration for the temporary LOB created by FETCH_CLOB, either DBMS_LOB.SESSION (the default) or DBMS_LOB.CALL.
doc	The metadata for the objects, or NULL if all objects have been returned.

Table 84–7 (Cont.) FETCH_xxx Function Parameters

Parameters	Description
parsed_items	A nested table containing the items specified by SET_PARSE_ITEM. If SET_PARSE_ITEM was not called, a NULL is returned.
object_type_path	For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to FETCH_XXX. If handle designates a homogeneous object type, a NULL is returned.

Return Values

The metadata for the objects or NULL if all objects have been returned.

Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to OPEN that returned the handle, and subsequent calls to SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. Each call to FETCH_xxx returns the number of objects specified by SET_COUNT (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to FETCH_xxx return NULL and cause the stream created by OPEN to be transparently closed.

There are several different FETCH_xxx functions and procedures:

- The FETCH_XML function returns the XML metadata for an object as an XMLType. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.
- The FETCH_DDL function returns the DDL (to create the object) in a sys.ku$_ddls nested table. It assumes that the DDL transform has been specified. Each row of the sys.ku$_ddls nested table contains a single DDL statement in the ddlText column; if requested, parsed items for the DDL statement will be returned in the parsedItems column. Multiple DDL statements may be returned under the following circumstances:
  - When you call SET_COUNT to specify a count greater than 1
  - When an object is transformed into multiple DDL statements. For example, A TYPE object that has a DDL transform applied to it can be transformed into both CREATE TYPE and CREATE TYPE BODY statements. A TABLE object can be transformed into a CREATE TABLE, and one or more ALTER TABLE statements
- The FETCH_CLOB function simply returns the object, transformed or not, as a CLOB. By default, the CLOB is read into the buffer cache and has session duration, but these defaults can be overridden with the cache_lob and lob_duration parameters.
- The FETCH_CLOB procedure returns the objects by reference in an IN OUT NOCOPY parameter. This is faster than the function variant, which returns LOBs by value, a practice that involves an expensive LOB copy.
- The FETCH_XML_CLOB procedure returns the XML metadata for the objects as a CLOB in an IN OUT NOCOPY parameter. This helps to avoid LOB copies, which can consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.

- All LOBs returned by FETCH_xxx are temporary LOBs. You must free the LOB. If the LOB is supplied as an IN OUT NOCOPY parameter, you must also create the LOB.
- If SET_PARSE_ITEM was called, FETCH_DDL and FETCH_XML_CLOB return attributes of the object's metadata (or the DDL statement) in a sys.ku$_parsed_items nested table. For FETCH_XML_CLOB, the nested table is an OUT parameter. For FETCH_DDL, it is a column in the returned sys.ku$_ddls nested table. Each row of the nested table corresponds to an item specified by SET_PARSE_ITEM and contains the following columns:
  - item—the name of the attribute as specified in the name parameter to SET_PARSE_ITEM.
  - value—the attribute value, or NULL if the attribute is not present in the DDL statement.
  - object-row—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by FETCH_xxx, (because SET_COUNT specified a count greater than 1) then object_row=1 for all items for the first object, 2 for the second, and so on.
- The rows of the sys.ku$_parsed_items nested table are ordered by ascending object_row, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on item.
- In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be NULL.
- If SET_PARSE_ITEM was not called, NULL is returned as the value of the parsed items nested table.
- It is expected that the same variant of FETCH_xxx will be called for all objects selected by OPEN. That is, programs will not intermix calls to FETCH_XML, FETCH_DDL, FETCH_CLOB, and so on using the same OPEN handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.
- Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the FETCH_xxx calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

Exceptions

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. Either FETCH_XML was called when the DDL transform had been specified, or FETCH_DDL was called when the DDL transform had *not* been specified.

GET_xxx Functions

The following GET_xxx functions let you fetch metadata for objects with a single call:

- GET_XML
- GET_DDL
- GET_SXML
- GET_DEPENDENT_XML
- GET_DEPENDENT_DDL
- GET_GRANTED_XML
- GET_GRANTED_DDL

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 84-9

Syntax

```
DBMS_METADATA.GET_XML (
object_type     IN VARCHAR2,
name            IN VARCHAR2,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

DBMS_METADATA.GET_DDL (
object_type     IN VARCHAR2,
name            IN VARCHAR2,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL')
RETURN CLOB;

DBMS_METADATA.GET_SXML (
object_type     IN VARCHAR2,
name            IN VARCHAR2 DEFAULT NULL,
schema          IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'SXML')
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_XML (
object_type        IN VARCHAR2,
base_object_name   IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version            IN VARCHAR2 DEFAULT 'COMPATIBLE',
model              IN VARCHAR2 DEFAULT 'ORACLE',
transform          IN VARCHAR2 DEFAULT NULL,
object_count       IN NUMBER   DEFAULT 10000)
RETURN CLOB;
```

```
DBMS_METADATA.GET_DEPENDENT_DDL (
object_type         IN VARCHAR2,
base_object_name    IN VARCHAR2,
base_object_schema  IN VARCHAR2 DEFAULT NULL,
version             IN VARCHAR2 DEFAULT 'COMPATIBLE',
model               IN VARCHAR2 DEFAULT 'ORACLE',
transform           IN VARCHAR2 DEFAULT 'DDL',
object_count        IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_XML (
object_type     IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT NULL,
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_DDL (
object_type     IN VARCHAR2,
grantee         IN VARCHAR2 DEFAULT NULL,
version         IN VARCHAR2 DEFAULT 'COMPATIBLE',
model           IN VARCHAR2 DEFAULT 'ORACLE',
transform       IN VARCHAR2 DEFAULT 'DDL',
object_count    IN NUMBER   DEFAULT 10000)
RETURN CLOB;
```

Parameters

Table 84–8 GET_xxx Function Parameters

Parameter	Description
object_type	The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object.
name	The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified See Table 84–17 for a list of filters.
schema	The object schema. It is used internally in a SCHEMA filter. The default is the current user.
version	The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter.
model	The object model to use. This parameter takes the same values as the OPEN model parameter.
transform	The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL.
base_object_name	The base object name. It is used internally in a BASE_OBJECT_NAME filter.
base_object_schema	The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user.

Table 84–8 (Cont.) GET_xxx Function Parameters

Parameter	Description
grantee	The grantee. It is used internally in a GRANTEE filter. The default is the current user.
object_count	The maximum number of objects to return. See SET_COUNT Procedure on page 84-36.

Return Values

The metadata for the specified object as XML or DDL.

Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML, SXML, or DDL.
  - GET_xxx is used to fetch named objects, especially schema objects (tables, views).
  - GET_DEPENDENT_xxx is used to fetch dependent objects (audits, object grants).
  - GET_GRANTED_xxx is used to fetch granted objects (system grants, role grants).
- For some object types you can use more than one function. For example, you can use GET_xxx to fetch an index by name, or GET_DEPENDENT_xxx to fetch the same index by specifying the table on which it is defined.
- GET_xxx only returns a single named object.
- For GET_DEPENDENT_xxx and GET_GRANTED_xxx, an arbitrary number of dependent or granted objects can match the input criteria. You can specify an object count when fetching these objects. (The default count of 10000 should be adequate in most cases.)
- If the DDL transform is specified, session-level transform parameters are inherited.
- If you invoke these functions from SQL*Plus, you should set the PAGESIZE to 0 and set LONG to some large number to get complete, uninterrupted output.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT_NOT_FOUND. The specified object was not found in the database.

Examples

Example: Fetch the XML Representation of SCOTT.EMP

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE','EMP','SCOTT')
```

```
FROM DUAL;
```

Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter Out Nested Tables and Overflow Segments

This example fetches the DDL for all "complete" tables in the current schema, filtering out nested tables and overflow segments. The example uses `SET_TRANSFORM_PARAM` (with the handle value = `DBMS_METADATA.SESSION_TRANSFORM` meaning "for the current session") to specify that storage clauses are not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupted output, set the `PAGESIZE` to 0 and set `LONG` to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM,'STORAGE',false);
SELECT DBMS_METADATA.GET_DDL('TABLE',u.table_name)
     FROM USER_ALL_TABLES u
     WHERE u.nested='NO'
     AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_
TRANSFORM,'DEFAULT');
```

Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES

```
SELECT DBMS_METADATA.GET_DEPENDENT_DDL('OBJECT_GRANT',
    'EMPLOYEES','HR') FROM DUAL;
```

Example: Fetch the DDL For All System Grants Granted To SCOTT

```
SELECT DBMS_METADATA.GET_GRANTED_DDL('SYSTEM_GRANT','SCOTT')
    FROM DUAL;
```

GET_QUERY Function

This function returns the text of the queries that are used by `FETCH_xxx`. This function assists in debugging.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 84-9

Syntax

```
DBMS_METADATA.GET_QUERY (
   handle  IN NUMBER)
 RETURN VARCHAR2;
```

Parameters

Table 84–9 GET_QUERY Function Parameters

Parameter	Description
`handle`	The handle returned from `OPEN`. It cannot be the handle for a heterogeneous object type.

Return Values

The text of the queries that will be used by `FETCH_xxx`.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for the `handle` parameter.

OPEN Function

This function specifies the type of object to be retrieved, the version of its metadata, and the object model. The return value is an opaque context handle for the set of objects to be used in subsequent calls.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 84-9

Syntax

```
DBMS_METADATA.OPEN (
   object_type  IN VARCHAR2,
   version      IN VARCHAR2 DEFAULT 'COMPATIBLE',
   model        IN VARCHAR2 DEFAULT 'ORACLE',
   network_link IN VARCHAR2 DEFAULT NULL)
 RETURN NUMBER;
```

Parameters

Table 84–10 Open Function Parameters

Parameter	Description
`object_type`	The type of object to be retrieved. Table 84–11 lists the valid type names and their meanings. These object types will be supported for the ORACLE model of metadata (see `model` in this table). The Attributes column in Table 84–11 specifies some object type attributes: ▪ Schema objects, such as tables, belong to schemas. ▪ Named objects have unique names (if they are schema objects, the name is unique to the schema). ▪ Dependent objects, such as indexes, are defined with reference to a base schema object. ▪ Granted objects are granted or assigned to a user or role and therefore have a named grantee. ▪ Heterogeneous object types denote a collection of related objects of different types. See Table 84–12 for a listing of object types returned for the heterogeneous object type. These attributes are relevant when choosing object selection criteria. See "SET_FILTER Procedure" on page 84-37 for more information.
`version`	The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows: `COMPATIBLE` (default)—the version of the metadata corresponds to the database compatibility level. `LATEST`—the version of the metadata corresponds to the database version. A specific database version. The value cannot be lower than 9.2.0.

Table 84–10 (Cont.) Open Function Parameters

Parameter	Description
model	Specifies which view to use, because the API can support multiple views on the metadata. Only the ORACLE model is supported.
network_link	The name of a database link to the database whose metadata is to be retrieved. If NULL (the default), metadata is retrieved from the database on which the caller is running

Table 84–11 provides the name, meaning, attributes, and notes for the DBMS_METADATA package object types. In the attributes column, S represents a schema object, N represents a named object, D represents a dependent object, G represents a granted object, and H represents a heterogeneous object.

Table 84–11 DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
AQ_QUEUE	queues	SND	Dependent on table
AQ_QUEUE_TABLE	additional metadata for queue tables	ND	Dependent on table
AQ_TRANSFORM	transforms	SN	None
ASSOCIATION	associate statistics	D	None
AUDIT	audits of SQL statements	DG	Modeled as dependent, granted object. The base object name is the statement audit option name (for example, ALTER SYSTEM). There is no base object schema. The grantee is the user or proxy whose statements are audited.
AUDIT_OBJ	audits of schema objects	D	None
CLUSTER	clusters	SN	None
COMMENT	comments	D	None
CONSTRAINT	constraints	SND	Does not include: ■ primary key constraint for IOT ■ column NOT NULL constraints ■ certain REF SCOPE and WITH ROWID constraints for tables with REF columns
CONTEXT	application contexts	N	None
DATABASE_EXPORT	all metadata objects in a database	H	Corresponds to a full database export
DB_LINK	database links	SN	Modeled as schema objects because they have owners. For public links, the owner is PUBLIC. For private links, the creator is the owner.
DEFAULT_ROLE	default roles	G	Granted to a user by ALTER USER
DIMENSION	dimensions	SN	None
DIRECTORY	directories	N	None
FGA_POLICY	fine-grained audit policies	D	Not modeled as named object because policy names are not unique.

Table 84–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
FUNCTION	stored functions	SN	None
INDEX_STATISTICS	precomputed statistics on indexes	D	The base object is the index's table.
INDEX	indexes	SND	None
INDEXTYPE	indextypes	SN	None
JAVA_SOURCE	Java sources	SN	None
JOB	jobs	S	None
LIBRARY	external procedure libraries	SN	None
MATERIALIZED_VIEW	materialized views	SN	None
MATERIALIZED_ VIEW_LOG	materialized view logs	D	None
OBJECT_GRANT	object grants	DG	None
OPERATOR	operators	SN	None
PACKAGE	stored packages	SN	By default, both package specification and package body are retrieved. See "SET_ FILTER Procedure" on page 84-37.
PACKAGE_SPEC	package specifications	SN	None
PACKAGE_BODY	package bodies	SN	None
PROCEDURE	stored procedures	SN	None
PROFILE	profiles	N	None
PROXY	proxy authentications	G	Granted to a user by ALTER USER
REF_CONSTRAINT	referential constraint	SND	None
REFRESH_GROUP	refresh groups	SN	None
RESOURCE_COST	resource cost info		None
RLS_CONTEXT	driving contexts for enforcement of fine-grained access-control policies	D	Corresponds to the DBMS_RLS.ADD_ POLICY_CONTENT procedure
RLS_GROUP	fine-grained access-control policy groups	D	Corresponds to the DBMS_RLS.CREATE_ GROUP procedure
RLS_POLICY	fine-grained access-control policies	D	Corresponds to DBMS_RLS.ADD_ GROUPED_POLICY. Not modeled as named objects because policy names are not unique.
RMGR_CONSUMER_ GROUP	resource consumer groups	SN	Data Pump does not use these object types. Instead, it exports resource manager objects as procedural objects.
RMGR_INTITIAL_ CONSUMER_GROUP	assign initial consumer groups to users	G	None
RMGR_PLAN	resource plans	SN	None
RMGR_PLAN_ DIRECTIVE	resource plan directives	D	Dependent on resource plan
ROLE	roles	N	None

Table 84–11 (Cont.) DBMS_METADATA: Object Types

Type Name	Meaning	Attributes	Notes
ROLE_GRANT	role grants	G	None
ROLLBACK_SEGMENT	rollback segments	N	None
SCHEMA_EXPORT	all metadata objects in a schema	H	Corresponds to user-mode export.
SEQUENCE	sequences	SN	None
SYNONYM	synonyms	See notes	Private synonyms are schema objects. Public synonyms are not, but for the purposes of this API, their schema name is PUBLIC. The name of a synonym is considered to be the synonym itself. For example, in CREATE PUBLIC SYNONYM FOO FOR BAR, the resultant object is considered to have name FOO and schema PUBLIC.
SYSTEM_GRANT	system privilege grants	G	None
TABLE	tables	SN	None
TABLE_DATA	metadata describing row data for a table, nested table, or partition	SND	For partitions, the object name is the partition name. For nested tables, the object name is the storage table name. The base object is the top-level table to which the table data belongs. For nested tables and partitioning, this is the top-level table (*not* the parent table or partition). For nonpartitioned tables and non-nested tables this is the table itself.
TABLE_EXPORT	metadata for a table and its associated objects	H	Corresponds to table-mode export
TABLE_STATISTICS	precomputed statistics on tables	D	None
TABLESPACE	tablespaces	N	None
TABLESPACE_QUOTA	tablespace quotas	G	Granted with ALTER USER
TRANSPORTABLE_EXPORT	metadata for objects in a transportable tablespace set	H	Corresponds to transportable tablespace export
TRIGGER	triggers	SND	None
TRUSTED_DB_LINK	trusted links	N	None
TYPE	user-defined types	SN	By default, both type and type body are retrieved. See "SET_FILTER Procedure" on page 84-37.
TYPE_SPEC	type specifications	SN	None
TYPE_BODY	type bodies	SN	None
USER	users	N	None
VIEW	views	SN	None
XMLSCHEMA	XML schema	SN	The object's name is its URL (which may be longer than 30 characters). Its schema is the user who registered it.

Table 84–12 lists the types of objects returned for the major heterogeneous object types. For SCHEMA_EXPORT, certain object types are only returned if the INCLUDE_USER filter is specified at TRUE. In the table, such object types are marked INCLUDE_USER.

Table 84–12 Object Types Returned for the Heterogeneous Object Type

Object Type	DATABASE_ EXPORT	SCHEMA_ EXPORT	TABLE_ EXPORT	TRANSPORTABLE_ EXPORT
ASSOCIATION	Yes	No	No	No
AUDIT	Yes	No	No	No

TYPE_BODY	Yes	Yes	No	Yes, if the types are used by tables in the transportable set
USER	Yes	INCLUDE_USER	No	No
VIEW	Yes	Yes	No	No
XMLSCHEMA	Yes	Yes	No	No

Return Values

An opaque handle to the class of objects. This handle is used as input to `SET_FILTER`, `SET_COUNT`, `ADD_TRANSFORM`, `GET_QUERY`, `SET_PARSE_ITEM`, `FETCH_xxx`, and `CLOSE`.

Exceptions

- `INVALID_ARGVAL`. A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INVALID_OBJECT_PARAM`. The `version` or `model` parameter was not valid for the `object_type`.

OPENW Function

This function specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Submitting XML to the Database on page 84-10

Syntax

```
DBMS_METADATA.OPENW
  (object_type  IN VARCHAR2,
  version       IN VARCHAR2 DEFAULT 'COMPATIBLE',
  model         IN VARCHAR2 DEFAULT 'ORACLE')
 RETURN NUMBER;
```

Parameters

Table 84–13 OPENW Function Parameters

Parameter	Description
object_type	The type of object to be submitted. Valid types names and their meanings are listed in Table 84–11. The type cannot be a heterogeneous object type.
version	The version of DDL to be generated by the CONVERT function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows: ■ COMPATIBLE - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher. ■ LATEST - The version of the DDL corresponds to the database version. ■ A specific database version. The value cannot be lower than 9.2.0.
model	Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by DBMS_METADATA.

Return Values

An opaque handle to write context. This handle is used as input to the ADD_TRANSFORM, CONVERT, PUT, and CLOSE procedures.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OBJECT_PARAM. The model parameter was not valid for the object_type.

PUT Function

This function submits an XML document containing object metadata to the database to create the object.

See Also: For more information about related subprograms:

- Subprograms for Submitting XML to the Database on page 84-10

Syntax

```
DBMS_METADATA.PUT (
   handle     IN             NUMBER,
   document   IN             sys.XMLType,
   flags      IN             NUMBER,
   results    IN OUT NOCOPY  sys.ku$_SubmitResults)
  RETURN BOOLEAN;

DBMS_METADATA.PUT (
   handle     IN             NUMBER,
   document   IN             CLOB,
   flags      IN             NUMBER,
   results    IN OUT NOCOPY  sys.ku$_SubmitResults)
 RETURN BOOLEAN;
```

Parameters

Table 84–14 PUT Function Parameters

Parameter	Description
handle	The handle returned from OPENW.
document	The XML document containing object metadata for the type of the OPENW handle.
flags	Reserved for future use
results	Detailed results of the operation.

Return Values

TRUE if all SQL operations succeeded; FALSE if there were any errors.

Usage Notes

The PUT function converts the XML document to DDL just as CONVERT does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with CONVERT, the DDL transform must be specified. The DDL statements and associated parse items are returned in the sys.ku$_SubmitResults nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- `INVALID_ARGVAL`. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- `INCONSISTENT_OPERATION`. The DDL transform was not specified.
- `INCOMPATIBLE_DOCUMENT`. The version of the XML document is not compatible with this version of the software.

SET_COUNT Procedure

This procedure specifies the maximum number of objects to be retrieved in a single FETCH_xxx call. By default, each call to FETCH_xxx returns one object. You can use the SET_COUNT procedure to override this default. If FETCH_xxx is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single FETCH_xxx operation only returns objects of a single object type.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 84-9

Syntax

```
DBMS_METADATA.SET_COUNT (
   handle           IN NUMBER,
   value            IN NUMBER,
   object_type_path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 84–15 SET_COUNT Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN.
value	The maximum number of objects to retrieve.
object_type_path	A path name designating the object types to which the count value applies. By default, the count value applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following: ■ if object_type_path is omitted, the count applies to all object types within the heterogeneous collection ■ if object_type_path is specified, the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. SET_COUNT was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_COUNT for the current OPEN context are permitted.
- INCONSISTENT_ARGS. object_type parameter is not consistent with handle.

SET_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 84-9

Syntax

```
DBMS_METADATA.SET_FILTER (
   handle           IN NUMBER,
   name             IN VARCHAR2,
   value            IN VARCHAR2,
   object_type_path IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_FILTER (
   handle            IN NUMBER,
   name              IN VARCHAR2,
   value             IN BOOLEAN DEFAULT TRUE,
   object_type_path  IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_FILTER (
   handle            IN NUMBER,
   name              IN VARCHAR2,
   value             IN NUMBER,
   object_type_path  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 84–16 SET_FILTER Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN.
name	The name of the filter. For each filter, Table 84–17 lists the object_type it applies to, its name, its datatype (text or Boolean) and its meaning or effect (including its default value, if any). The Datatype column of Table 84–17 also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.)) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (*not* a double quote) are needed to represent an apostrophe. For example, an example of a NAME_EXPR filter in PL/SQL is as follows: 'IN (''DEPT'',''EMP'')' The filter value is combined with a particular object attribute to produce a WHERE condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.
value	The value of the filter. Text, Boolean, and Numeric filters are supported.

Table 84–16 (Cont.) SET_FILTER Procedure Parameters

Parameter	Description
object_type_path	A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See Table 84–18 for a listing of some of the values for this parameter.

Table 84–17 describes the object type, name, datatype, and meaning of the filters available with the SET_FILTER procedure.

Table 84–17 SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Named objects	NAME	text	Objects with this exact name are selected.
Named objects	NAME_EXPR	text expression	The filter value is combined with the object attribute corresponding to the object name to produce a WHERE condition in the query that fetches the objects. By default, all named objects of object_type are selected.
Named objects	EXCLUDE_NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the object name to specify objects that are to be excluded from the set of objects fetched. By default, all named objects of the object type are selected.
Schema objects	SCHEMA	text	Objects in this schema are selected. If the object type is SYNONYM, specify PUBLIC to select public synonyms.
Schema objects	SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the object's schema. The default is determined as follows: - if BASE_OBJECT_SCHEMA is specified, then objects in that schema are selected; - otherwise, objects in the current schema are selected.
PACKAGE, TYPE	SPECIFICATION	Boolean	If TRUE, retrieve the package or type specification. Defaults to TRUE.
PACKAGE, TYPE	BODY	Boolean	If TRUE, retrieve the package or type body. Defaults to TRUE.
TABLE, CLUSTER, INDEX, TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_EXPORT	TABLESPACE	text	Objects in this tablespace (or having a partition in this tablespace) are selected.

Table 84–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE, CLUSTER, INDEX,TABLE_DATA, TABLE_EXPORT, TRANSPORTABLE_ EXPORT	TABLESPACE_ EXPR	text expression	The filter value is combined with the attribute corresponding to the object's tablespace (or in the case of a partitioned table or index, the partition's tablespaces). By default, objects in all tablespaces are selected.
TABLE, objects dependent on tables	PRIMARY	Boolean	If TRUE, retrieve primary tables (that is, tables for which the secondary object bit in obj$ is clear. Defaults to TRUE.
TABLE, objects dependent on tables	SECONDARY	Boolean	If TRUE, retrieve secondary tables (that is, tables for which the secondary object bit in obj$ is set). Defaults to TRUE.
Dependent Objects	BASE_OBJECT_ NAME	text	Objects are selected that are defined or granted on objects with this name. Specify SCHEMA for triggers on schemas. Specify DATABASE for database triggers. Column-level comments cannot be selected by column name; the base object name must be the name of the table, view, or materialized view containing the column.
Dependent Objects	BASE_OBJECT_ SCHEMA	text	Objects are selected that are defined or granted on objects in this schema. If BASE_OBJECT_NAME is specified with a value other than SCHEMA or DATABASE, this defaults to the current schema.
Dependent Objects	BASE_OBJECT_ NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object. Not valid for schema and database triggers.
Dependent Objects	EXCLUDE_BASE_ OBJECT_NAME_ EXPR	text expression	The filter value is combined with the attribute corresponding to the name of the base object to specify objects that are to be excluded from the set of objects fetched. Not valid for schema and database triggers.
Dependent Objects	BASE_OBJECT_ SCHEMA_EXPR	text expression	The filter value is combined with the attribute corresponding to the schema of the base object.
Dependent Objects	BASE_OBJECT_ TYPE	text	The object type of the base object.
Dependent Objects	BASE_OBJECT_ TYPE_EXPR	text expression	The filter value is combined with the attribute corresponding to the object type of the base object. By default no filtering is done on object type.
Dependent Objects	BASE_OBJECT_ TABLESPACE	text	The tablespace of the base object.
Dependent Objects	BASE_OBJECT_ TABLESPACE_ EXPR	text expression	The filter value is combined with the attribute corresponding to the tablespaces of the base object. By default, no filtering is done on the tablespace.
INDEX, TRIGGER	SYSTEM_ GENERATED	Boolean	If TRUE, select indexes or triggers even if they are system-generated. If FALSE, omit system-generated indexes or triggers. Defaults to TRUE.
Granted Objects	GRANTEE	text	Objects are selected that are granted to this user or role. Specify PUBLIC for grants to PUBLIC.
Granted Objects	PRIVNAME	text	The name of the privilege or role to be granted. For TABLESPACE_QUOTA, only UNLIMITED can be specified.

Table 84–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
Granted Objects	PRIVNAME_EXPR	text expression	The filter value is combined with the attribute corresponding to the privilege or role name. By default, all privileges/roles are returned.
Granted Objects	GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name.
Granted Objects	EXCLUDE_ GRANTEE_EXPR	text expression	The filter value is combined with the attribute corresponding to the grantee name to specify objects that are to be excluded from the set of objects fetched.
OBJECT_GRANT	GRANTOR	text	Object grants are selected that are granted by this user.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME	text	A name longer than 30 characters. Objects with this exact name are selected. If the object name is 30 characters or less, the NAME filter must be used.
SYNONYM, JAVA_ SOURCE, XMLSCHEMA	LONGNAME_EXPR	text	The filter value is combined with the attribute corresponding to the object's long name. By default, no filtering is done on the long name of an object.
All objects	CUSTOM_FILTER	text	The text of a WHERE condition. The condition is appended to the query that fetches the objects. By default, no custom filter is used. The other filters are intended to meet the needs of the majority of users. Use CUSTOM_FILTER when no defined filters exists for your purpose. Of necessity such a filter depends on the detailed structure of the UDTs and views used in the query. Because filters may change from version to version, upward compatibility is not guaranteed.
All objects	EDITION	text	The edition filter is accepted for any object type, but affects only objects that support editions. The filter is only accepted for local objects (that is, the network_link parameter is not specified in the OPEN call). The edition name must be a valid edition name. If an edition is not specified, the edition of the active session is used.
SCHEMA_EXPORT	SCHEMA	text	The schema whose objects are selected.
SCHEMA_EXPORT	SCHEMA_EXPR	text expression	The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches schema objects, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches dependent objects. By default the current user's objects are selected.
SCHEMA_EXPORT	INCLUDE_USER	Boolean	If TRUE, retrieve objects containing privileged information about the user. For example, USER, PASSWORD_HISTORY, TABLESPACE_QUOTA. Defaults to FALSE.
TABLE_EXPORT	SCHEMA	text	Objects (tables and their dependent objects) in this schema are selected.

Table 84–17 (Cont.) SET_FILTER: Filters

Object Type	Name	Datatype	Meaning
TABLE_EXPORT	SCHEMA_EXPR	text expression	The filter value is either: combined with the attribute corresponding to a schema name to produce a WHERE condition in the query that fetches the tables, combined with the attribute corresponding to a base schema name to produce a WHERE condition in the query that fetches the tables' dependent objects. By default the current user's objects are selected.
TABLE_EXPORT	NAME	text	The table with this exact name is selected along with its dependent objects.
TABLE_EXPORT	NAME_EXPR	text expression	The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects. By default all tables in the selected schemas are selected, along with their dependent objects.
Heterogeneous objects	BEGIN_WITH	text	The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved.
Heterogeneous objects	BEGIN_AFTER	text	The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type.
Heterogeneous objects	END_BEFORE	text	The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type.
Heterogeneous objects	END_WITH	text	The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved.
Heterogeneous objects	INCLUDE_PATH_EXPR, EXCLUDE_PATH_EXPR	text expression	For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See Table 84–18 for valid path names that can be used with these filters. BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.

Usage Notes

- Each call to SET_FILTER causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are ANDed together, so you can use multiple SET_FILTER calls to refine the set of objects to be returned.

For example to specify that you want the object named EMP in schema SCOTT, do the following:

```
SET_FILTER(handle,'SCHEMA','SCOTT');
SET_FILTER(handle,'NAME','EMP');
```

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:

```
SET_FILTER(handle,'NAME_EXPR','>=''FELIX''');
SET_FILTER(handle,'NAME_EXPR','<=''OSCAR''');
```

- With SET_FILTER, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is SYS or has SELECT_CATALOG_ROLE, then any object can be retrieved; otherwise, only the following can be retrieved:
  - Schema objects owned by the current user
  - Public synonyms
  - System privileges granted to the current user or to PUBLIC
  - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as PUBLIC).
  - SCHEMA_EXPORT where the name is the current user
  - TABLE_EXPORT where SCHEMA is the current user

  If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

  In stored procedures, functions, and definers-rights packages, roles (such as SELECT_CATALOG_ROLE) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of SELECT_CATALOG_ROLE), you must make the program invokers-rights.

- For heterogeneous object types, the BEGIN_WITH and BEGIN_AFTER filters allow restart on an object type boundary. Appropriate filter values are returned by the FETCH_XML_CLOB procedure.

  Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for SCHEMA_EXPORT the NAME filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a NAME_EXPR filter explicitly for the TABLE object type path. Table 84–18 lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (The same information is available in the following catalog views: DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS.) See Table 84–17 for filters defined for each path name. These path names are valid in the INCLUDE_PATH_EXPR and EXCLUDE_PATH_EXPR filters. Path names marked with an asterisk (*) are *only* valid in those filters; they cannot be used as values of the SET_FILTER object_type_path parameter.

Table 84–18 Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
TABLE_EXPORT	AUDIT_OBJ	Object audits on the selected tables
TABLE_EXPORT	COMMENT	Table and column comments for the selected tables
TABLE_EXPORT	CONSTRAINT	Constraints (including referential constraints) on the selected tables
TABLE_EXPORT	*GRANT	Object grants on the selected tables
TABLE_EXPORT	INDEX	Indexes (including domain indexes) on the selected tables
TABLE_EXPORT	OBJECT_GRANT	Object grants on the selected tables
TABLE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on the selected tables
TABLE_EXPORT	STATISTICS	Statistics on the selected tables
TABLE_EXPORT	TABLE_DATA	Row data for the selected tables
TABLE_EXPORT	TRIGGER	Triggers on the selected tables
SCHEMA_EXPORT	ASSOCIATION	Statistics type associations for objects in the selected schemas
SCHEMA_EXPORT	AUDIT_OBJ	Audits on all objects in the selected schemas
SCHEMA_EXPORT	CLUSTER	Clusters in the selected schemas and their indexes
SCHEMA_EXPORT	COMMENT	Comments on all objects in the selected schemas
SCHEMA_EXPORT	CONSTRAINT	Constraints (including referential constraints) on all objects in the selected schemas
SCHEMA_EXPORT	DB_LINK	Private database links in the selected schemas
SCHEMA_EXPORT	DEFAULT_ROLE	Default roles granted to users associated with the selected schemas
SCHEMA_EXPORT	DIMENSION	Dimensions in the selected schemas
SCHEMA_EXPORT	FUNCTION	Functions in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	*GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters in the selected schemas
SCHEMA_EXPORT	INDEXTYPE	Indextypes in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JAVA_SOURCE	Java sources in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	JOB	Jobs in the selected schemas
SCHEMA_EXPORT	LIBRARY	External procedure libraries in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW	Materialized views in the selected schemas
SCHEMA_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs on tables in the selected schemas
SCHEMA_EXPORT	OBJECT_GRANT	Grants on objects in the selected schemas
SCHEMA_EXPORT	OPERATOR	Operators in the selected schemas and their dependent grants and audits

Table 84–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
SCHEMA_EXPORT	PACKAGE	Packages (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	PACKAGE_BODY	Package bodies in the selected schemas
SCHEMA_EXPORT	PACKAGE_SPEC	Package specifications in the selected schemas
SCHEMA_EXPORT	PASSWORD_HISTORY	The password history for users associated with the selected schemas
SCHEMA_EXPORT	PROCEDURE	Procedures in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the selected schemas
SCHEMA_EXPORT	REFRESH_GROUP	Refresh groups in the selected schemas
SCHEMA_EXPORT	SEQUENCE	Sequences in the selected schemas and their dependent grants and audits
SCHEMA_EXPORT	STATISTICS	Statistics on tables and indexes in the selected schemas
SCHEMA_EXPORT	SYNONYM	Private synonyms in the selected schemas
SCHEMA_EXPORT	TABLE	Tables in the selected schemas and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
SCHEMA_EXPORT	TABLE_DATA	Row data for tables in the selected schemas
SCHEMA_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users associated with the selected schemas
SCHEMA_EXPORT	TRIGGER	Triggers on tables in the selected schemas
SCHEMA_EXPORT	TYPE	Types (both specification and body) in the selected schemas, and their dependent grants and audits
SCHEMA_EXPORT	TYPE_BODY	Type bodies in the selected schemas
SCHEMA_EXPORT	TYPE_SPEC	Type specifications in the selected schemas
SCHEMA_EXPORT	USER	User definitions for users associated with the selected schemas
SCHEMA_EXPORT	VIEW	Views in the selected schemas and their dependent objects (grants, constraints, comments, audits)
DATABASE_EXPORT	ASSOCIATION	Statistics type associations for objects in the database
DATABASE_EXPORT	AUDIT	Audits of SQL statements
DATABASE_EXPORT	AUDIT_OBJ	Audits on all objects in the database
DATABASE_EXPORT	CLUSTER	Clusters and their indexes
DATABASE_EXPORT	COMMENT	Comments on all objects
DATABASE_EXPORT	CONSTRAINT	Constraints (including referential constraints)
DATABASE_EXPORT	CONTEXT	Application contexts
DATABASE_EXPORT	DB_LINK	Private and public database links
DATABASE_EXPORT	DEFAULT_ROLE	Default roles granted to users in the database
DATABASE_EXPORT	DIMENSION	Dimensions in the database

Table 84–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	DIRECTORY	Directory objects in the database
DATABASE_EXPORT	FGA_POLICY	Fine-grained audit policies
DATABASE_EXPORT	FUNCTION	Functions
DATABASE_EXPORT	* GRANT	Object and system grants
DATABASE_EXPORT	INDEX	Indexes (including domain indexes) on tables and clusters
DATABASE_EXPORT	INDEXTYPE	Indextypes and their dependent grants and audits
DATABASE_EXPORT	JAVA_SOURCE	Java sources and their dependent grants and audits
DATABASE_EXPORT	JOB	Jobs
DATABASE_EXPORT	LIBRARY	External procedure libraries
DATABASE_EXPORT	MATERIALIZED_VIEW	Materialized views
DATABASE_EXPORT	MATERIALIZED_VIEW_LOG	Materialized view logs
DATABASE_EXPORT	OBJECT_GRANT	All object grants in the database
DATABASE_EXPORT	OPERATOR	Operators and their dependent grants and audits
DATABASE_EXPORT	PACKAGE	Packages (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	PACKAGE_BODY	Package bodies
DATABASE_EXPORT	PACKAGE_SPEC	Package specifications
DATABASE_EXPORT	PASSWORD_HISTORY	Password histories for database users
DATABASE_EXPORT	*PASSWORD_VERIFY_FUNCTION	The password complexity verification function
DATABASE_EXPORT	PROCEDURE	Procedures and their dependent grants and objects
DATABASE_EXPORT	PROFILE	Profiles
DATABASE_EXPORT	PROXY	Proxy authentications
DATABASE_EXPORT	REF_CONSTRAINT	Referential (foreign key) constraints on tables in the database
DATABASE_EXPORT	REFRESH_GROUP	Refresh groups
DATABASE_EXPORT	*RESOURCE_ COST	Resource cost information
DATABASE_EXPORT	RLS_CONTEXT	Fine-grained access-control driving contexts
DATABASE_EXPORT	RLS_GROUP	Fine-grained access-control policy groups
DATABASE_EXPORT	RLS_POLICY	Fine-grained access-control policies
DATABASE_EXPORT	ROLE	Roles
DATABASE_EXPORT	ROLE_GRANT	Role grants to users in the database
DATABASE_EXPORT	ROLLBACK_SEGMENT	Rollback segments

Table 84–18 (Cont.) Object Type Path Names for Heterogeneous Object Types

Heterogeneous Type	Path Name (*=valid only in xxx_PATH_EXPR)	Scope
DATABASE_EXPORT	*SCHEMA (named object)	Database schemas including for each schema all related and dependent objects: user definitions and their attributes (default roles, role grants, tablespace quotas, and so on), objects in the schema (tables, view, packages, types, and so on), and their dependent objects (grants, audits, indexes, constraints, and so on). The NAME and NAME_EXPR filters can be used with this object type path name to designate the database schemas to be fetched.
DATABASE_EXPORT	SEQUENCE	Sequences
DATABASE_EXPORT	STATISTICS	Statistics on tables and indexes
DATABASE_EXPORT	SYNONYM	Public and private synonyms
DATABASE_EXPORT	SYSTEM_GRANT	System privilege grants
DATABASE_EXPORT	TABLE	Tables and their dependent objects (indexes, constraints, triggers, grants, audits, comments, table data, and so on)
DATABASE_EXPORT	TABLE_DATA	Row data for all tables
DATABASE_EXPORT	TABLESPACE	Tablespace definitions
DATABASE_EXPORT	TABLESPACE_QUOTA	Tablespace quota granted to users in the database
DATABASE_EXPORT	TRIGGER	Triggers on the database, on schemas, and on schema objects
DATABASE_EXPORT	TRUSTED_DB_LINK	Trusted links
DATABASE_EXPORT	TYPE	Types (both specification and body) and their dependent grants and audits
DATABASE_EXPORT	TYPE_BODY	Type bodies
DATABASE_EXPORT	TYPE_SPEC	Type specifications
DATABASE_EXPORT	USER	User definitions
DATABASE_EXPORT	VIEW	Views

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. SET_FILTER was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_FILTER are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. Possible inconsistencies include the following:
  - filter name not valid for the object type associated with the OPEN context
  - filter name not valid for the object_type_path
  - object_type_path not part of the collection designated by handle
  - filter value is the wrong datatype

SET_PARSE_ITEM Procedure

This procedure is used for both retrieval and submission. This procedure enables output parsing and specifies an object attribute to be parsed and returned.

> **See Also:** For more information about related subprograms:
>
> - Subprograms for Retrieving Multiple Objects From the Database on page 84-9
> - Subprograms for Submitting XML to the Database on page 84-10

Syntax

The following syntax applies when SET_PARSE_ITEM is used for object retrieval:

```
DBMS_METADATA.SET_PARSE_ITEM (
   handle       IN  NUMBER,
   name         IN  VARCHAR2,
   object_type  IN  VARCHAR2 DEFAULT NULL);
```

The following syntax applies when SET_PARSE_ITEM is used for XML submission:

```
DBMS_METADATA.SET_PARSE_ITEM (
   handle     IN NUMBER,
   name        IN VARCHAR2);
```

Parameters

Table 84–19 SET_PARSE_ITEM Procedure Parameters

Parameter	Description
handle	The handle returned from OPEN (or OPENW).
name	The name of the object attribute to be parsed and returned. See Table 84–20 for the attribute object type, name, and meaning.
object_type	Designates the object type to which the parse item applies (this is an object type name, not a path name). By default, the parse item applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following: ▪ if object_type is omitted, the parse item applies to all object types within the heterogeneous collection ▪ if object_type is specified, the parse item only applies to that specific object type within the collection This parameter only applies when SET_PARSE_ITEM is used for object retrieval.

Table 84–20 describes the object type, name, and meaning of the items available in the SET_PARSE_ITEM procedure.

Table 84–20 SET_PARSE_ITEM: Parse Items

Object Type	Name	Meaning
All objects	VERB	If FETCH_XML_CLOB is called, no value is returned. If FETCH_DDL is called, then for every row in the sys.ku$_ddls nested table returned by FETCH_DDL the verb in the corresponding ddlText is returned. If the ddlText is a SQL DDL statement, then the SQL verb (for example, CREATE, GRANT, AUDIT) is returned. If the ddlText is a procedure call (for example, DBMS_AQADM.CREATE_QUEUE_TABLE()) then the package.procedure-name is returned.
All objects	OBJECT_TYPE	If FETCH_XML_CLOB is called, an object type name from Table 84–11 is returned. If FETCH_DDL is called and the ddlText is a SQL DDL statement whose verb is CREATE or ALTER, the object type as used in the DDL statement is returned (for example, TABLE, PACKAGE_BODY, and so on). Otherwise, an object type name from Table 84–11 is returned.
Schema objects	SCHEMA	The object schema is returned. If the object is not a schema object, no value is returned.
Named objects	NAME	The object name is returned. If the object is not a named object, no value is returned.
TABLE, TABLE_DATA, INDEX	TABLESPACE	The name of the object's tablespace or, if the object is a partitioned table, the default tablespace is returned. For a TABLE_DATA object, this is always the tablespace where the rows are stored.
TRIGGER	ENABLE	If the trigger is enabled, ENABLE is returned. If the trigger is disabled, DISABLE is returned.
OBJECT_GRANT, TABLESPACE_QUOTA	GRANTOR	The grantor is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_NAME	The name of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_SCHEMA	The schema of the base object is returned. If the object is not a dependent object, no value is returned.
Dependent objects (including domain index secondary tables)	BASE_OBJECT_TYPE	The object type of the base object is returned. If the object is not a dependent object, no value is returned.
Granted objects	GRANTEE	The grantee is returned. If the object is not a granted object, no value is returned.

Usage Notes

These notes apply when using SET_PARSE_ITEM to retrieve objects.

By default, the FETCH_xxx routines return an object's metadata as XML or creation DDL. By calling SET_PARSE_ITEM you can request that individual attributes of the object be returned as well.

You can call SET_PARSE_ITEM multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the sys.ku$_parsed_items nested table.

For TABLE_DATA objects, the following parse item return values are of interest:

If Object Is	NAME, SCHEMA	BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA
nonpartitioned table	table name, schema	table name, schema
table partition	partition name, schema	table name, schema
nested table	storage table name, schema	name and schema of top-level table (*not* the parent nested table)

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA and BASE_OBJECT_TYPE parse items for secondary TABLE objects return the name, schema, and type of the domain index.

See Also:

- "FETCH_xxx Functions and Procedures" on page 84-19
- *Oracle Database Utilities* for information about using the Metadata API

By default, the CONVERT and PUT procedures simply transform an object's XML metadata to DDL. By calling SET_PARSE_ITEM you can request that individual attributes of the object be returned as well.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. SET_PARSE_ITEM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_PARSE_ITEM are permitted.
- INCONSISTENT_ARGS. The attribute name is not valid for the object type associated with the OPEN context.

SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures

These procedures are used for both retrieval and submission. SET_TRANSFORM_PARAM and SET_REMAP_PARAM specify parameters to the XSLT stylesheet identified by transform_handle. Use them to modify or customize the output of the transform.

See Also: For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database on page 84-9
- Subprograms for Submitting XML to the Database on page 84-10

Syntax

```
DBMS_METADATA.SET_TRANSFORM_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   value              IN VARCHAR2,
   object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_TRANSFORM_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   value              IN BOOLEAN DEFAULT TRUE,
   object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_TRANSFORM_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   value              IN NUMBER,
   object_type        IN VARCHAR2 DEFAULT NULL);

DBMS_METADATA.SET_REMAP_PARAM (
   transform_handle   IN NUMBER,
   name               IN VARCHAR2,
   old_value          IN VARCHAR2,
   new_value          IN VARCHAR2,
   object_type        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 84–21 describes the parameters for the SET_TRANSFORM_PARAM and SET_REMAP_PARAM procedures.

Table 84–21 SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
transform_handle	Either (1) the handle returned from ADD_TRANSFORM, or (2) the enumerated constant SESSION_TRANSFORM that designates the DDL transform for the whole session. Note that the handle returned by OPEN is not a valid transform handle. For SET_REMAP_PARAM, the transform handle must designate the MODIFY transform.

Table 84–21 (Cont.) SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

Parameters	Description
name	The name of the parameter. Table 84–22 lists the transform parameters defined for the DDL transform, specifying the object_type it applies to, its datatype, and its meaning or effect. This includes its default value, if any, and whether the parameter is additive. Table 84–23 describes the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure. Table 84–24 describes the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.
value	The value of the transform. This parameter is valid only for SET_TRANSFORM_PARAM.
old_value	The old value for the remapping. This parameter is valid only for SET_REMAP_PARAM.
new_value	The new value for the remapping. This parameter is valid only for SET_REMAP_PARAM.
object_type	Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply: ▪ If object_type is omitted, the parameter applies to all applicable object types within the heterogeneous collection. ▪ If object_type is specified, the parameter only applies to that object type. This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection.

Table 84–22 describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the SET_TRANSFORM_PARAM procedure.

Table 84–22 SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	PRETTY	BOOLEAN	If TRUE, format the output with indentation and line feeds. Defaults to TRUE.
All objects	SQLTERMINATOR	BOOLEAN	If TRUE, append a SQL terminator (; or /) to each DDL statement. Defaults to FALSE.
TABLE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
TABLE	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
TABLE	CONSTRAINTS	BOOLEAN	If TRUE, emit all non-referential table constraints. Defaults to TRUE.
TABLE	REF_CONSTRAINTS	BOOLEAN	If TRUE, emit all referential constraints (foreign keys). Defaults to TRUE.

Table 84–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
TABLE	CONSTRAINTS_AS_ALTER	BOOLEAN	If TRUE, emit table constraints as separate ALTER TABLE (and, if necessary, CREATE INDEX) statements. If FALSE, specify table constraints as part of the CREATE TABLE statement. Defaults to FALSE. Requires that CONSTRAINTS be TRUE.
TABLE	OID	BOOLEAN	If TRUE, emit the OID clause for object tables. Defaults to FALSE.
TABLE	SIZE_BYTE_KEYWORD	BOOLEAN	If TRUE, emit the BYTE keyword as part of the size specification of CHAR and VARCHAR2 columns that use byte semantics. If FALSE, omit the keyword. Defaults to FALSE.
TABLE, INDEX	PARTITIONING	BOOLEAN	If TRUE, emit partitioning clauses; if FALSE, suppress them. Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER, TABLESPACE	SEGMENT_ATTRIBUTES	BOOLEAN	If TRUE, emit segment attributes (physical attributes, storage attributes, tablespace, logging). Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	STORAGE	BOOLEAN	If TRUE, emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is FALSE.) Defaults to TRUE.
INDEX, CONSTRAINT, ROLLBACK_ SEGMENT, CLUSTER	TABLESPACE	BOOLEAN	If TRUE, emit tablespace. (Ignored if SEGMENT_ ATTRIBUTES is FALSE.) Defaults to TRUE.
TYPE	SPECIFICATION	BOOLEAN	If TRUE, emit the type specification. Defaults to TRUE.
TYPE	BODY	BOOLEAN	If TRUE, emit the type body. Defaults to TRUE.
TYPE	OID	BOOLEAN	If TRUE, emit the OID clause. Defaults to FALSE.
PACKAGE	SPECIFICATION	BOOLEAN	If TRUE, emit the package specification. Defaults to TRUE.
PACKAGE	BODY	BOOLEAN	If TRUE, emit the package body. Defaults to TRUE.
VIEW	FORCE	BOOLEAN	If TRUE, use the FORCE keyword in the CREATE VIEW statement. Defaults to TRUE.
OUTLINE	INSERT	BOOLEAN	If TRUE, emit the INSERT statements into the OL$ dictionary tables that will create the outline and its hints. If FALSE, emit a CREATE OUTLINE statement. Defaults to FALSE. Note: This object type is being deprecated.
All objects	DEFAULT	BOOLEAN	Calling SET_TRANSFORM_PARAM with this parameter set to TRUE has the effect of resetting all parameters for the transform to their default values. Setting this FALSE has no effect. There is no default.

Table 84–22 (Cont.) SET_TRANSFORM_PARAM: Transform Parameters for the DDL Transform

Object Type	Name	Datatype	Meaning
All objects	INHERIT	BOOLEAN	If TRUE, inherits session-level parameters. Defaults to FALSE. If an application calls ADD_TRANSFORM to add the DDL transform, then by default the only transform parameters that apply are those explicitly set for that transform handle. This has no effect if the transform handle is the session transform handle.
ROLE	REVOKE_FROM	Text	The name of a user from whom the role must be revoked. If this is a non-null string and if the CREATE ROLE statement grants you the role, a REVOKE statement is emitted after the CREATE ROLE. Note: When you issue a CREATE ROLE statement, Oracle may grant you the role. You can use this transform parameter to undo the grant. Defaults to null string.
TABLESPACE	REUSE	BOOLEAN	If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. Defaults to FALSE.
CLUSTER, INDEX, ROLLBACK_SEGMENT, TABLE, TABLESPACE	PCTSPACE	NUMBER	A number representing the percentage by which space allocation for the object type is to be modified. The value is the number of one-hundreths of the current allocation. For example, 100 means 100%. If the object type is TABLESPACE, the following size values are affected: - in file specifications, the value of SIZE - MINIMUM EXTENT - EXTENT MANAGEMENT LOCAL UNIFORM SIZE For other object types, INITIAL and NEXT are affected.

Table 84–23 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_TRANSFORM_PARAM procedure.

Table 84–23 SET_TRANSFORM_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
All objects	OBJECT_ROW	NUMBER	A number designating the object row for an object. The object in the document that corresponds to this number will be copied to the output document. This parameter is additive. By default, all objects are copied to the output document.

Table 84–24 describes the object type, name, datatype, and meaning of the parameters for the MODIFY transform in the SET_REMAP_PARAM procedure.

Table 84–24 SET_REMAP_PARAM: Transform Parameters for the MODIFY Transform

Object Type	Name	Datatype	Meaning
LIBRARY, TABLESPACE, DIRECTORY	REMAP_DATAFILE	Text	Objects in the document will have their filespecs renamed as follows: any filespec matching old_value will be changed to new_value. Filespecs should *not* be enclosed in quotes. This parameter is additive. By default, filespecs are not renamed.
Schema Objects, Dependent Objects, Granted Objects, USER	REMAP_SCHEMA	Text	Any schema object in the document whose name matches old_value will have its schema name changed to new_value. Any dependent object whose base object schema name matches old_value will have its base object schema name changed to new_value. Any granted object whose grantee name matches old_value will have its grantee name changed to new_value. Any user whose name matches old_value will have its name changed to new_value. This parameter is additive. By default, schemas are not remapped.
TABLE, CLUSTER, CONSTRAINT, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, TABLESPACE_QUOTA	REMAP_TABLESPACE	Text	Objects in the document will have their tablespaces renamed as follows: any tablespace name matching old_value will be changed to new_value. This parameter is additive. By default, tablespaces are not remapped.
Named objects and all objects dependent on named objects	REMAP_NAME	Text	Any named object in the document whose name matches old_value will have its name changed to new_value. Any dependent object whose base object name matches old_value will have its base schema name changed to new_value. This parameter is additive. By default, names are not remapped. (Use REMAP_TABLESPACE to remap the name of a TABLESPACE object.)

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OPERATION. Either SET_TRANSFORM_PARAM or SET_REMAP_PARAM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_TRANSFORM_PARAM or SET_REMAP_PARAM are permitted.
- INCONSISTENT_ARGS. The arguments are inconsistent. This can mean the following:

- The transform parameter name is not valid for the object type associated with the OPEN context or for the transform associated with the transform handle.
- The transform applies to all object types in a heterogeneous collection, but object_type is not part of the collection.

Usage Notes

XSLT allows parameters to be passed to stylesheets. You call SET_TRANSFORM_PARAM or SET_REMAP_PARAM to specify the value of a parameter to be passed to the stylesheet identified by transform_handle.

Normally, if you call SET_TRANSFORM_PARAMETER multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the STORAGE transform parameter to TRUE.

```
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',false);
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the OBJECT_ROW parameter to the MODIFY transform is additive. If you specify the following, then both specified rows are copied to the output document.

```
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',5);
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',8);
```

The REMAP_TABLESPACE parameter is also additive. If you specify the following, then tablespaces TBS1 and TBS3 are changed to TBS2 and TBS4, respectively.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS3','TBS4');
```

The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS2','TBS3');
```

> **Note:** The number of remap parameters that can be specified for a MODIFY transform is limited to ten. That is, you can specify up to ten REMAP_DATAFILE parameters, up to ten REMAP_SCHEMA parameters and so on. Additional instances are ignored. To work around this, you can perform another DBMS_METADATA.ADD_TRANSFORM and specify additional remap parameters.

The GET_DDL, GET_DEPENDENT_DDL, and GET_GRANTED_DDL functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant SESSION_TRANSFORM as the handle of the DDL transform at the session level. You can call SET_TRANSFORM_PARAM using DBMS_METADATA.SESSION_TRANSFORM as the transform handle to set transform parameters for the whole session. GET_DDL, GET_DEPENDENT_DDL, and GET GRANTED_DDL inherit these parameters when they invoke the DDL transform.

> **Note:** The enumerated constant must be prefixed with the package name DBMS_METADATA.SESSION_TRANSFORM.

85

DBMS_METADATA_DIFF

The DBMS_METADATA_DIFF package contains the interfaces for comparing two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the DBMS_METADATA submit interface and the CONVERT API.

Use of the DBMS_METADATA_DIFF package requires a license to the Oracle Enterprise Manager Change Management option.

> **See Also:** *Oracle Database Utilities* for more information and for examples of using the Metadata API

This chapter contains the following topics:

- Browsing APIs for Fetching and Comparing Objects
- Summary of DBMS_METADATA_DIFF Subprograms

Browsing APIs for Fetching and Comparing Objects

These functions allow you to compare the metadata for two objects with a single call.

Syntax

```
DBMS_METADATA_DIFF.COMPARE_SXML(
object_type   IN VARCHAR2,
name1         IN VARCHAR2,
name2         IN VARCHAR2,
schema1       IN VARCHAR2 DEFAULT NULL,
schema2       IN VARCHAR2 DEFAULT NULL,
network_link1 IN VARCHAR2 DEFAULT NULL,
network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

DBMS_METADATA_DIFF.COMPARE_ALTER(
object_type   IN VARCHAR2,
name1         IN VARCHAR2,
name2         IN VARCHAR2,
schema1       IN VARCHAR2 DEFAULT NULL,
schema2       IN VARCHAR2 DEFAULT NULL,
network_link1 IN VARCHAR2 DEFAULT NULL,
network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

DBMS_METADATA_DIFF.COMPARE_ALTER_XML(
object_type   IN VARCHAR2,
name1         IN VARCHAR2,
name2         IN VARCHAR2,
schema1       IN VARCHAR2 DEFAULT NULL,
schema2       IN VARCHAR2 DEFAULT NULL,
network_link1 IN VARCHAR2 DEFAULT NULL,
network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

Parameters

Table 85–1 COMPARE_xxx Function Parameters

Parameters	Description
`object_type`	The type of object to be compared. Valid type names are `CLUSTER`, `CONTEXT`, `DB_LINK`, `FGA_POLICY`, `INDEX`, `MATERIALIZED_VIEW`, `MATERIALIZED_VIEW_LOG`, `QUEUE`, `QUEUE_TABLE`, `RLS_CONTEXT`, `RLS_GROUP`, `RLS_POLICY`, `ROLE`, `SEQUENCE`, `SYNONYM`, `TABLE`, `TABLESPACE`, `TRIGGER`, `TYPE`, `TYPE_SPEC`, `TYPE_BODY`, `USER`, and `VIEW`.
`name1`	The name of the first object in the comparison.
`name2`	The name of the second object in the comparison.
`schema1`	The schema of the first object in the comparison. The default is the current user.
`schema2`	The schema of the second object in the comparison. The default is the value of `schema1`.

Table 85–1 (Cont.) COMPARE_xxx Function Parameters

Parameters	Description
network_link1	The name of a database link to the database on which the first object resides. If NULL (the default), then the object is assumed to be in the database on which the caller is running.
network_link2	The name of a database link to the database on which the second object resides. The default is the value of network_link1.

Return Values

DBMS_METADATA_DIFF.COMPARE_xxx returns the differences between two objects.

Exceptions

- INVALID_ARGVAL

  A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- OBJECT_NOT_FOUND

  The specified object was not found in the database.

Usage Notes

These functions encapsulate calls to both DBMS_METADATA and DBMS_METADATA_DIFF functions and procedures to fetch the metadata for each of the two objects and compare them.

Which function you use depends on the comparison format you want:

- COMPARE_SXML returns an SXML difference document.
- COMPARE_ALTER returns a set of ALTER statements for making the first object like the second object.
- COMPARE_ALTER_XML returns an ALTER_XML document.

Summary of DBMS_METADATA_DIFF Subprograms

The DBMS_METADATA_DIFF subprograms are used to:

- Specify the type of objects to be compared
- Specify the SXML documents to be compared
- Show the differences between the compared documents
- Clean up after the comparison

Table 85–2 provides a summary of DBMS_METADATA_DIFF subprograms.

Table 85–2 DBMS_METADATA_DIFF Package Subprograms

Subprogram	Description
OPENC Function on page 85-5	Specifies the type of objects to be compared
ADD_DOCUMENT Procedure on page 85-6	Specifies an SXML document to be compared
FETCH_CLOB Functions and Procedures on page 85-7	Returns a CLOB showing the differences between the two documents specified by ADD_DOCUMENT
CLOSE Procedure on page 85-8	Invalidates the handle returned by OPENC and cleans up associated state

OPENC Function

This function specifies the type of objects to be compared. The return value is an opaque context handle.

Syntax

```
DBMS_METADATA_DIFF.OPENC (
object_type  IN VARCHAR2)
RETURN NUMBER;
```

Parameters

Table 85–3 OPENC Function Parameters

Parameters	Description
object_type	The type of object to be compared. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW.

Return Values

The opaque handle that is returned is used as input to ADD_DOCUMENT, FETCH_xxx and CLOSE.

Exceptions

- INVALID_ARGVAL

  A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

ADD_DOCUMENT Procedure

This procedure specifies an SXML document to be compared.

Syntax

```
DBMS_METADATA_DIFF.ADD_DOCUMENT(
handle IN NUMBER, document IN sys.XMLType);

DBMS_METADATA_DIFF.ADD_DOCUMENT(
handle IN NUMBER, document IN CLOB);
```

Parameters

Table 85–4 CLOSE Procedure Parameters

Parameter	Description
handle	The handle returned from OPENC
document	A document to be compared. The document must be of the type specified in OPENC.

Usage Notes

Because the comparison interface allows you to compare exactly two SXML documents, a program must call ADD_DOCUMENT exactly twice for each OPENC handle. In the comparison result, the document specified by the first call is document 1, and the document specified by the second call is document 2.

Exceptions

- INVALID_ARGVAL

  A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

FETCH_CLOB Functions and Procedures

The FETCH_CLOB functions and procedures return a CLOB showing the differences between the two documents specified by ADD_DOCUMENT.

Syntax

```
DBMS_METADATA_DIFF.FETCH_CLOB(
handle IN NUMBER)
RETURN CLOB;

DBMS_METADATA_DIFF.FETCH_CLOB(
handle IN  NUMBER,
doc    IN  OUT NOCOPY CLOB);

DBMS_METADATA_DIFF.FETCH_CLOB(
handle IN  NUMBER,
doc    IN  OUT NOCOPY CLOB
diffs  OUT BOOLEAN);
```

Parameters

Table 85–5 CONVERT Subprogram Parameters

Parameter	Description
handle	The handle returned from OPENC.
doc	A CLOB containing the differences between documents 1 and 2.
diffs	TRUE if the documents are different or FALSE if they are identical.

Return Values

The differences between documents 1 and 2.

Exceptions

- INVALID_ARGVAL

  A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

CLOSE Procedure

This procedure invalidates the handle returned by OPENC and cleans up associated state.

Syntax

```
DBMS_METADATA_DIFF.CLOSE(
handle IN NUMBER);
```

Parameters

Table 85–6 FETCH_xxx Function Parameters

Parameters	Description
handle	The handle returned from OPENC

Exceptions

- INVALID_ARGVAL

  A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

86

DBMS_MGD_ID_UTL

The DBMS_MGD_ID_UTL package contains various functions and procedures that comprise the following utility subprograms:

- A logging utility that sets and gets Java and PL/SQL logging levels.
- A proxy utility consisting of two procedures used to set and unset the host and port of the proxy server.
- A metadata utility consisting of functions and procedures used for managing metadata.

> **See Also:** *Oracle Database Advanced Application Developer's Guide* for more information.

This chapter describes each of these utility subprograms and contains the following topics:

- Using DBMS_MGD_ID_UTL
  - Constants
  - Exceptions
- Summary of DBMS_MGD_ID_UTL Subprograms

The examples in this chapter assume that the user has run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by password;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

Using DBMS_MGD_ID_UTL

- Constants
- Exceptions

Constants

DBMS_MGD_ID_UTL uses the constants shown in Table 86–1.

Table 86–1 DBMS_MGD_ID_UTL Constants

Name	Value
Installed Category IDs and Names	
EPC_ENCODING_CATEGORY_ID	1
EPC_ENCODING_CATEGORY_NAME	EPC
Logging Levels	
LOGGING_LEVEL_OFF	0
LOGGING_LEVEL_SEVERE	1
LOGGING_LEVEL_WARNING	2
LOGGING_LEVEL_INFO	3
LOGGING_LEVEL_FINE	4
LOGGING_LEVEL_FINER	5
LOGGING_LEVEL_FINEST	6
LOGGING_LEVEL_ALL	7

Exceptions

Table 86–2 lists the DBMS_MGD_ID_UTL exceptions.

Table 86–2 Exceptions Raised by DBMS_MGD_ID_UTL Package

Name	Error Code	Description
TDTJavaException	-55200	During the tag data translation, a Java exception was raised.
TDTCategoryNotFound	-55201	The specified category was not found.
TDTSchemeNotFound	-55202	During the tag data translation, the specified scheme was not found.
TDTLevelNotFound	-55203	During the tag data translation, the specified level was not found.
TDTOptionNotFound	-55204	During the tag data translation, the specified option was not found.
TDTFieldValidationException	-55205	During the tag data translation, the validation operation failed on a field.
TDTUndefinedField	-55206	During the tag data translation, an undefined field was detected.
TDTRuleEvaluationFailed	-55207	During the tag data translation, the rule evaluation operation failed.
TDTTooManyMatchingLevels	-55208	During the tag data translation, too many matching levels were found.

Summary of DBMS_MGD_ID_UTL Subprograms

Table 86–3 describes the utility subprograms in the `DBMS_MGD_ID_UTL` package.

All the values and names passed to the procedures defined in the `DBMS_MGD_ID_UTL` package are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 86–3 DBMS_MGD_ID_UTL Package Subprograms

Subprogram	Description
ADD_SCHEME Procedure	Adds a tag data translation scheme to an existing category
CREATE_CATEGORY Function	Creates a new category or a new version of a category
EPC_TO_ORACLE_SCHEME Function	Converts the EPCglobal tag data translation (TDT) XML to Oracle tag data translation XML
GET_CATEGORY_ID Function	Returns the category ID given the category name and the category version
GET_COMPONENTS Function	Returns all relevant separated component names separated by semicolon (';') for the specified scheme
GET_ENCODINGS Function	Returns a list of semicolon (';') separated encodings (formats) for the specified scheme
GET_JAVA_LOGGING_LEVEL Function	Returns an integer representing the current Java trace logging level
GET_PLSQL_LOGGING_LEVEL Function	Returns an integer representing the current PL/SQL trace logging level
GET_SCHEME_NAMES Function	Returns a list of semicolon (';') separated scheme names for the specified category
GET_TDT_XML Function	Returns the Oracle tag data translation XML for the specified scheme
GET_VALIDATOR Function	Returns the Oracle Database tag data translation schema
REFRESH_CATEGORY Function	Refreshes the metadata information on the Java stack for the specified category
REMOVE_CATEGORY Procedure	Removes a category including all the related TDT XML if the value of `category_version` parameter is NULL
REMOVE_PROXY Procedure	Unsets the host and port of the proxy server
REMOVE_SCHEME Procedure	Removes a tag data translation scheme from a category
SET_JAVA_LOGGING_LEVEL Procedure	Sets the Java logging level
SET_PLSQL_LOGGING_LEVEL Procedure	Sets the PL/SQL tracing logging level
SET_PROXY Procedure	Sets the host and port of the proxy server for Internet access
VALIDATE_SCHEME Function	Validates the input tag data translation XML against the Oracle tag data translation schema

ADD_SCHEME Procedure

This procedure adds a tag data translation scheme to an existing category.

Syntax

```
procedure DBMS_MGD_ID_UTL.ADD_SCHEME (
              category_id IN  VARCHAR2,
              tdt_xml     IN  CLOB);
```

Parameters

Table 86–4 ADD_SCHEME Procedure Parameters

Parameter	Description
category_id	Category ID
tdt_xml	Tag data translation XML

Usage Notes

None.

Examples

This example performs the following actions:

1. Creates a category.
2. Adds a contractor scheme and an employee scheme to the MGD_SAMPLE_CATEGORY category.
3. Validates the MGD_SAMPLE_CATEGORY scheme.
4. Tests the tag translation of the contractor scheme and the employee scheme.
5. Removes the contractor scheme.
6. Tests the tag translation of the contractor scheme and this returns the expected exception for the removed contractor scheme.
7. Tests the tag translation of the employee scheme and this returns the expected values.
8. Removes the MGD_SAMPLE_CATEGORY category.

```
--contents of add_scheme2.sql
SET LINESIZE 160
-----------------------------------------------------------------------
---CREATE CATEGORY, ADD_SCHEME, REMOVE_SCHEME, REMOVE_CATEGORY-------
-----------------------------------------------------------------------
DECLARE
  amt          NUMBER;
  buf          VARCHAR2(32767);
  pos          NUMBER;
  tdt_xml      CLOB;
  validate_tdtxml VARCHAR2(1042);
  category_id  VARCHAR2(256);
BEGIN
  -- remove the testing category if already existed
  DBMS_MGD_ID_UTL.remove_category('MGD_SAMPLE_CATEGORY', '1.0');
  -- Step 1. Create the testing category 'MGD_SAMPLE_CATEGORY', version 1.0.
```

```
  category_id := DBMS_MGD_ID_UTL.CREATE_CATEGORY('MGD_SAMPLE_CATEGORY', '1.0', 'Oracle',
'http://www.oracle.com/mgd/sample');
  -- Step 2. Add contractor scheme to the category.
  DBMS_LOB.CREATETEMPORARY(tdt_xml, true);
  DBMS_LOB.OPEN(tdt_xml, DBMS_LOB.LOB_READWRITE);

CREATE_CATEGORY Function

This function creates a new category or a new version of a category.

Syntax

```
function DBMS_MGD_ID_UTL.CREATE_CATEGORY (
              category_name    IN  VARCHAR2,
              category_version IN  VARCHAR2,
              agency           IN  VARCHAR2,
              URI              IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 86–5 CREATE_CATEGORY Function Parameters

Parameter	Description
`category_name`	Name of category
`category_version`	Category version
`agency`	Organization that owns the category. For example, EPCglobal owns the category `EPC`.
`URI`	URI that provides additional information about the category

Usage Notes

The return value is the category ID.

Examples

See the ADD_SCHEME Procedure for an example of creating the `MGD_SAMPLE_CATEGORY` category.

EPC_TO_ORACLE_SCHEME Function

This function converts the EPCglobal tag data translation (TDT) XML to Oracle Database tag data translation XML.

Syntax

```
function DBMS_MGD_ID_UTL.EPC_TO_ORACLE_SCHEME (
              xml_scheme IN CLOB)
RETURN CLOB;
```

Parameters

Table 86–6 EPC_TO_ORACLE_SCHEME Function Parameters

Parameter	Description
xml_scheme	Name of EPC tag scheme to be converted

Usage Notes

The return value is the contents of the CLOB containing the Oracle Datanase tag data translation XML.

Examples

The following example converts standard EPCglobal Tag Data Translation (TDT) files into Oracle Database TDT files:

```
--Contents of MGD_ID_DOC2.sql
-----------------------------
-- EPC_TO_ORACLE_SCHEME   --
-----------------------------
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');

BEGIN
 DBMS_JAVA.set_output(1000000);
 DBMS_OUTPUT.ENABLE(1000000);
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_SEVERE);
END;
/

GET_CATEGORY_ID Function

This function returns the category ID for a given category name and category version.

Syntax

```
function DBMS_MGD_ID_UTL.GET_CATEGORY_ID (
              category name     IN  VARCHAR2,
              category_version  IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 86–7 GET_CATEGORY_ID Function Parameters

Parameter	Description
`category_name`	Name of category
`category_version`	Category version

Usage Notes

- If the value of `category_version` is NULL, then the ID of the latest version of the specified category is returned.
- The return value is the category ID for the specified category name.

Examples

The following example returns a category ID given a category name and its version:

```
-- Contents of get_category1.sql file
SELECT DBMS_MGD_ID_UTL.get_category_id('EPC', NULL) FROM DUAL;

SQL> @get_category1.sql
.
.
.
DBMS_MGD_ID_UTL.GET_CATEGORY_ID('EPC',NULL)
--------------------------------------------------------------------------------
1
.
.
.
```

GET_COMPONENTS Function

This function returns all relevant separated component names separated by semicolon (;) for the specified scheme.

Syntax

```
function DBMS_MGD_ID_UTL.GET_COMPONENTS (
              category_id IN VARCHAR2,
              scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 86–8 GET_COMPONENTS Function Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

Usage Notes

The return value contains the component names separated by a semicolon (;) for the specified scheme.

Examples

The following example gets the components:

```
--Contents of get_components.sql
DECLARE
  id             mgd_id;
  getcomps       VARCHAR2(1000);
  getencodings   VARCHAR2(1000);
  getschemenames VARCHAR2(1000);
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 getcomps := DBMS_MGD_ID_UTL.get_components(1,'SGTIN-64');
 dbms_output.put_line('Component names are: ' || getcomps);
 getencodings := DBMS_MGD_ID_UTL.get_encodings(1,'SGTIN-64');
 dbms_output.put_line('Encodings are: ' || getencodings);
 getschemenames := DBMS_MGD_ID_UTL.get_scheme_names(1);
 dbms_output.put_line('Scheme names are: ' || getschemenames);
END;
/
SHOW ERRORS;

GET_ENCODINGS Function

This function returns a list of semicolon (;) separated encodings (formats) for the specified scheme.

Syntax

```
function DBMS_MGD_ID_UTL.GET_ENCODINGS (
              category_id IN VARCHAR2,
              scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 86–9 GET_ENCODINGS Function Parameters

Parameter	Description
`category_id`	Category ID
`scheme_name`	Name of scheme

Usage Notes

The return value contains the encodings separated by a semicolon (;) for the specified scheme.

Examples

See the GET_COMPONENTS Function for an example.

GET_JAVA_LOGGING_LEVEL Function

This function returns an integer representing the current trace logging level.

Syntax

```
function DBMS_MGD_ID_UTL.GET_JAVA_LOGGING_LEVEL
RETURN INTEGER;
```

Parameters

None.

Usage Notes

The return value is the integer value denoting the current Java logging level.

Examples

The following example gets the Java logging level.

```
--Contents of getjavaloggінglevel.sql
DECLARE
     loglevel   NUMBER;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);

.
```

GET_PLSQL_LOGGING_LEVEL Function

This function returns an integer representing the current PL/SQL trace logging level.

Syntax

```
function DBMS_MGD_ID_UTL.GET_PLSQL_LOGGING_LEVEL
RETURN INTEGER;
PRAGMA restrict_references(get_plsql_logging_level, WNDS);
```

Parameters

None.

Usage Notes

The return value is the integer value denoting the current PL/SQL logging level.

Examples

The following example gets the PL/SQL logging level.

```
--Contents of getplsqlloggінglevel.sql
DECLARE
     loglevel   NUMBER;
BEGIN
  DBMS_MGD_ID_UTL.set_plsql_logging_level(0);
  loglevel := DBMS_MGD_ID_UTL.get_plsql_logging_level();
  dbms_output.put_line('PL/SQL logging level = ' ||loglevel);
END;
/
SHOW ERRORS;

SQL> @getplsqlloggінglevel.sql
.
.
.
PL/SQL logging level = 0
PL/SQL procedure successfully completed.
.
.
.
```

GET_SCHEME_NAMES Function

This function returns a list of semicolon (;) separated scheme names for the specified category.

Syntax

```
function DBMS_MGD_ID_UTL.GET_SCHEME_NAMES (
              category_id IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 86–10 GET_SCHEME_NAMES Function Parameters

Parameter	Description
`category_id`	Category ID

Usage Notes

The return value contains the scheme names for the specified category ID.

Examples

See the GET_COMPONENTS Function for an example.

GET_TDT_XML Function

This function returns the Oracle Database tag data translation XML for the specified scheme.

Syntax

```
function DBMS_MGD_ID_UTL.GET_TDT_XML (
              category_id  IN VARCHAR2,
              scheme_name  IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 86–11 GET_TDT_XML Function Parameters

Parameter	Description
`category_id`	Category ID
`scheme_name`	Name of scheme

Usage Notes

The return value contains the Oracle Database tag data translation XML for the specified scheme.

Examples

The following example gets the Oracle Database TDT XML for the specified scheme:

```
--Contents of get_tdtxml.sql
DECLARE
  gettdtxml      CLOB;

BEGIN
  gettdtxml := DBMS_MGD_ID_UTL.get_tdt_xml(1,'SGTIN-64');
  dbms_output.put_line('Length of tdt XML is '||DBMS_LOB.GETLENGTH(gettdtxml));

REFRESH_CATEGORY Function

This function refreshes the metadata information on the Java stack for the specified category. This function must be called before using MGD_ID functions.

Syntax

```
function DBMS_MGD_ID_UTL.REFRESH_CATEGORY (
              category_id  IN VARCHAR2);
```

Parameters

Table 86–12 REFRESH_CATEGORY Function Parameters

Parameter	Description
category_id	Category ID

Usage Notes

None.

Examples

The following example refreshes the metadata information for the EPC category ID.

```
--Contents of tostring3.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.us.oracle.com', '80');
DECLARE
id          MGD_ID;
BEGIN
 DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
 DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
 dbms_output.put_line('..Testing to_string');
 DBMS_OUTPUT.PUT_LINE('test to_string');
   id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970',
'scheme=GID-96');
      DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
      DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @tostring3.sql
..Testing to_string
test to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager =
0037000;scheme = GID-96;1 = 1;serial = 1041970

PL/SQL procedure successfully completed.
```

REMOVE_CATEGORY Procedure

This procedure removes a category including all the related TDT XML. This procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Removes a category based on the specified category ID.

```
procedure DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
              category_id  IN VARCHAR2);
```

Removes a category based on the specified category name and category version.

```
procedure DBMS_MGD_ID_UTL.REMOVE_CATEGORY (
              category_name    IN VARCHAR2,
              category_version IN VARCHAR2);
```

Parameters

Table 86–13 REMOVE_CATEGORY Procedure Parameters

Parameter	Description
`category_id`	Category ID
`category_name`	Name of category
`category_version`	Category version

Usage Notes

If the value of `category_version` is NULL, all versions for the specified category will be removed.

Examples

See the ADD_SCHEME Procedure for an example of removing a category.

REMOVE_PROXY Procedure

This procedure unsets the host and port of the proxy server.

Syntax

```
procedure DBMS_MGD_ID_UTL.REMOVE_PROXY;
```

Parameters

None.

Usage Notes

None.

Examples

See the REFRESH_CATEGORY Function for an example.

REMOVE_SCHEME Procedure

This procedure removes a tag data translation scheme from a category.

Syntax

```
procedure DBMS_MGD_ID_UTL.REMOVE_SCHEME (
              category_id  IN  VARCHAR2,
              scheme_name  IN  VARCHAR2);
```

Parameters

Table 86–14 REMOVE_SCHEME Procedure Parameters

Parameter	Description
category_id	Category ID
scheme_name	Name of scheme

Usage Notes

None.

Examples

See the ADD_SCHEME Procedure for an example of removing a scheme.

SET_JAVA_LOGGING_LEVEL Procedure

This procedure sets the Java trace logging level.

Syntax

```
procedure DBMS_MGD_ID_UTL.SET_JAVA_LOGGING_LEVEL (
              logginglevel IN  INTEGER);
```

Parameters

Table 86–15 SET_JAVA_LOGGING_LEVEL Procedure Parameters

Parameter	Description
`logginglevel`	Logging level. The Java logging level can be one of the following values in descending order: ■ `LOGGING_LEVEL_OFF CONSTANT INTEGER := 0` ■ `LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1` ■ `LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2` ■ `LOGGING_LEVEL_INFO CONSTANT INTEGER := 3` ■ `LOGGING_LEVEL_FINE CONSTANT INTEGER := 4` ■ `LOGGING_LEVEL_FINER CONSTANT INTEGER := 5` ■ `LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6` ■ `LOGGING_LEVEL_ALL CONSTANT INTEGER := 7`

Usage Notes

None.

Examples

See the GET_JAVA_LOGGING_LEVEL Function for an example.

SET_PLSQL_LOGGING_LEVEL Procedure

This procedure sets the PL/SQL trace logging level.

Syntax

```
procedure DBMS_MGD_ID_UTL.SET_PLSQL_LOGGING_LEVEL (
              level IN INTEGER);
PRAGMA restrict_references(set_plsql_logging_level, WNDS);
```

Parameters

Table 86–16 SET_PLSQL_LOGGING_LEVEL Procedure Parameters

Parameter	Description
`level`	Logging level. The PL/SQL logging level can be one of the following values in descending order: ■ `LOGGING_LEVEL_OFF CONSTANT INTEGER := 0` ■ `LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1` ■ `LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2` ■ `LOGGING_LEVEL_INFO CONSTANT INTEGER := 3` ■ `LOGGING_LEVEL_FINE CONSTANT INTEGER := 4` ■ `LOGGING_LEVEL_FINER CONSTANT INTEGER := 5` ■ `LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6` ■ `LOGGING_LEVEL_ALL CONSTANT INTEGER := 7`

Usage Notes

None.

Examples

See the GET_PLSQL_LOGGING_LEVEL Function for an example.

SET_PROXY Procedure

This procedure sets the host and port of the proxy server for Internet access. This procedure must be called if the database server accesses the Internet using a proxy server. Internet access is necessary because some rules need to look up the Object Naming Service (ONS) table to get the company prefix index.

You do not need to call this procedure does if you are only using schemes that do not contain any rules requiring Internet access.

Syntax

```
procedure DBMS_MGD_ID_UTL.SET_PROXY (
               proxt_host   IN  VARCHAR2,
               proxy_port   IN  VARCHAR2);
```

Parameters

Table 86–17 SET_PROXY Procedure Parameters

Parameter	Description
proxy_host	Name of host
proxy_port	Host port number

Usage Notes

None.

Examples

See the REFRESH_CATEGORY Function for an example.

VALIDATE_SCHEME Function

This function validates the input tag data translation XML against the Oracle Database tag data translation schema.

Syntax

```
function DBMS_MGD_ID_UTL.VALIDATE_SCHEME (
             xml_scheme IN CLOB)
RETURN VARCHAR2;
```

Parameters

Table 86–18 VALIDATE_SCHEME Function Parameters

Parameter	Description
xml_scheme	Scheme to be validated.

Usage Notes

The return value contains the components names for the specified scheme.

Examples

See the ADD_SCHEME Procedure or the EPC_TO_ORACLE_SCHEME Function for an example.

87

DBMS_MGWADM

DBMS_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

Note: You must run the catmgw.sql script to load the Messaging Gateway packages and types into the database.

See Also: *Oracle Streams Advanced Queuing User's Guide* contains information on loading database objects and using DBMS_MGWADM

This chapter contains the following topics:

- Using DBMS_MGWADM
  - Constants
  - Deprecated Subprograms
- Data Structures
- Summary of DBMS_MGWADM Subprograms

Using DBMS_MGWADM

- Deprecated Subprograms
- Constants

Deprecated Subprograms

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g Release 1having been superseded by improved technology:

- ADD_SUBSCRIBER Procedure - use instead CREATE_JOB Procedure
- ALTER_PROPAGATION_SCHEDULE Procedure - use instead ALTER_JOB Procedure
- ALTER_SUBSCRIBER Procedure - use instead ALTER_JOB Procedure
- DB_CONNECT_INFO Procedure - use instead ALTER_AGENT Procedures
- DISABLE_PROPAGATION_SCHEDULE Procedure - use instead DISABLE_JOB Procedure
- ENABLE_PROPAGATION_SCHEDULE Procedure - use instead ENABLE_JOB Procedure
- REMOVE_SUBSCRIBER Procedure - use instead REMOVE_JOB Procedure
- RESET_SUBSCRIBER Procedure - use instead RESET_JOB Procedure
- SCHEDULE_PROPAGATION Procedure - use instead CREATE_JOB Procedure
- UNSCHEDULE_PROPAGATION Procedure - use instead REMOVE_JOB Procedure

Constants

- DBMS_MGWADM Constants—Cleanup Actions on page 87-4
- DBMS_MGWADM Constants—Force Values on page 87-4
- DBMS_MGWADM Constants—Logging Levels on page 87-4
- DBMS_MGWADM Constants—Named Property Constants on page 87-5
- DBMS_MGWADM Constants—Other Constants on page 87-5
- DBMS_MGWADM Constants—Propagation Types on page 87-6
- DBMS_MGWADM Constants—Queue Domain Types on page 87-6
- DBMS_MGWADM Constants—Shutdown Modes on page 87-6
- DBMS_MGWADM Constants—WebSphere MQ Interface Types on page 87-6
- DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures on page 87-6
- DBMS_MGWADM Constants—conntype Argument of CREATE_AGENT and ALTER_AGENT Procedures on page 87-6

Table 87–1 DBMS_MGWADM Constants—Cleanup Actions

Name	Type	Description
CLEAN_STARTUP_STATE	CONSTANT BINARY_INTEGER	Sets the Messaging Gateway agent to a known state so that it can be started
CLEAN_LOG_QUEUES	CONSTANT BINARY_INTEGER	Messaging Gateway agent will clean log queues for all configured messaging system links
RESET_SUB_MISSING_LOG_REC	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing log record
RESET_SUB_MISSING_MESSAGE	CONSTANT BINARY_INTEGER	Messaging Gateway agent recovers a Messaging Gateway subscriber that has failed due to a missing persistent source message

Table 87–2 DBMS_MGWADM Constants—Force Values

Name	Type	Description
FORCE	CONSTANT BINARY_INTEGER	Represents a forced action
NO_FORCE	CONSTANT BINARY_INTEGER	Represents a normal, nonforced action

Table 87–3 DBMS_MGWADM Constants—Logging Levels

Name	Type	Description
BASIC_LOGGING	CONSTANT BINARY_INTEGER	The standard (the least) information written to the log file

Table 87–3 (Cont.) DBMS_MGWADM Constants—Logging Levels

Name	Type	Description
TRACE_DEBUG_LOGGING	CONSTANT BINARY_INTEGER	The greatest information written to the log file
TRACE_HIGH_LOGGING	CONSTANT BINARY_INTEGER	The third level of detail of logging information written to the log file
TRACE_LITE_LOGGING	CONSTANT BINARY_INTEGER	The second level detail of logging information written to the log file

Table 87–4 DBMS_MGWADM Constants—Named Property Constants

Name	Type	Description
MGWPROP_PREFIX	CONSTANT VARCHAR2	A constant (MGWPROP$_) for the reserved property name prefix
MGWPROP_REMOVE	CONSTANT VARCHAR2	A constant (MGWPROP$_REMOVE) for the reserved property name used to remove an existing property
MGWPROP_REMOVE_ALL	CONSTANT VARCHAR2	A constant (MGWPROP$_REMOVE_ALL) for the reserved property name used to remove all properties

Table 87–5 DBMS_MGWADM Constants—Other Constants

Name	Type	Description
JMS_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS connections will be used to access JMS destinations in a domain-independent manner that supports a unified messaging model
JMS_QUEUE_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS queue connections will be used to access JMS destinations
JMS_TOPIC_CONNECTION	CONSTANT BINARY_INTEGER	Used to indicate that JMS topic connections will be used to access JMS destinations
NO_CHANGE	CONSTANT VARCHAR2	Indicates that an existing value should be preserved (not changed). This is used for certain APIs where the desire is to change one or more parameters but leave others unchanged.
DEFAULT_AGENT	CONSTANT VARCHAR2	Name of the Messaging Gateway default agent

Table 87–6 DBMS_MGWADM Constants—Propagation Types

Name	Type	Description
INBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for non-Oracle to Oracle Streams AQ propagation. The propagation source is a queue in a foreign (non-Oracle) messaging system and the destination is a local Oracle Streams AQ queue.
OUTBOUND_PROPAGATION	CONSTANT BINARY_INTEGER	Represents the propagation type for Oracle Streams AQ to non-Oracle propagation. The propagation source is a local Oracle Streams AQ queue and the destination is a queue in a foreign (non-Oracle) messaging system.

Table 87–7 DBMS_MGWADM Constants—Queue Domain Types

Name	Type	Description
DOMAIN_QUEUE	CONSTANT BINARY_INTEGER	Represents a queue destination. A JMS queue (point-to-point model) is classified as a queue.
DOMAIN_TOPIC	CONSTANT BINARY_INTEGER	Represents a topic destination. A JMS topic (publish-subscribe model) is classified as a topic.

Table 87–8 DBMS_MGWADM Constants—Shutdown Modes

Name	Type	Description
SHUTDOWN_IMMEDIATE	CONSTANT BINARY_INTEGER	Represents the immediate shutdown mode
SHUTDOWN_NORMAL	CONSTANT BINARY_INTEGER	Represents the normal shutdown mode

Table 87–9 DBMS_MGWADM Constants—WebSphere MQ Interface Types

Name	Type	Description
MQSERIES_BASE_JAVA_INTERFACE	CONSTANT BINARY_INTEGER	Represents the Base Java interface for the WebSphere MQ messaging system

Table 87–10 DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures

Name	Type	Description
AGENT_JAVA_PROP	CONSTANT PLS_INTEGER	Used for an agent option used to set a Java System property
MSGLINK_OPTION	CONSTANT PLS_INTEGER	Used for a messaging system link option
JOB_OPTION	CONSTANT PLS_INTEGER	Used for a propagation job option

Table 87–11 DBMS_MGWADM Constants—conntype Argument of CREATE_AGENT and ALTER_AGENT Procedures

Name	Type	Description
JDBC_OCI	CONSTANT VARCHAR2	Used to specify the JDBC OCI driver
JDBC_THIN	CONSTANT VARCHAR2	Used to specify the JDBC Thin driver

Data Structures

The DBMS_MGWADM package defines the following OBJECT types.

Object Types

- SYS.MGW_MQSERIES_PROPERTIES Object Type
- SYS.MGW_PROPERTIES Object Type
- SYS.MGW_PROPERTY Object Type
- SYS.MGW_TIBRV_PROPERTIES Object Type

SYS.MGW_MQSERIES_PROPERTIES Object Type

This type specifies basic properties for a WebSphere MQ messaging system link.

Syntax

```
TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT (
   queue_manager       VARCHAR2(64),
   hostname            VARCHAR2(64),
   port                INTEGER,
   channel             VARCHAR2(64),
   interface_type      INTEGER,
   max_connections     INTEGER,
   username            VARCHAR2(64),
   password            VARCHAR2(64),
   inbound_log_queue   VARCHAR2(64),
   outbound_log_queue  VARCHAR2(64),

-- Methods
STATIC FUNCTION construct
RETURN SYS.MGW_MQSERIES_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_MQSERIES_PROPERTIES );
```

Attributes

Table 87–12 SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
queue_manager	The name of the WebSphere MQ queue manager
hostname	The host on which the WebSphere MQ messaging system resides. If hostname is NULL, then a WebSphere MQ bindings connection is used. If not NULL, then a client connection is used and requires that a port and channel be specified.
port	The port number. This is used only for client connections; that is, when hostname is not NULL.
channel	The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not NULL.
interface_type	The type of messaging interface to use. Values: ■ DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE if the WebSphere MQ Base Java interface should be used. ■ DBMS_MGWADM.JMS_CONNECTION if the link is to be used to access JMS destinations in a unified, domain-independent manner. ■ DBMS_MGWADM.JMS_QUEUE_CONNECTION if the link is to be used for accessing JMS queues ■ DBMS_MGWADM.JMS_TOPIC_CONNECTION if the link is to be used for accessing JMS topics.
max_connections	The maximum number of messaging connections to the WebSphere MQ messaging system
username	The username used for authentication to the WebSphere MQ messaging system

Table 87–12 (Cont.) SYS.MGW_MQSERIES_PROPERTIES Attributes

Attribute	Description
password	The password used for authentication to the WebSphere MQ messaging system
inbound_log_queue	The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serve as a propagation source: ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.
outbound_log_queue	The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination: ■ For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools. ■ For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.

Methods

Table 87–13 SYS.MGW_MQSERIES_PROPERTIES Methods

Method	Description
construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance. All attributes are assigned a value of NULL
alter_construct	Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance for altering the properties of an existing messaging link. All attributes having a VARCHAR2 data type are assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other data types are assigned a value of NULL.

SYS.MGW_PROPERTIES Object Type

This type specifies an array of properties.

Syntax

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (2000) OF SYS.MGW_PROPERTY;
```

Attributes

Table 87–14 SYS.MGW_PROPERTIES Attributes

Attribute	Description
`name`	Property name
`value`	Property value

Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

- Names with the `MGWPROP$_` prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.
- A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.
- In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.
- You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

- Add or modify property

  ```
  MGW_PROPERTY.NAME = property_name
  MGW_PROPERTY.VALUE = property_value
  ```

  If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

- Remove property

  ```
  MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
  MGW_PROPERTY.VALUE = name_of_property_to_remove
  ```

  No action is taken if the property name does not exist in the original list.

- Remove all properties

  ```
  MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
  MGW_PROPERTY.VALUE = not used
  ```

See Also: "The DBMS_MGWADM package defines constants to represent the reserved property names on Table 87–4, " DBMS_MGWADM Constants—Named Property Constants"

SYS.MGW_PROPERTY Object Type

This type specifies a named property which is used to specify optional properties for messaging links, foreign queues, and subscribers.

Syntax

```
TYPE SYS.MGW_PROPERTY IS OBJECT(
   name  VARCHAR2(500),
   value VARCHAR2(4000),

-- Methods
STATIC FUNCTION construct    --- (1)
RETURN SYS.MGW_PROPERTY,

STATIC FUNCTION construct(   --- (2)
   p_name   IN VARCHAR2,
   p_value  IN VARCHAR2)
RETURN SYS.MGW_PROPERTY );
```

Attributes

Table 87–15 SYS.MGW_PROPERTY Attributes

Attribute	Description
`name`	Property name
`value`	Property value

Methods

Table 87–16 SYS.MGW_PROPERTY Methods

Method	Description
`construct --- (1)`	Constructs a new `MGW_PROPERTY` instance. All attributes are assigned a value of `NULL`
`construct --- (2)`	Constructs a new `MGW_PROPERTY` instance initialized using the given parameters

SYS.MGW_TIBRV_PROPERTIES Object Type

A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type `TibrvRvdTransport` for each Messaging Gateway link.

Syntax

```
TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
   service   VARCHAR2(128),
   daemon    VARCHAR2(128),
   network   VARCHAR2(256),
   cm_name   VARCHAR2(256),
   cm_ledger VARCHAR2(256),

-- Methods
STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_TIBRV_PROPERTIES );
```

Attributes

Table 87–17 SYS.MGW_TIBRV_PROPERTIES Attributes

Attribute	Description
`service`	The service parameter for the rvd transport
`daemon`	The daemon parameter for the rvd transport
`network`	The network parameter for the rvd transport
`cm_name`	The CM correspondent name. Reserved for future use.
`cm_ledger`	The CM ledger file name. Reserved for future use.

Methods

Table 87–18 SYS.MGW_TIBRV_PROPERTIES Methods

Method	Description
`construct`	Constructs a new `SYS.MGW_TIBRV_PROPERTIES` instance. All attributes will be assigned a value of `NULL`.
`alter_construct`	Constructs a new `SYS.MGW_TIBRV_PROPERTIES` instance. This function is useful for altering the properties of an existing messaging link. All attributes having a `VARCHAR2` data type will be assigned a value of `DBMS_MGWADM.NO_CHANGE`. Attributes of other data types will be assigned a value of `NULL`.

Summary of DBMS_MGWADM Subprograms

Table 87–19 DBMS_MGWADM Package Subprograms

Subprogram	Description
ADD_SUBSCRIBER Procedure on page 87-16	Adds a subscriber used to consume messages from a source queue for propagation to a destination
ALTER_AGENT Procedures on page 87-20	Alters Messaging Gateway agent parameters
ALTER_JOB Procedure on page 87-22	Alters the properties of a propagation job
ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous on page 87-24	Alters the properties of a TIB/Rendezvous messaging system link
ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ on page 87-25	Alters the properties of a WebSphere MQ messaging system link
ALTER_PROPAGATION_ SCHEDULE Procedure on page 87-26	Alters a propagation schedule
ALTER_SUBSCRIBER Procedure on page 87-27	Alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination
CLEANUP_GATEWAY Procedures on page 87-29	Cleans up Messaging Gateway
CREATE_AGENT Procedure on page 87-32	Creates a Messaging Gateway agent that will be used to process propagation jobs
CREATE_JOB Procedure on page 87-34	Creates a job used to propagate message from a source to a destination
CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous on page 87-38	Creates a messaging system link to a TIB/Rendezvous messaging system
CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ on page 87-39	Creates a messaging system link to a WebSphere MQ messaging system
DB_CONNECT_INFO Procedure on page 87-40	Configures connection information used by the Messaging Gateway agent for connections to Oracle Database
DISABLE_JOB Procedure on page 87-41	Disables a propagation job
DISABLE_PROPAGATION_ SCHEDULE Procedure on page 87-42	Disables a propagation schedule
ENABLE_JOB Procedure on page 87-43	Enables a propagation job
ENABLE_PROPAGATION_ SCHEDULE Procedure on page 87-44	Enables a propagation schedule
REGISTER_FOREIGN_QUEUE Procedure on page 87-45	Registers a non-Oracle queue entity in Messaging Gateway

Table 87–19 (Cont.) DBMS_MGWADM Package Subprograms

Subprogram	Description
REMOVE_AGENT Procedure on page 87-46	Removes a Messaging Gateway agent
REMOVE_JOB Procedure on page 87-47	Removes a propagation job
REMOVE_MSGSYSTEM_LINK Procedure on page 87-48	Removes a messaging system link for a non-Oracle messaging system
REMOVE_OPTION Procedure on page 87-49	Removes a Messaging Gateway configuration option
REMOVE_SUBSCRIBER Procedure on page 87-51	Removes a subscriber used to consume messages from a source queue for propagation to a destination
RESET_JOB Procedure on page 87-52	Resets the propagation error state for a propagation job
RESET_SUBSCRIBER Procedure on page 87-53	Resets the propagation error state for a subscriber
SCHEDULE_PROPAGATION Procedure on page 87-54	Schedules message propagation from a source to a destination
SET_LOG_LEVEL Procedures on page 87-56	Dynamically alters the Messaging Gateway agent logging level
SET_OPTION Procedure on page 87-57	Sets a Messaging Gateway configuration option
SHUTDOWN Procedures on page 87-59	Shuts down the Messaging Gateway agent
STARTUP Procedures on page 87-60	Starts the Messaging Gateway agent
UNREGISTER_FOREIGN_QUEUE Procedure on page 87-61	Removes a non-Oracle queue entity in Messaging Gateway
UNSCHEDULE_PROPAGATION Procedure on page 87-62	Removes a propagation schedule

ADD_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

Note: This subprogram has been deprecated as a result of improved technology (see CREATE_JOB Procedure on page 87-34), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ADD_SUBSCRIBER(
   subscriber_id     IN VARCHAR2,
   propagation_type  IN BINARY_INTEGER,
   queue_name        IN VARCHAR2,
   destination       IN VARCHAR2,
   rule              IN VARCHAR2 DEFAULT NULL,
   transformation    IN VARCHAR2 DEFAULT NULL,
   exception_queue   IN VARCHAR2 DEFAULT NULL
   options           IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

Parameters

Table 87–20 ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Specifies a user-defined name that identifies this subscriber
propagation_type	Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Streams AQ propagation
queue_name	Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. If NULL, then the Oracle Streams AQ payload type must be supported by Messaging Gateway.

Table 87–20 (Cont.) ADD_SUBSCRIBER Procedure Parameters

Parameter	Description
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.

Usage Notes

> **See Also:** "Handling Arbitrary Payload Types Using Message Transformations", in *Oracle Streams Advanced Queuing User's Guide* for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

> **See Also:** For additional information regarding subscriber options
>
> - "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide*
> - "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide*

OUTBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- queue_name specifies the local Oracle Streams AQ queue that is the propagation source. This must have a syntax of schema.queue.
- destination specifies the foreign queue to which messages are propagated. This must have a syntax of registered_queue@message_link.
- rule specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Streams AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If NULL, then no rule or selector is used.
- transformation specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway.

  Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a

known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Streams AQ interface is used, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$_agent('MGW_`*`subscriber_id`*`',NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_`*`subscriber_id`*. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

- The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.
- The payload type of the source and exception queue must match.
- The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an Oracle Streams AQ queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for inbound propagation are interpreted as follows:

- `queue_name` specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the foreign messaging system. This is `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type.

  Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.
- `exception_queue` specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of `registered_queue@message_link`.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.

ALTER_AGENT Procedures

This procedure configures Messaging Gateway agent parameters.

Syntax

```
DBMS_MGWADM.ALTER_AGENT (
   max_connections  IN  BINARY_INTEGER DEFAULT NULL,
   max_memory       IN  BINARY_INTEGER DEFAULT NULL,
   max_threads      IN  BINARY_INTEGER DEFAULT NULL,
   service          IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );

DBMS_MGWADM.ALTER_AGENT (
   agent_name      IN   VARCHAR2,
   username        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   password        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   database        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   conntype        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   max_memory      IN   PLS_INTEGER DEFAULT NULL,
   max_threads     IN   PLS_INTEGER DEFAULT NULL,
   service         IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   initfile        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   comment         IN   VARCHAR2  DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 87–21 ALTER_AGENT Procedure Parameters

Parameter	Description
max_connections	The maximum number of messaging connections to Oracle Database used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged. **Caution: This parameter has been deprecated**.
max_memory	The maximum heap size, in MB, used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.
max_threads	The number of messaging threads that the Messaging Gateway agent creates. If it is NULL, then the current value is unchanged.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In a RAC environment, this means that the Messaging Gateway agent will run on only those database instances that are assigned to the service. If NULL, the job class used by this agent will be altered to belong to the default service which is mapped to every instance. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.
username	Specifies the username used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. If a username is specified then a password must also be specified.
password	Specifies the password used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. A password must be specified if a username is specified.

Table 87–21 (Cont.) ALTER_AGENT Procedure Parameters

Parameter	Description
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. Oracle strongly recommends that a connect string, rather than NULL, be specified. Usually it will be a net service name from tnsnames.ora.
conntype	Specifies the type of connection to the Oracle Database, DBMS_MGWADM.JDBC_OCI or DBMS_MGWADM.JDBC_THIN. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
comment	Optional comments for this agent. NULL if a comment is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.

Note: The max_connections parameter included in previous versions of this subprogram has been deprecated and is non-operational

Usage Notes

- Default values for these configuration parameters are set when the Messaging Gateway agent is installed.
- Changes to the max_memory and max_threads parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.
- The service parameter is used to set an Oracle Scheduler job class attribute. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is NULL, the job class will belong to an internal service that is mapped to all instances.
- The max_connections parameter is being deprecated as of the Oracle RDBMS 11g release. The number of messaging connections used by the Messaging Gateway Agent is based on the value of the max_threads parameter.
- The username, password, and database parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the user and grant it the role MGW_AGENT_ROLE.

ALTER_JOB Procedure

This procedure alters the properties of a propagation job.

Syntax

```
DBMS_MGWADM.ALTER_JOB (
   job_name          IN   VARCHAR2,
   rule              IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   transformation    IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   exception_queue   IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   poll_interval     IN   PLS_INTEGER DEFAULT 0,
   options           IN   SYS.MGW_PROPERTIES DEFAULT NULL,
   comments          IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 87–22 ALTER_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job
rule	Specifies an optional subscription rule used to dequeue messages from the propagation source. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. In cases in which no exception queue is associated with the job, propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.
poll_interval	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL, 0, or value > 0: ■ If zero (default), the current value will not be changed. ■ If NULL, the current value will be reset and the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.

Table 87–22 (Cont.) ALTER_JOB Procedure Parameters

Parameter	Description
options	Optional job properties. If NULL, no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of job options.
comments	An optional comment for this agent, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, the current value will not be changed.

Usage Notes

- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- The subscriber rule cannot be altered when propagating from a JMS source. Instead, the propagation job must be dropped and re-created with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be DBMS_MGWADM.NO_CHANGE (the default value).
- The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner; add a new property, replace an existing property, remove an existing property or remove all properties.

See Also:

- SYS.MGW_PROPERTY Object Type on page 87-12 for more information about the options parameter
- OUTBOUND_PROPAGATION Jobs on page 87-35 for outbound propagation parameter interpretation
- INBOUND_PROPAGATION Jobs on page 87-36 for inbound propagation parameter interpretation

ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

Alters the properties of a TIB/Rendezvous messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
   linkname      IN  VARCHAR2,
   properties    IN  SYS.MGW_TIBRV_PROPERTIES,
   options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment       IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 87–23 ALTER_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameters	Description
`linkname`	The messaging system link name
`properties`	Basic properties for a TIB/Rendezvous messaging system link. If `NULL`, then no link properties will be changed.
`options`	Optional link properties. If `NULL`, then no options will be changed. If not `NULL`, then the properties specified in this list are combined with the current options properties to form a new set of link options.
`comment`	A user-specified description, or `NULL` if one is not desired. If `DBMS_MGWADM.NO_CHANGE`, then the current value will not be changed.

Usage Notes

To retain an existing value for a messaging link property with a `VARCHAR2` data type, specify `DBMS_MGWADM.NO_CHANGE` for that particular property. To preserve an existing value for a property of another data type, specify `NULL` for that property.

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: SYS.MGW_PROPERTIES Object Type on page 87-10

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
   linkname   IN  VARCHAR2,
   properties IN  SYS.MGW_MQSERIES_PROPERTIES,
   options    IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment    IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

Parameters

Table 87–24 ALTER_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameters	Description
`linkname`	The messaging system link name
`properties`	Basic properties for a WebSphere MQ messaging system link. If it is `NULL`, then no link properties are changed.
`options`	Optional link properties. `NULL` if no options are changed. If not `NULL`, then the properties specified in this list are combined with the current options properties to form a new set of link options.
`comment`	An optional description or `NULL` if not desired. If `DBMS_MGWADM.NO_CHANGE` is specified, then the current value is not changed.

Usage Notes

To retain an existing value for a messaging link property with a `VARCHAR2` data type, specify `DBMS_MGWADM.NO_CHANGE` for that particular property. To preserve an existing value for a property of another data type, specify `NULL` for that property.

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also: SYS.MGW_PROPERTIES Object Type on page 87-10

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also: "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters a propagation schedule.

> **Note:** This subprogram has been deprecated as a result of improved technology (see ALTER_JOB Procedure on page 87-22), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (
   schedule_id  IN VARCHAR2,
   duration     IN NUMBER DEFAULT NULL,
   next_time    IN VARCHAR2 DEFAULT NULL,
   latency      IN NUMBER DEFAULT NULL);
```

Parameters

Table 87–25 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
`schedule_id`	Identifies the propagation schedule to be altered
`duration`	Reserved for future use
`next_time`	Reserved for future use
`latency`	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: `NULL` or value > 0. If `latency` is `NULL`, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.

ALTER_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

> **Note:** This subprogram has been deprecated as a result of improved technology (see ALTER_JOB Procedure on page 87-22), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ALTER_SUBSCRIBER (
   subscriber_id    IN VARCHAR2,
   rule             IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   transformation   IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   exception_queue  IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,
   options          IN SYS.MGW_PROPERTIES DEFAULT NULL );
```

Parameters

Table 87–26 ALTER_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be altered
rule	Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type. A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.
exception_queue	Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type. A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. The source queue and exception queue cannot be the same queue.
options	Optional subscriber properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options.

Usage Notes

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be `DBMS_MGWADM.NO_CHANGE` (the default value).

The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

CLEANUP_GATEWAY Procedures

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The MGW_GATEWAY view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

Syntax

```
DBMS_MGWADM.CLEANUP_GATEWAY(
   action       IN   BINARY_INTEGER,
   sarg         IN   VARCHAR2 DEFAULT NULL);

DBMS_MGWADM.CLEANUP_GATEWAY(
   agent_name   IN   VARCHAR2,
   action       IN   BINARY_INTEGER,
   sarg         IN   VARCHAR2 DEFAULT NULL );
```

Parameters

Table 87–27 CLEANUP_GATEWAY Procedure Parameters

Parameter	Description
action	The cleanup action to be performed. Values: ■ DBMS_MGWADM.CLEAN_STARTUP_STATE for Messaging Gateway start up state recovery ■ DBMS_MGWADM.CLEAN_LOG_QUEUES for log queue cleanup ■ DBMS_MGWADM.RESET_SUB_MISSING_LOG_REC for propagation job recovery due to missing log record ■ DBMS_MGWADM.RESET_SUB_MISSING_MESSAGE for propagation job recovery due to missing message
sarg	Optional argument whose meaning depends on the value specified for action. This should be NULL if it is not used for the specified action.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

Usage Notes

CLEAN_STARTUP_STATE

sarg is not used and must be NULL.

The CLEAN_STARTUP_STATE action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.

The CLEAN_STARTUP_STATE action may be needed when the MGW_GATEWAY view shows that the AGENT_STATUS value is something other than NOT_STARTED or START_SCHEDULED, and the AGENT_PING value is UNREACHABLE for an extended period of time.

If the AGENT_STATUS value is BROKEN, then the Messaging Gateway agent cannot be started until the problem has been resolved and the CLEAN_STARTUP_STATE action used to reset the agent status. A BROKEN status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the Scheduler job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to NOT_STARTED.

Execution of this command fails if:

- The agent status is NOT_STARTED or START_SCHEDULED.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is STARTING.
- The Messaging Gateway agent is successfully contacted.

  The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.

> **Note:** Terminate any Messaging Gateway agent process that may still be running after a CLEAN_STARTUP_STATE action has been successfully performed. This should be done before calling DBMS_MGWADM.STARTUP to start Messaging Gateway. The process is usually named extprocmgwextproc.

CLEAN_LOG_QUEUES

sarg is not used and must be NULL.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.

> **Note:** The CLEAN_LOG_QUEUES action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

RESET_SUB_MISSING_LOG_REC

sarg specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be NULL.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

Caution: If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

RESET_SUB_MISSING_MESSAGE

`sarg` specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be `NULL`.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that propagation job. The procedure will fail if the Messaging Gateway agent is not running.

CREATE_AGENT Procedure

This procedure creates a Messaging Gateway agent that will be used to process propagation jobs.

Syntax

```
DBMS_MGWADM.CREATE_AGENT (
   agent_name     IN   VARCHAR2,
   username       IN   VARCHAR2 DEFAULT NULL,
   password       IN   VARCHAR2 DEFAULT NULL,
   database       IN   VARCHAR2 DEFAULT NULL,
   conntype       IN   VARCHAR2 DEFAULT DBMS_MGWADM.JDBC_OCI,
   max_memory     IN   PLS_INTEGER DEFAULT 64,
   max_threads    IN   PLS_INTEGER DEFAULT 1,
   service        IN   VARCHAR2 DEFAULT NULL,
   initfile       IN   VARCHAR2 DEFAULT NULL,
   comment        IN   VARCHAR2  DEFAULT NULL );
```

Parameters

Table 87–28 CREATE_AGENT Procedure Parameters

Parameter	Description
agent_name	A name used to identify the agent
username	Specifies the username used for connections to the Oracle Database
password	Specifies the password used for connections to the Oracle Database. A password must be specified if a username is specified.
database	Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. A value can be specified only if username is specified. Oracle strong recommends that a connect string, rather than NULL be specified. Usually it will be a net service name from tnsnames.ora.
conntype	Specifies the type of connection to the Oracle Database.Values: DBMS_MGWADM.JDBC_OCI, DBMS_MGWADM.JDBC_THIN
max_memory	Specifies the maximum heap size, in MB, used by the Messaging Gateway agent
max_threads	Specifies the number of messaging threads that the Messaging Gateway agent creates. This determines the number of propagation jobs that the agent can concurrently process.
service	Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In a RAC environment, this means that the Messaging Gateway agent will only run on those database instances that are assigned to the service. If NULL, then the job class will belong to the default service which is mapped to every instance.
initfile	Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file.
comment	An optional comment for this agent. NULL if one is not desired.

Usage Notes

- The Messaging Gateway automatically configures a default agent when Messaging Gateway is installed. The name of the default agent is `DEFAULT_AGENT`. This procedure can be used to create additional agents.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the database user and grant it the role `MGW_AGENT_ROLE`. It is not mandatory that the connection information be specified when this procedure is called but it must be set before the agent can be started.
- The `service` parameter is used to create an Oracle Scheduler job class. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is `NULL`, the job class will belong to an internal service that is mapped to all instances.

CREATE_JOB Procedure

This procedure creates a job used to propagate message from a source to a destination.

Syntax

```
DBMS_MGWADM.CREATE_JOB (
   job_name           IN   VARCHAR2,
   propagation_type   IN   PLS_INTEGER,
   source             IN   VARCHAR2,
   destination        IN   VARCHAR2,
   rule               IN   VARCHAR2 DEFAULT NULL,
   transformation     IN   VARCHAR2 DEFAULT NULL,
   exception_queue    IN   VARCHAR2 DEFAULT NULL,
   poll_interval      IN   PLS_INTEGER DEFAULT NULL,
   options            IN   SYS.MGW_PROPERTIES DEFAULT NULL,
   enabled            IN   BOOLEAN DEFAULT TRUE,
   comments           IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 87–29 CREATE_JOB Procedure Parameters

Parameter	Description
job_name	A user defined name to identify the propagation job
propagation_type	Specifies the type of message propagation. ■ DBMS_MGWADM.OUTBOUND_PROPAGATION for Oracle Streams AQ to non-Oracle propagation. ■ DBMS_MGWADM.INBOUND_PROPAGATION for non-Oracle to Oracle Streams AQ propagation.
source	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
rule	Specifies an optional subscription rule used to dequeue messages from the source queue. This should be NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
transformation	Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. If no transformation is specified the Oracle Streams AQ payload type must be supported by Messaging Gateway.
exception_queue	Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, an exception queue will not be used and propagation will stop if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.

Table 87–29 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
poll_interval	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If NULL, then the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.
options	Optional job properties, NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.
enabled	Specifies whether this propagation job is enabled after creation. Values: TRUE, FALSE. ■ If TRUE (default), the job will be enabled after it is created. ■ If FALSE, the job will be disabled after it is created. A propagation job must be enabled and the Messaging Gateway agent running before messages can be propagated.
comments	An optional comment for this job. NULL if one is not desired.

Usage Notes

- The job must be enabled and Messaging Gateway agent started in order for messages to be propagated.
- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.
- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

OUTBOUND_PROPAGATION Jobs

The parameters for an outbound propagation job are interpreted as follows:

- source specifies the local Oracle Streams AQ queue that is the propagation source. This must have syntax of schema.queue. This can be either a multiple consumer queue or a single consumer queue.
- destination specifies the non-Oracle queue to which messages are propagated. This must have syntax of registered_queue@message_link.
- rule specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Stream AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If NULL, then no rule or selector is used. This parameter must be NULL if the native Oracle Stream AQ interface is used and the propagation source is a single consumer queue.
- transformation specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway. The full transformation name (schema.name) should be used if one is specified.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the non-Oracle messaging system based on the Messaging Gateway ADT.

- `exception_queue` specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. The syntax must be `schema.queue`.

  If the native Oracle Streams AQ interface is used and the source is a multiple consumer queue, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not the Messaging Gateway agent is running. The local subscriber will be of the form `sys.aq$_agent('MGW_job_name', NULL, NULL)`.

  If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_job_name`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

  The exception queue has the following conditions:

  – The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.

  – The payload type of the source queue and exception queue must match.

  – The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE`. Enqueue restrictions prevent Messaging Gateway from using an Oracle Streams AQ queue of type `DBMS_AQADM.EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Jobs

The parameters for an inbound propagation job are interpreted as follows:

- `source` specifies the non-Oracle queue that is the propagation source. The syntax must be `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. The syntax must be `schema.queue`.
- `rule` specifies an optional subscriber rule that is valid for the non-Oracle messaging system. This should be `NULL` if no rule is needed.
- `transformation` specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type. The full transformation name (`schema.name`) should be used if one is specified

  Messaging Gateway propagation dequeues messages from the non-Oracle messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- `exception_queue` specifies the name of a registered non-Oracle queue to which messages are moved if an exception occurs. The syntax must be `registered_queue@message_link`.

  Whether or not a subscriber is needed for the source queue depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then the Messaging Gateway agent will create it. If the agent is not

running when this procedure is called, then the subscriber will be created on the non-Oracle messaging system the next time the agent starts.

The exception queue has the following conditions:

- The exception queue must be a registered non-Oracle queue.
- The source queue and exception queue must use the same messaging system link.

CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous

Creates a link to a TIB/Rendezvous messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
   linkname     IN  VARCHAR2,
   properties   IN  SYS.MGW_TIBRV_PROPERTIES,
   options      IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment      IN  VARCHAR2 DEFAULT NULL );

DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (
   linkname     IN  VARCHAR2,
   agent_name   IN  VARCHAR2,
   properties   IN  SYS.MGW_TIBRV_PROPERTIES,
   options      IN  SYS.MGW_PROPERTIES DEFAULT NULL,
   comment      IN  VARCHAR2 DEFAULT NULL );
```

Parameters

Table 87–30 CREATE_MSGSYSTEM_LINK Procedure Parameters for TIB/Rendezvous

Parameter	Description
`linkname`	A user-defined name to identify this messaging system link
`properties`	Basic properties of a TIB/Rendezvous messaging system link.
`options`	Optional link properties. `NULL` if there are none. These are less frequently used configuration properties supported by the messaging system
`comment`	A user-specified description. `NULL` if one is not desired.
`agent_name`	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. `DBMS_MGWADM.DEFAULT_AGENT` specifies the default agent.

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

> **See Also:** "TIB/Rendezvous System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
   linkname    IN VARCHAR2,
   properties  IN SYS.MGW_MQSERIES_PROPERTIES,
   options     IN SYS.MGW_PROPERTIES DEFAULT NULL,
   comment     IN VARCHAR2 DEFAULT NULL);

DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(
   linkname    IN VARCHAR2,
   agent_name  IN  VARCHAR2,
   properties  IN SYS.MGW_MQSERIES_PROPERTIES,
   options     IN SYS.MGW_PROPERTIES DEFAULT NULL,
   comment     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 87–31 CREATE_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

Parameter	Description
`linkname`	A user-defined name to identify the messaging system link
`properties`	Basic properties of a WebSphere MQ messaging system link
`options`	Optional link properties. `NULL` if there are none. These are less frequently used configuration properties supported by the messaging system.
`comment`	A user-specified description. `NULL` if one is not desired
`agent_name`	Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. `DBMS_MGWADM.DEFAULT_AGENT` specifies the default agent.

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

> **See Also:** "WebSphere MQ System Properties" in *Oracle Streams Advanced Queuing User's Guide* for more information about the messaging system properties and options

DB_CONNECT_INFO Procedure

This procedure configures connection information used by the Messaging Gateway default agent for connections to Oracle Database.

> **Note:** This subprogram has been deprecated as a result of improved technology (see ALTER_AGENT Procedures on page 87-20), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.DB_CONNECT_INFO (
   username      IN VARCHAR2,
   password      IN VARCHAR2,
   database      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 87–32 DB_CONNECT_INFO Procedure Parameters

Parameter	Description
username	The username used for connections to Oracle Database. NULL is not allowed
password	The password used for connections to Oracle Database. NULL is not allowed
database	The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used. Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from tnsnames.ora.

Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role MGW_AGENT_ROLE, and then call this procedure to configure Messaging Gateway. Role MGW_AGENT_ROLE is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Streams AQ queues, and perform certain Oracle Streams AQ administration tasks.

DISABLE_JOB Procedure

This procedure disables a propagation job.

Syntax

```
DBMS_MGWADM.DISABLE_JOB (
   job_name  IN VARCHAR2);
```

Parameters

Table 87–33 DISABLE_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job

DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Note: This subprogram has been deprecated as a result of improved technology (see DISABLE_JOB Procedure on page 87-41), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (
   schedule_id  IN VARCHAR2);
```

Parameters

Table 87–34 DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be disabled

ENABLE_JOB Procedure

This procedure enables a propagation job.

Syntax

```
DBMS_MGWADM.ENABLE_JOB (
   job_name  IN VARCHAR2 );
```

Parameters

Table 87–35 ENABLE_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job

ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a propagation schedule.

Note: This subprogram has been deprecated as a result of improved technology (see ENABLE_JOB Procedure on page 87-43), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE (
   schedule_id  IN VARCHAR2 );
```

Parameters

Table 87–36 ENABLE_PROPAGATION_SCHEDULE Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be enabled

REGISTER_FOREIGN_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE(
   name            IN VARCHAR2,
   linkname        IN VARCHAR2,
   provider_queue  IN VARCHAR2 DEFAULT NULL,
   domain          IN INTEGER DEFAULT NULL,
   options         IN SYS.MGW_PROPERTIES DEFAULT NULL,
   comment         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 87–37 REGISTER_FOREIGN_QUEUE Procedure Parameters

Parameters	Description
`name`	The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system.
`linkname`	The link name for the messaging system on which this queue exists
`provider_queue`	The message provider (native) queue name. If `NULL`, then the value provided for the `name` parameter is used as the provider queue name.
`domain`	The domain type of the queue. `NULL` means the domain type is automatically determined based on the messaging system of the queue. `DBMS_MGWADM.DOMAIN_QUEUE` is for a queue (point-to-point model). `DBMS_MGWADM.DOMAIN_TOPIC` is for a topic (publish-subscribe model).
`options`	Optional queue properties
`comment`	A user-specified description. Can be `NULL`.

Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.

> **See Also:** For more information when registering queues for the WebSphere MQ messaging system or the TIB/Rendezvous messaging system, specifically "Optional Foreign Queue Configuration Properties" in *Oracle Streams Advanced Queuing User's Guide*.

REMOVE_AGENT Procedure

This procedure removes a Messaging Gateway agent.

Syntax

```
DBMS_MGWADM.REMOVE_AGENT(
   agent_name   IN   VARCHAR2 );
```

Parameters

Table 87–38 REMOVE_AGENT Procedure Parameters

Parameters	Description
agent_name	Identifies the Messaging Gateway agent

Usage Notes

All messaging system links associated with this Messaging Gateway agent must be removed and the agent must be stopped before it can be removed. The Messaging Gateway default agent cannot be removed.

REMOVE_JOB Procedure

This procedure removes a propagation job.

Syntax

```
DBMS_MGWADM.REMOVE_JOB(
   job_name   IN   VARCHAR2,
   force      IN   PLS_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

Parameters

Table 87–39 REMOVE_JOB Procedure Parameters

Parameters	Description
job_name	Identifies the propagation job
force	Specifies whether the procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this propagation job. Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE ■ NO_FORCE (default) means the job is not removed if Messaging Gateway is unable to clean up successfully ■ FORCE means the job is removed even though all cleanup actions may not be done

Usage Notes

- The Messaging Gateway agent uses various resources of the Oracle Database and the non-Oracle messaging system for its propagation work. These resources need to be released when the job is removed. For example, Messaging Gateway may create a durable subscriber on the source queue that should be removed when the job is removed. Therefore, this procedure should normally be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this job.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue when the propagation source is a multiple consumer queue.

REMOVE_MSGSYSTEM_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

Syntax

```
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK(
   linkname  IN VARCHAR2);
```

Parameters

Table 87–40 REMOVE_MSGSYSTEM_LINK Procedure Parameters

Parameters	Description
`linkname`	The messaging system link name

Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.

REMOVE_OPTION Procedure

This procedure removes a Messaging Gateway configuration option. It can be used to remove an agent option, a messaging link option, or a propagation job option.

Syntax

```
DBMS_MGWADM.REMOVE_OPTION (
   target_type   IN   PLS_INTEGER,
   target_name   IN   VARCHAR2,
   option_name   IN   VARCHAR2);
```

Parameters

Table 87–41 REMOVE_OPTION Procedure Parameters

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: ■ DBMS_MGWADM.AGENT_JAVA_PROP to remove a Java System property for a Messaging Gateway agent ■ DBMS_MGWADM.MSGLINK_OPTION to remove a messaging link option ■ DBMS_MGWADM.JOB_OPTION to remove a propagation job option
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.

See Also: Table 87–10, " DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures" on page 87-6 regarding options for the option_type parameter

Usage Notes

DBMS_MGWADM.AGENT_JAVA_PROP Target

The procedure removes an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target_name specifies the name of the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT can be used for the default agent.
- option_name specifies the Java System property
- encrypted can be either TRUE or FALSE

DBMS_MGWADM.MSGLINK_OPTION Target

The procedure removes a single option for a Messaging Gateway messaging system link. This is equivalent to calling DBMS_MGWADM.ALTER_MSGSYSTEM_LINK and using the options parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the message system link
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

DBMS_MGWADM.JOB_OPTION Target

The procedure removes a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the options parameter to remove an option.

The parameters are interpreted as follows:

- `target_name` specifies the name of the propagation job
- `option_name` specifies the option to set
- `encrypted` must be `FALSE`

REMOVE_SUBSCRIBER Procedure

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

> **Note:** This subprogram has been deprecated as a result of improved technology (see REMOVE_JOB Procedure on page 87-47), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.REMOVE_SUBSCRIBER (
   subscriber_id  IN VARCHAR2,
   force          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```

Parameters

Table 87–42 REMOVE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber to be removed
force	Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber. Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE ■ NO_FORCE means the subscriber is not removed if Messaging Gateway is unable to clean up successfully (default) ■ FORCE means the subscriber is removed even though all cleanup actions may not be done

Usage Notes

- The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.
- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue.

RESET_JOB Procedure

This procedure resets the propagation error state for a propagation job.

Syntax

```
DBMS_MGWADM.RESET_JOB (
   job_name   IN   VARCHAR2);
```

Parameters

Table 87–43 RESET_JOB Procedure Parameters

Parameter	Description
job_name	Identifies the propagation job

Usage Notes

This procedure can be used to reset a propagation job that has been set to a failed state and propagation activities have been stopped. The administrator should correct the problem and then call this procedure to allow the agent to retry the propagation job. The STATUS field of the MGW_JOBS view indicates the job status.

RESET_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

> **Note:** This subprogram has been deprecated as a result of improved technology (see RESET_JOB Procedure on page 87-52), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.RESET_SUBSCRIBER (
   subscriber_id  IN VARCHAR2 );
```

Parameters

Table 87–44 RESET_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_id	Identifies the subscriber

SCHEDULE_PROPAGATION Procedure

This procedure schedules message propagation from a source to a destination. The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

> **Note:** This subprogram has been deprecated as a result of improved technology (see CREATE_JOB Procedure on page 87-34), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.SCHEDULE_PROPAGATION (
   schedule_id       IN VARCHAR2,
   propagation_type  IN BINARY_INTEGER,
   source            IN VARCHAR2,
   destination       IN VARCHAR2,
   start_time        IN DATE DEFAULT SYSDATE,
   duration          IN NUMBER DEFAULT NULL,
   next_time         IN VARCHAR2 DEFAULT NULL,
   latency           IN NUMBER DEFAULT NULL);
```

Parameters

Table 87–45 SCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
schedule_id	Specifies a user-defined name that identifies the schedule
propagation_type	Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Streams AQ to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Streams AQ propagation.
source	Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
destination	Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.
start_time	Reserved for future use
duration	Reserved for future use
next_time	Reserved for future use
latency	Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value > 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file.

Usage Notes

For outbound propagation, parameters are interpreted as follows:

- `source` specifies the local Oracle Streams AQ queue from which messages are propagated. This must have a syntax of `schema.queue`.
- `destination` specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- `source` specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- `destination` specifies the local Oracle Streams AQ queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.

SET_LOG_LEVEL Procedures

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

Syntax

```
DBMS_MGWADM.SET_LOG_LEVEL (
   log_level    IN   BINARY_INTEGER);

DBMS_MGWADM.SET_LOG_LEVEL (
   agent_name   IN   VARCHAR2,
   log_level    IN   BINARY_INTEGER);
```

Parameters

Table 87–46 SET_LOG_LEVEL Procedure Parameters

Parameter	Description
`log_level`	Level at which the Messaging Gateway agent logs information. `DBMS_MGWADM.BASIC_LOGGING` generates the least information while `DBMS_MGWADM.TRACE_DEBUG_LOGGING` generates the most information.
`agent_name`	Identifies the Messaging Gateway agent. `DBMS_MGWADM.DEFAULT_AGENT` specifies the default agent.

See Also: Table 87–3, " DBMS_MGWADM Constants—Logging Levels" on page 87-4 for details on the `log_level` parameter

SET_OPTION Procedure

This procedure sets a Messaging Gateway configuration option. It can be used to set an agent option, a messaging link option, or a propagation job option.

Syntax

```
DBMS_MGWADM.SET_OPTION (
   target_type   IN   PLS_INTEGER,
   target_name   IN   VARCHAR2,
   option_name   IN   VARCHAR2,
   option_value  IN   VARCHAR2,
   encrypted     IN   BOOLEAN DEFAULT FALSE );
```

Parameters

Table 87–47 SET_OPTION Procedure Parameters

Parameter	Description
target_type	Specifies the target type of the Messaging Gateway entity: ■ DBMS_MGWADM.AGENT_JAVA_PROP to set a Java System property for a Messaging Gateway agent ■ DBMS_MGWADM.MSGLINK_OPTION to set a messaging link option ■ DBMS_MGWADM.JOB_OPTION to set a propagation job option
target_name	Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.
option_name	Option name. This must not be NULL.
option_value	Option value
encrypted	Indicates whether the value should be stored as encrypted: ■ TRUE if the value should be stored in an encrypted form ■ FALSE if the value should be stored in a cleartext form

See Also: Table 87–10, " DBMS_MGWADM Constants—target_type Argument of SET_OPTION and REMOVE_OPTION Procedures" on page 87-6 regarding options for the option_type parameter

Usage Notes

DBMS_MGWADM.AGENT_JAVA_PROP Target

The procedure will store an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- target_name specifies the name of the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT can be used for the default agent.
- option_name specifies the Java System property

- encrypted can be either TRUE or FALSE

DBMS_MGWADM.MSGLINK_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway messaging system link. This is equivalent to calling DBMS_MGWADM.ALTER_MSGSYSTEM_LINK and using the options parameter to set an option.

The parameters are interpreted as follows:

- target_name specifies the name of the message system link
- option_name specifies the option to set
- encrypted must be FALSE

DBMS_MGWADM.JOB_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway propagation job. This is equivalent to calling DBMS_MGWADM.ALTER_JOB and using the options parameter to set an option.

The parameters are interpreted as follows:

- target_name specifies the name of the propagation job
- option_name specifies the option to set
- encrypted must be FALSE

SHUTDOWN Procedures

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

Syntax

```
DBMS_MGWADM.SHUTDOWN (
   sdmode      IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);

DBMS_MGWADM.SHUTDOWN (
   agent_name  IN VARCHAR2);
```

Parameters

Table 87–48 SHUTDOWN Procedure Parameters

Parameter	Description
sdmode	The shutdown mode. The only value currently supported is DBMS_MGWADM.SHUTDOWN_NORMAL for normal shutdown. The Messaging Gateway agent may attempt to complete any propagation work currently in progress.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

Usage Notes

The Messaging Gateway default agent is shut down if no agent name is specified.

STARTUP Procedures

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

Syntax

```
DBMS_MGWADM.STARTUP(
   instance       IN  BINARY_INTEGER DEFAULT 0,
   force          IN  BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);

DBMS_MGWADM.STARTUP(
   agent_name     IN  VARCHAR2);
```

Parameters

Table 87–49 STARTUP Procedure Parameters

Parameter	Description
instance	Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance. **Caution: This parameter has been deprecated**.
force	If this is DBMS_MGWADM.FORCE, then any positive integer is acceptable as the job instance. If this is DBMS_MGWADM.NO_FORCE (the default), then the specified instance must be running; otherwise the routine raises an exception. **Caution: This parameter has been deprecated**.
agent_name	Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.

Usage Notes

- The Messaging Gateway default agent will be started if an agent name is not specified.
- The force and instance parameters are no longer used and will be ignored. If the instance affinity parameters were being used to start the default agent on a specific instance, the administrator will need to create a database service and then assign that service to the default agent using the DBMS_MGWADM.ALTER_AGENT procedure.
- The Messaging Gateway agent cannot be started until an agent user has been configured by the DBMS_MGWADM.CREATE_AGENT or DBMS_MGWADM.ALTER_AGENT subprograms.

UNREGISTER_FOREIGN_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

Syntax

```
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE(
   name         IN VARCHAR2,
   linkname     IN VARCHAR2);
```

Parameters

Table 87–50 UNREGISTER_FOREIGN_QUEUE Procedure Parameters

Parameter	Description
`name`	The queue name
`linkname`	The link name for the messaging system on which the queue exists

Usage Notes

- This procedure does not remove the physical queue in the non-Oracle messaging system.
- All propagation jobs, subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a propagation job, subscriber, or propagation schedule references the non-Oracle queue.

UNSCHEDULE_PROPAGATION Procedure

This procedure removes a propagation schedule.

> **Note:** This subprogram has been deprecated as a result of improved technology (see REMOVE_JOB Procedure on page 87-52), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.UNSCHEDULE_PROPAGATION (
   schedule_id   IN VARCHAR2 );
```

Parameters

Table 87–51 UNSCHEDULE_PROPAGATION Procedure Parameters

Parameter	Description
schedule_id	Identifies the propagation schedule to be removed

88

DBMS_MGWMSG

DBMS_MGWMSG provides:

- Object types used by the canonical message types to convert message bodies.
- Methods, constants, and subprograms for working with Messaging Gateway message types.

> **See Also:** Chapter 87, "DBMS_MGWADM" which describes the Messaging Gateway administrative interface, DBMS_MGWADM

This chapter contains the following topics:

- Using DBMS_MGWMSG
  - Security Model
  - Constants
  - Types
- Summary of DBMS_MGWMSG Subprograms

Using DBMS_MGWMSG

- Security Model
- Constants
- Types

Security Model

The EXECUTE privilege is granted to PUBLIC on all types defined in the DBMS_MGWMSG package as well as the canonical types. The DBMS_MGWMSG packages and object types are owned by SYS.

Note: You must run the catmgw.sql script to load the Messaging Gateway packages and object types into the database. Refer to the *Oracle Streams Advanced Queuing User's Guide* for information on loading database objects and using DBMS_MGWMSG.

Constants

Table 88–1 DBMS_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW_NAME_VALUE_T Object

Value	Constant
TEXT_VALUE	CONSTANT BINARY_INTEGER := 1
RAW_VALUE	CONSTANT BINARY_INTEGER := 2
BOOLEAN_VALUE	CONSTANT BINARY_INTEGER := 3
BYTE_VALUE	CONSTANT BINARY_INTEGER := 4
SHORT_VALUE	CONSTANT BINARY_INTEGER := 5
INTEGER_VALUE	CONSTANT BINARY_INTEGER := 6
LONG_VALUE	CONSTANT BINARY_INTEGER := 7
FLOAT_VALUE	CONSTANT BINARY_INTEGER := 8
DOUBLE_VALUE	CONSTANT BINARY_INTEGER := 9
DATE_VALUE	CONSTANT BINARY_INTEGER := 10

Table 88–2 DBMS_MGWMSG Constants: Boolean Values—Constants Representing a Boolean as a Numeric Value

Value	Constant
BOOLEAN_FALSE	CONSTANT BINARY_INTEGER := 0
BOOLEAN_TRUE	CONSTANT BINARY_INTEGER := 1

Table 88–3 DBMS_MGWMSG Constants: Case Comparisons

Value	Constant
CASE_SENSITIVE	CONSTANT BINARY_INTEGER := 0
CASE_INSENSITIVE	CONSTANT BINARY_INTEGER := 1

Table 88–4 Constants for the TIB/Rendezvous field type

Value	Constant
TIBRVMSG_BOOL	CONSTANT INTEGER := 1
TIBRVMSG_F32	CONSTANT INTEGER := 2
TIBRVMSG_F64	CONSTANT INTEGER := 3
TIBRVMSG_I8	CONSTANT INTEGER := 4
TIBRVMSG_I16	CONSTANT INTEGER := 5
TIBRVMSG_I32	CONSTANT INTEGER := 6
TIBRVMSG_I64	CONSTANT INTEGER := 7
TIBRVMSG_IPADDR32	CONSTANT INTEGER := 8
TIBRVMSG_IPPORT16	CONSTANT INTEGER := 9
TIBRVMSG_DATETIME	CONSTANT INTEGER := 10
TIBRVMSG_F32ARRAY	CONSTANT INTEGER := 11

Table 88–4 (Cont.) Constants for the TIB/Rendezvous field type

Value	Constant
TIBRVMSG_F64ARRAY	CONSTANT INTEGER := 12
TIBRVMSG_I8ARRAY	CONSTANT INTEGER := 13
TIBRVMSG_I16ARRAY	CONSTANT INTEGER := 14
TIBRVMSG_I32ARRAY	CONSTANT INTEGER := 15
TIBRVMSG_I64ARRAY	CONSTANT INTEGER := 16
TIBRVMSG_OPAQUE	CONSTANT INTEGER := 17
TIBRVMSG_STRING	CONSTANT INTEGER := 18
TIBRVMSG_XML	CONSTANT INTEGER := 19

Types

- SYS.MGW_NAME_VALUE_T Type
- SYS.MGW_NAME_VALUE_T Type-Attribute Mapping
- SYS.MGW_NAME_TYPE_ARRAY_T Type
- SYS.MGW_TEXT_VALUE_T Type
- SYS.MGW_RAW_VALUE_T Type
- SYS.MGW_BASIC_MSG_T Type
- SYS.MGW_NUMBER_ARRAY_T Type
- SYS.MGW_TIBRV_FIELD_T Type
- SYS.MGW_TIBRV_MSG_T Type

SYS.MGW_NAME_VALUE_T Type

This type specifies a named value. The `name` attribute, `type` attribute, and one of the `<>_value` attributes are typically not `NULL`.

Syntax

```
TYPE SYS.MGW_NAME_VALUE_T IS OBJECT(
   name               VARCHAR2(250),
   type               INTEGER,
   integer_value      INTEGER,
   number_value       NUMBER,
   text_value         VARCHAR2(4000),
   raw_value          RAW(2000),
   date_value         DATE,

-- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BOOLEAN (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BYTE (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_SHORT (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_INTEGER (
   name   IN VARCHAR2,
   value  IN INTEGER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_LONG (
   name   IN VARCHAR2,
```

```
   value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (
   name   IN VARCHAR2,
   value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DOUBLE (
   name   IN VARCHAR2,
   value  IN NUMBER )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_TEXT (
   name   IN VARCHAR2,
   value  IN VARCHAR2 )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_RAW (
   name   IN VARCHAR2,
   value  IN RAW )
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (
   name   IN VARCHAR2,
   value  IN DATE )
RETURN SYS.MGW_NAME_VALUE_T );
```

Attributes

Table 88–5 SYS.MGW_NAME_VALUE_T Attributes

Attribute	Description
`name`	Name associated with the value
`type`	Value type. Refer to the `DBMS_MGWMSG.<>_VALUE` constants in Table 88–1. This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value.
`integer_value`	Stores a numeric integer value
`number_value`	Stores a numeric float or large integer value
`text_value`	Stores a text value
`raw_value`	Stores a `RAW` (bytes) value
`date_value`	Stores a date value

SYS.MGW_NAME_VALUE_T Type-Attribute Mapping

Table 88–6 shows the mapping between the value type and the attribute used to store the value.

Table 88–6 SYS.MGW_NAME_VALUE_T Type Attribute Mapping

Type	Value Stored in Attribute
`DBMS_MGWMSG.TEXT_VALUE`	`text_value`
`DBMS_MGWMSG.RAW_VALUE`	`raw_value`
`DBMS_MGWMSG.BOOLEAN_VALUE`	`integer_value`

Table 88–6 (Cont.) SYS.MGW_NAME_VALUE_T Type Attribute Mapping

Type	Value Stored in Attribute
DBMS_MGWMSG.BYTE_VALUE	integer_value
DBMS_MGWMSG.SHORT_VALUE	integer_value
DBMS_MGWMSG.INTEGER_VALUE	integer_value
DBMS_MGWMSG.LONG_VALUE	number_value
DBMS_MGWMSG.FLOAT_VALUE	number_value
DBMS_MGWMSG.DOUBLE_VALUE	number_value
DBMS_MGWMSG.DATE_VALUE	date_value

CONSTRUCT Method

This method constructs a new SYS.MGW_NAME_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

CONSTRUCT_*TYPE* Methods

These methods construct a new SYS.MGW_NAME_VALUE_T instance initialized with the value of a specific type. Each method sets the name and type attributes and one of the <>_value attributes, as shown in the mappings in Table 88–6.

Syntax

```
STATIC FUNCTION CONSTRUCT_<> (
   name   IN VARCHAR2,
   value  IN datatype )
RETURN SYS.MGW_NAME_VALUE_T;
```

Usage Notes

The construct_boolean method sets the value to either DBMS_MGWMSG.BOOLEAN_TRUE or DBMS_MGWMSG.BOOLEAN_FALSE.

SYS.MGW_NAME_TYPE_ARRAY_T Type

This type specifies an array of name-value pairs. An object of SYS.MGW_NAME_VALUE_ARRAY_T type can have up to 1024 elements.

Syntax

```
TYPE SYS.MGW_NAME_VALUE_ARRAY_T
  AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;
```

SYS.MGW_TEXT_VALUE_T Type

This type specifies a TEXT value. It can store a large value as a CLOB or a smaller value (size <= 4000) as VARCHAR2. Only one of the < >_ value attributes should be set.

Syntax

```
TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
   small_value VARCHAR2(4000),
```

```
   large_value CLOB,

-- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T);
```

Attributes

Table 88–7 SYS.MGW_TEXT_VALUE_T Attributes

Attribute	Description
small_value	Small TEXT value. Used for values <= 4000.
large_value	Large TEXT value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new SYS.MGW_TEXT_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;
```

SYS.MGW_RAW_VALUE_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the < >_value attributes.

Syntax

```
TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
   small_value RAW(2000),
   large_value BLOB,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T);
```

Attributes

Table 88–8 SYS.MGW_RAW_VALUE_T Attributes

Attribute	Description
small_value	Small RAW (bytes) value <= 2000
large_value	Large RAW value. Used when the value is too large for the small_value attribute.

CONSTRUCT Method

This method constructs a new SYS.MGW_RAW_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
```

```
RETURN SYS.MGW_RAW_VALUE_T;
```

SYS.MGW_BASIC_MSG_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

Syntax

```
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(
   header     SYS.MGW_NAME_VALUE_ARRAY_T,
   text_body  SYS.MGW_TEXT_VALUE_T,
   raw_body   SYS.MGW_RAW_VALUE_T,

--Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T);
```

Attributes

Table 88–9 SYS.MGW_BASIC_MSG_T Attributes

Attribute	Description
header	Message header information as an array of name-value pairs
text_body	Message body for a TEXT message
raw_body	Message body for a RAW (bytes) message

CONSTRUCT Method

This method constructs a new SYS.MGW_BASIC_MSG_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;
```

SYS.MGW_NUMBER_ARRAY_T Type

A type that specifies an array of numbers.

Syntax

```
TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;
```

SYS.MGW_TIBRV_FIELD_T Type

A type representing a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW_TIBRV_MSG_T instance.

Syntax

```
TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
   field_name       VARCHAR2(256),
   field_id         INTEGER,
   field_type       INTEGER,
   number_value     NUMBER,
   number_array_value  SYS.MGW_NUMBER_ARRAY_T,
```

```
  text_value       VARCHAR2(4000),
  raw_value        RAW(2000),
  date_value       DATE,
  clob_value       CLOB,
  blob_value       BLOB);
```

Attributes

Table 88–10 SYS.MGW_TIBRV_FIELD_T Attributes

Attribute	Description
field_name	Field name. This will be NULL if the field has no name.
field_id	Field identifier. If the field identifier is zero (0), then that field is considered not to have a field identifier. Otherwise the field identifier is a nonzero value that is unique for all fields of that message.
field_type	Field wire format datatype. The DBMS_MGWMSG.TIBRVMSG_<> constants represent valid values for this attribute. The value of this field discriminates which value attribute is used to store the field data.
number_value	Used to store a numeric value
number_array_value	Used to store a numeric array value
text_value	Used to store a small text value
raw_value	Used to store a small raw value
date_value	Used to store a date value
clob_value	Used to store a large text value. This is used when the text data will not fit in text_value, that is, when size is larger than 4000.
blob_value	Used to store a large raw value. This is used when the raw data will not fit in raw_value; that is, when size is larger than 2000.

SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Table 88–11 describes the mapping in type SYS.MGW_TIBRV_FIELD_T between the field type and attribute used to store the value.

Table 88–11 SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_BOOL	number_value
TIBRVMSG_F32	number_value
TIBRVMSG_F64	number_value
TIBRVMSG_I8	number_value
TIBRVMSG_I16	number_value
TIBRVMSG_I32	number_value
TIBRVMSG_I64	number_value
TIBRVMSG_IPADDR32	text_value
TIBRVMSG_IPPORT16	number_value
TIBRVMSG_DATETIME	date_value

Table 88–11 (Cont.) SYS.MGW_TIBRV_FIELD_T Type and Attribute Mapping

Field Type (DBMS_MGWMSG constant)	Value Stored in Attribute
TIBRVMSG_F32ARRAY	number_array_value
TIBRVMSG_F64ARRAY	number_array_value
TIBRVMSG_I8ARRAY	number_array_value
TIBRVMSG_I16ARRAY	number_array_value
TIBRVMSG_I32ARRAY	number_array_value
TIBRVMSG_I64ARRAY	number_array_value
TIBRVMSG_OPAQUE	raw_value or blob_value
TIBRVMSG_STRING	text_value or clob_value
TIBRVMSG_XML	raw_value or blob_value

SYS.MGW_TIBRV_MSG_T Type

A type representing a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

Syntax

```
TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
   send_subject    VARCHAR2(256),
   reply_subject   VARCHAR2(256),
   cm_time_limit   NUMBER,
   cm_sender_name  VARCHAR2(256),
   cm_sequence_num NUMBER,
   fields          SYS.MGW_TIBRV_IFIELDS_T,
   clob_data1      CLOB,
   clob_data2      CLOB,
   clob_data3      CLOB,
   blob_data1      BLOB,
   blob_data2      BLOB,
   blob_data3      BLOB,

STATIC FUNCTION construct

Attributes

Table 88–12 SYS.MGW_TIBRV_MSG_T Type Attributes

Attribute	Description
send_subject	Send subject name
reply_subject	Reply subject name
cm_time_limit	Time limit for a certified message
cm_sender_name	Sender name of a certified message
cm_sequence_num	Sequence number of a certified message
fields	Collection of message fields
clob_data1	Used to store a large text value
clob_data2	Used to store a large text value
clob_data3	Used to store a large text value
blob_data1	Used to store a large raw value
blob_data2	Used to store a large raw value
blob_data3	Used to store a large raw value

Construct Method

Constructs a new SYS.MGW_TIBRV_MSG_T instance. All attributes are set to NULL.

Syntax

```
STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;
```

ADD_<> Methods

Adds a new field to the message.

Syntax

```
MEMBER PROCEDURE ADD_<> (
   name  IN  VARCHAR2,
   id    IN  INTEGER,
   value IN  datatype );
```

Parameters

Table 88–13 SYS.MGW_TIBRV_MSG_T ADD_<> Method Parameters

Parameter	Description
name	Field name
id	Field identifier
value	Field data

Table 88–14 shows, for each add method, the field type that will be assigned and valid values for the field data.

Table 88–14 MGW_TIBRV_MSG_T Add Method Field Types

Method Name	Field Type Assigned	Comment
add_bool	TIBRVMSG_BOOL	Valid values: 0 (false), 1 (true)
add_f32	TIBRVMSG_F32	n/a

add_string	TIBRVMSG_STRING	Value stored as VARCHAR2 if size < 4000; otherwise value stored in CLOB

Table 88–14 (Cont.) MGW_TIBRV_MSG_T Add Method Field Types

Method Name	Field Type Assigned	Comment
add_xml	TIBRVMSG_XML	Value stored as RAW if size < 2000; otherwise value stored in BLOB

SET_<> Methods

Accessor methods to set an instance attribute to a specific value.

Syntax

```
MEMBER PROCEDURE SET_<> (
  value IN datatype );
```

Parameters

Table 88–15 SYS.MGW_TIBRV_MSG_T SET_<> Method Parameters

Parameter	Description
value	Value to be assigned

GET_<> Methods

Accessor methods to retrieve the value for an instance attribute.

Syntax

```
MEMBER PROCEDURE GET_<>
RETURN datatype;
```

Parameters

None

Return Values

Returns the attribute value.

GET_FIELD_COUNT Function

Gets the number of message fields.

Syntax

```
MEMBER PROCEDURE get_field_count
RETURN INTEGER;
```

Parameters

None

Return Values

Returns the number of fields, or zero (0) if there are none.

GET_FIELD Function

Retrieves field information for the field having a given field collection index. This method should only be called if the GET_FIELD_COUNT Function returns a nonzero

value and idx must specify a valid collection index; that is, 1<=idx<=get_field_count().

Syntax

```
MEMBER PROCEDURE get_field (
    idx    IN    INTEGER )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 88–16 SYS.MGW_TIBRV_MSG_T GET_FIELD Function Parameters

Parameter	Description
idx	Specifies the 1-based field collection index of the field to retrieve

Note: A 1-based index begins at one (1) instead of zero (0).

Return Values

Returns the field information.

GET_FIELD_BY_NAME Function

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

Syntax

```
MEMBER PROCEDURE get_field_by_name (
   name  IN   VARCHAR2 )
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 88–17 SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_NAME Function Parameters

Parameter	Description
name	Specifies the field name to search for. This can be NULL to find the first field that does not have a field name.

Return Values

Returns the field information, or NULL if no match was found.

GET_FIELD_BY_ID Function

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or NULL, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

Syntax

```
MEMBER PROCEDURE get_field_by_id (
   id   IN  INTEGER )
```

```
RETURN SYS.MGW_TIBRV_FIELD_T;
```

Parameters

Table 88–18 SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_ID Function Parameters

Parameter	Description
id	Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier.

Return Values

Returns the field information, or NULL if no match was found.

FIND_FIELD_NAME Function

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

Syntax

```
MEMBER PROCEDURE find_field_name (
   name      IN  VARCHAR2,
   start_idx IN  INTEGER )
RETURN INTEGER;
```

Parameters

Table 88–19 SYS.MGW_TIBRV_MSG_T FIND_FIELD_NAME Function Parameters

Parameter	Description
name	Specifies the field name to search for. This can be NULL to search for a field that does not have a field name.
start_idx	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

FIND_FIELD_ID Function

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

Syntax

```
MEMBER PROCEDURE find_field_id (
     id        IN  INTEGER,
     start_idx IN INTEGER )
RETURN    INTEGER;
```

Parameters

Table 88–20 SYS.MGW_TIBRV_MSG_T FIND_FIELD_ID Function Parameters

Parameter	Description
`id`	Specifies the field identifier to search for. This can be zero (0) or `NULL` to find a field that does not have an identifier.
`start_idx`	Specifies the 1-based field collection index from which the search should start.

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

Summary of DBMS_MGWMSG Subprograms

Table 88–21 DBMS_MGWMSG Package Subprograms

Subprogram	Description
LCR_TO_XML Function on page 88-22	Converts a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD) to a SYS.XMLTYPE object
NVARRAY_ADD Procedure on page 88-23	Appends a name-value element to the end of a name-value array
NVARRAY_FIND_NAME Function on page 88-24	Searches a name-value array for the element with the name you specify in p_name
NVARRAY_FIND_NAME_TYPE Function on page 88-25	Searches a name-value array for an element with the name and value type you specify
NVARRAY_GET Function on page 88-26	Gets the name-value element of the name you specify in p_name from a name-value array
NVARRAY_GET_BOOLEAN Function on page 88-27	Gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type
NVARRAY_GET_BYTE Function on page 88-28	Gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type
NVARRAY_GET_DATE Function on page 88-29	Gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type
NVARRAY_GET_DOUBLE Function on page 88-30	Gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type
NVARRAY_GET_FLOAT Function on page 88-31	Gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type
NVARRAY_GET_INTEGER Function on page 88-32	Gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type
NVARRAY_GET_LONG Function on page 88-33	Gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type
NVARRAY_GET_RAW Function on page 88-34	Gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type
NVARRAY_GET_SHORT Function on page 88-35	Gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type
NVARRAY_GET_TEXT Function on page 88-36	Gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type
XML_TO_LCR Function on page 88-37	Converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD)

LCR_TO_XML Function

This function converts a SYS.ANYDATA object encapsulating a row LCR (Logical Change Record, in this case a LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD) to a SYS.XMLTYPE object.

See Also: XML_TO_LCR Function on page 88-37

Syntax

```
DBMS_MGWMSG.LCR_TO_XML (
   p_anydata IN SYS.ANYDATA )
 RETURN SYS.XMLTYPE;
```

Parameters

Table 88–22 LCR_TO_XML Function Parameters

Parameter	Description
p_anydata	An ANYDATA object to be converted

Return Values

Returns a SYS.XMLTYPE object.

Usage Notes

An exception is raised if the encapsulated type p_anydata is not an LCR.

NVARRAY_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_ADD (
   p_array  IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,
   p_value  IN     SYS.MGW_NAME_VALUE_T );
```

Parameters

Table 88–23 NVARRAY_ADD Procedure Parameters

Parameter	Description
p_array	On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance.
p_value	The value to add. If NULL, then p_array is not changed.

NVARRAY_FIND_NAME Function

This function searches a name-value array for the element with the name you specify in `p_name`.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 88–24 NVARRAY_FIND_NAME Function Parameters

Parameters	Description
`p_array`	The name-value array to search
`p_name`	The name to find
`p_compare`	Name comparison method. Values are `CASE_SENSITIVE` and `CASE_INSENSITIVE`.

Return Values

Returns a positive integer that is the array index of the matching element or zero (`0`) if the specified name is not found.

NVARRAY_FIND_NAME_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

Syntax

```
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_type     IN BINARY_INTEGER
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

Table 88–25 NVARRAY_FIND_NAME_TYPE Function Parameters

Parameter	Description
p_array	The name-value array to search
p_name	The name to find
p_type	The value type. Refer to the value type constants in Table 88–1 on page 88-4.
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

NVARRAY_GET Function

This function gets the name-value element of the name you specify in `p_name` from a name-value array.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN SYS.MGW_NAME_VALUE_T;
```

Parameters

Table 88–26 NVARRAY_GET Function Parameters

Parameter	Description
`p_array`	The name-value array
`p_name`	The value name
`p_compare`	Name comparison method. Values are `CASE_SENSITIVE` and `CASE_INSENSITIVE`.

Return Values

Returns the matching element, or `NULL` if the specified name is not found.

NVARRAY_GET_BOOLEAN Function

This function gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 88–27 NVARRAY_GET_BOOLEAN Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_BYTE Function

This function gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_BYTE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 88–28 NVARRAY_GET_BYTE Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_DATE Function

This function gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DATE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN DATE;
```

Parameters

Table 88–29 NVARRAY_GET_DATE Function Parameters

Parameters	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_DOUBLE Function

This function gets the value of the name-value array element that you specify in p_name and with the DOUBLE_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DOUBLE (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 88–30 NVARRAY_GET_DOUBLE Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_FLOAT Function

This function gets the value of the name-value array element that you specify in p_name and with the FLOAT_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_FLOAT (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 88–31 NVARRAY_GET_FLOAT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_INTEGER Function

This function gets the value of the name-value array element that you specify in p_name and with the INTEGER_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_INTEGER (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 88–32 NVARRAY_GET_INTEGER Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_LONG Function

This function gets the value of the name-value array element that you specify in p_name and with the LONG_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_LONG (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

Parameters

Table 88–33 NVARRAY_GET_LONG Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_RAW Function

This function gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type .

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_RAW (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

Parameters

Table 88–34 NVARRAY_GET_RAW Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_SHORT Function

This function gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_SHORT (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```

Parameters

Table 88–35 NVARRAY_GET_SHORT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

NVARRAY_GET_TEXT Function

This function gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_TEXT (
   p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
   p_name     IN VARCHAR2,
   p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN VARCHAR2;
```

Parameters

Table 88–36 NVARRAY_GET_TEXT Function Parameters

Parameter	Description
p_array	The name-value array
p_name	The value name
p_compare	Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

XML_TO_LCR Function

This function converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD).

See Also: LCR_TO_XML Function on page 88-22

Syntax

```
DBMS_MGWMSG.XML_TO_LCR (
   p_xmldata IN SYS.XMLTYPE )
 RETURN SYS.ANYDATA;
```

Parameters

Table 88–37 XML_TO_LCR Function Parameters

Parameter	Description
p_xmldata	An XMLTYPE object representing an LCR

Return Values

Returns a SYS.ANYDATA object.

Usage Notes

An exception is raised if p_xmldata cannot be converted to an LCR.

89

DBMS_MONITOR

The DBMS_MONITOR package let you use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

- Summary of DBMS_MONITOR Subprograms

Summary of DBMS_MONITOR Subprograms

Table 89–1 DBMS_MONITOR Package Subprograms

Subprogram	Description
CLIENT_ID_STAT_DISABLE Procedure on page 89-3	Disables statistic gathering previously enabled for a given Client Identifier
CLIENT_ID_STAT_ENABLE Procedure on page 89-4	Enables statistic gathering for a given Client Identifier
CLIENT_ID_TRACE_DISABLE Procedure on page 89-5	Disables the trace previously enabled for a given Client Identifier globally for the database
CLIENT_ID_TRACE_ENABLE Procedure on page 89-6	Enables the trace for a given Client Identifier globally for the database
DATABASE_TRACE_DISABLE Procedure on page 89-7	Disables SQL trace for the whole database or a specific instance
DATABASE_TRACE_ENABLE Procedure on page 89-8	Enables SQL trace for the whole database or a specific instance
SERV_MOD_ACT_STAT_ DISABLE Procedure on page 89-9	Disables statistic gathering enabled for a given combination of Service Name, `MODULE` and `ACTION`
SERV_MOD_ACT_STAT_ ENABLE Procedure on page 89-10	Enables statistic gathering for a given combination of Service Name, `MODULE` and `ACTION`
SERV_MOD_ACT_TRACE_ DISABLE Procedure on page 89-12	Disables the trace for ALL enabled instances for a or a given combination of Service Name, `MODULE` and `ACTION` name globally
SERV_MOD_ACT_TRACE_ ENABLE Procedure on page 89-13	Enables SQL tracing for a given combination of Service Name, `MODULE` and `ACTION` globally unless an `instance_name` is specified
SESSION_TRACE_DISABLE Procedure on page 89-15	Disables the previously enabled trace for a given database session identifier (SID) on the local instance
SESSION_TRACE_ENABLE Procedure on page 89-16	Enables the trace for a given database session identifier (SID) on the local instance

CLIENT_ID_STAT_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V$CLIENT_STATS view enabled by the CLIENT_ID_STAT_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(
   client_id            IN   VARCHAR2);
```

Parameters

Table 89–2 CLIENT_ID_STAT_DISABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is disabled

Examples

To disable accumulation:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');
```

CLIENT_ID_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier. Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V$CLIENT_STATS views.

Syntax

```
DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(
   client_id            IN   VARCHAR2);
```

Parameters

Table 89–3 CLIENT_ID_STAT_ENABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which statistic aggregation is enabled

Examples

To enable statistic accumulation for a client with a given client ID:

```
EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
```

CLIENT_ID_TRACE_DISABLE Procedure

This procedure will disable tracing enabled by the CLIENT_ID_TRACE_ENABLE Procedure.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(
 client_id    IN  VARCHAR2);
```

Parameters

Table 89–4 CLIENT_ID_TRACE_DISABLE Procedure Parameters

Parameter	Description
client_id	Client Identifier for which SQL tracing is disabled

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');
```

CLIENT_ID_TRACE_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

Syntax

```
DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(
 client_id    IN  VARCHAR2,
 waits        IN  BOOLEAN DEFAULT TRUE,
 binds        IN  BOOLEAN DEFAULT FALSE,
 plan_stat    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 89–5 CLIENT_ID_TRACE_ENABLE Procedure Parameters

Parameter	Description
client_id	Database Session Identifier for which SQL tracing is enabled
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.

Examples

```
EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE,
FALSE);
```

DATABASE_TRACE_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_DISABLE(
   instance_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 89–6 DATABASE_TRACE_DISABLE Procedure Parameters

Parameter	Description
instance_name	Disables tracing for the named instance

DATABASE_TRACE_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

Syntax

```
DBMS_MONITOR.DATABASE_TRACE_ENABLE(
   waits          IN BOOLEAN DEFAULT TRUE,
   binds          IN BOOLEAN DEFAULT FALSE,
   instance_name  IN VARCHAR2 DEFAULT NULL,
   plan_stat      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 89–7 DATABASE_TRACE_ENABLE Procedure Parameters

Parameter	Description
`waits`	If `TRUE`, wait information will be present in the trace
`binds`	If `TRUE`, bind information will be present in the trace
`instance_name`	If set, restricts tracing to the named instance
`plan_stat`	Frequency at which we dump row source statistics. Value should be '`NEVER`', '`FIRST_EXECUTION`' (equivalent to `NULL`) or '`ALL_EXECUTIONS`'.

SERV_MOD_ACT_STAT_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V$SERV_MOD_ACT_STATS view. Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2,
   action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 89–8 SERV_MOD_ACT_STAT_DISABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which statistic aggregation is disabled
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level.

Usage Notes

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

SERV_MOD_ACT_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, MODULE and ACTION. Calling this procedure enables statistic gathering for a hierarchical combination of Service name, MODULE name, and ACTION name on all instances for the same database. Statistics are accessible by means of the V$SERV_MOD_ACT_STATS view.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2,
   action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
```

Parameters

Table 89–9 SERV_MOD_ACT_STAT_ENABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which statistic aggregation is enabled
module_name	Name of the MODULE. An additional qualifier for the service. It is a required parameter.
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level.

Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL_ACTIONS for an action specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1','PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE
DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE('APPS1','GLEDGER','DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.
- For all actions in the `PAYROLL` Module.
- For the `DEBIT_ENTRY` Action within the `GLEDGER` Module.

SERV_MOD_ACT_TRACE_DISABLE Procedure

This procedure will disable the trace at ALL enabled instances for a given combination of Service Name, MODULE, and ACTION name globally.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(
   service_name    IN  VARCHAR2,
   module_name     IN  VARCHAR2,
   action_name     IN  VARCHAR2 DEFAULT ALL_ACTIONS,
   instance_name   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 89–10 SERV_MOD_ACT_TRACE_DISABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which tracing is disabled.
module_name	Name of the MODULE. An additional qualifier for the service
action_name	Name of the ACTION. An additional qualifier for the Service and MODULE name.
instance_name	If set, this restricts tracing to the named instance_name

Usage Notes

Specifying NULL for the module_name parameter means that statistics will no longer be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
            DBMS_MONITOR.ALL_MODULES,  DBMS_MONITOR.ALL_ACTIONS,TRUE,
FALSE,NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and MODULE (all ACTIONs):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1','PAYROLL',
            DBMS_MONITOR.ALL_ACTIONS,TRUE,FALSE,NULL);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1','PAYROLL');
```

SERV_MOD_ACT_TRACE_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified.

Syntax

```
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(
   service_name    IN VARCHAR2,
   module_name     IN VARCHAR2 DEFAULT ANY_MODULE,
   action_name     IN VARCHAR2 DEFAULT ANY_ACTION,
   waits           IN BOOLEAN DEFAULT TRUE,
   binds           IN BOOLEAN DEFAULT FALSE,
   instance_name   IN VARCHAR2 DEFAULT NULL,
   plan_stat       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 89–11 SERV_MOD_ACT_TRACE_ENABLE Procedure Parameters

Parameter	Description
service_name	Name of the service for which SQL trace is enabled
module_name	Name of the MODULE for which SQL trace is enabled. An optional additional qualifier for the service. If omitted, SQL trace is enabled or all modules and actions in a given service.
action_name	Name of the ACTION for which SQL trace is enabled. An optional additional qualifier for the Service and MODULE name. If omitted, SQL trace is enabled for all actions in a given module.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
instance_name	If set, this restricts tracing to the named instance_name
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONs. Using the ALL_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The instance_name parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the trcsess tool to collect it into a single file.

- Specifying NULL for the module_name parameter means that statistics will be accumulated for the sessions which do not set the MODULE attribute.

Examples

To enable tracing for a Service named APPS1:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
            DBMS_MONITOR.ALL_MODULES,  DBMS_MONITOR.ALL_ACTIONS,TRUE,
FALSE,NULL);
```

To enable tracing for a given combination of Service and MODULE (all ACTIONs):

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1','PAYROLL',
            DBMS_MONITOR.ALL_ACTIONS,TRUE,FALSE,NULL);
```

SESSION_TRACE_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

Syntax

```
DBMS_MONITOR.SESSION_TRACE_DISABLE(
   session_id      IN     BINARY_INTEGER DEFAULT NULL,
   serial_num      IN     BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 89–12 SESSION_TRACE_DISABLE Procedure Parameters

Parameter	Description
session_id	Database Session Identifier for which SQL trace is disabled
serial_num	Serial number for this session

Usage Notes

If serial_num is NULL but session_id is specified, a session with a given session_id is no longer traced irrespective of its serial number. If both session_id and serial_num are NULL, the current user session is no longer traced. It is illegal to specify NULL session_id and non-NULL serial_num. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);;
```

SESSION_TRACE_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance

Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE(
    session_id   IN  BINARY_INTEGER DEFAULT NULL,
    serial_num   IN  BINARY_INTEGER DEFAULT NULL,
    waits        IN  BOOLEAN DEFAULT TRUE,
    binds        IN  BOOLEAN DEFAULT FALSE,
    plan_stat    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 89–13 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
session_id	Client Identifier for which SQL trace is enabled. If omitted (or NULL), the user's own session is assumed.
serial_num	Serial number for this session. If omitted (or NULL), only the session ID is used to determine a session.
waits	If TRUE, wait information is present in the trace
binds	If TRUE, bind information is present in the trace
plan_stat	Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.

Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If serial_num is NULL but session_id is specified, a session with a given session_id is traced irrespective of its serial number. If both session_id and serial_num are NULL, the current user session is traced. It is illegal to specify NULL session_id and non-NULL serial_num. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);
```

traces the session with session ID of 5, while either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();
```

or

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);
```

traces the current user session. Also,

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);
```

traces the current user session including waits and binds. The same can be also expressed using keyword syntax:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
```

90

DBMS_MVIEW

DBMS_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

Note: DBMS_MVIEW is a synonym for DBMS_SNAPSHOT.

See Also:

- *Oracle Database Advanced Replication* for more information about using materialized views in a replication environment
- *Oracle Database Data Warehousing Guide* for more information about using materialized views in a data warehousing environment

This chapter contains the following topics:

- Using DBMS_MVIEW
  - Operational Notes
  - Rules and Limits
- Summary of DBMS_MVIEW Subprograms

Using DBMS_MVIEW

This section contains topics which relate to using the `DBMS_MVIEW` package.

- Operational Notes
- Rules and Limits

Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN..END` block, as shown in the examples in `/rdbms/demo/smxrw.sql`.

Rules and Limits

The EXPLAIN_REWRITE procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the EXPLAIN_MVIEW procedure.

Summary of DBMS_MVIEW Subprograms

Table 90–1 DBMS_MVIEW Package Subprograms

Subprogram	Description
BEGIN_TABLE_ REORGANIZATION Procedure on page 90-6	Performs a process to preserve materialized view data needed for refresh
END_TABLE_ REORGANIZATION Procedure on page 90-7	Ensures that the materialized view data for the master table is valid and that the master table is in the proper state
ESTIMATE_MVIEW_SIZE Procedure on page 90-8	Estimates the size of a materialized view that you might create, in bytes and rows
EXPLAIN_MVIEW Procedure on page 90-9	Explains what is possible with a materialized view or potential materialized view
EXPLAIN_REWRITE Procedure on page 90-10	Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views
I_AM_A_REFRESH Function on page 90-12	Returns the value of the `I_AM_REFRESH` package state
PMARKER Function on page 90-13	Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT)
PURGE_DIRECT_LOAD_LOG Procedure on page 90-14	Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing)
PURGE_LOG Procedure on page 90-15	Purges rows from the materialized view log
PURGE_MVIEW_FROM_LOG Procedure on page 90-16	Purges rows from the materialized view log
REFRESH Procedures on page 90-17	Refreshes one or more materialized views that are not members of the same refresh group
REFRESH_ALL_MVIEWS Procedure on page 90-19	Refreshes all materialized views that do not reflect changes to their master table or master materialized view
REFRESH_DEPENDENT Procedures on page 90-20	Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views
REGISTER_MVIEW Procedure on page 90-22	Enables the administration of individual materialized views
UNREGISTER_MVIEW Procedure on page 90-24	Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view

BEGIN_TABLE_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (
   tabowner    IN   VARCHAR2,
   tabname     IN   VARCHAR2);
```

Parameters

Table 90–2 BEGIN_TABLE_REORGANIZATION Procedure Parameters

Parameter	Description
`tabowner`	Owner of the table being reorganized
`tabname`	Name of the table being reorganized

END_TABLE_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (
   tabowner    IN   VARCHAR2,
   tabname     IN   VARCHAR2);
```

Parameters

Table 90–3 END_TABLE_REORGANIZATION Procedure Parameters

Parameter	Description
tabowner	Owner of the table being reorganized
tabname	Name of the table being reorganized

ESTIMATE_MVIEW_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_MVIEW.ESTIMATE_MVIEW_SIZE (
   stmt_id       IN  VARCHAR2,
   select_clause IN  VARCHAR2,
   num_rows      OUT NUMBER,
   num_bytes     OUT NUMBER);
```

Parameters

Table 90–4 ESTIMATE_MVIEW_SIZE Procedure Parameters

Parameter	Description
`stmt_id`	Arbitrary string used to identify the statement in an `EXPLAIN PLAN`
`select_clause`	The `SELECT` statement to be analyzed
`num_rows`	Estimated cardinality
`num_bytes`	Estimated number of bytes

EXPLAIN_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call DBMS_MVIEW.EXPLAIN_MVIEW, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the SELECT string or CREATE MATERIALIZED VIEW statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called MV_CAPABILITIES_TABLE, which is the default, or to an array called MSG_ARRAY.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to MV_CAPABILITIES_TABLE.
- The second version is for explaining an existing or potential materialized view with output to a VARRAY.

Syntax

```
DBMS_MVIEW.EXPLAIN_MVIEW (
   mv            IN VARCHAR2,
   statement_id  IN VARCHAR2:= NULL);

DBMS_MVIEW.EXPLAIN_MVIEW (
   mv          IN VARCHAR2,
   msg_array   OUT SYS.ExplainMVArrayType);
```

Parameters

Table 90–5 EXPLAIN_MVIEW Procedure Parameters

Parameter	Description
mv	The name of an existing materialized view (optionally qualified with the owner name separated by a ".") or a SELECT statement or a CREATE MATERIALIZED VIEW statement for a potential materialized view.
statement_id	A client-supplied unique identifier to associate output rows with specific invocations of EXPLAIN_MVIEW
msg_array	The PL/SQL VARRAY that receives the output. Use this parameter to direct EXPLAIN_MVIEW's output to a PL/SQL VARRAY rather than MV_CAPABILITIES_TABLE.

Usage Notes

You must run the utlxmv.sql script to create MV_CAPABILITIES_TABLE in the current schema prior to calling EXPLAIN_MVIEW except when you direct output to a VARRAY. The script is found in the ADMIN directory.

EXPLAIN_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used. Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the EXPLAIN_REWRITE statement is never actually executed.

A demo file, xrwutl.sql, is available to help format the output from EXPLAIN_REWRITE.

Syntax

You can obtain the output from DBMS_MVIEW.EXPLAIN_REWRITE in two ways. The first is to use a table, while the second is to create a VARRAY. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query           VARCHAR2,
    mv              VARCHAR2(30),
    statement_id    VARCHAR2(30));
```

You can create an output table called REWRITE_TABLE by executing the utlxrw.sql script.

The query parameter is a text string representing the SQL query. The parameter, mv, is a fully qualified materialized view name in the form of schema.mv. This is an optional parameter. When it is not specified, EXPLAIN_REWRITE returns any relevant messages regarding all the materialized views considered for rewriting the given query. When schema is omitted and only mv is specified, EXPLAIN_REWRITE looks for the materialized view in the current schema.

If you want to direct the output of EXPLAIN_REWRITE to a VARRAY instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query           [VARCHAR2 | CLOB],
    mv               VARCHAR2(30),
    output_array     SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, EXPLAIN_REWRITE can be easily invoked with the EXECUTE command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL BEGIN... END block, as shown in the examples in /rdbms/demo/smxrw*.

You can also use EXPLAIN_REWRITE with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views mv1, mv2, and mv3 could be used to rewrite the query, query_txt, and, if not, why not, use EXPLAIN_REWRITE as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the EXPLAIN_REWRITE procedure.

Parameters

Table 90–6 EXPLAIN_REWRITE Procedure Parameters

Parameter	Description
query	SQL SELECT statement to be explained
mv	The fully qualified name of an existing materialized view in the form of SCHEMA.MV. For multiple materialized views, you can provide a comma-delimited list of names.
statement_id	A client-supplied unique identifier to distinguish output messages
msg_array	The PL/SQL VARRAY that receives the output. Use this parameter to direct EXPLAIN_REWRITE's output to a PL/SQL VARRAY.

Usage Notes

To obtain the output into a table, you must run the utlxrw.sql script before calling EXPLAIN_REWRITE. This script creates a table named REWRITE_TABLE in the current schema.

I_AM_A_REFRESH Function

This function returns the value of the `I_AM_REFRESH` package state.

Syntax

```
DBMS_MVIEW.I_AM_A_REFRESH
   RETURN BOOLEAN;
```

Return Values

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.

PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

Syntax

```
DBMS_MVIEW.PMARKER(
   rid IN ROWID)
 RETURN NUMBER;
```

Parameters

Table 90–7 PMARKER Function Parameters

Parameter	Description
rid	The rowid of a row entry in a master table

PURGE_DIRECT_LOAD_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

> **See Also:** *Oracle Database Data Warehousing Guide* for more information

Syntax

```
DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG();
```

PURGE_LOG Procedure

This procedure purges rows from the materialized view log.

Syntax

```
DBMS_MVIEW.PURGE_LOG (
   master         IN   VARCHAR2,
   num            IN   BINARY_INTEGER := 1,
   flag           IN   VARCHAR2       := 'NOP');
```

Parameters

Table 90–8 PURGE_LOG Procedure Parameters

Parameter	Description
`master`	Name of the master table or master materialized view.

`num`	Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:
	`DBMS_MVIEW.PURGE_LOG('master_table', 2);`
	To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:
	`DBMS_MVIEW.PURGE_LOG('master_table',9999);`
	This statement completely purges the materialized view log that corresponds to `master_table` if fewer than 9999 materialized views are based on `master_table`. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed.

`flag`	Specify `delete` to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter `num`. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view: `DBMS_MVIEW.PURGE_LOG('master_table',1,'delete');`

PURGE_MVIEW_FROM_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by its `mview_id` or the combination of the `mviewowner`, `mviewname`, and the `mviewsite`. If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

Syntax

```
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (
   mview_id       IN   BINARY_INTEGER  |
   mviewowner     IN   VARCHAR2,
   mviewname      IN   VARCHAR2,
   mviewsite      IN   VARCHAR2);
```

> **Note:** This procedure is overloaded. The `mview_id` parameter is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`.

Parameters

Table 90–9 PURGE_MVIEW_FROM_LOG Procedure Parameters

Parameter	Description
`mview_id`	If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the `mview_id` parameter. Query the `DBA_BASE_TABLE_MVIEWS` view at the materialized view log site for a listing of materialized view IDs. Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (`DBA_REGISTERED_MVIEWS`).
`mviewowner`	If you do not specify an `mview_id`, enter the owner of the target materialized view using the `mviewowner` parameter. Query the `DBA_REGISTERED_MVIEWS` view at the materialized view log site to view the materialized view owners.
`mviewname`	If you do not specify an `mview_id`, enter the name of the target materialized view using the `mviewname` parameter. Query the `DBA_REGISTERED_MVIEWS` view at the materialized view log site to view the materialized view names.
`mviewsite`	If you do not specify an `mview_id`, enter the site of the target materialized view using the `mviewsite` parameter. Query the `DBA_REGISTERED_MVIEWS` view at the materialized view log site to view the materialized view sites.

Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

REFRESH Procedures

This procedure refreshes a list of materialized views.

Syntax

```
DBMS_MVIEW.REFRESH (
   { list                 IN     VARCHAR2,
   | tab                  IN     DBMS_UTILITY.UNCL_ARRAY,}
   method                 IN     VARCHAR2       := NULL,
   rollback_seg           IN     VARCHAR2       := NULL,
   push_deferred_rpc      IN     BOOLEAN        := true,
   refresh_after_errors   IN     BOOLEAN        := false,
   purge_option           IN     BINARY_INTEGER := 1,
   parallelism            IN     BINARY_INTEGER := 0,
   heap_size              IN     BINARY_INTEGER := 0,
   atomic_refresh         IN     BOOLEAN        := true,
   nested                 IN     BOOLEAN        := false);
```

Note: This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 90–10 REFRESH Procedure Parameters

Parameter	Description
`list | tab`	Comma-delimited list of materialized views that you want to refresh. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type `DBMS_UTILITY.UNCL_ARRAY`, where each element is the name of a materialized view.

`method`	A string of refresh methods indicating how to refresh the listed materialized views. An `f` indicates fast refresh, `?` indicates force refresh, `C` or `c` indicates complete refresh, and `A` or `a` indicates always refresh. `A` and `C` are equivalent. `P` or `p` refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
	
	If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following `EXECUTE` statement within SQL*Plus:
	
	`DBMS_MVIEW.REFRESH`
	`('countries_mv,regions_mv,hr.employees_mv','cf');`
	
	This statement performs a complete refresh of the `countries_mv` materialized view, a fast refresh of the `regions_mv` materialized view, and a default refresh of the `hr.employees` materialized view.

`rollback_seg`	Name of the materialized view site rollback segment to use while refreshing materialized views

Table 90–10 (Cont.) REFRESH Procedure Parameters

Parameter	Description
`push_deferred_rpc`	Used by updatable materialized views only. Set this parameter to `true` if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.
`refresh_after_errors`	If this parameter is `true`, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the `DEFERROR` view for the materialized view's master table or master materialized view. If this parameter is `true` and `atomic_refresh` is `false`, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
`purge_option`	If you are using the parallel propagation mechanism (in other words, parallelism is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set purge to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to `0` and occasionally execute `PUSH` with this parameter set to `2` to reduce the queue.
`parallelism`	0 specifies serial propagation. *n* > 1 specifies parallel propagation with *n* parallel processes. 1 specifies parallel propagation using only one parallel process.
`heap_size`	Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance. Note**:** Do not set this parameter unless directed to do so by Oracle Support Services.
`atomic_refresh`	If this parameter is set to `true`, then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to `false`, then each of the materialized views is refreshed in a separate transaction.
`nested`	If `true`, then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REFRESH_ALL_MVIEWS Procedure

This procedure refreshes all materialized views that have the following properties:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
   number_of_failures     OUT   BINARY_INTEGER,
   method                 IN    VARCHAR2         := NULL,
   rollback_seg           IN    VARCHAR2         := NULL,
   refresh_after_errors   IN    BOOLEAN          := false,
   atomic_refresh         IN    BOOLEAN          := true);
```

Parameters

Table 90–11 REFRESH_ALL_MVIEWS Procedure Parameters

Parameter	Description
number_of_ failures	Returns the number of failures that occurred during processing
method	A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_ errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.

REFRESH_DEPENDENT Procedures

This procedure refreshes all materialized views that have the following properties:

- The materialized view depends on a master table or master materialized view in the list of specified masters.
- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view DBA_MVIEWS.

This procedure is intended for use with data warehouses.

Syntax

```
DBMS_MVIEW.REFRESH_DEPENDENT (
   number_of_failures     OUT    BINARY_INTEGER,
   { list                 IN     VARCHAR2,
   | tab                  IN     DBMS_UTILITY.UNCL_ARRAY,}
   method                 IN     VARCHAR2    := NULL,
   rollback_seg           IN     VARCHAR2    := NULL,
   refresh_after_errors   IN     BOOLEAN     := false,
   atomic_refresh         IN     BOOLEAN     := true,
   nested                 IN     BOOLEAN     := false);
```

Note: This procedure is overloaded. The list and tab parameters are mutually exclusive.

Parameters

Table 90–12 REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
number_of_ failures	Returns the number of failures that occurred during processing
list | tab	Comma-delimited list of master tables or master materialized views on which materialized views can depend. (Synonyms are not supported.) These tables and the materialized views that depend on them can be located in different schemas. However, all of the tables and materialized views must be in your local database. Alternatively, you may pass in a PL/SQL index-by table of type DBMS_ UTILITY.UNCL_ARRAY, where each element is the name of a table.

Table 90–12 (Cont.) REFRESH_DEPENDENT Procedure Parameters

Parameter	Description
method	A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a particular table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables. If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus: `DBMS_MVIEW.REFRESH_DEPENDENT ('employees,deptartments,hr.regions','cf');` performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table.
rollback_seg	Name of the materialized view site rollback segment to use while refreshing materialized views
refresh_after_errors	If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.
atomic_refresh	If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the refreshed materialized views is refreshed in a separate transaction.
nested	If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.

REGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (
   mviewowner  IN   VARCHAR2,
   mviewname   IN   VARCHAR2,
   mviewsite   IN   VARCHAR2,
   mview_id    IN   DATE | BINARY_INTEGER,
   flag        IN   BINARY_INTEGER,
   qry_txt     IN   VARCHAR2,
   rep_type    IN   BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

Parameters

Table 90–13 REGISTER_MVIEW Procedure Parameters

Parameter	Description
mviewowner	Owner of the materialized view.
mviewname	Name of the materialized view.
mviewsite	Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.
mview_id	The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE.
flag	A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_ROWID_MVIEW for a rowid materialized view DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW for a primary key materialized view DBMS_MVIEW.REG_OBJECT_ID_MVIEW for an object id materialized view DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW for a materialized view that can be fast refreshed DBMS_MVIEW.REG_UPDATABLE_MVIEW for a materialized view that is updatable A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter: DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW + DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW You can determine the properties of a materialized view by querying the ALL_MVIEWS data dictionary view.
qry_txt	The first 32,000 bytes of the materialized view definition query.

Table 90–13 (Cont.) REGISTER_MVIEW Procedure Parameters

Parameter	Description
rep_type	Version of the materialized view. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site ■ DBMS_MVIEW.REG_V8_SNAPSHOT if the materialized view is at an Oracle database version 8.x or higher site DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site

Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview_id, flag, and qry_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of mview_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.

UNREGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (
   mviewowner      IN   VARCHAR2,
   mviewname       IN   VARCHAR2,
   mviewsite       IN   VARCHAR2);
```

Parameters

Table 90–14 UNREGISTER_MVIEW Procedure Parameters

Parameters	Description
mviewowner	Owner of the materialized view
mviewname	Name of the materialized view
mviewsite	Name of the materialized view site

91

DBMS_NETWORK_ACL_ADMIN

The DBMS_NETWORK_ACL_ADMIN package provides the interface to administer the network Access Control List (ACL).

> **See Also:** For more information, see "Managing Fine-grained Access to External Network Services" in Oracle Database Security Guide

The chapter contains the following topics:

- Using DBMS_NETWORK_ACL_ADMIN
  - Examples
- Summary of DBMS_NETWORK_ACL_ADMIN Subprograms

Using DBMS_NETWORK_ACL_ADMIN

- Examples

Examples

Example1

Grant the connect and resolve privileges for host www.us.oracle.com to SCOTT.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(acl         => 'www.xml',
                                    description => 'WWW ACL',
                                    principal   => 'SCOTT',
                                    is_grant    => true,
                                    privilege   => 'connect');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(acl       => 'www.xml',
                                       principal => 'SCOTT',
                                       is_grant  => true,
                                       privilege => 'resolve');

  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(acl  => 'www.xml',
                                    host => 'www.us.oracle.com');
END;
/
COMMIT;
```

Example 2

Grant the resolve privilege for www.us.oracle.com to ADAMS. Since an ACL for www.us.oracle.com exists already, just add the privilege for ADAMS.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(acl       => 'www.xml',
                                       principal => 'ADAMS',
                                       is_grant  => true,
                                       privilege => 'resolve');
END;
/
COMMIT;
```

Example 3

Assign the ACL www.xml to www-proxy.us.oracle.com so that SCOTT and ADAMS can access www-proxy.us.oracle.com also.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(acl  => 'www.xml',
                                    host => 'www-proxy.us.oracle.com');
END;
/
COMMIT;
```

Example 4

Unassign the ACL from www.us.oracle.com so that no access to www.us.oracle.com is allowed.

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(host => 'www.us.oracle.com');
END;
/
COMMIT;
```

Example 5

The DOMAINS Function in the DBMS_NETWORK_ACL_UTLILITY package returns all the domains to which a host belongs. It can be used in conjunction with the CHECK_PRIVILEGE_ACLID Function in this package to determine the privilege assignments affecting a user's permission to access a network host. The function DOMAIN_LEVEL Function in the DBMS_NETWORK_ACL_UTILITY package returns the level of each domain and can be used to order the ACL assignments by their precedence.

For example, for SCOTT's permission to connect to www.us.oracle.com:

```
SELECT host, lower_port, upper_port, acl,
   DECODE(
       DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
          1, 'GRANTED', 0, 'DENIED', NULL) privilege
   FROM dba_network_acls
  WHERE host IN
    (SELECT * FROM
       TABLE(DBMS_NETWORK_ACL_UTILITY.DOMAINS('www.us.oracle.com')))
 ORDER BY DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) desc, lower_port,
                                          upper_port;

HOST                 LOWER_PORT UPPER_PORT         ACL          PRIVILEGE
-------------------- ---------- ---------- -------------------- ---------
www.us.oracle.com            80         80 /sys/acls/www.xml    GRANTED
www.us.oracle.com          3000       3999 /sys/acls/www.xml    GRANTED
www.us.oracle.com                          /sys/acls/www.xml    GRANTED
*.oracle.com                               /sys/acls/all.xml
*                                          /sys/acls/all.xml
```

Example 6

For example, for SCOTT's permission to do domain name resolution for www.us.oracle.com:

```
SELECT host, acl,
  DECODE(
       DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
         1, 'GRANTED', 0, 'DENIED', NULL) privilege
  FROM dba_network_acls
 WHERE host IN
   (SELECT * FROM
      TABLE(DBMS_NETWORK_ACL_UTILITY.DOMAINS('www.us.oracle.com'))) and
   lower_port IS NULL AND upper_port IS NULL
ORDER BY DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) desc;

HOST                          ACL          PRIVILEGE
-------------------- -------------------- ---------
www.us.oracle.com    /sys/acls/www.xml    GRANTED
*.oracle.com         /sys/acls/all.xml
*                    /sys/acls/all.xml
```

Note that the '`resolve`' privilege takes effect only in ACLs assigned without any port range (when `lower_port` and `upper_port` are `NULL`). For this reason, the example does not include `lower_port` and `upper_port` columns in the query.

Summary of DBMS_NETWORK_ACL_ADMIN Subprograms

Table 91–1 DBMS_NETWORK_ACL_ADMIN Package Subprograms

Subprogram	Description
ADD_PRIVILEGE Procedure on page 91-6	Adds a privilege to grant or deny the network access to the user in an access control list (ACL)
ASSIGN_ACL Procedure on page 91-8	Assigns an access control list (ACL) to a network host, and optionally specific to a TCP port range
ASSIGN_WALLET_ACL Procedure on page 91-10	Assigns an access control list (ACL) to a wallet
CHECK_PRIVILEGE Function on page 91-11	Checks if a privilege is granted to or denied from the user in an access control list (ACL)
CHECK_PRIVILEGE_ACLID Function on page 91-12	Checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list
CREATE_ACL Procedure on page 91-13	Creates an access control list (ACL) with an initial privilege setting
DELETE_PRIVILEGE Procedure on page 91-14	Deletes a privilege in an access control list (ACL)
DROP_ACL Procedure on page 91-15	Drops an access control list (ACL)
UNASSIGN_ACL Procedure on page 91-16	Unassigns the access control list (ACL) currently assigned to a network host
UNASSIGN_WALLET_ACL Procedure on page 91-17	Unassigns the access control list (ACL) currently assigned to a wallet

ADD_PRIVILEGE Procedure

This procedure adds a privilege to grant or deny the network access to the user. The access control entry (ACE) is created if it does not exist.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (
   acl             IN VARCHAR2,
   principal       IN VARCHAR2,
   is_grant        IN BOOLEAN,
   privilege       IN VARCHAR2,
   position        IN PLS_INTEGER DEFAULT NULL,
   start_date      IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL,
   end_date        IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL );
```

Parameters

Table 91–2 ADD_PRIVILEGE Function Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to "/sys/acls"
`principal`	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
`is_grant`	Network privilege to be granted or denied - `'connect | resolve'` (case sensitive). A database user needs the `connect` privilege to an external network host computer if he or she is connecting using the `UTL_TCP`, `UTL_HTTP`, `UTL_SMTP`, and `UTL_MAIL` utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the `UTL_INADDR` package, grant the database user the `resolve` privilege.
`privilege`	Network privilege to be granted or denied
`position`	Position (1-based) of the ACE. If a non-`NULL` value is given, the privilege will be added in a new ACE at the given position and there should not be another ACE for the principal with the same `is_grant` (grant or deny). If a `NULL` value is given, the privilege will be added to the ACE matching the principal and the `is_grant` if one exists, or to the end of the ACL if the matching ACE does not exist.
`start_date`	Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date. The `start_date` will be ignored if the privilege is added to an existing ACE.
`end_state`	End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The `end_date` must be greater than or equal to the `start_date`. The `end_date` will be ignored if the privilege is added to an existing ACE.

Usage Notes

To remove the permission, use the DELETE_PRIVILEGE Procedure.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
```

```
        acl         => 'us-oracle-com-permissions.xml',
        principal   => 'ST_USERS',
        is_grant    =>  TRUE,
        privilege   => 'connect')
END;
```

ASSIGN_ACL Procedure

This procedure assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL (
   acl         IN VARCHAR2,
   host        IN VARCHAR2,
   lower_port  IN PLS_INTEGER DEFAULT NULL,
   upper_port  IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 91–3 ASSIGN_ACL Function Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to "`/sys/acls`".
`host`	Host to which the ACL is to be assigned. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive.
`lower_port`	Lower bound of a TCP port range if not `NULL`
`upper_port`	Upper bound of a TCP port range. If `NULL`, lower_port is assumed.

Usage Notes

- Only one ACL can be assigned to any host computer, domain, or IP subnet, and if specified, the TCP port range. When you assign a new access control list to a network target, Oracle Database unassigns the previous access control list that was assigned to the same target. However, Oracle Database does not drop the access control list. You can drop the access control list by using the DROP_ACL Procedure. To remove an access control list assignment, use the UNASSIGN_ACL Procedure.
- The ACL assigned to a domain takes a lower precedence than the other ACLs assigned sub-domains, which take a lower precedence than the ACLs assigned to the individual hosts. So for a given host, for example, "www.us.oracle.com", the following domains are listed in decreasing precedences:

  - www.us.oracle.com
  - *.us.oracle.com
  - *.oracle.com
  - *.com
  - *

  In the same way, the ACL assigned to an subnet takes a lower precedence than the other ACLs assigned smaller subnets, which take a lower precedence than the ACLs assigned to the individual IP addresses. So for a given IP address, for example, "192.168.0.100", the following subnets are listed in decreasing precedences:

- 192.168.0.100

- 192.168.0.*

- 192.168.*

- 192.*

- *

- The port range is applicable only to the "connect" privilege assignments in the ACL. The "resolve" privilege assignments in an ACL have effects only when the ACL is assigned to a host without a port range.

  For the "connect" privilege assignments, an ACL assigned to the host without a port range takes a lower precedence than other ACLs assigned to the same host with a port range.

- When specifying a TCP port range, both `lower_port` and `upper_port` must not be `NULL` and `upper_port` must be greater than or equal to `lower_port`. The port range must not overlap with any other port ranges for the same host assigned already.

- To remove the assignment, use UNASSIGN_ACL Procedure.

Examples

```
BEGIN
   DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(
     acl         => 'us-oracle-com-permissions.xml',
     host        => '*.us.oracle.com',
     lower_port  => 80);
END;
```

ASSIGN_WALLET_ACL Procedure

This procedure assigns an access control list (ACL) to a wallet.

Syntax

```
UTL_HTTP.ASSIGN_WALLET_ACL (
   acl          IN  VARCHAR2,
   wallet_path  IN  VARCHAR2);
```

Parameters

Table 91–4 ASSIGN_WALLET_ACL Procedure Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to `"/sys/acls"`
`wallet_path`	Directory path of the wallet to which the ACL is to be assigned. The path is case-sensitive and of the format `file:`*`directory-path`*.

Usage Notes

To remove the assignment, use the UNASSIGN_WALLET_ACL Procedure.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl         => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-client-certificates');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
    acl         => 'wallet-acl.xml',
    principal   => 'SCOTT',
    is_grant    => TRUE,
    privilege   => 'use-passwords');

  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_ACL(
    acl         => 'wallet-acl.xml',
    wallet_path => 'file:/oracle/wallets/test_wallet');
END;
```

CHECK_PRIVILEGE Function

This function checks if a privilege is granted to or denied from the user in an ACL.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE (
   acl             IN VARCHAR2,
   user            IN VARCHAR2,
   privilege       IN VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 91–5 CHECK_PRIVILEGE Function Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
user	User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view.
privilege	Network privilege to check

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

Examples

```
SELECT DECODE(
  DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE(
       'us-oracle-com-permissions.xml', 'SCOTT', 'resolve'),
  1, 'GRANTED', 0, 'DENIED', NULL) PRIVILEGE
FROM DUAL;
```

CHECK_PRIVILEGE_ACLID Function

This function checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID (
   aclid           IN RAW,
   user            IN VARCHAR2 DEFAULT NULL)
   privilege       IN VARCHAR2,
 RETURN NUMBER;
```

Parameters

Table 91–6 CHECK_PRIVILEGE_ACLID Function Parameters

Parameter	Description
`aclid`	Object ID of the ACL
`user`	User to check against. If the user is `NULL`, the invoker is assumed. The username is case-sensitive as in the `USERNAME` column of the `ALL_USERS` view.
`privilege`	Network privilege to check

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; `NULL` when the privilege is neither granted or denied.

CREATE_ACL Procedure

This procedure creates an access control list (ACL) with an initial privilege setting. An ACL must have at least one privilege setting. The ACL has no access control effect unless it is assigned to the network target.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CREATE_ACL (
   acl             IN VARCHAR2,
   description     IN VARCHAR2,
   principal       IN VARCHAR2,
   is_grant        IN BOOLEAN,
   privilege       IN VARCHAR2,
   start_date      IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
   end_date        IN TIMESTAMP WITH TIMEZONE DEFAULT NULL );
```

Parameters

Table 91–7 CREATE_ACL Procedure Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".
description	Description attribute in the ACL
principal	Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.
is_grant	Privilege is granted or not (denied)
privilege	Network privilege to be granted or denied - 'connect | resolve' (case sensitive). A database user needs the connect privilege to an external network host computer if he or she is connecting using the UTL_TCP, UTL_HTTP, UTL_SMTP, and UTL_MAIL utility packages. To resolve a host name that was given a host IP address, or the IP address that was given a host name, with the UTL_INADDR package, grant the database user the resolve privilege.
start_date	Start date of the access control entry (ACE). When specified, the ACE is valid only on and after the specified date.
end_state	End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The end_date must be greater than or equal to the start_date.

Usage Notes

To drop the access control list, use the DROP_ACL Procedure.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
     acl          => 'us-oracle-com-permissions.xml',
     description  => 'Network permissions for *.us.oracle.com',
     principal    => 'SCOTT',
     is_grant     => TRUE,
     privilege    => 'connect');
END;
```

DELETE_PRIVILEGE Procedure

This procedure deletes a privilege in an access control list.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (
   acl           IN VARCHAR2,
   principal     IN VARCHAR2,
   is_grant      IN BOOLEAN DEFAULT NULL,
   privilege     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 91–8 DELETE_PRIVILEGE Function Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to "/sys/acls".
`principal`	Principal (database user or role) for whom all the ACE will be deleted
`is_grant`	Privilege is granted or not (denied). If a `NULL` value is given, the deletion is applicable to both granted or denied privileges.
`privilege`	Network privilege to be deleted. If a `NULL` value is given, the deletion is applicable to all privileges.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE(
        acl         => 'us-oracle-com-permissions.xml',
        principal   => 'ST_USERS')
END;
```

DROP_ACL Procedure

This procedure drops an access control list (ACL).

Syntax

```
DBMS_NETWORK_ACL_ADMIN.DROP_ACL (
   acl            IN VARCHAR2);
```

Parameters

Table 91–9 DROP_ACL Procedure Parameters

Parameter	Description
acl	Name of the ACL. Relative path will be relative to "/sys/acls".

Examples

```
BEGIN
   DBMS_NETWORK_ACL_ADMIN.DROP_ACL(
      acl => 'us-oracle-com-permissions.xml');
END;
```

UNASSIGN_ACL Procedure

This procedure unassigns the access control list (ACL) currently assigned to a network host.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL (
   acl         IN VARCHAR2 DEFAULT NULL,
   host        IN VARCHAR2 DEFAULT NULL,
   lower_port  IN PLS_INTEGER DEFAULT NULL,
   upper_port  IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 91–10 UNASSIGN_ACL Function Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to "/sys/acls". If ACL is `NULL`, any ACL assigned to the host is unassigned.
`host`	Host from which the ACL is to be removed. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. If host is `NULL`, the ACL will be unassigned from any host. If both `host` and `acl` are `NULL`, all ACLs assigned to any hosts are unassigned.
`lower_port`	Lower bound of a TCP port range if not `NULL`
`upper_port`	Upper bound of a TCP port range. If `NULL`, `lower_port` is assumed.

Examples

```
BEGIN
   DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(
     host        => '*.us.oracle.com',
     lower_port  => 80);
END;
```

UNASSIGN_WALLET_ACL Procedure

This procedure unassigns the access control list (ACL) currently assigned to a wallet.

Syntax

```
UTL_HTTP.UNASSIGN_WALLET_ACL (
   acl          IN  VARCHAR2 DEFAULT NULL,
   wallet_path  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 91–11 UNASSIGN_WALLET_ACL Procedure Parameters

Parameter	Description
`acl`	Name of the ACL. Relative path will be relative to `"/sys/acls"`. If `acl` is `NULL`, any ACL assigned to the wallet is unassigned
`wallet_path`	Directory path of the wallet to which the ACL is assigned. The path is case-sensitive and of the format `file:`*`directory-path`*. If both `acl` and `wallet_path` are `NULL`, all ACLs assigned to any wallets are unassigned.

Examples

```
BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_WALLET_ACL(
    acl         => 'wallet-acl.xml',
    wallet_path => 'file:/oracle/wallets/test_wallet');
END;
```

92

DBMS_NETWORK_ACL_UTILITY

The DBMS_NETWORK_ACL_UTILITY package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.

> **See Also:** For more information, see ""Managing Fine-grained Access to External Network Services"" in *Oracle Database Security Guide*

The chapter contains the following topics:

- Using DBMS_NETWORK_ACL_UTILITY
  - Examples
- Summary of DBMS_NETWORK_ACL_UTILITY Subprograms

Using DBMS_NETWORK_ACL_UTILITY

- Examples

Examples

The CONTAINS_HOST Function in this package indicates if a domain or subnet contains a given host or IP address. It can be used in conjunction with the CHECK_PRIVILEGE_ACLID Function in the DBMS_NETWORK_ACL_ADMIN package to determine the privilege assignments affecting a user's permission to access a network host. The return value of the CONTAINS_HOST Function in can also be used to order the ACL assignments by their precedence.

Example 1

For example, for SCOTT's permission to connect to www.hr.example.com:

```
  SELECT host, lower_port, upper_port, acl,
     DECODE(
         DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
            1, 'GRANTED', 0, 'DENIED', NULL) privilege
     FROM (SELECT host, acl, aclid, lower_port, upper_port,
                DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
                  precedence
           FROM dba_network_acls)
 WHERE precedence > 0
 ORDER BY precedence DESC, lower_port nulls LAST;

   HOST                 LOWER_PORT UPPER_PORT  ACL                  PRIVILEGE
   -------------------- ---------- ---------- -------------------- ---------
   www.hr.example.com           80         80  /sys/acls/www.xml    GRANTED
   www.hr.example.com         3000       3999  /sys/acls/www.xml    GRANTED
   www.hr.example.com                         /sys/acls/www.xml    GRANTED
   *.hr.example.com                           /sys/acls/all.xml
   *.example.com                              /sys/acls/all.xml
```

Example 2

For example, for SCOTT's permission to do domain name resolution for www.hr.example.com:

```
SELECT host, acl,
  DECODE(
    DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
      1, 'GRANTED', 0, 'DENIED', null) privilege
  FROM (SELECT host, acl, aclid,
               DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host)
                 precedence
          FROM dba_network_acls
         WHERE lower_port IS NULL AND upper_port IS NULL)
 WHERE precedence > 0
 ORDER BY precedence DESC;

HOST                 ACL                          PRIVILEGE
-------------------- ---------------------------- ---------
www.hr.example.com   /sys/acls/hr-www.xml         GRANTED
*.hr.example.com     /sys/acls/hr-domain.xml
*.example.com        /sys/acls/corp-domain.xml
```

Note that the "resolve" privilege takes effect only in ACLs assigned without any port range (when lower_port and upper_port are NULL). For this reason, the example does not include lower_port and upper_port columns in the query.

Summary of DBMS_NETWORK_ACL_UTILITY Subprograms

Table 92–1 DBMS_NETWORK_ACL_UTILITY Package Subprograms

Subprogram	Description
CONTAINS_HOST Function on page 92-5	Determines if the given host is equal to or contained in the given host, domain, or subnet
DOMAIN_LEVEL Function on page 92-6	Returns the domain level of the given host name, domain, or subnet
DOMAINS Function on page 92-7	For a given host, this function returns the domains whose ACL assigned is used to determine if a user has the privilege to access the given host or not.
EQUALS_HOST Function on page 92-8	Determines if the two given hosts, domains, or subnets are equal

CONTAINS_HOST Function

This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST (
   host      IN    VARCHAR2,
   domain    IN    VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 92–2 CONTAINS_HOST Function Parameters

Parameter	Description
host	Network host
domain	Network host, domain, or subnet

Return Values

Returns a non-NULL value if the given host is equal to or contained in the related host, domain, or subnet:

- If domain is a hostname, returns the level of its domain + 1
- If domain is a domain name, returns the domain level
- If domain is an IP address or subnet, return the number of significant address bits of the IP address or subnet
- If domain is the wildcard "*", returns 0

The non-NULL value returned indicates the precedence of the domain or subnet for ACL assignment. The higher the value, the higher is the precedence. NULL will be returned if the host is not equal to or contained in the given host, domain or subnet.

Examples

```
SELECT host, acl, precedence
  FROM (select host, acl,
               DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('192.0.2.3', host)
                 precedence
          FROM dba_network_acls)
 WHERE precedence > 0
 ORDER BY precedence DESC;

HOST                 ACL                         PRECEDENCE
-------------------- --------------------------- ----------
192.0.2.3            /sys/acls/hr-www.xml                32
::ffff:192.0.2.0/120 /sys/acls/hr-domain.xml             24
::ffff:192.0.0.0/104 /sys/acls/corp-domain.xml            8
```

DOMAIN_LEVEL Function

This function returns the domain level of the given host name, domain, or subnet.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL (
    host  IN VARCHAR2)
  RETURN NUMBER;
```

Parameters

Table 92–3 DOMAIN_LEVEL Function Parameters

Parameter	Description
host	Network host, domain, or subnet

Return Values

The domain level of the given host, domain, or subnet.

Usage Notes

Note that this function cannot handle IPv6 addresses and subnets, and subnets in CIDR notation.

Examples

```
SELECT host, acl, domain_level
  FROM (select host, acl,
               DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) domain_level
          FROM dba_network_acls)
 order by domain_level desc;

HOST                   ACL                           DOMAIN_LEVEL
---------------------- ----------------------------- ------------
www.hr.example.com     /sys/acls/hr-www.xml                     4
*.hr.example.com       /sys/acls/hr-domain.xml                  3
*.example.com          /sys/acls/corp-domain.xml                2
```

DOMAINS Function

For a given host, this function returns the domains whose ACL assigned determines if a user has the privilege to access the given host or not. When the IP address of the host is given, return the subnets instead.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.DOMAINS (
    host  IN VARCHAR2)
  RETURN DOMAIN_TABLE PIPELINED;
```

Parameters

Table 92–4 DOMAINS Function Parameters

Parameter	Description
host	Network host

Return Values

The domains or subnets for the given host.

Usage Notes

Note that this function cannot handle IPv6 addresses. Nor can it generate subnets of arbitrary number of prefix bits for an IPv4 address.

Examples

```
select * from table(dbms_network_acl_utility.domains('www.hr.example.com'));

DOMAINS
--------------------------
www.hr.example.com
*.hr.example.com
*.example.com
*.com
*
```

EQUALS_HOST Function

This function determines if the two given hosts, domains, or subnets are equal. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4- native address it represents. It does not perform domain name resolution when comparing the two hosts or domains.

Syntax

```
DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST (
   host1    IN    VARCHAR2,
   host2    IN    VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 92–5 EQUALS_HOST Function Parameters

Parameter	Description
host1	Network host, domain, or subnet to compare
host2	Network host, domain, or subnet to compare

Return Values

1 if the two hosts, domains, or subnets are equal. 0 otherwise.

Examples

```
SELECT host, acl
  FROM dba_network_acls
 WHERE DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST('192.0.2.*', host) = 1;

HOST                   ACL
---------------------- ----------------------------
::ffff:192.0.2.0/120   /sys/acls/hr-domain.xml
```

93

DBMS_OBFUSCATION_TOOLKIT

DBMS_OBFUSCATION_TOOLKIT enables an application to encrypt data using either the Data Encryption Standard (DES) or the Triple DES algorithms.

This chapter contains the following topics:

- Using DBMS_OBFUSCATION_TOOLKIT
  - Overview
  - Security Model
  - Operational Notes
- Summary of DBMS_OBFUSCATION Subprograms

Using DBMS_OBFUSCATION_TOOLKIT

- Overview
- Security Model
- Operational Notes

Overview

The Data Encryption Standard (DES), also known as the Data Encryption Algorithm (DEA) by the American National Standards Institute (ANSI) and DEA-1 by the International Standards Organization (ISO), has been a worldwide encryption standard for over 20 years. The banking industry has also adopted DES-based standards for transactions between private financial institutions, and between financial institutions and private individuals. DES will eventually be replaced by a new Advanced Encryption Standard (AES).

DES is a symmetric key cipher; that is, the same key is used to encrypt data as well as decrypt data. DES encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm ignores 8 bits of the 64-bit key that is supplied; however, you must supply a 64-bit key to the algorithm.

Triple DES (3DES) is a far stronger cipher than DES; the resulting ciphertext (encrypted data) is much harder to break using an exhaustive search: 2**112 or 2**168 attempts instead of 2**56 attempts. Triple DES is also not as vulnerable to certain types of cryptanalysis as is DES.

Security Model

Oracle installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed. The package also grants access to the `PUBLIC` role so no explicit grant needs to be done.

Operational Notes

- Key Management
- Storing the Key in the Database
- Storing the Key in the Operating System
- User-Supplied Keys

Key Management

Key management, including both generation and secure storage of cryptographic keys, is one of the most important aspects of encryption. If keys are poorly chosen or stored improperly, then it is far easier for a malefactor to break the encryption. Rather than using an exhaustive key search attack (that is, cycling through all the possible keys in hopes of finding the correct decryption key), cryptanalysts typically seek weaknesses in the choice of keys, or the way in which keys are stored.

Key generation is an important aspect of encryption. Typically, keys are generated automatically through a random-number generator. Provided that the random number generation is cryptographically secure, this can be an acceptable form of key generation. However, if random numbers are not cryptographically secure, but have elements of predictability, the security of the encryption may be easily compromised.

The `DBMS_OBFUSCATION_TOOLKIT` package includes tools for generating random material that can be used for encryption keys, but it does not provide a mechanism for maintaining them. Care must be taken by the application developer to ensure the secure generation and storage of encryption keys used with this package. Furthermore, the encryption and decryption done by the `DBMS_OBFUSCATION_TOOLKIT` takes place on the server, not the client. If the key is passed over the connection between the client and the server, the connection must be protected by using network encryption. Otherwise, the key is vulnerable to capture over the wire. See *Oracle Database Advanced Security Administrator's Guide* for information about configuring and using network encryption for Oracle Net.

Key storage is one of the most important, yet difficult aspects of encryption and one of the hardest to manage properly. To recover data encrypted with a symmetric key, the key must be accessible to the application or user seeking to decrypt data. The key needs to be easy enough to retrieve that users can access encrypted data when they need to without significant performance degradation. The key also needs to be secure enough that it is not easily recoverable by unauthorized users trying to access encrypted data that they are not supposed to see.

The three options available are:

- Store the key in the database
- Store the key in the operating system
- Have the user manage the key

Storing the Key in the Database

Storing the keys in the database cannot always provide bullet-proof security if you are trying to protect data against the DBA accessing encrypted data (since an all-privileged DBA can access tables containing encryption keys), but it can provide security against the casual snooper, or against someone compromising the database files on the operating system. Furthermore, the security you can obtain by storing keys in the database does not have to be bullet-proof in order to be extremely useful.

For example, suppose you want to encrypt an employee's social security number, one of the columns in table EMP. You could encrypt each employee's SSN using a key which is stored in a separate column in EMP. However, anyone with SELECT access on the EMP table could retrieve the encryption key and decrypt the matching social security number. Alternatively, you could store the encryption keys in another table, and use a package to retrieve the correct key for the encrypted data item, based on a primary key-foreign key relationship between the tables.

You can envelope both the `DBMS_OBFUSCATION_TOOLKIT` package and the procedure to retrieve the encryption keys supplied to the package. Furthermore, the encryption key itself could be transformed in some way (for example, XORed with the foreign key to the EMP table) so that the key itself is not stored in easily recoverable form.

Oracle recommends using the wrap utility of PL/SQL to obfuscate the code within a PL/SQL package itself that does the encryption. That prevents people from breaking the encryption by looking at the PL/SQL code that handles keys, calls encrypting routines, and so on. In other words, use the wrap utility to obfuscate the PL/SQL packages themselves. This scheme is secure enough to prevent users with `SELECT` access to `EMP` from reading unencrypted sensitive data, and a DBA from easily retrieving encryption keys and using them to decrypt data in the `EMP` table. It can be made more secure by changing encryption keys regularly, or having a better key storage algorithm (so the keys themselves are encrypted, for example).

Storing the Key in the Operating System

Storing keys in a flat file in the operating system is another option. You can make callouts from PL/SQL, which you can use to retrieve encryption keys. If you store keys in a file and make callouts to retrieve the keys, the security of your encrypted data is only as secure as the protection of the key file on the operating system. Of course, a user retrieving keys from the operating system would have to be able to either access the Oracle database files (to decrypt encrypted data), or be able to gain access to the table in which the encrypted data is stored as a legitimate user.

User-Supplied Keys

If you ask a user to supply the key, it is crucial that you use network encryption, such as that provided by Oracle Advanced Security, so the key is not passed from client to server in the clear. The user must remember the key, or your data is not recoverable.

Summary of DBMS_OBFUSCATION Subprograms

Table 93–1 DBMS_OBFUSCATION Package Subprograms

Subprogram	Description
DES3DECRYPT Procedures and Functions on page 93-8	Generates the decrypted form of the input data
DES3ENCRYPT Procedures and Functions on page 93-10	Generates the encrypted form of the input data by passing it through the Triple DES encryption algorithm
DES3GETKEY Procedures and Functions on page 93-8	Takes a random value and uses it to generate an encryption key, using Triple DES
DESDECRYPT Procedures and Functions on page 93-13	Generates the decrypted form of the input data
DESENCRYPT Procedures and Functions on page 93-15	Generates the encrypted form of the input data
DESGETKEY Procedures and Functions on page 93-17	Takes a random value and uses it to generate an encryption key
MD5 Procedures and Functions on page 93-18	Generates MD5 hashes of data

DES3DECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

For a discussion of the initialization vector that you can use with this procedure, see the section, "DES3ENCRYPT Procedures and Functions" on page 93-10.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input             IN   RAW,
   key               IN   RAW,
   decrypted_data    OUT  RAW,
   which             IN   PLS_INTEGER  DEFAULT TwoKeyMode
   iv                IN   RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input_string      IN   VARCHAR2,
   key_string        IN   VARCHAR2,
   decrypted_string  OUT  VARCHAR2,
   which             IN   PLS_INTEGER  DEFAULT TwoKeyMode
   iv_string         IN   VARCHAR2     DEFAUTL NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input         IN  RAW,
   key           IN  RAW,
   which         IN  PLS_INTEGER DEFAULT TwoKeyMode
   iv            IN  RAW         DEFAULT NULL)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3DECRYPT(
   input_string  IN  VARCHAR2,
   key_string    IN  VARCHAR2,
   which         IN  PLS_INTEGER DEFAULT TwoKeyMode
   iv_string     IN  VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 93–2 DES3DECRYPT Parameters for Raw Data

Parameter	Description
`input`	Data to be decrypted
`key`	Decryption key
`decrypted_data`	Decrypted data
`which`	If = 0, (default), then TwoKeyMode is used. If = 1, then ThreeKeyMode is used.
`iv`	Initialization vector
`input_string`	String to be decrypted
`key_string`	Decryption key string
`decrypted_ string`	Decrypted string
`iv_string`	Initialization vector

Usage Notes

If the input data or key given to the DES3DECRYPT procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit."

If the input data given to the DES3DECRYPT procedure is not a multiple of 8 bytes, the procedure raises the error ORA-28232 "Invalid input size for Obfuscation toolkit." ORA-28233 is NOT applicable for the DES3DECRYPT function.

If the key length is missing or is less than 8 bytes, then the procedure raises the error ORA-28234 "Key length too short." Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the WHICH parameter, ORA-28236 "Invalid Triple DES mode" is generated. Only the values 0 (TwoKeyMode) and 1 (ThreeKeyMode) are valid.

Restrictions

You must supply a single key of either 128 bits for a 2-key implementation (of which only 112 are used), or a single key of 192 bits for a 3-key implementation (of which 168 bits are used). Oracle automatically truncates the supplied key into 56-bit lengths for decryption. This key length is fixed and cannot be altered.

Note: Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3ENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data by passing it through the Triple DES (3DES) encryption algorithm.

Oracle's implementation of 3DES supports either a 2-key or 3-key implementation, in outer cipher-block-chaining (CBC) mode.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input           IN     RAW,
   key             IN     RAW,
   encrypted_data  OUT    RAW,
   which           IN     PLS_INTEGER  DEFAULT TwoKeyMode
   iv              IN     RAW          DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input_string      IN     VARCHAR2,
   key_string        IN     VARCHAR2,
   encrypted_string  OUT    VARCHAR2,
   which             IN     PLS_INTEGER  DEFAULT TwoKeyMode
   iv_string         IN     VARCHAR2     DEFAULT NULL);

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input        IN RAW,
   key          IN RAW,
   which        IN PLS_INTEGER DEFAULT TwoKeyMode
   iv           IN RAW         DEFAULT NULL)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3Encrypt(
   input_string  IN VARCHAR2,
   key_string    IN VARCHAR2,
   which         IN PLS_INTEGER DEFAULT TwoKeyMode
   iv_string     IN VARCHAR2    DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 93–3 DES3ENCRYPT Parameters Procedure and Function

Parameter	Description
`input`	Data to be encrypted.
`key`	Encryption key.
`encrypted_data`	Encrypted data.
`which`	If = 0, (default), then `TwoKeyMode` is used. If = 1, then `ThreeKeyMode` is used.
iv	Initialization vector.
`input_string`	String to be encrypted.
`key_string`	Encryption key string.
`encrypted_ string`	Encrypted string.
iv_string	Initialization vector.

Usage Notes

If you are using Oracle's 3DES interface with a 2-key implementation, you must supply a single key of 128 bits as an argument to the DES3ENCRYPT procedure. With a 3-key implementation, you must supply a single key of 192 bits. Oracle then breaks the supplied key into two 64-bit keys. As with DES, the 3DES algorithm throws away 8 bits of each derived key. However, you must supply a single 128-bit key for the 2-key 3DES implementation or a single 192-bit key for the 3-key 3DES implementation; otherwise the package will raise an error. The DES3ENCRYPT procedure uses the 2-key implementation by default.

You also have the option of providing an *initialization vector* (IV) with the DES3ENCRYPT procedure. An IV is a block of random data prepended to the data you intend to encrypt. The IV has no meaning. It is there to make each message unique. Prepending an IV to your input data avoids starting encrypted blocks of data with common header information, which may give cryptanalysts information they can use to decrypt your data.

If the input data or key given to the PL/SQL DES3ENCRYPT procedure is empty, then the procedure raises the error `ORA-28231 "Invalid input to Obfuscation toolkit."`

If the input data given to the DES3ENCRYPT procedure is not a multiple of 8 bytes, the procedure raises the error `ORA-28232 "Invalid input size for Obfuscation toolkit."`

If you try to double encrypt data using the DES3ENCRYPT procedure, then the procedure raises the error `ORA-28233 "Double encryption not supported."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

If an incorrect value is specified for the `which` parameter, `ORA-28236 "Invalid Triple DES mode"` is generated. Only the values 0 (`TwoKeyMode`) and 1 (`ThreeKeyMode`) are valid.

Restrictions

The DES3ENCRYPT procedure has two restrictions. The first is that the DES key length for encryption is fixed at 128 bits (for 2-key DES) or 192 bits (for 3-key DES); you cannot alter these key lengths.

The second is that you cannot execute multiple passes of encryption using 3DES. (Note: the 3DES algorithm itself encrypts data multiple times; however, you cannot call the DES3ENCRYPT function itself more than once to encrypt the same data using 3DES.)

> **Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DES3GETKEY Procedures and Functions

These subprograms take a random value and uses it to generate an encryption key. For Triple DES, you specify the mode so that the returned key has the proper length.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which        IN   PLS_INTEGER DEFAULT TwoKeyMode,
   seed         IN   RAW,
   key          OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which        IN   PLS_INTEGER DEFAULT TwoKeyMode,
   seed_string  IN   VARCHAR2,
   key          OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which  IN  PLS_INTEGER DEFAULT TwoKeyMode,
   seed   IN  RAW)
 RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DES3GetKey(
   which        IN  PLS_INTEGER DEFAULT TwoKeyMode,
   seed_string  IN  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 93–4 DES3GETKEY Procedure and Function Parameters

Parameter	Description
`which`	If = 0, (default), then `TwoKeyMode` is used. If = 1, then `ThreeKeyMode` is used.
`seed`	A value at least 80 characters long.
`key`	Encryption key.
`seed_string`	A value at least 80 characters long.
`key`	Encryption key.

DESDECRYPT Procedures and Functions

These subprograms generate the decrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input             IN   RAW,
   key               IN   RAW,
   decrypted_data    OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input_string      IN   VARCHAR2,
   key_string        IN   VARCHAR2,
   decrypted_string  OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input            IN  RAW,
   key              IN  RAW)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESDecrypt(
   input_string     IN  VARCHAR2,
   key_string       IN  VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 93–5 DESDECRYPT Procedure and Function Parameters

Parameter	Description
`input`	Data to be decrypted.
`key`	Decryption key.
`decrypted_data`	Decrypted data.
`input_string`	String to be decrypted.
`key_string`	Decryption key string.
`decrypted_string`	Decrypted string.

Usage Notes

If the input data or key given to the PL/SQL `DESDECRYPT` function is empty, then Oracle raises `ORA error 28231 "Invalid input to Obfuscation toolkit."`

If the input data given to the `DESDECRYPT` function is not a multiple of 8 bytes, Oracle raises `ORA error 28232 "Invalid input size for Obfuscation toolkit."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

> **Note:** `ORA-28233` is not applicable to the `DESDECRYPT` function.

Restrictions

The DES key length for encryption is fixed at 64 bits (of which 56 bits are used); you cannot alter this key length.

Note: The key length limitation is a requirement of U.S. regulations governing the export of cryptographic products.

DESENCRYPT Procedures and Functions

These subprograms generate the encrypted form of the input data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input            IN    RAW,
   key              IN    RAW,
   encrypted_data   OUT   RAW);

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input_string     IN    VARCHAR2,
   key_string       IN    VARCHAR2,
   encrypted_string OUT   VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input         IN  RAW,
   key           IN  RAW)
  RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESEncrypt(
   input_string  IN  VARCHAR2,
   key_string    IN  VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 93–6 DESENCRYPT Procedure and Function Parameters

Parameter	Description
`input`	Data to be encrypted.
`key`	Encryption key.
`encrypted_data`	Encrypted data.
`input_string`	String to be encrypted.
`key_string`	Encryption key string.
`encrypted_string`	Encrypted string.

Usage Notes

The DES algorithm encrypts data in 64-bit blocks using a 56-bit key. The DES algorithm throws away 8 bits of the supplied key (the particular bits which are thrown away is beyond the scope of this documentation). However, when using the algorithm, you must supply a 64-bit key or the package will raise an error.

If the input data or key given to the PL/SQL DESEncrypt procedure is empty, then the procedure raises the error ORA-28231 "Invalid input to Obfuscation toolkit".

If the input data given to the `DESENCRYPT` procedure is not a multiple of 8 bytes, the procedure raises the error `ORA-28232 "Invalid input size for Obfuscation toolkit."`

If you try to double-encrypt data using the `DESENCRYPT` procedure, then the procedure raises the error `ORA-28233 "Double encryption not supported."`

If the key length is missing or is less than 8 bytes, then the procedure raises the error `ORA-28234 "Key length too short."` Note that if larger keys are used, extra bytes are ignored. So a 9-byte key will not generate an exception.

Restrictions

The `DESENCRYPT` procedure has the following restrictions:

- The DES key length for encryption is fixed at 56 bits; you cannot alter this key length.
- You cannot execute multiple passes of encryption. That is, you cannot re-encrypt previously encrypted data by calling the function twice.

> **Note:** Both the key length limitation and the prevention of multiple encryption passes are requirements of U.S. regulations governing the export of cryptographic products.

DESGETKEY Procedures and Functions

These subprograms take a random value and use it to generate an encryption key.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed         IN   RAW,
   key          OUT  RAW);

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed_string  IN   VARCHAR2,
   key          OUT  VARCHAR2);

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed IN RAW)
 RETURN RAW;

DBMS_OBFUSCATION_TOOLKIT.DESGetKey(
   seed_string IN VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 93–7 DESGETKEY Procedure and Function Parameters

Parameter	Description
`seed`	A value at least 80 characters long.
`key`	Encryption key.
`seed_string`	A value at least 80 characters long.
`key`	Encryption key.

MD5 Procedures and Functions

These subprograms generate MD5 hashes of data. The MD5 algorithm ensures data integrity by generating a 128-bit cryptographic message digest value from given data.

Syntax

```
DBMS_OBFUSCATION_TOOLKIT.MD5(
   input            IN   RAW,
   checksum         OUT  raw_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5(
   input_string     IN   VARCHAR2,
   checksum_string  OUT  varchar2_checksum);

DBMS_OBFUSCATION_TOOLKIT.MD5(
   input         IN  RAW)
  RETURN raw_checksum;

DBMS_OBFUSCATION_TOOLKIT.MD5(
   input_string  IN  VARCHAR2)
  RETURN varchar2_checksum;
```

Parameters

Table 93–8 MD5 Procedure and Function Parameters

Parameter Name	Description
`input`	Data to be hashed
`checksum`	128-bit cryptographic message digest
`input_string`	String to be hashed
`checksum_ string`	128-bit cryptographic message digest

94

DBMS_ODCI

`DBMS_ODCI` package contains a single user function related to the use of Data Cartridges.

See Also:

- *Oracle Database Data Cartridge Developer's Guide*

This chapter contains the following topic:

- Summary of DBMS_ODCI Subprograms

Summary of DBMS_ODCI Subprograms

Table 94–1 DBMS_ODCI Package Subprograms

Subprogram	Description
ESTIMATE_CPU_UNITS Function on page 94-3	Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds)

ESTIMATE_CPU_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, ESTIMATE_CPU_UNITS considers the speed of a single processor.

Syntax

```
DBMS_ODCI.ESTIMATE_CPU_UNITS(
   elapsed_time     NUMBER)
  RETURN NUMBER;
```

Parameters

Parameter	Description
elapsed_time	The elapsed time in seconds that it takes to execute a function.

Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by ESTIMATE_CPU_UNITS; multiply the number returned by ESTIMATE_CPU_UNITS by 1,000.

95

DBMS_OFFLINE_OG

The `DBMS_OFFLINE_OG` package contains the public interface for offline instantiation of master groups.

This chapter contains the following topics:

- Documentation of DBMS_OFFLINE_OG

Documentation of DBMS_OFFLINE_OG

For a complete description of this package within the context of Replication, see DBMS_OFFLINE_OG in the *Oracle Database Advanced Replication Management API Reference*.

96

DBMS_OUTLN

The DBMS_OUTLN package, synonymous with OUTLN_PKG, contains the functional interface for subprograms associated with the management of stored outlines.

> **See Also:** For more information about using the DBMS_OUTLN package, see "Using Plan Stability" in *Oracle Database Performance Tuning Guide*.

Note: Stored outlines will be desupported in a future release in favor of SQL plan management. In Oracle Database 11g Release 1 (11.1), stored outlines continue to function as in past releases. However, Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines.

If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the LOAD_PLANS_FROM_CURSOR_CACHE Functions or LOAD_PLANS_FROM_SQLSET Function of the DBMS_SPM package. When the migration is complete, you should disable or remove the stored outlines.

This chapter contains the following topics:

- Using DBMS_OUTLN
  - Overview
  - Security Model
- Summary of DBMS_OUTLN Subprograms

Using DBMS_OUTLN

- Overview
- Security Model

Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline.The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Stored outlines will be de-supported in a future release in favor of SQL plan management. As of 11g R1, stored outlines continue to function as in past releases, but Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines.

If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the LOAD_PLANS_FROM_CURSOR_CACHE Functions or the LOAD_PLANS_FROM_SQLSET Function of the DBMS_SPM package. When the migration is complete, you should disable or remove the stored outlines.

Security Model

DBMS_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

Summary of DBMS_OUTLN Subprograms

Table 96–1 DBMS_OUTLN Package Subprograms

Subprogram	Description
CLEAR_USED Procedure on page 96-6	Clears the outline 'used' flag
CREATE_OUTLINE Procedure on page 96-7	Generates outlines from the shared cursor identified by hash value and child number
DROP_BY_CAT Procedure on page 96-8	Drops outlines that belong to a specified category
DROP_UNUSED Procedure on page 96-9	Drops outlines that have never been applied in the compilation of a SQL statement
EXACT_TEXT_SIGNATURES Procedure on page 96-10	Updates outline signatures to those that compute based on exact text matching
UPDATE_BY_CAT Procedure on page 96-11	Changes the category of outlines in one category to a new category
UPDATE_SIGNATURES Procedure on page 96-12	Updates outline signatures to the current version's signature

CLEAR_USED Procedure

This procedure clears the outline 'used' flag.

Syntax

```
DBMS_OUTLN.CLEAR_USED (
   name     IN     VARCHAR2);
```

Parameters

Table 96–2 CLEAR_USED Procedure Parameters

Parameter	Description
name	Name of the outline.

CREATE_OUTLINE Procedure

This procedure generates an outline by reparsing the SQL statement from the shared cursor identified by hash value and child number.

Syntax

```
DBMS_OUTLN.CREATE_OUTLINE (
   hash_value    IN NUMBER,
   child_number  IN NUMBER,
   category      IN VARCHAR2 DEFAULT 'DEFAULT');
```

Parameters

Table 96–3 CREATE_OUTLINE Procedure Parameters

Parameter	Description
`hash_value`	Hash value identifying the target shared cursor.
`child_number`	Child number of the target shared cursor.
`category`	Category in which to create outline (optional).

DROP_BY_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the DEFAULT category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

Syntax

```
DBMS_OUTLN.DROP_BY_CAT (
   cat VARCHAR2);
```

Parameters

Table 96–4 DROP_BY_CAT Procedure Parameters

Parameter	Description
cat	Category of outlines to drop.

Usage Notes

This procedure purges a category of outlines in a single call.

Examples

This example drops all outlines in the DEFAULT category:

```
DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
```

DROP_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

Syntax

```
DBMS_OUTLN.DROP_UNUSED;
```

Usage Notes

You can use `DROP_UNUSED` for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

EXACT_TEXT_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

Syntax

```
DBMS.OUTLN.EXACT_TEXT_SIGNATURES;
```

Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

UPDATE_BY_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

Syntax

```
DBMS.OUTLN.UPDATE_BY_CAT (
   oldcat    VARCHAR2 default 'DEFAULT',
   newcat    VARCHAR2 default 'DEFAULT');
```

Parameters

Table 96–5 UPDATE_BY_CAT Procedure Parameters

Parameter	Description
`oldcat`	The current category of outlines.
`newcat`	The new category of outlines.

UPDATE_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

Syntax

```
DBMS.OUTLN.UPDATE_SIGNATURES;
```

Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.

97

DBMS_OUTPUT

The DBMS_OUTPUT package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

- Using DBMS_OUTPUT
  - Overview
  - Security Model
  - Operational Notes
  - Exceptions
  - Rules and Limits
  - Examples
- Data Structures
  - TABLE Types
  - OBJECT Types
- Summary of DBMS_OUTPUT Subprograms

Using DBMS_OUTPUT

This section contains topics which relate to using the `DBMS_OUTPUT` package.

- Overview
- Security Model
- Operational Notes
- Exceptions
- Rules and Limits
- Examples

Overview

The package is typically used for debugging, or for displaying messages and reports to SQL*DBA or SQL*Plus (such as are produced by applying the SQL command `DESCRIBE` to procedures).

The PUT Procedure and PUT_LINE Procedure in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the GET_LINE Procedure and GET_LINES Procedure.

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

Security Model

The `dbmsotpt.sql` script must be run as user `SYS`. This creates the public synonym `DBMS_OUTPUT`, and `EXECUTE` permission on this package is granted to `public`.

Operational Notes

- If you do not call `GET_LINE`, or if you do not display the messages on your screen in SQL*Plus, the buffered messages are ignored.
- SQL*Plus calls `GET_LINES` after issuing a SQL statement or anonymous PL/SQL calls.
- Typing `SET SERVEROUTPUT ON` in SQL*Plus has the effect of invoking

  ```
  DBMS_OUTPUT.ENABLE (buffer_size => NULL);
  ```

  with no limit on the output.
- You should generally avoid having application code invoke either the DISABLE Procedure or ENABLE Procedure because this could subvert the attempt of an external tool like SQL*Plus to control whether or not to display output.

Note: Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

Exceptions

DBMS_OUTPUT subprograms raise the application error ORA-20000, and the output procedures can return the following errors:

Table 97–1 DBMS_OUTPUT Errors

Error	Description
ORU-10027:	Buffer overflow
ORU-10028:	Line length overflow

Rules and Limits

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

Examples

Example 1: Using a Trigger to Produce Output

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```
DBMS_OUTPUT.PUT_LINE('I got here:'||:new.col||' is the new value');
```

If you have enabled the DBMS_OUTPUT package, then the text produced by this PUT_LINE would be buffered, and you could, after executing the statement (presumably some INSERT, DELETE, or UPDATE that caused the trigger to fire), retrieve the line of information. For example:

```
BEGIN
   DBMS_OUTPUT.GET_LINE(:buffer, :status);
END;
```

You could then optionally display the buffer on the screen. You repeat calls to GET_LINE until status comes back as nonzero. For better performance, you should use calls to GET_LINES Procedure which can return an array of lines.

Example 2: Debugging Stored Procedures and Triggers

The DBMS_OUTPUT package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in "Example 3: Retrieving Information About an Object" on page 97-9.

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the PUT_LINE procedure:

```
CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
   CURSOR emp_cursor IS
      SELECT sal, comm FROM emp WHERE deptno = dnum;
   total_wages    NUMBER(11, 2) := 0;
   counter        NUMBER(10) := 1;
BEGIN

   FOR emp_record IN emp_cursor LOOP
      emp_record.comm := NVL(emp_record.comm, 0);
      total_wages := total_wages + emp_record.sal
         + emp_record.comm;
      DBMS_OUTPUT.PUT_LINE('Loop number = ' || counter ||
         '; Wages = '|| TO_CHAR(total_wages));    /* Debug line */
      counter := counter + 1; /* Increment debug counter */
   END LOOP;
   /* Debug line */
   DBMS_OUTPUT.PUT_LINE('Total wages = ' ||
     TO_CHAR(total_wages));
   RETURN total_wages;

END dept_salary;
```

Assume the EMP table contains the following rows:

```
EMPNO          SAL     COMM     DEPT
-----        ------- -------- -------
1002           1500      500      20
1203           1000               30
1289           1000               10
```

```
1347          1000      250      20
```

Assume the user executes the following statements in SQL*Plus:

```
SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);
```

The user would then see the following information displayed in the output pane:

```
Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
Total wages = 3250

PL/SQL procedure successfully executed.
```

Example 3: Retrieving Information About an Object

In this example, the user has used the EXPLAIN PLAN command to retrieve information about the execution plan for a statement and has stored it in PLAN_TABLE. The user has also assigned a statement ID to this statement. The example EXPLAIN_OUT procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```
 /*****************************************************************/
/* Create EXPLAIN_OUT procedure. User must pass STATEMENT_ID to */
/* to procedure, to uniquely identify statement.                 */
/*****************************************************************/
CREATE OR REPLACE PROCEDURE explain_out
   (statement_id IN VARCHAR2) AS

   -- Retrieve information from PLAN_TABLE into cursor EXPLAIN_ROWS.

   CURSOR explain_rows IS
      SELECT level, id, position, operation, options,
         object_name
      FROM plan_table
      WHERE statement_id = explain_out.statement_id
      CONNECT BY PRIOR id = parent_id
         AND statement_id = explain_out.statement_id
      START WITH id = 0
       ORDER BY id;

BEGIN

   -- Loop through information retrieved from PLAN_TABLE:

   FOR line IN explain_rows LOOP

      -- At start of output, include heading with estimated cost.

      IF line.id = 0 THEN
         DBMS_OUTPUT.PUT_LINE ('Plan for statement '
            || statement_id
            || ', estimated cost = ' || line.position);
      END IF;

      -- Output formatted information. LEVEL determines indention level.

      DBMS_OUTPUT.PUT_LINE (lpad(' ',2*(line.level-1)) ||
```

```
            line.operation || ' ' || line.options || ' ' ||
            line.object_name);
      END LOOP;

END;
```

See Also: Chapter 220, "UTL_FILE"

Data Structures

The DBMS_OUTPUT package declares 2 collection types for use with the GET_LINES Procedure.

TABLE Types

CHARARR Table Type

OBJECT Types

DBMSOUTPUT_LINESARRAY Object Type

CHARARR Table Type

This package type is to be used with the GET_LINES Procedure to obtain text submitted through the PUT Procedure and PUT_LINE Procedure.

Syntax

```
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

DBMSOUTPUT_LINESARRAY Object Type

This package type is to be used with the GET_LINES Procedure to obtain text submitted through the PUT Procedure and PUT_LINE Procedure.

Syntax

```
TYPE DBMSOUTPUT_LINESARRAY IS
     VARRAY(2147483647) OF VARCHAR2(32767);
```

Summary of DBMS_OUTPUT Subprograms

Table 97–2 DBMS_OUTPUT Package Subprograms

Subprogram	Description
DISABLE Procedure on page 97-15	Disables message output
ENABLE Procedure on page 97-16	Enables message output
GET_LINE Procedure on page 97-17	Retrieves one line from buffer
GET_LINES Procedure on page 97-18	Retrieves an array of lines from buffer
NEW_LINE Procedure on page 97-19	Terminates a line created with `PUT`
PUT Procedure on page 97-20	Places a line in the buffer
PUT_LINE Procedure on page 97-21	Places partial line in buffer

Note: The PUT Procedure that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

DISABLE Procedure

This procedure disables calls to `PUT`, `PUT_LINE`, `NEW_LINE`, `GET_LINE`, and `GET_LINES`, and purges the buffer of any remaining information.

As with the ENABLE Procedure, you do not need to call this procedure if you are using the `SERVEROUTPUT` option of SQL*Plus.

Syntax

```
DBMS_OUTPUT.DISABLE;
```

Pragmas

```
pragma restrict_references(disable,WNDS,RNDS);
```

ENABLE Procedure

This procedure enables calls to PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. Calls to these procedures are ignored if the DBMS_OUTPUT package is not activated.

Syntax

```
DBMS_OUTPUT.ENABLE (
   buffer_size IN INTEGER DEFAULT 20000);
```

Pragmas

```
pragma restrict_references(enable,WNDS,RNDS);
```

Parameters

Table 97–3 ENABLE Procedure Parameters

Parameter	Description
buffer_size	Upper limit, in bytes, the amount of buffered information. Setting buffer_size to NULL specifies that there should be no limit.

Usage Notes

- It is not necessary to call this procedure when you use the SET SERVEROUTPUT option of SQL*Plus.
- If there are multiple calls to ENABLE, then buffer_size is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies buffer_size (NOT NULL).
- NULL is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

GET_LINE Procedure

This procedure retrieves a single line of buffered information.

Syntax

```
DBMS_OUTPUT.GET_LINE (
   line    OUT VARCHAR2,
   status  OUT INTEGER);
```

Parameters

Table 97–4 GET_LINE Procedure Parameters

Parameter	Description
line	Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as VARCHAR2 (32767) to avoid the risk of "ORA-06502: PL/SQL: numeric or value error: character string buffer too small".
status	If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET_LINE or GET_LINES, any lines not retrieved before the next call to PUT, PUT_LINE, or NEW_LINE are discarded to avoid confusing them with the next message.

GET_LINES Procedure

This procedure retrieves an array of lines from the buffer.

Syntax

```
DBMS_OUTPUT.GET_LINES (
   lines       OUT     CHARARR,
   numlines    IN OUT  INTEGER);

DBMS_OUTPUT.GET_LINES (
   lines       OUT     DBMSOUTPUT_LINESARRAY,
   numlines    IN OUT INTEGER);
```

Parameters

Table 97–5 GET_LINES Procedure Parameters

Parameter	Description
`lines`	Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the `VARRAY` overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block.
`numlines`	Number of lines you want to retrieve from the buffer. After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer.

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the `GET_LINE` procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the `GET_LINES` procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special `SET SERVEROUTPUT ON` command.
- After calling `GET_LINE` or `GET_LINES`, any lines not retrieved before the next call to `PUT`, `PUT_LINE`, or `NEW_LINE` are discarded to avoid confusing them with the next message.

NEW_LINE Procedure

This procedure puts an end-of-line marker. The GET_LINE Procedure and the GET_LINES Procedure return "lines" as delimited by "newlines". Every call to the PUT_LINE Procedure or NEW_LINE Procedure generates a line that is returned by `GET_LINE(S)`.

Syntax

```
DBMS_OUTPUT.NEW_LINE;
```

PUT Procedure

This procedure places a partial line in the buffer.

> **Note:** The PUT procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT (
    item IN VARCHAR2);
```

Parameters

Table 97–6 PUT Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 97–7 PUT Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceed the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

  For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```

PUT_LINE Procedure

This procedure places a line in the buffer.

> **Note:** The PUT_LINE procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

```
DBMS_OUTPUT.PUT_LINE (
   item IN VARCHAR2);
```

Parameters

Table 97–8 PUT_LINE Procedure Parameters

Parameter	Description
item	Item to buffer.

Exceptions

Table 97–9 PUT_LINE Procedure Exceptions

Error	Description
ORA-20000, ORU-10027:	Buffer overflow, limit of <buf_limit> bytes.
ORA-20000, ORU-10028:	Line length overflow, limit of 32767 bytes for each line.

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.
- If your lines exceeds the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

  For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program. For example:

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
   2 DBMS_OUTPUT.PUT_LINE ('hello');
   3 DBMS_LOCK.SLEEP (10);
   4 END;
```

DBMS_PARALLEL_EXECUTE

The `DBMS_PARALLEL_EXECUTE` package enables the user to incrementally update table data in parallel.

- Summary of DBMS_PARALLEL_EXECUTE Subprograms

Using DBMS_PARALLEL_EXECUTE

- Overview
- Security Model
- Constants
- Views
- Exceptions
- Examples

Overview

This package enables the user to incrementally update table data in parallel, in two high level steps:

1. Group sets of rows in the table into smaller sized chunks.
2. Run a user specified statement on these chunks in parallel, and commit when finished processing each chunk.

This package introduces the notion of *parallel execution task*. This task groups the various steps associated with the parallel execution of a PL/SQL block, which is typically updating table data.

All of the package subroutines (except the GENERATE_TASK_NAME Function and the TASK_STATUS Procedure) perform a commit.

Security Model

DBMS_PARALLEL_EXECUTE is a SYS-owned package which is granted to PUBLIC.

Any user can create or operate his own parallel execution tasks and access the USER view.

Users who have the ADM_PARALLEL_EXECUTE_TASK role can perform administrative routines (qualified by the prefix ADM_) and access the DBA view.

Apart from the administrative routines, all the subprograms refer to tasks owned by the current user.

To execute chunks in parallel, the user must have CREATE JOB system privilege.

The CHUNK_BY_SQL, RUN_TASK, and RESUME_TASK subprograms require a query, and are executed using DBMS_SQL. Invokers of the DBMS_SQL interface must ensure that none of the queries passed-in contains SQL injection.

Constants

The DBMS_PARALLEL_EXECUTE package uses the constants shown in following tables:

- Table 98–1, " DBMS_PARALLEL_EXECUTE Constants - Chunk Status Value"
- Table 98–2, " DBMS_PARALLEL_EXECUTE Constants - Task Status Value"

Table 98–1 DBMS_PARALLEL_EXECUTE Constants - Chunk Status Value

Constant	Type	Value	Description
ASSIGNED	NUMBER	1	Chunk has been assigned for processing
PROCESSED	NUMBER	2	Chunk has been processed successfully
PROCESSED_WITH_ERROR	NUMBER	3	Chunk has been processed, but an error occurred during processing
UNASSIGNED	NUMBER	0	Chunk is unassigned

Table 98–2 DBMS_PARALLEL_EXECUTE Constants - Task Status Value

Constant	Type	Value	Description
CHUNKED	NUMBER	4	Table associated with the task has been chunked, but none of the chunk has been assigned for processing
CHUNKING	NUMBER	2	Table associated with the task is being chunked
CHUNKING_FAILED	NUMBER	3	Chunking failed
CRASHED	NUMBER	8	Only applicable if parallel execution is used, this occurs if a job slave crashes or if the database crashes during EXECUTE, leaving a chunk in ASSIGNED or UNASSIGNED state.
CREATED	NUMBER	1	The task has been created by the CREATE_TASK Procedure
FINISHED	NUMBER	6	All chunks processed without error
FINISHED_WITH_ERROR	NUMBER	7	All chunks processed, but with errors in some cases
PROCESSING	NUMBER	5	Part of the chunk assigned for processing, or which has been processed

Views

The DBMS_PARALLEL_EXECUTE package uses views listed in the *Oracle Database Reference*:

- DBA_PARALLEL_EXECUTE_CHUNKS
- DBA_PARALLEL_EXECUTE_TASKS
- USER_PARALLEL_EXECUTE_CHUNKS
- USER_PARALLEL_EXECUTE_TASKS

Exceptions

The following table lists the exceptions raised by DBMS_PARALLEL_EXECUTE.

Table 98–3 Exceptions Raised by DBMS_PARALLEL_EXECUTE

Exception	Error Code	Description
CHUNK_NOT_FOUND	29499	Specified chunk does not exist
DUPLICATE_TASK_NAME	29497	Same task name has been used by an existing task
INVALID_STATE_FOR_CHUNK	29492	Attempts to chunk a table that is not in CREATED or CHUNKING_FAILED state
INVALID_STATE_FOR_REDSUME	29495	Attempts to resume execution, but the task is not in FINISHED_WITH_ERROR or CRASHED state
INVALID_STATE_FOR_RUN	29494	Attempts to execute the task that is not in CHUNKED state
INVALID_STATUS	29493	Attempts to set an invalid value to the chunk status
INVALID_TABLE	29491	Attempts to chunk a table by rowid in cases in which the table is not a physical table, or the table is an IOT
MISSING_ROLE	29490	User does not have the necessary ADM_PARALLEL_EXECUTE role
TASK_NOT_FOUND	29498	Specified task_name does not exist

Examples

The following examples run on the Human Resources (HR) schema of the Oracle Database Sample Schemas. It requires that the HR schema be created with the `JOB SYSTEM` privilege.

Chunk by ROWID

This example shows the most common usage of this package. After calling the RUN_TASK Procedure, it checks for errors and re-runs in the case of error.

```
DECLARE
  l_sql_stmt VARCHAR2(1000);
  l_try NUMBER;
  l_status NUMBER;
BEGIN

  -- Create the TASK
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

  -- Chunk the table by ROWID
  DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true,
100);

  -- Execute the DML in parallel
  l_sql_stmt := 'update /*+ ROWID (dda) */ EMPLOYEES e
      SET e.salary = e.salary + 10
      WHERE rowid BETWEEN :start_id AND :end_id';
  DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
                                 parallel_level => 10);

  -- If there is an error, RESUME it for at most 2 times.
  L_try := 0;
  L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
  WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
  LOOP
    L_try := l_try + 1;
    DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
    L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
  END LOOP;

  -- Done with processing; drop the task
  DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

END;
/
```

Chunk by User-Provided SQL

A user can specify their own chunk algorithm by using the CREATE_CHUNKS_BY_SQL Procedure. This example shows that rows with the same `manager_id` are grouped together and processed in one chunk.

```
DECLARE
  l_chunk_sql VARCHAR2(1000);
  l_sql_stmt VARCHAR2(1000);
  l_try NUMBER;
  l_status NUMBER;
BEGIN
```

```
  -- Create the TASK
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

  -- Chunk the table by MANAGER_ID
  l_chunk_sql := 'SELECT distinct manager_id, manager_id FROM employees';
  DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL('mytask', l_chunk_sql, false);

  -- Execute the DML in parallel
  --   the WHERE clause contain a condition on manager_id, which is the chunk
  --   column. In this case, grouping rows is by manager_id.
  l_sql_stmt := 'update /*+ ROWID (dda) */ EMPLOYEES e
      SET e.salary = e.salary + 10
      WHERE manager_id between :start_id and :end_id';
  DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
                                 parallel_level => 10);

  -- If there is error, RESUME it for at most 2 times.
  L_try := 0;
  L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
  WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
  Loop
    L_try := l_try + 1;
    DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
    L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
  END LOOP;

  -- Done with processing; drop the task
  DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

end;
/
```

Executing Chunks in an User-defined Framework

The user can execute chunks in his own defined framework without using the RUN_TASK Procedure. This example shows how to use GET_ROWID_CHUNK Procedure, EXECUTE IMMEDIATE, SET_CHUNK_STATUS Procedure to execute the chunks.

```
DECLARE
  l_sql_stmt varchar2(1000);
  l_try number;
  l_status number;
  l_chunk_id number;
  l_start_rowid rowid;
  l_end_rowid rowid;
  l_any_rows boolean;
  CURSOR c1 IS SELECT chunk_id
               FROM user_parallel_execute_chunks
               WHERE task_name = 'mytask'
                 AND STATUS IN (DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR,
                                DBMS_PARALLEL_EXECUTE.ASSIGNED);
BEGIN

  -- Create the Objects, task, and chunk by ROWID
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');
  DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true,
100);

  l_sql_stmt := 'update /*+ ROWID (dda) */ EMPLOYEES e
      SET e.salary = e.salary + 10
      WHERE rowid BETWEEN :start_id AND :end_id';
```

```
-- Execute the DML in his own framework
--
-- Process each chunk and commit.
-- After processing one chunk, repeat this process until
-- all the chunks are processed.
--
<<main_processing>>
LOOP
    --
    -- Get a chunk to process; if there is nothing to process, then exit the
    -- loop;
    --
    DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK('mytask',
                                                        l_chunk_id,
                                                        l_start_rowid,
                                                        l_end_rowid,
                                                        l_any_rows);
    IF (l_any_rows = false) THEN EXIT; END IF;

    --
    -- The chunk is specified by start_id and end_id.
    -- Bind the start_id and end_id and then execute it
    --
    -- If no error occured, set the chunk status to PROCESSED.
    --
    -- Catch any exception. If an exception occured, store the error num/msg
    -- into the chunk table and then continue to process the next chunk.
    --
    BEGIN
      EXECUTE IMMEDIATE l_sql_stmt using l_start_rowid, l_end_rowid;
      DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS('mytask',l_chunk_id,
        DBMS_PARALLEL_EXECUTE.PROCESSED);
    EXCEPTION WHEN OTHERS THEN
      DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS('mytask', l_chunk_id,
        DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR, SQLCODE, SQLERRM);
    END;

    --
    -- Finished processing one chunk; Commit here
    --
    COMMIT;
END LOOP;
```

Summary of DBMS_PARALLEL_EXECUTE Subprograms

Table 98–4 DBMS_PARALLEL_EXECUTE Package Subprograms

Subprogram	Description
ADM_DROP_CHUNKS Procedure on page 98-12	Drops all chunks of the specified task owned by the specified owner
ADM_DROP_TASK Procedure on page 98-13	Drops the task of the given user and all related chunks
ADM_TASK_STATUS Procedure on page 98-14	Returns the task status
ADM_STOP_TASK Procedure on page 98-15	Stops the task of the given owner and related job slaves
CREATE_TASK Procedure on page 98-16	Creates a task for the current user
CREATE_CHUNKS_BY_NUMBER_COL Procedure on page 98-17	Chunks the table associated with the given task by the specified column.
CREATE_CHUNKS_BY_ROWID Procedure on page 98-18	Chunks the table associated with the given task by `ROWID`
CREATE_CHUNKS_BY_SQL Procedure on page 98-19	Chunks the table associated with the given task by means of a user-provided `SELECT` statement
DROP_TASK Procedure on page 98-20	Drops the task and all related chunks
DROP_CHUNKS Procedure on page 98-21	Drops the task's chunks
GENERATE_TASK_NAME Function on page 98-22	Returns a unique name for a task
GET_NUMBER_COL_CHUNK Procedure on page 98-23	Picks an unassigned `NUMBER` chunk and changes it to `ASSIGNED`
GET_ROWID_CHUNK Procedure on page 98-24	Picks an unassigned `ROWID` chunk and changes it to `ASSIGNED`
PURGE_PROCESSED_CHUNKS Procedure on page 98-25	Deletes all the processed chunks whose status is `PROCESSED` or `PROCESSED_WITH_ERROR`
RESUME_TASK Procedures on page 98-26	Retries the given the task if the RUN_TASK Procedure finished with error, or resumes the task if a crash has occurred.
RUN_TASK Procedure on page 98-28	Executes the specified SQL statement on the chunks in parallel
SET_CHUNK_STATUS Procedure on page 98-30	Sets the status of the chunk
STOP_TASK Procedure on page 98-31	Stops the task and related job slaves
TASK_STATUS Procedure on page 98-32	Returns the task status

ADM_DROP_CHUNKS Procedure

This procedure drops all chunks of the specified task owned by the specified owner.

Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_CHUNKS (
   task_owner      IN  VARCHAR2,
   task_name       IN  VARCHAR2);
```

Parameters

Table 98–5 ADM_DROP_CHUNKS Procedure Parameters

Parameter	Description
`task_owner`	Owner of the task
`task_name`	Name of the task

ADM_DROP_TASK Procedure

This procedure drops the task of the specified user and all related chunks.

Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_DROP_TASK (
   task_owner      IN  VARCHAR2,
   task_name       IN  VARCHAR2);
```

Parameters

Table 98–6 ADM_DROP_TASK Procedure Parameters

Parameter	Description
`task_owner`	Owner of the task
`task_name`	Name of the task

ADM_TASK_STATUS Procedure

This function returns the task status.

Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_TASK_STATUS  (
   task_owner      IN  VARCHAR2,
   task_name       IN  VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 98–7 ADM_TASK_STATUS Function Parameters

Parameter	Description
`task_owner`	Owner of the task
`task_name`	Name of the task

ADM_STOP_TASK Procedure

This procedure stops the task of the specified owner and related job slaves.

Syntax

```
DBMS_PARALLEL_EXECUTE.ADM_STOP_TASK (
   task_owner      IN  VARCHAR2,
   task_name       IN  VARCHAR2);
```

Parameters

Table 98–8 ADM_STOP_TASK Procedure Parameters

Parameter	Description
`task_owner`	Owner of the task
`task_name`	Name of the task

CREATE_TASK Procedure

This procedure creates a task for the current user. The pairing of `task_name` and `current_user` must be unique.

Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_TASK (
   task_name        IN   VARCHAR2,
   comment          IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 98–9 CREATE_TASK Procedure Parameters

Parameter	Description
`task_name`	Name of the task. The task_name can be any string in which related length must be less than or equal to 128 bytes.
`comment`	Comment field. The comment must be less than 4000 bytes.

CREATE_CHUNKS_BY_NUMBER_COL Procedure

This procedure chunks the table (associated with the specified task) by the specified column. The specified column must be a NUMBER column. This procedure takes the MIN and MAX value of the column, and then divide the range evenly according to chunk_size. The chunks are:

```
START_ID                          END_ID
--------------------------        --------------------------
min_id_val                        min_id_val+1*chunk_size-1
min_id_val+1*chunk_size           min_id_val+2*chunk_size-1
…                                 …
min_id_val+i*chunk_size           max_id_val
```

Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_NUMBER_COL (
   task_name       IN  VARCHAR2,
   table_owner     IN  VARCHAR2,
   table_name      IN  VARCHAR2,
   table_column    IN  VARCHAR2,
   chunk_size      IN  NUMBER);
```

Parameters

Table 98–10 CREATE_CHUNKS_BY_NUMBER_COL Procedure Parameters

Parameter	Description
task_name	Name of the task
table_owner	Owner of the table
table_name	Name of the table
table_column	Name of the NUMBER column
chunk_size	Range of each chunk

CREATE_CHUNKS_BY_ROWID Procedure

This procedure chunks the table (associated with the specified task) by ROWID. num_row and num_block are approximate guidance for the size of each chunk. The table to be chunked must be a physical table with physical ROWID having views and table functions. Index Organized Tables are not allowed.

Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID (
   task_name       IN  VARCHAR2,
   table_owner     IN  VARCHAR2,
   table_name      IN  VARCHAR2,
   by_rows         IN  BOOLEAN,
   chunk_size      IN  NUMBER);
```

Parameters

Table 98–11 CREATE_CHUNKS_BY_ROWID Procedure Parameters

Parameter	Description
task_name	Name of the task
table_owner	Owner of the table
table_name	Name of the table
by_rows	TRUE if chunk_size refers to the number of rows, otherwise, chunk_size refers to the number of blocks
chunk_size	Approximate number of rows/blocks to process for each commit cycle

CREATE_CHUNKS_BY_SQL Procedure

This procedure chunks the table (associated with the specified task) by means of a user-provided SELECT statement. The select statement which returns the range of each chunk must have two columns: start_id and end_id. If task is to chunk by ROWID, then the two columns must be of ROWID type. If the task is to chunk the table by NUMBER column, then the two columns must be of NUMBER type. The procedure provides the flexibility to users who want to deploy user-defined chunk algorithms.

Syntax

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL (
   task_name       IN  VARCHAR2,
   sql_statement   IN  CLOB,
   by_rowid        IN  BOOLEAN);
```

Parameters

Table 98–12 CREATE_CHUNKS_BY_SQL Procedure Parameters

Parameter	Description
task_name	Name of the task
sql_statment	SQL which returns the chunk ranges
by_rowid	TRUE if the table is chunked by rowids

DROP_TASK Procedure

This procedure drops the task and all related chunks.

Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_TASK (
   task_name       IN VARCHAR2);
```

Parameters

Table 98–13 DROP_TASK Procedure Parameters

Parameter	Description
task_name	Name of the task

DROP_CHUNKS Procedure

This procedure drops the task's chunks.

Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_CHUNKS (
   task_name       IN VARCHAR2);
```

Parameters

Table 98–14 DROP_CHUNKS Procedure Parameters

Parameter	Description
`task_name`	Name of the task

GENERATE_TASK_NAME Function

This function returns a unique name for a task. The name is of the form *prefix*N where N is a number from a sequence. If no prefix is specified, the generated name is, by default, be `TASK$_1`, `TASK$_2`, `TASK$_3`, and so on. If '`SCOTT`' is specified as the prefix, the name is `SCOTT1`, `SCOTT2`, and so on.

Syntax

```
DBMS_PARALLEL_EXECUTE.GENERATE_TASK_NAME (
   prefix      IN      VARCHAR2 DEFAULT 'TASK$_')
 RETURN VARCHAR2;
```

Parameters

Table 98–15 GENERATE_TASK_NAME Function Parameters

Parameter	Description
`prefix`	The prefix to use when generating the task name

GET_NUMBER_COL_CHUNK Procedure

This procedure picks an unassigned NUMBER chunk and changes it to ASSIGNED. If there are no more chunks to assign, any_rows is set to FALSE. Otherwise, the chunk_id, start and end_id of the chunk is returned as OUT parameters. The chunk info in DBMS_PARALLEL_EXECUTE_CHUNKS$ is updated as follows: STATUS becomes ASSIGNED; START_TIMESTAMP records the current time; END_TIMESTAMP is cleared.

See Also: Views on page 98-6

Syntax

```
DBMS_PARALLEL_EXECUTE.GET_NUMBER_COL_CHUNK (
   task_name       IN VARCHAR2,
   chunk_id        OUT NUMBER,
   start_rowid     OUT ROWID,
   end_id          OUT ROWID,
   any_rows        OUT BOOLEAN);
```

Parameters

Table 98–16 GET_NUMBER_COL_CHUNK Procedure Parameters

Parameter	Description
task_name	Name of the task
chunk_id	Chunk_id of the chunk
start_rowid	Start rowid in the returned range
end_id	End rowid in the returned range
any_rows	Indicating if there could be any rows to process in the range

Usage Notes

If the task is chunked by ROWID, then get_rowid_range should be used. If the task is chunked by NUMBER column, then get_number_col_range should be used. If the user makes the wrong function call, the returning chunk_id and any_rows has a valid value but start/end_(row)id is NULL.

GET_ROWID_CHUNK Procedure

This procedure picks an unassigned ROWID chunk and changes it to ASSIGNED. If there are no more chunks to assign, any_rows is set to FALSE. Otherwise, the chunk_id, start and end_id of the chunk is returned as OUT parameters. The chunk info in DBMS_PARALLEL_EXECUTE_CHUNKS$ is updated as follows: STATUS becomes ASSIGNED; START_TIMESTAMP records the current time; END_TIMESTAMP is cleared.

See Also: Views on page 98-6

Syntax

```
DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK (
   task_name       IN VARCHAR2,
   chunk_id        OUT NUMBER,
   start_rowid     OUT ROWID,
   end_id          OUT ROWID,
   any_rows        OUT BOOLEAN);
```

Parameters

Table 98–17 GET_ROWID_CHUNK Procedure Parameters

Parameter	Description
task_name	Name of the task
chunk_id	Chunk_id of the chunk
start_rowid	Start rowid in the returned range
end_id	End rowid in the returned range
any_rows	Indicating if there could be any rows to process in the range

Usage Notes

If the task is chunked by ROWID, then get_rowid_range should be used. If the task is chunked by NUMBER column, then get_number_col_range should be used. If the user makes the wrong function call, the returning chunk_id and any_rows still have valid value but start/end_(row)id is NULL.

PURGE_PROCESSED_CHUNKS Procedure

This procedure deletes all the processed chunks whose status is `PROCESSED` or `PROCESSED_WITH_ERROR`.

Syntax

```
DBMS_PARALLEL_EXECUTE.PURGE_PROCESSED_CHUNKS (
   task_name       IN VARCHAR2);
```

Parameters

Table 98–18 PURGE_PROCESSED_CHUNKS Procedure Parameters

Parameter	Description
`task_name`	Name of the task

RESUME_TASK Procedures

This procedure retries the specified the task if the RUN_TASK Procedure finished with error, or resumes the task if a crash has occurred.

The user can only invoke this procedure if the task is in a `CRASHED` or `FINISHED_WITH_ERROR` state. For a crashed serial execution, the state remains in processing. The `FORCE` option allows user to resume any task in `PROCESSING` state. However, it is the user's responsibility to determine that a crash has occurred.

The procedure resumes processing the chunks which have not been processed. Also, chunks which are in `PROCESSED_WITH_ERROR` or `ASSIGNED` (due to crash) state are processed because those chunks did not commit.

This procedure takes the same argument as the RUN_TASK Procedure.

The overload which takes `task_name` as the only input argument re-uses the arguments provided in the previous invoking of the RUN_TASK Procedure or RESUME_TASK Procedures.

> **See Also:** Table 98–2, " DBMS_PARALLEL_EXECUTE Constants - Task Status Value" on page 98-5

Syntax

```
DBMS_PARALLEL_EXECUTE.RESUME_TASK (
   task_name                    IN  VARCHAR2,
   sql_stmt                     IN  CLOB,
   language_flag                IN  NUMBER,
   edition                      IN  VARCHAR2  DEFAULT NULL,
   apply_crossedition_trigger   IN  VARCHAR2  DEFAULT NULL,
   fire_apply_trigger           IN  BOOLEAN   DEFAULT TRUE,
   parallel_level               IN  NUMBER    DEFAULT 0,
   job_class                    IN  VARCHAR2  DEFAULT 'DEFAULT_JOB_CLASS',
   force                        IN  BOOLEAN   DEFAULT FALSE);

DBMS_PARALLEL_EXECUTE.RESUME_TASK (
   task_name                    IN  VARCHAR2,
   force                        IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 98–19 RESUME_TASK Procedure Parameters

Parameter	Description
`task_name`	Name of the task
`sql_stmt`	SQL statement; must have `:start_id` and `:end_id` placeholder
`language_flag`	Determines how Oracle handles the SQL statement. The following options are recognized: ▪ `V6` (or 0) specifies version 6 behavior ▪ `NATIVE` (or 1) specifies normal behavior for the database to which the program is connected ▪ `V7` (or 2) specifies Oracle database version 7 behavior
`edition`	Specifies the edition to run the statement in. Default is the current edition.

Table 98–19 (Cont.) RESUME_TASK Procedure Parameters

Parameter	Description
apply_crossedition_trigger	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user who executes the statement.
fire_apply_trigger	Indicates whether the specified apply_crossedition_trigger is itself to be executed, or should only be a guide used in selecting other triggers
parallel_level	Number of parallel jobs; zero if run in serial; NULL uses the default parallelism
job_class	If running in parallel, the jobs all belong to the specified job class
force	If TRUE, do not raise an error if the status is PROCESSING.

Examples

Suppose the chunk table contains the following chunk ranges:

```
START_ID                        END_ID
--------------------------      --------------------------
1                               10
11                              20
21                              30
```

And the specified SQL statement is:

```
UPDATE employees
      SET salary = salary + 10
      WHERE e.employee_id  BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
      SET salary =.salary + 10  WHERE employee_id BETWEEN 1 and 10;
      COMMIT;

UPDATE employees
      SET salary =.salary + 10  WHERE employee_id between 11 and 20;
      COMMIT;

UPDATE employees
      SET salary =.salary + 10  WHERE employee_id between 21 and 30;
      COMMIT;
```

RUN_TASK Procedure

This procedure executes the specified statement (sql_stmt) on the chunks in parallel. It commits after processing each chunk. The specified statement must have two placeholders called start_id, and end_id respectively, which represent the range of the chunk to be processed. The types of the placeholder must be rowid where ROWID based chunking was used, or NUMBER where number based chunking was used. The specified statement should not commit unless it is idempotent.

The SQL statement is executed as the current user.

If apply_crossedition_trigger is specified, DBMS_CROSSEDITION_TRIGGER.IS_APPLYING returns true for the sessions executing the SQL. Therefore, for parallel execution, DBMS_CROSSEDITION_TRIGGER.IS_APPLYING returns true in the Job slaves session.

Chunks can be executed in parallel by DBMS_SCHEDULER Job slaves. Therefore, parallel execution requires CREATE JOB system privilege. The Job slaves is created under the current user. The default number of Job slaves is computed as the product of Oracle parameters cpu_count and parallel_threads_per_cpu. On a Real Application Clusters installation, the number of Job slaves is the sum of individual settings on each node in the cluster. This procedure returns only when all the chunks are processed. In parallel cases, this procedure returns only when all the Job slaves finished.

Syntax

```
DBMS_PARALLEL_EXECUTE.RUN_TASK (
   task_name                      IN  VARCHAR2,
   sql_stmt                       IN  CLOB,
   language_flag                  IN  NUMBER,
   edition                        IN  VARCHAR2  DEFAULT NULL,
   apply_crossedition_trigger     IN  VARCHAR2  DEFAULT NULL,
   fire_apply_trigger             IN  BOOLEAN   DEFAULT TRUE,
   parallel_level                 IN  NUMBER    DEFAULT 0,
   job_class                      IN  VARCHAR2  DEFAULT 'DEFAULT_JOB_CLASS');
```

Parameters

Table 98–20 RUN_TASK Procedure Parameters

Parameter	Description
task_name	Name of the task
sql_stmt	SQL statement; must have :start_id and :end_id placeholder
language_flag	Determines how Oracle handles the SQL statement. The following options are recognized: ■ V6 (or 0) specifies version 6 behavior ■ NATIVE (or 1) specifies normal behavior for the database to which the program is connected ■ V7 (or 2) specifies Oracle database version 7 behavior
edition	Specifies the edition to run the statement in. Default is the current edition.

Table 98–20 (Cont.) RUN_TASK Procedure Parameters

Parameter	Description
apply_crossedition_trigger	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user executes the statement.
fire_apply_trigger	Indicates whether the specified apply_crossedition_trigger is itself to be executed, or should only be a guide used in selecting other triggers.
parallel_level	Number of parallel jobs; zero if run in serial; NULL uses the default parallelism.\
job_class	If running in parallel, the jobs belong to the specified job class

Examples

Suppose the chunk table contains the following chunk ranges:

```
START_ID                          END_ID
--------------------------        --------------------------
1                                 10
11                                20
21                                30
```

And the specified SQL statement is:

```
UPDATE employees
      SET salary = salary + 10
      WHERE e.employee_id  BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
      SET salary =.salary + 10  WHERE employee_id BETWEEN 1 and 10;
      COMMIT;

UPDATE employees
      SET salary =.salary + 10  WHERE employee_id between 11 and 20;
      COMMIT;

UPDATE employees
      SET salary =.salary + 10  WHERE employee_id between 21 and 30;
      COMMIT;
```

SET_CHUNK_STATUS Procedure

This procedure sets the status of the chunk. The START_TIMESTAMP and END_TIMESTAMP of the chunk is updated according to the new status:

```
Value of the new Status              Side Effect
---------------------------          ---------------------------
UNASSIGNED                           START_TIMESTAMP and END_TIMESTAMP
                                     will be cleared
ASSIGNED                             START_TIMESTAMP will be the current time
                                     and END_TIMESTAMP will be cleared.
PROCESSED or PROCESSED_WITH_ERROR    The current time will be recorded
                                     in END_TIMESTAMP
```

See Also: Views on page 98-6

Syntax

```
DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS (
   task_name       IN VARCHAR2,
   chunk_id        OUT NUMBER,
   status          IN  NUMBER,
   err_num         IN  NUMBER   DEFAULT NULL,
   err_msg         IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 98–21 SET_CHUNK_STATUS Procedure Parameters

Parameter	Description
task_name	Name of the task
chunk_id	Chunk_id of the chunk
status	Status of the chunk: UNASSIGNED, ASSIGNED, PROCESSED PROCESSED_WITH_ERROR
err_num	Error code returned during the processing of the chunk
err_msg	Error message returned during the processing of the chunk

STOP_TASK Procedure

This procedure stops the task and related job slaves.

Syntax

```
DBMS_PARALLEL_EXECUTE.STOP_TASK (
   task_name       IN VARCHAR2);
```

Parameters

Table 98–22 STOP_TASK Procedure Parameters

Parameter	Description
`task_name`	Name of the task

TASK_STATUS Procedure

This function returns the task status.

Syntax

```
DBMS_PARALLEL_EXECUTE.TASK_STATUS (
   task_name       IN VARCHAR2);
```

Parameters

Table 98–23 TASK_STATUS Procedure Parameters

Parameter	Description
task_name	Name of the task

99

DBMS_PCLXUTIL

The DBMS_PCLXUTIL package provides intra-partition parallelism for creating partition-wise local indexes. DBMS_PCLXUTIL circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one slave process for each partition is used.

> **See Also:** There are several rules concerning partitions and indexes. For more information, see *Oracle Database Concepts* and *Oracle Database Administrator's Guide*.

This chapter contains the following topics:

- Using DBMS_PCLXUTIL
  - Overview
  - Security Model
  - Operational Notes
  - Rules and Limits
- Summary of DBMS_PCLXUTIL Subprograms

Using DBMS_PCLXUTIL

- Overview
- Security Model
- Operational Notes
- Rules and Limits

Overview

DBMS_PCLXUTIL uses the DBMS_JOB package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with DBMS_JOB), in combination with intra-partition parallelism using the parallel query slave processes.

DBMS_PCLXUTIL works with both range and range-hash composite partitioning.

The DBMS_PCLXUTIL package can be used during the following DBA tasks:

1. Local index creation

   The procedure BUILD_PART_INDEX assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the UNUSABLE option.

   ```
   CREATE INDEX <idx_name> on <tab_name>(...) local(...) unusable;
   ```

This causes the dictionary entries to be created without "building" the index itself, the time consuming part of creating an index. Now, invoking the procedure BUILD_PART_INDEX causes a concurrent build of local indexes with the specified degree of parallelism.

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

2. Local index maintenance

   By marking desired partitions usable or unusable, the BUILD_PART_INDEX procedure also enables selective rebuilding of local indexes. The force_opt parameter provides a way to override this and build local indexes for all partitions.

   ```
   ALTER INDEX <idx_name> local(...) unusable;
   ```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using force_opt = TRUE:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the DBMS_OUTPUT package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

Security Model

This utility can be run only as table owner, and not as any other user.

Operational Notes

DBMS_PCLXUTIL submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the INIT.ORA parameter JOB_QUEUE_PROCESSES correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

Rules and Limits

> **Note:** For range partitioning, the minimum compatibility mode is 8.0; for range-hash composite partitioning, the minimum compatibility mode is 8*i*.

Because DBMS_PCLXUTIL uses the DBMS_JOB package, you must be aware of the following limitations pertaining to DBMS_JOB:

- You must decide appropriate values for the job_queue_processes initialization parameter. Clearly, if the job processes are not started before calling BUILD_PART_INDEX(), then the package will not function properly. The background processes are specified by the following init.ora parameters:

  ```
  job_queue_processes=n   #the number of background processes = n
  ```

- Failure conditions are reported only in the trace files (a DBMS_JOB limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the j*.trc trace files.

Summary of DBMS_PCLXUTIL Subprograms

Table 99–1 DBMS_PCLXUTIL Package Subprograms

Subprogram	Description
BUILD_PART_INDEX Procedure on page 99-8	Provides intra-partition parallelism for creating partition-wise local indexes

BUILD_PART_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

Syntax

```
DBMS_PCLXUTIL.BUILD_PART_INDEX (
   jobs_per_batch  IN NUMBER   DEFAULT 1,
   procs_per_job   IN NUMBER   DEFAULT 1,
   tab_name        IN VARCHAR2 DEFAULT NULL,
   idx_name        IN VARCHAR2 DEFAULT NULL,
   force_opt       IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 99–2 BUILD_PART_INDEX Procedure Parameters

Parameter	Description
jobs_per_batch	The number of concurrent partition-wise "local index builds".
procs_per_job	The number of parallel query slaves to be utilized for each local index build (1 <= procs_per_job <= max_slaves).
tab_name	The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).
idx_name	The name given to the local index (an exception is raised if a local index is not created on the table tab_name).
force_opt	If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.

Usage Notes

This utility can be run only as table owner, and not as any other user.

Examples

Suppose a table PROJECT is created with two partitions PROJ001 and PROJ002, along with a local index IDX.

A call to the procedure BUILD_PART_INDEX(2,4,'PROJECT','IDX',TRUE) produces the following output:

```
SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);
Statement processed.
INFO: Job #21 created for partition PROJ002 with 4 slaves
INFO: Job #22 created for partition PROJ001 with 4 slaves
```

100

DBMS_PIPE

The `DBMS_PIPE` package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

This chapter contains the following topics:

- Using DBMS_PIPE
  - Overview
  - Security Model
  - Constants
  - Operational Notes
  - Exceptions
  - Examples
- Summary of DBMS_PIPE Subprograms

Using DBMS_PIPE

- Overview
- Security Model
- Constants
- Operational Notes
- Exceptions
- Examples

Overview

Pipe functionality has several potential applications:

- External service interface: You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without time out) at a later time. The service can be written in any of the 3GL languages that Oracle supports.
- Independent transactions: The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).
- Alerters (non-transactional): You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "`SELECT FOR UPDATE`" to make sure it read the correct data.
- Debugging: Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.
- Concentrator: This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.

Security Model

Security can be achieved by use of `GRANT EXECUTE` on the `DBMS_PIPE` package by creating a pipe using the `private` parameter in the `CREATE_PIPE` function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either Public Pipes or Private Pipes.

Constants

```
maxwait   constant integer := 86400000; /* 1000 days */
```

This is the maximum time to wait attempting to send or receive a message.

Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

> **Caution: Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.**

The operation of DBMS_PIPE is considered with regard to the following topics:

- Public Pipes
- Writing and Reading Pipes
- Private Pipes

Public Pipes

You may create a public pipe either implicitly or explicitly. For *implicit* public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an *explicit* public pipe by calling the `CREATE_PIPE` function with the `private` flag set to `FALSE`. You must deallocate explicitly-created pipes by calling the `REMOVE_PIPE` function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

Writing and Reading Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have `EXECUTE` permission on the `DBMS_PIPE` package, and they know the name of the public pipe. However, once buffered information is read by one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the `PACK_MESSAGE` procedure. This procedure adds the message to the session's local message buffer. The information in this buffer is sent by calling the `SEND_MESSAGE` function, designating the pipe name to be used to send the message. When `SEND_MESSAGE` is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the `RECEIVE_MESSAGE` function, designating the pipe name from which to receive the message. The process then calls the `UNPACK_MESSAGE` procedure to access each of the items in the message.

Private Pipes

You explicitly create a private pipe by calling the `CREATE_PIPE` function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the `REMOVE_PIPE` function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, CREATE_PIPE returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as SYSDBA

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to PACK_MESSAGE before calling SEND_MESSAGE. Similarly, you must call RECEIVE_MESSAGE to retrieve the message before accessing the items in the message by calling UNPACK_MESSAGE.

Exceptions

DBMS_PIPE package subprograms can return the following errors:

Table 100–1 DBMS_PIPE Errors

Error	Description
ORA-23321:	Pipename may not be null. This can be returned by the CREATE_PIPE function, or any subprogram that takes a pipe name as a parameter.
ORA-23322:	Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.

Examples

- Example 1: Debugging - PL/SQL
- Example 3: Execute System Commands
- Example 4: External Service Interface

Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status  NUMBER;
BEGIN
  DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
  DBMS_PIPE.PACK_MESSAGE(msg);
  status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
  IF status != 0 THEN
    raise_application_error(-20099, 'Debug error');
  END IF;
END debug;
```

Example 2: Debugging - Pro*C

The following Pro*C code receives messages from the PLSQL_DEBUG pipe in the previous example, and displays the messages. If the Pro*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```
#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
   VARCHAR username[20];
   int     status;
   int     msg_length;
   char    retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;

void sql_error();

main()
{

-- Prepare username:
   strcpy(username.arr, "SCOTT/TIGER");
   username.len = strlen(username.arr);

   EXEC SQL WHENEVER SQLERROR DO sql_error();
   EXEC SQL CONNECT :username;

   printf("connected\n");

-- Start an endless loop to look for and print messages on the pipe:
   FOR (;;)
```

```
   {
      EXEC SQL EXECUTE
         DECLARE
            len INTEGER;
            typ INTEGER;
            sta INTEGER;
            chr VARCHAR2(2000);
         BEGIN
            chr := '';
            sta := dbms_pipe.receive_message('plsql_debug');
            IF sta = 0 THEN
               DBMS_PIPE.UNPACK_MESSAGE(len);
               DBMS_PIPE.UNPACK_MESSAGE(chr);
            END IF;
            :status := sta;
            :retval := chr;
            IF len IS NOT NULL THEN
               :msg_length := len;
            ELSE
               :msg_length := 2000;
            END IF;
         END;
      END-EXEC;
      IF (status == 0)
         printf("\n%.*s\n", msg_length, retval);
      ELSE
         printf("abnormal status, value is %d\n", status);
   }
}

void sql_error()
{
   char msg[1024];
   int rlen, len;
   len = sizeof(msg);
   sqlglm(msg, &len, &rlen);
   printf("ORACLE ERROR\n");
   printf("%.*s\n", rlen, msg);
   exit(1);
}
```

Example 3: Execute System Commands

This example shows PL/SQL and Pro*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro*C program that is listening for them.

The Pro*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro*C program processes it, carrying out the required action, such as executing a UNIX command through the *system*() call or executing a SQL command using embedded SQL.

`DAEMON.SQL` is the source code for the PL/SQL package. This package contains procedures that use the `DBMS_PIPE` package to send and receive message to and from the Pro*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the `STOP` command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL*Plus or Enterprise Manager. For example:

```
SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');
```

On a UNIX system, this causes the Pro*C daemon to execute the command *system*("*ls -la*").

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL*Plus or Enterprise Manager session from which you call it.

The DAEMON.SQL also uses the DBMS_OUTPUT package to display the results. For this example to work, you must have execute privileges on this package.

DAEMON.SQL Example. This is the code for the PL/SQL DAEMON package:

```
CREATE OR REPLACE PACKAGE daemon AS
  FUNCTION execute_sql(command VARCHAR2,
                       timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
    RETURN NUMBER;

  PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/
CREATE OR REPLACE PACKAGE BODY daemon AS

  FUNCTION execute_system(command VARCHAR2,
                          timeout NUMBER DEFAULT 10)
  RETURN NUMBER IS

    status       NUMBER;
    result       VARCHAR2(20);
    command_code NUMBER;
    pipe_name    VARCHAR2(30);
  BEGIN
    pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

    DBMS_PIPE.PACK_MESSAGE('SYSTEM');
    DBMS_PIPE.PACK_MESSAGE(pipe_name);
    DBMS_PIPE.PACK_MESSAGE(command);
    status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20010,
        'Execute_system: Error while sending.  Status = ' ||
         status);
    END IF;

    status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
    IF status <> 0 THEN
      RAISE_APPLICATION_ERROR(-20011,
        'Execute_system: Error while receiving.
         Status = ' || status);
    END IF;

    DBMS_PIPE.UNPACK_MESSAGE(result);
    IF result <> 'done' THEN
```

```
    RAISE_APPLICATION_ERROR(-20012,
      'Execute_system: Done not received.');
  END IF;

  DBMS_PIPE.UNPACK_MESSAGE(command_code);
  DBMS_OUTPUT.PUT_LINE('System command executed.  result = ' ||
                       command_code);
  RETURN command_code;
END execute_system;

FUNCTION execute_sql(command VARCHAR2,
                     timeout NUMBER DEFAULT 10)
RETURN NUMBER IS

  status       NUMBER;
  result       VARCHAR2(20);
  command_code NUMBER;
  pipe_name    VARCHAR2(30);

BEGIN
  pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

  DBMS_PIPE.PACK_MESSAGE('SQL');
  DBMS_PIPE.PACK_MESSAGE(pipe_name);
  DBMS_PIPE.PACK_MESSAGE(command);
  status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20020,
      'Execute_sql: Error while sending.  Status = ' || status);
  END IF;

  status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);

  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20021,
      'execute_sql: Error while receiving.
       Status = ' || status);
  END IF;

  DBMS_PIPE.UNPACK_MESSAGE(result);
  IF result <> 'done' THEN
    RAISE_APPLICATION_ERROR(-20022,
      'execute_sql: done not received.');
  END IF;

  DBMS_PIPE.UNPACK_MESSAGE(command_code);
  DBMS_OUTPUT.PUT_LINE
      ('SQL command executed.  sqlcode = ' || command_code);
  RETURN command_code;
END execute_sql;

PROCEDURE stop(timeout NUMBER DEFAULT 10) IS
  status NUMBER;
BEGIN
  DBMS_PIPE.PACK_MESSAGE('STOP');
  status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR(-20030,
      'stop: error while sending.  status = ' || status);
  END IF;
```

```
  END stop;
END daemon;
```

daemon.pc Example. This is the code for the Pro*C daemon. You must precompile this using the Pro*C Precompiler, Version 1.5.x or later. You must also specify the USERID and SQLCHECK options, as the example contains embedded PL/SQL code.

> **Note:** To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

```
proc iname=daemon userid=scott/tiger sqlcheck=semantics
```

Then C-compile and link in the normal way.

```
#include <stdio.h>
#include <string.h>

EXEC SQL INCLUDE SQLCA;

EXEC SQL BEGIN DECLARE SECTION;
  char *uid = "scott/tiger";
  int status;
  VARCHAR command[20];
  VARCHAR value[2000];
  VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
  char msg_buffer[512];
  int msg_length;
  int buffer_size = 512;

  EXEC SQL WHENEVER SQLERROR CONTINUE;
  sqlglm(msg_buffer, &buffer_size, &msg_length);
  printf("Daemon error while connecting:\n");
  printf("%.*s\n", msg_length, msg_buffer);
  printf("Daemon quitting.\n");
  exit(1);
}

void
sql_error()
{
  char msg_buffer[512];
  int msg_length;
  int buffer_size = 512;

  EXEC SQL WHENEVER SQLERROR CONTINUE;
  sqlglm(msg_buffer, &buffer_size, &msg_length);
  printf("Daemon error while executing:\n");
  printf("%.*s\n", msg_length, msg_buffer);
  printf("Daemon continuing.\n");
}
main()
{
command.len = 20; /*initialize length components*/
```

```
value.len = 2000;
return_name.len  = 30;
  EXEC SQL WHENEVER SQLERROR DO connect_error();
  EXEC SQL CONNECT :uid;
  printf("Daemon connected.\n");

  EXEC SQL WHENEVER SQLERROR DO sql_error();
  printf("Daemon waiting...\n");
  while (1) {
    EXEC SQL EXECUTE
      BEGIN
        :status := DBMS_PIPE.RECEIVE_MESSAGE('daemon');
        IF :status = 0 THEN
          DBMS_PIPE.UNPACK_MESSAGE(:command);
        END IF;
      END;
    END-EXEC;
    IF (status == 0)
    {
      command.arr[command.len] = '\0';
      IF (!strcmp((char *) command.arr, "STOP"))
      {
        printf("Daemon exiting.\n");
        break;
      }

      ELSE IF (!strcmp((char *) command.arr, "SYSTEM"))
      {

          END;
        END-EXEC;

        IF (status)
        {
          printf
           ("Daemon error while responding to system command.");
          printf("  status: %d\n", status);
        }
      }
      ELSE IF (!strcmp((char *) command.arr, "SQL")) {
        EXEC SQL EXECUTE
          BEGIN
            DBMS_PIPE.UNPACK_MESSAGE(:return_name);
            DBMS_PIPE.UNPACK_MESSAGE(:value);
          END;
        END-EXEC;
```

```
      value.arr[value.len] = '\0';
      printf("Will execute sql command '%s'\n", value.arr);

      EXEC SQL WHENEVER SQLERROR CONTINUE;
      EXEC SQL EXECUTE IMMEDIATE :value;
      status = sqlca.sqlcode;

      EXEC SQL WHENEVER SQLERROR DO sql_error();
      EXEC SQL EXECUTE
        BEGIN
          DBMS_PIPE.PACK_MESSAGE('done');
          DBMS_PIPE.PACK_MESSAGE(:status);
          :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
        END;
      END-EXEC;

      IF (status)
      {
        printf("Daemon error while responding to sql command.");
        printf("  status: %d\n", status);
      }
    }
    ELSE
    {
      printf
        ("Daemon error: invalid command '%s' received.\n",
          command.arr);
    }
  }
  ELSE
  {
    printf("Daemon error while waiting for signal.");
    printf("  status = %d\n", status);
  }
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);
```

Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program connects to the database and executes PL/SQL code to read its request from the pipe, computes the result, and then executes PL/SQL code to send the result on a pipe back to the requestor.

Below is an example of a stock service request. The recommended sequence for the arguments to pass on the pipe for all service requests is:

```
protocol_version      VARCHAR2        - '1', 10 bytes or less
returnpipe            VARCHAR2        - 30 bytes or less
service               VARCHAR2        - 30 bytes or less
arg1                  VARCHAR2/NUMBER/DATE
   ...
argn                  VARCHAR2/NUMBER/DATE
```

The recommended format for returning the result is:

```
success               VARCHAR2        - 'SUCCESS' if OK,
                                        otherwise error message
arg1                  VARCHAR2/NUMBER/DATE
   ...
```

```
  argn                  VARCHAR2/NUMBER/DATE
```

The "stock price request server" would do, using OCI or PRO* (in pseudo-code):

```
<loop forever>
  BEGIN dbms_stock_server.get_request(:stocksymbol); END;
  <figure out price based on stocksymbol (probably from some radio
        signal), set error if can't find such a stock>
  BEGIN dbms_stock_server.return_price(:error, :price); END;
```

A client would do:

```
BEGIN :price := stock_request('YOURCOMPANY'); end;
```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```
CREATE OR REPLACE PACKAGE dbms_stock_server IS
  PROCEDURE get_request(symbol OUT VARCHAR2);
  PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
  returnpipe    VARCHAR2(30);

  PROCEDURE returnerror(reason VARCHAR2) IS
    s INTEGER;
  BEGIN
    dbms_pipe.pack_message(reason);
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:' || to_char(s) ||
        ' sending on pipe');
    END IF;
  END;

  PROCEDURE get_request(symbol OUT VARCHAR2) IS
    protocol_version VARCHAR2(10);
    s                INTEGER;
    service          VARCHAR2(30);
  BEGIN
    s := dbms_pipe.receive_message('stock_service');
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:' || to_char(s) ||
        'reading pipe');
    END IF;
    dbms_pipe.unpack_message(protocol_version);
    IF protocol_version <> '1' THEN
      raise_application_error(-20000, 'Bad protocol: ' ||
        protocol_version);
    END IF;
    dbms_pipe.unpack_message(returnpipe);
    dbms_pipe.unpack_message(service);
    IF service != 'getprice' THEN
      returnerror('Service ' || service || ' not supported');
    END IF;
    dbms_pipe.unpack_message(symbol);
  END;

  PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
    s INTEGER;
```

```
  BEGIN
    IF errormsg is NULL THEN
      dbms_pipe.pack_message('SUCCESS');
      dbms_pipe.pack_message(price);
    ELSE
      dbms_pipe.pack_message(errormsg);
    END IF;
    s := dbms_pipe.send_message(returnpipe);
    IF s <> 0 THEN
      raise_application_error(-20000, 'Error:'||to_char(s)||
        ' sending on pipe');
    END IF;
  END;
END;
```

The procedure called by the client is:

```
CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2)
    RETURN VARCHAR2 IS
  s        INTEGER;
  price    VARCHAR2(20);
  errormsg VARCHAR2(512);
BEGIN
  dbms_pipe.pack_message('1');  -- protocol version
  dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
  dbms_pipe.pack_message('getprice');
  dbms_pipe.pack_message(symbol);
  s := dbms_pipe.send_message('stock_service');
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
      ' sending on pipe');
  END IF;
  s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
      ' receiving on pipe');
  END IF;
  dbms_pipe.unpack_message(errormsg);
  IF errormsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errormsg);
  END IF;
  dbms_pipe.unpack_message(price);
  RETURN price;
END;
```

You would typically only `GRANT EXECUTE` on `DBMS_STOCK_SERVICE` to the stock service application server, and would only `GRANT EXECUTE` on `stock_request` to those users allowed to use the service.

Summary of DBMS_PIPE Subprograms

Table 100–2 DBMS_PIPE Package Subprograms

Subprogram	Description
CREATE_PIPE Function on page 100-19	Creates a pipe (necessary for private pipes)
NEXT_ITEM_TYPE Function on page 100-21	Returns datatype of next item in buffer
PACK_MESSAGE Procedures on page 100-22	Builds message in local buffer
PURGE Procedure on page 100-24	Purges contents of named pipe
RECEIVE_MESSAGE Function on page 100-25	Copies message from named pipe into local buffer
REMOVE_PIPE Function on page 100-28	Removes the named pipe
RESET_BUFFER Procedure on page 100-27	Purges contents of local buffer
SEND_MESSAGE Function on page 100-29	Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist
UNIQUE_SESSION_NAME Function on page 100-31	Returns unique session name
UNPACK_MESSAGE Procedures on page 100-32	Accesses next item in buffer

CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the `private` flag is `TRUE`, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling `REMOVE_PIPE`, or by shutting down the instance.

Syntax

```
DBMS_PIPE.CREATE_PIPE (
   pipename     IN VARCHAR2,
   maxpipesize  IN INTEGER DEFAULT 8192,
   private      IN BOOLEAN DEFAULT TRUE)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(create_pipe,WNDS,RNDS);
```

Parameters

Table 100–3 CREATE_PIPE Function Parameters

Parameter	Description
`pipename`	Name of the pipe you are creating. You must use this name when you call `SEND_MESSAGE` and `RECEIVE_MESSAGE`. This name must be unique across the instance. Caution: Do not use pipe names beginning with `ORA$`. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.
`maxpipesize`	The maximum size allowed for the pipe, in bytes. The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default `maxpipesize` is 8192 bytes. The `maxpipesize` for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of `SEND_MESSAGE` with larger values cause the `maxpipesize` to be increased. Callers with a smaller value use the existing, larger value.
`private`	Uses the default, `TRUE`, to create a private pipe. Public pipes can be implicitly created when you call `SEND_MESSAGE`.

Return Values

Table 100–4 CREATE_PIPE Function Return Values

Return	Description
0	Successful. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
ORA-23322	Failure due to naming conflict. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 100–5 CREATE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Pipe with the same name already exists, and you are not allowed to use it.

NEXT_ITEM_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call NEXT_ITEM_TYPE.

Syntax

```
DBMS_PIPE.NEXT_ITEM_TYPE
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(next_item_type,WNDS,RNDS);
```

Return Values

Table 100–6 NEXT_ITEM_TYPE Function Return Values

Return	Description
0	No more items
6	NUMBER
9	VARCHAR2
11	ROWID
12	DATE
23	RAW

PACK_MESSAGE Procedures

This procedure builds your message in the local message buffer. To send a message, first make one or more calls to PACK_MESSAGE. Then, call SEND_MESSAGE to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type VARCHAR2, NCHAR, NUMBER, DATE., RAW and ROWID items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message.The overhead for all types other than VARCHAR is 4 bytes.

Syntax

```
DBMS_PIPE.PACK_MESSAGE (
   item  IN  VARCHAR2);

DBMS_PIPE.PACK_MESSAGE (
   item  IN  NCHAR);

DBMS_PIPE.PACK_MESSAGE (
   item  IN  NUMBER);

DBMS_PIPE.PACK_MESSAGE (
   item  IN  DATE);

DBMS_PIPE.PACK_MESSAGE_RAW (
   item  IN  RAW);

DBMS_PIPE.PACK_MESSAGE_ROWID (
   item  IN  ROWID);
```

Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

Parameters

Table 100–7 PACK_MESSAGE Procedure Parameters

Parameter	Description
item	Item to pack into the local message buffer.

Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call SEND_MESSAGE to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

Exceptions

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling PURGE lets you free the memory associated with an implicitly-created pipe.

Syntax

```
DBMS_PIPE.PURGE (
   pipename  IN  VARCHAR2);
```

Pragmas

```
pragma restrict_references(purge,WNDS,RNDS);
```

Parameters

Table 100–8 PURGE Procedure Parameters

Parameter	Description
pipename	Name of pipe from which to remove all messages. The local buffer may be overwritten with messages as they are discarded. Pipename should not be longer than 128 bytes, and is case-insensitive.

Usage Notes

Because PURGE calls RECEIVE_MESSAGE, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an ORA-23322 (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

Exceptions

Permission error if pipe belongs to another user.

RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```
DBMS_PIPE.RECEIVE_MESSAGE (
   pipename     IN VARCHAR2,
   timeout      IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(receive_message,WNDS,RNDS);
```

Parameters

Table 100–9 RECEIVE_MESSAGE Function Parameters

Parameter	Description
pipename	Name of the pipe on which you want to receive a message. Names beginning with ORA$ are reserved for use by Oracle
timeout	Time to wait for a message, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you read without blocking.

Return Values

Table 100–10 RECEIVE_MESSAGE Function Return Values

Return	Description
0	Success
1	Timed out. If the pipe was implicitly-created and is empty, then it is removed.
2	Record in the pipe is too large for the buffer. (This should not happen.)
3	An interrupt occurred.
ORA-23322	User has insufficient privileges to read from the pipe.

Usage Notes

To receive a message from a pipe, first call RECEIVE_MESSAGE. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call RECEIVE_MESSAGE does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to UNPACK_MESSAGE to access the individual items in the message. The UNPACK_MESSAGE procedure is

overloaded to unpack items of type DATE, NUMBER, VARCHAR2, and there are two additional procedures to unpack RAW and ROWID items. If you do not know the type of data that you are attempting to unpack, then call NEXT_ITEM_TYPE to determine the type of the next item in the buffer.

Exceptions

Table 100–11 RECEIVE_MESSAGE Function Exceptions

Exception	Description
Null pipe name	Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.

RESET_BUFFER Procedure

This procedure resets the PACK_MESSAGE and UNPACK_MESSAGE positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

Syntax

```
DBMS_PIPE.RESET_BUFFER;
```

Pragmas

```
pragma restrict_references(reset_buffer,WNDS,RNDS);
```

REMOVE_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by SEND_MESSAGE are automatically removed when empty. However, pipes created explicitly by CREATE_PIPE are removed only by calling REMOVE_PIPE, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling PURGE on an implicitly-created pipe.

Syntax

```
DBMS_PIPE.REMOVE_PIPE (
   pipename  IN  VARCHAR2)
RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(remove_pipe,WNDS,RNDS);
```

Parameters

Table 100–12 REMOVE_PIPE Function Parameters

Parameter	Description
pipename	Name of pipe that you want to remove.

Return Values

Table 100–13 REMOVE_PIPE Function Return Values

Return	Description
0	Success If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed.
ORA-23322	Insufficient privileges. If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges.

Exceptions

Table 100–14 REMOVE_PIPE Function Exception

Exception	Description
Null pipe name	Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else.

SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to PACK_MESSAGE. You can create a pipe explicitly using CREATE_PIPE, otherwise, it is created implicitly.

Syntax

```
DBMS_PIPE.SEND_MESSAGE (
    pipename     IN VARCHAR2,
    timeout      IN INTEGER DEFAULT MAXWAIT,
    maxpipesize  IN INTEGER DEFAULT 8192)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(send_message,WNDS,RNDS);
```

Parameters

Table 100–15 SEND_MESSAGE Function Parameters

Parameter	Description
pipename	Name of the pipe on which you want to place the message. If you are using an explicit pipe, then this is the name that you specified when you called CREATE_PIPE. Caution: Do not use pipe names beginning with 'ORA$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.
timeout	Time to wait while attempting to place a message on a pipe, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days).
maxpipesize	Maximum size allowed for the pipe, in bytes. The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes. The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value simply use the existing, larger value. Specifying maxpipesize as part of the SEND_MESSAGE procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional maxpipesize parameter to override the creation pipe size specifications.

Return Values

Table 100–16 SEND_MESSAGE Function Return Values

Return	Description
0	Success. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.
1	Timed out. This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.
3	An interrupt occurred. If the pipe was implicitly created and is empty, then it is removed.
ORA-23322	Insufficient privileges. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.

Exceptions

Table 100–17 SEND_MESSAGE Function Exception

Exception	Description
Null pipe name	Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.

UNIQUE_SESSION_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the `PIPENAME` parameter for your `SEND_MESSAGE` and `RECEIVE_MESSAGE` calls.

Syntax

```
DBMS_PIPE.UNIQUE_SESSION_NAME
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);
```

Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

UNPACK_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call UNPACK_MESSAGE.

> **Note:** The UNPACK_MESSAGE procedure is overloaded to return items of type VARCHAR2, NCHAR, NUMBER, or DATE. There are two additional procedures to unpack RAW and ROWID items.

Syntax

```
DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT VARCHAR2);

DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT NCHAR);

DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT NUMBER);

DBMS_PIPE.UNPACK_MESSAGE (
   item  OUT DATE);

DBMS_PIPE.UNPACK_MESSAGE_RAW (
   item  OUT RAW);

DBMS_PIPE.UNPACK_MESSAGE_ROWID (
   item  OUT ROWID);
```

Pragmas

```
pragma restrict_references(unpack_message,WNDS,RNDS);
pragma restrict_references(unpack_message_raw,WNDS,RNDS);
pragma restrict_references(unpack_message_rowid,WNDS,RNDS);
```

Parameters

Table 100–18 UNPACK_MESSAGE Procedure Parameters

Parameter	Description
item	Argument to receive the next unpacked item from the local message buffer.

Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.

101

DBMS_PREDICTIVE_ANALYTICS

Data mining can discover useful information buried in vast amounts of data. However, it is often the case that both the programming interfaces and the data mining expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Data Mining.

The `DBMS_PREDICTIVE_ANALYTICS` package addresses both of these complexities by automating the entire data mining process from data preprocessing through model building to scoring new data. This package provides an important tool that makes data mining possible for a broad audience of users, in particular, business analysts.

> **See Also:** *Oracle Data Mining Concepts* for an overview of Oracle predictive analytics, including information about the Oracle Spreadsheet Add-In for Predictive Analytics.

This chapter contains the following topics:

- Using DBMS_PREDICTIVE_ANALYTICS
  - Overview
- Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

Using DBMS_PREDICTIVE_ANALYTICS

This section contains topics that relate to using the `DBMS_PREDICTIVE_ANALYTICS` package.

- Overview

Overview

Data mining, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

`DBMS_PREDICTIVE_ANALYTICS` automates parts of step 3 — 5 of this process.

Predictive analytics procedures analyze and prepare the input data, create and test mining models using the input data, and then use the input data for scoring. The results of scoring are returned to the user. The models and supporting objects are not preserved after the operation completes.

Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

Table 101–1 DBMS_PREDICTIVE_ANALYTICS Package Subprograms

Subprogram	Purpose
EXPLAIN Procedure on page 101-5	Ranks attributes in order of influence in explaining a target column.
PREDICT Procedure on page 101-7	Predicts the value of a target column based on values in the input data.
PROFILE Procedure on page 101-9	Generates rules that identify the records that have the same target value.

EXPLAIN Procedure

The EXPLAIN procedure identifies the attributes that are important in explaining the variation in values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train a model that calculates the attribute importance.

> **Note:** EXPLAIN supports DATE and TIMESTAMP data types in addition to the numeric, character, and nested data types supported by Oracle Data Mining models.
>
> Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide.*

The EXPLAIN procedure creates a result table that lists the attributes in order of their explanatory power. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (
     data_table_name     IN VARCHAR2,
     explain_column_name IN VARCHAR2,
     result_table_name   IN VARCHAR2,
     data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 101–2 EXPLAIN Procedure Parameters

Parameter	Description
data_table_name	Name of input table or view
explain_column_name	Name of the column to be explained
result_table_name	Name of the table where results are saved
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

Usage Notes

The EXPLAIN procedure creates a result table with the columns described in Table 101–3.

Table 101–3 EXPLAIN Procedure Result Table

Column Name	Data Type	Description
ATTRIBUTE_NAME	VARCHAR2(30)	Name of a column in the input data; all columns except the explained column are listed in the result table.
EXPLANATORY_VALUE	NUMBER	Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1. An individual column's explanatory value is independent of other columns in the input table. The values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column. An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for PREDICT. In practice, an explanatory power equal to 1 is rarely returned.
RANK	NUMBER	Ranking of explanatory power. Rows with equal values for explanatory_value have the same rank. Rank values are not skipped in the event of ties.

Example

The following example performs an EXPLAIN operation on the SUPPLEMENTARY_DEMOGRAPHICS table of Sales History.

```
--Perform EXPLAIN operation
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
        data_table_name      => 'supplementary_demographics',
        explain_column_name  => 'home_theater_package',
        result_table_name    => 'demographics_explain_result');
END;
/
--Display results
SELECT * FROM demographics_explain_result;

ATTRIBUTE_NAME                          EXPLANATORY_VALUE       RANK
--------------------------------------- ----------------- ----------
Y_BOX_GAMES                                    .524311073          1
YRS_RESIDENCE                                  .495987246          2
HOUSEHOLD_SIZE                                 .146208506          3
AFFINITY_CARD                                    .0598227          4
EDUCATION                                      .018462703          5
OCCUPATION                                     .009721543          6
FLAT_PANEL_MONITOR                              .00013733          7
PRINTER_SUPPLIES                                       0          8
OS_DOC_SET_KANJI                                       0          8
BULK_PACK_DISKETTES                                    0          8
BOOKKEEPING_APPLICATION                                0          8
COMMENTS                                               0          8
CUST_ID                                                0          8
```

The results show that Y_BOX_GAMES, YRS_RESiDENCE, and HOUSEHOLD_SIZE are the best predictors of HOME_THEATER_PACKAGE.

PREDICT Procedure

The PREDICT procedure predicts the values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train and test a model that makes the predictions.

> **Note:** PREDICT supports DATE and TIMESTAMP data types in addition to the numeric, character, and nested data types supported by Oracle Data Mining models.
>
> Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide.*

The PREDICT procedure creates a result table that contains a predicted target value for every record. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PREDICT (
    accuracy                OUT NUMBER,
    data_table_name         IN VARCHAR2,
    case_id_column_name     IN VARCHAR2,
    target_column_name      IN VARCHAR2,
    result_table_name       IN VARCHAR2,
    data_schema_name        IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 101–4 PREDICT Procedure Parameters

Parameter	Description
accuracy	Output parameter that returns the predictive confidence, a measure of the accuracy of the predicted values. The predictive confidence for a categorical target is the most common target value; the predictive confidence for a numerical target is the mean.
data_table_name	Name of the input table or view.
case_id_column_name	Name of the column that uniquely identifies each case (record) in the input data.
target_column_name	Name of the column to predict.
result_table_name	Name of the table where results will be saved.
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

Usage Notes

The PREDICT procedure creates a result table with the columns described in Table 101–5.

Table 101–5 PREDICT Procedure Result Table

Column Name	Data Type	Description
Case ID column name	VARCHAR2 or NUMBER	The name of the case ID column in the input data.
PREDICTION	VARCHAR2 or NUMBER	The predicted value of the target column for the given case.
PROBABILITY	NUMBER	For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains NULL.

Note: Make sure that the name of the case ID column is not 'PREDICTION' or 'PROBABILITY'.

Predictions are returned for all cases whether or not they contained target values in the input.

Predicted values for known cases may be interesting in some situations. For example, you could perform deviation analysis to compare predicted values and actual values.

Example

The following example performs a PREDICT operation and displays the first 10 predictions. The results show an accuracy of 79% in predicting whether each customer has an affinity card.

```
--Perform PREDICT operation
DECLARE
    v_accuracy NUMBER(10,9);
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PREDICT(
        accuracy             => v_accuracy,
        data_table_name      => 'supplementary_demographics',
        case_id_column_name  => 'cust_id',
        target_column_name   => 'affinity_card',
        result_table_name    => 'pa_demographics_predict_result');
    DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;
/

Accuracy = .788696903

--Display results
SELECT * FROM pa_demographics_predict_result WHERE rownum < 10;

   CUST_ID PREDICTION PROBABILITY
---------- ---------- -----------
    101501          1  .834069848
    101502          0  .991269965
    101503          0   .99978311
    101504          1  .971643388
    101505          1  .541754127
    101506          0  .803719133
    101507          0  .999999303
    101508          0  .999999987
    101509          0  .999953074
```

PROFILE Procedure

The PROFILE procedure generates rules that describe the cases (records) from the input data. For example, if a target column CHURN has values 'Yes' and 'No', PROFILE generates a set of rules describing the expected outcomes. Each profile includes a rule, record count, and a score distribution.

The input data must contain some cases where the target value is known (not NULL). These cases are used by the procedure to build a model that calculates the rules.

> **Note:** PROFILE does not support nested types or dates.
>
> Data requirements for Oracle Data Mining are described in *Oracle Data Mining Application Developer's Guide.*

The PROFILE procedure creates a result table that specifies rules (profiles) and their corresponding target values. The result table is described in the Usage Notes.

Syntax

```
DBMS_PREDICTIVE_ANALYTICS.PROFILE (
     data_table_name           IN VARCHAR2,
     target_column_name        IN VARCHAR2,
     result_table_name         IN VARCHAR2,
     data_schema_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 101–6 PROFILE Procedure Parameters

Parameter	Description
data_table_name	Name of the table containing the data to be analyzed.
target_column_name	Name of the target column.
result_table_name	Name of the table where the results will be saved.
data_schema_name	Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.

Usage Notes

The PROFILE procedure creates a result table with the columns described in Table 101–7.

Table 101–7 PROFILE Procedure Result Table

Column Name	Data Type	Description
PROFILE_ID	NUMBER	A unique identifier for this profile (rule).
RECORD_COUNT	NUMBER	The number of records described by the profile.
DESCRIPTION	SYS.XMLTYPE	The profile rule. See "XML Schema for Profile Rules".

XML Schema for Profile Rules

The DESCRIPTION column of the result table contains XML that conforms to the following XSD:

```
<xs:element name="SimpleRule">
  <xs:complexType>
    <xs:sequence>
      <xs:group ref="PREDICATE"/>
      <xs:element ref="ScoreDistribution" minOccurs="0" maxOccurs="unbounded"/>
    </xs:sequence>
    <xs:attribute name="id" type="xs:string" use="optional"/>
    <xs:attribute name="score" type="xs:string" use="required"/>
    <xs:attribute name="recordCount" type="NUMBER" use="optional"/>
  </xs:complexType>
</xs:element>
```

Example

This example generates a rule describing customers who are likely to use an affinity card (target value is 1) and a set of rules describing customers who are not likely to use an affinity card (target value is 0). The rules are based on only two predictors: education and occupation.

```
SET serveroutput ON
SET trimspool ON
SET pages 10000
SET long 10000
SET pagesize 10000
SET linesize 150
CREATE VIEW cust_edu_occ_view AS
              SELECT cust_id, education, occupation, affinity_card
              FROM sh.supplementary_demographics;
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PROFILE(
         DATA_TABLE_NAME    => 'cust_edu_occ_view',
         TARGET_COLUMN_NAME => 'affinity_card',
         RESULT_TABLE_NAME  => 'profile_result');
END;
/
EXEC dbms_xdb_print.setPrintMode(dbms_xdb_print.PRINT_PRETTY, 2);
```

This example generates eight rules in the result table `profile_result`. Seven of the rules suggest a target value of 0; one rule suggests a target value of 1. The `score` attribute on a rule identifies the target value.

This `SELECT` statement returns all the rules in the result table.

```
SELECT a.profile_id, a.record_count, a.description.getstringval()
 FROM profile_result a;
```

This `SELECT` statement returns the rules for a target value of 0.

```
SELECT *
  FROM profile_result t
  WHERE extractvalue(t.description, '/SimpleRule/@score') = 0;
```

To obtain more readable output, you can cut and paste the XML for a rule into a text file, save it with the .xml extension, and view the rule in a browser. The eight rules generated by this example are displayed as follows.

```
<SimpleRule id="1" score="0" recordCount="443">

102

DBMS_PREPROCESSOR

The DBMS_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics

- Using DBMS_PREPROCESSOR
  - Overview
  - Operating Notes
- Data Structures
  - Table Types
- Summary of DBMS_PREPROCESSOR Subprograms

Using DBMS_PREPROCESSOR

- Overview
- Operating Notes

Overview

There are three styles of subprograms.

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a VARCHAR2 string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a VARCHAR2 index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is VALID and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single VARCHAR2 string in the second style, or as a VARCHAR2 index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the VARCHAR2 length limit.

Operating Notes

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be VALID. Likewise, the source text passed in as a VARCHAR2 string or a VARCHAR2 index-by table may contain compile time errors. If errors are found when generating the post-processed source, the error message text will also appear at the end of the post-processed source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.
- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as CREATE OR REPLACE. In general, the input source should be syntactically prepared in a way as if it were obtained from the ALL_SOURCE view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

  ```
  anonymous block   (BEGIN | DECLARE) ...
  package           PACKAGE <name> ...
  package body      PACKAGE BODY <name> ...
  procedure         PROCEDURE <name> ...
  function          FUNCTION <name> ...
  type              TYPE <name> ...
  type body         TYPE BODY <name> ...
  trigger           (BEGIN | DECLARE) ...
  ```

  If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.
- If the text of a wrapped PL/SQL unit is obtained from the ALL_SOURCE view, the keyword WRAPPED always immediately follows the name of the unit, as in this example:

  ```
  PROCEDURE "some proc" WRAPPED
  a000000
  b2
  ...
  ```

  If such source text is presented to one of the GET_POST_PROCESSED_SOURCE Functions or to one of the PRINT_POST_PROCESSED_SOURCE Procedures, the exception DBMS_PREPROCESSOR.WRAPPED_INPUT is raised.

Data Structures

The DBMS_PREPROCESSOR package defines a TABLE type.

Table Types

SOURCE_LINES_T Table Type

SOURCE_LINES_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

Syntax

```
TYPE source_lines_t IS
    TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_PREPROCESSOR Subprograms

Table 102–1 DBMS_PREPROCESSOR Package Subprograms

Subprogram	Description
GET_POST_PROCESSED_SOURCE Functions on page 102-8	Returns the post-processed source text
PRINT_POST_PROCESSED_SOURCE Procedures on page 102-10	Prints post-processed source text

GET_POST_PROCESSED_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
   object_type    VARCHAR2,
   schema_name    VARCHAR2,
   object_name    VARCHAR2);
  RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
   source        VARCHAR2);
  RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (
   source        source_lines_t);
  RETURN source_lines_t;
```

Parameters

Table 102–2 GET_POST_PROCESSED_SOURCE Function Parameters

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object.The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

Return Values

The function returns an INDEX-BY table containing the lines of the post-processed source text starting from index 1.

Usage Notes

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the INDEX-BY table.
- In the post-processed source, unselected text will have blank lines.

Exceptions

Table 102–3 GET_POST_PROCESSED_SOURCE Function Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.
ORA-06502	Numeric or value error: ■ Character string buffer too small ■ A line is too long (> 32767 bytes)

PRINT_POST_PROCESSED_SOURCE Procedures

This overloaded procedure calls DBMS_OUTPUT.PUT_LINE to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Prints post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
   object_type    VARCHAR2,
   schema_name    VARCHAR2,
   object_name    VARCHAR2);
```

Prints post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
   source        VARCHAR2);
```

Prints post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (
   source        source_lines_t);
```

Parameters

Table 102–4 PRINT_POST_PROCESSED_SOURCE Procedure Parameters

Parameter	Description
object_type	Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.
schema_name	The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.
object_name	The name of the object.The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.
source	The source text of the compilation unit
source_lines_t	INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.

Exceptions

Table 102–5 PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-24234	Insufficient privileges or object does not exist
ORA-24235	Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.
ORA-24236	The source text is empty
ORA-00931	Missing identifier. The object_name should not be NULL.

Table 102–5 (Cont.) PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

Exception	Description
ORA-06502	Numeric or value error: ■ Character string buffer too small ■ A line is too long (> 32767 bytes)

Usage Notes

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.

103

DBMS_PROFILER

The DBMS_PROFILER package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- Using DBMS_PROFILER
  - Overview
  - Security Model
  - Operational Notes
  - Exceptions
- Summary of DBMS_PROFILER Subprograms

Using DBMS_PROFILER

- Overview
- Security Model
- Operational Notes
- Exceptions

Overview

This package enables the collection of profiler (perfoprmance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

> **Note:** It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in Table 103–1, Table 103–2, and Table 103–3.

Table 103–1 Columns in Table PLSQL_PROFILER_RUNS

Column	Datatype	Definition
runid	NUMBER PRIMARY KEY	Unique run identifier from plsql_profiler_ runnumber
related_run	NUMBER	Runid of related run (for client/server correlation)
run_owner	VARCHAR2(32),	User who started run
run_date	DATE	Start time of run
run_comment	VARCHAR2(2047)	User provided comment for this run
run_total_ time	NUMBER	Elapsed time for this run in nanoseconds
run_system_ info	VARCHAR2(2047)	Currently unused
run_comment1	VARCHAR2(2047)	Additional comment
spare1	VARCHAR2(256)	Unused

Table 103–2 Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
runid	NUMBER	Primary key, references plsql_profiler_runs,
unit_number	NUMBER	Primary key, internally generated library unit #
unit_type	VARCHAR2(32)	Library unit type
unit_owner	VARCHAR2(32)	Library unit owner name
unit_name	VARCHAR2(32)	Library unit name timestamp on library unit
unit_ timestamp	DATE	In the future will be used to detect changes to unit between runs

Table 103–2 (Cont.) Columns in Table PLSQL_PROFILER_UNITS

Column	Datatype	Definition
total_time	NUMBER	Total time spent in this unit in nanoseconds. The profiler does not set this field, but it is provided for the convenience of analysis tools.
spare1	NUMBER	Unused
spare2	NUMBER	Unused

Table 103–3 Columns in Table PLSQL_PROFILER_DATA

Column	Datatype	Definition
runid	NUMBER	Primary key, unique (generated) run identifier
unit_number	NUMBER	Primary key, internally generated library unit number
line#	NUMBER	Primary key, not null, line number in unit
total_occur	NUMBER	Number of times line was executed
total_time	NUMBER	Total time spent executing line in nanoseconds
min_time	NUMBER	Minimum execution time for this line in nanoseconds
max_time	NUMBER	Maximum execution time for this line in nanoseconds
spare1	NUMBER	Unused
spare2	NUMBER	Unused
spare3	NUMBER	Unused
spare4	NUMBER	Unused

With Oracle database version 8.x, a sample textual report writer(profrep.sql) is provided with the PL/SQL demo scripts.

Security Model

The profiler only gathers data for units for which a user has CREATE privilege; you cannot use the package to profile units for which EXECUTE ONLY access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled DEBUG. Oracle advises that modules that are being profiled should be compiled DEBUG, since this provides additional information about the unit in the database.

Note: DBMS_PROFILER treats any program unit that is compiled in NATIVE mode as if you do not have CREATE privilege, that is, you will not get any output.

Operational Notes

- Typical Run
- Two Methods of Exception Generation

Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a *"run"*. A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the `START_PROFILER` and `STOP_PROFILER` functions.

A typical run involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

> **Note:** The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the `FLUSH_DATA` or the `STOP_PROFILER` function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the `FLUSH_DATA` function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures.

Flushing the collected data involves storing collected data in database tables. The tables should already exist in the profiler user's schema. The `PROFTAB.SQL` script creates the tables and other data structures required for persistently storing the profiler data.

Note that running `PROFTAB.SQL` drops the current tables. The `PROFTAB.SQL` script is in the `RDBMS/ADMIN` directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.

To avoid timing this overhead, *"warm up"* the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the SYSADMIN should use a modified `PROFLOAD.SQL` script which:

- Creates the profiler tables and sequence
- Grants SELECT/INSERT/UPDATE on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

Note: Do not alter the actual fields of the tables.

See Also: "FLUSH_DATA Function and Procedure" on page 103-10.

Two Methods of Exception Generation

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

Exceptions

Table 103–4 DBMS_PROFILER Exceptions

Exception	Description
`version_mismatch`	Corresponds to error_version.
`profiler_error`	Corresponds to either "error_param" or "error_io".

A `0` return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'

  ```
  error_param constant binary_integer := 1;
  ```

- 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'

  ```
  error_io    constant binary_integer := 2;
  ```

- There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the `DBMS_PROFILER` package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.

  ```
  error_version constant binary_integer := -1;
  ```

Summary of DBMS_PROFILER Subprograms

Table 103–5 DBMS_PROFILER Package Subprograms

Subprogram	Description
FLUSH_DATA Function and Procedure on page 103-10	Flushes profiler data collected in the user's session
GET_VERSION Procedure on page 103-11	Gets the version of this API
INTERNAL_VERSION_CHECK Function on page 103-12	Verifies that this version of the `DBMS_PROFILER` package can work with the implementation in the database
PAUSE_PROFILER Function and Procedure on page 103-13	Pauses profiler data collection
RESUME_PROFILER Function and Procedure on page 103-14	Resumes profiler data collection
START_PROFILER Functions and Procedures on page 103-15	Starts profiler data collection in the user's session
STOP_PROFILER Function and Procedure on page 103-16	Stops profiler data collection in the user's session

FLUSH_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

> **Note:** Use the PROFTAB.SQL script to create the tables and other data structures required for persistently storing the profiler data.

Syntax

```
DBMS_PROFILER.FLUSH_DATA
  RETURN BINARY_INTEGER;

DBMS_PROFILER.FLUSH_DATA;
```

GET_VERSION Procedure

This procedure gets the version of this API.

Syntax

```
DBMS_PROFILER.GET_VERSION (
   major  OUT BINARY_INTEGER,
   minor  OUT BINARY_INTEGER);
```

Parameters

Table 103–6 GET_VERSION Procedure Parameters

Parameter	Description
major	Major version of DBMS_PROFILER.
minor	Minor version of DBMS_PROFILER.

INTERNAL_VERSION_CHECK Function

This function verifies that this version of the `DBMS_PROFILER` package can work with the implementation in the database.

Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK
  RETURN BINARY_INTEGER;
```

PAUSE_PROFILER Function and Procedure

This function pauses profiler data collection.

Syntax

```
DBMS_PROFILER.PAUSE_PROFILER
  RETURN BINARY_INTEGER;

DBMS_PROFILER.PAUSE_PROFILER;
```

RESUME_PROFILER Function and Procedure

This function resumes profiler data collection.

Syntax

```
DBMS_PROFILER.RESUME_PROFILER
  RETURN BINARY_INTEGER;

DBMS_PROFILER.RESUME_PROFILER;
```

START_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the START_PROFILER function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

Syntax

```
DBMS_PROFILER.START_PROFILER(
   run_comment   IN VARCHAR2 := sysdate,
   run_comment1  IN VARCHAR2 :='',
   run_number    OUT BINARY_INTEGER)
 RETURN BINARY_INTEGER;

DBMS_PROFILER.START_PROFILER(
   run_comment IN VARCHAR2 := sysdate,
   run_comment1 IN VARCHAR2 :='')
RETURN BINARY_INTEGER;

DBMS_PROFILER.START_PROFILER(
   run_comment   IN VARCHAR2 := sysdate,
   run_comment1  IN VARCHAR2 :='',
   run_number    OUT BINARY_INTEGER);

DBMS_PROFILER.START_PROFILER(
   run_comment IN VARCHAR2 := sysdate,
   run_comment1 IN VARCHAR2 :='');
```

Parameters

Table 103–7 START_PROFILER Function Parameters

Parameter	Description
run_comment	Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.
run_number	Stores the number of the run so you can store and later recall the run's data.
run_comment1	Allows you to make interesting comments about the run.

STOP_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

Syntax

```
DBMS_PROFILER.STOP_PROFILER
  RETURN BINARY_INTEGER;

DBMS_PROFILER.STOP_PROFILER;
```

104

DBMS_PROPAGATION_ADM

The DBMS_PROPAGATION_ADM package, one of a set of Oracle Streams packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and propagations

This chapter contains the following topic:

- Summary of DBMS_PROPAGATION_ADM Subprograms

Summary of DBMS_PROPAGATION_ADM Subprograms

Table 104–1 DBMS_PROPAGATION_ADM Package Subprograms

Subprogram	Description
ALTER_PROPAGATION Procedure on page 104-3	Adds, alters, or removes a rule set for a propagation
CREATE_PROPAGATION Procedure on page 104-5	Creates a propagation and specifies the source queue, destination queue, and rule set for the propagation
DROP_PROPAGATION Procedure on page 104-8	Drops a propagation
START_PROPAGATION Procedure on page 104-10	Starts a propagation
STOP_PROPAGATION Procedure on page 104-11	Stops a propagation

Note: All subprograms commit unless specified otherwise.

ALTER_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

> **See Also:** *Oracle Streams Concepts and Administration* and Chapter 124, "DBMS_RULE_ADM" for more information about rules and rule sets

Syntax

```
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION(
   propagation_name          IN  VARCHAR2,
   rule_set_name             IN  VARCHAR2  DEFAULT NULL,
   remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
   negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
   remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 104–2 ALTER_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.
rule_set_name	The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages. If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named prop_rules, enter hr.prop_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then the procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then the procedure removes any existing positive rule set.
remove_rule_set	If TRUE, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages. If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified propagation. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

Table 104–2 (Cont.) ALTER_PROPAGATION Procedure Parameters

Parameter	Description
negative_rule_set_name	The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages. If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.
remove_negative_rule_set	If TRUE, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages. If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified propagation. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.

CREATE_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION(
   propagation_name           IN  VARCHAR2,
   source_queue               IN  VARCHAR2,
   destination_queue          IN  VARCHAR2,
   destination_dblink         IN  VARCHAR2  DEFAULT NULL,
   rule_set_name              IN  VARCHAR2  DEFAULT NULL,
   negative_rule_set_name     IN  VARCHAR2  DEFAULT NULL,
   queue_to_queue             IN  BOOLEAN   DEFAULT NULL,
   original_propagation_name  IN  VARCHAR2  DEFAULT NULL,
   auto_merge_threshold       IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 104–3 CREATE_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner. **Note:** The propagation_name setting cannot be altered after the propagation is created.
source_queue	The name of the source queue, specified as [*schema_name.*]*queue_name*. The current database must contain the source queue. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_queue	The name of the destination queue, specified as [*schema_name.*]*queue_name*. For example, to specify a destination queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.
destination_dblink	The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue. If NULL, then the source queue and destination queue must be in the same database. **Note:** Connection qualifiers are not allowed.

Table 104–3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
rule_set_name	The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages. If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a positive rule set in the hr schema named prop_rules, enter hr.prop_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue. If you specify NULL, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.
negative_rule_set_name	The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages. If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form [*schema_name*.]*rule_set_name*. For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue. If you specify NULL, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set. If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first.
queue_to_queue	If TRUE or NULL, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. **See Also:** *Oracle Streams Concepts and Administration* for more information about queue-to-queue propagations

Table 104–3 (Cont.) CREATE_PROPAGATION Procedure Parameters

Parameter	Description
original_propagation_name	Specify the original propagation name if the propagation being created is part of a split and merge operation initiated by the SPLIT_STREAMS procedure in the DBMS_STREAMS_ADM package. The split operation clones the original propagation under a new name. The name of the original propagation is important when the cloned propagation is copied back to the original stream using the MERGE_STREAMS procedure in the DBMS_STREAMS_ADM package. Specify NULL if the propagation being created is not part of a split and merge operation. **See Also:** "SPLIT_STREAMS Procedure" on page 141-171 and "MERGE_STREAMS Procedure" on page 141-126
auto_merge_theshold	Specify a positive number if both of the following conditions are met: ▪ The propagation being created is part of a split and merge operation initiated by the SPLIT_STREAMS procedure in the DBMS_STREAMS_ADM package. ▪ The stream will be merged back to the original stream automatically. Specify NULL if either of the following conditions are met: ▪ The propagation being created is not part of a split and merge operation. ▪ The propagation being created is part of a split and merge operation, but the stream being split off will not be merged back to the original stream automatically. **See Also:** "SPLIT_STREAMS Procedure" on page 141-171 and "MERGE_STREAMS Procedure" on page 141-126

Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

See Also:

- Chapter 124, "DBMS_RULE_ADM"
- *Oracle Streams Concepts and Administration* for more information about propagations, the privileges required to propagate messages, propagation jobs, and propagation schedules

DROP_PROPAGATION Procedure

This procedure drops a propagation and deletes all messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

Syntax

```
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
   propagation_name       IN  VARCHAR2,
   drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 104–4 DROP_PROPAGATION Procedure Parameters

Parameter	Description
propagation_name	The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.
drop_unused_rule_sets	If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Oracle Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.

Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about Oracle Streams data dictionary views

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

Note: When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.

START_PROPAGATION Procedure

This procedure starts a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.START_PROPAGATION(
   propagation_name  IN  VARCHAR2);
```

Parameter

Table 104–5 START_PROPAGATION Procedure Parameter

Parameter	Description
`propagation_name`	The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `ENABLED`, then the propagation is started upon database instance startup.

STOP_PROPAGATION Procedure

This procedure stops a propagation.

Syntax

```
DBMS_PROPAGATION_ADM.STOP_PROPAGATION(
   propagation_name  IN  VARCHAR2,
   force             IN  BOOLEAN  DEFAULT FALSE);
```

Parameter

Table 104–6 STOP_PROPAGATION Procedure Parameter

Parameter	Description
`propagation_name`	The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner.
`force`	If `TRUE`, then the procedure stops the propagation and clears the statistics for the propagation. If `FALSE`, then the procedure stops the propagation without clearing the statistics for the propagation.

Usage Notes

The propagation status is persistently recorded. Hence, if the status is `DISABLED` or `ABORTED`, then the propagation is not started upon database instance startup.

105

DBMS_RANDOM

The DBMS_RANDOM package provides a built-in random number generator. DBMS_RANDOM is not intended for cryptography.

This chapter contains the following topics:

- Using DBMS_RANDOM
  - Security Model
  - Operational Notes
- Summary of DBMS_RANDOM Subprograms

Using DBMS_RANDOM

- Security Model
- Operational Notes

Security Model

This package should be installed as SYS. By default, the package is initialized with the current user name, current time down to the second, and the current session. Oracle recommends that users who need to execute this package should be given EXECUTE privilege explicitly and should not rely on PUBLIC EXECUTE privilege.

Operational Notes

- `DBMS_RANDOM.RANDOM` produces integers in [-2^^31, 2^^31).
- `DBMS_RANDOM.VALUE` produces numbers in [0,1) with 38 digits of precision.

`DBMS_RANDOM` can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, user ID, and process ID if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of `DBMS_RANDOM.SEED`. To produce different output for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

Summary of DBMS_RANDOM Subprograms

Table 105–1 DBMS_RANDOM Package Subprograms

Subprogram	Description
INITIALIZE Procedure on page 105-6	Initializes the package with a seed value
NORMAL Function on page 105-7	Returns random numbers in a normal distribution
RANDOM Procedure on page 105-8	Generates a random number
SEED Procedures on page 105-9	Resets the seed
STRING Function on page 105-10	Gets a random string
TERMINATE Procedure on page 105-11	Terminates package
VALUE Functions on page 105-12	This function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number x, where x is greater than or equal to `low` and less than `high`

Note: The INITIALIZE Procedure, RANDOM Procedure and the TERMINATE Procedure are all obsolete and, while currently supported, are included in this release for legacy reasons only.

INITIALIZE Procedure

This procedure initializes the generator (but see Usage Notes).

Syntax

```
DBMS_RANDOM.INITIALIZE (
   val  IN  BINARY_INTEGER);
```

Pragmas

```
PRAGMA restrict_references (initialize, WNDS)
```

Parameters

Table 105–2 INITIALIZE Procedure Parameters

Parameter	Description
val	The seed number used to generate a random number.

Usage Notes

This procedure is obsolete as it simply calls the SEED Procedures on page 105-9.

NORMAL Function

This function returns random numbers in a standard normal distribution.

Syntax

```
DBMS_RANDOM.NORMAL
  RETURN NUMBER;
```

Pragmas

```
PRAGMA restrict_references (normal, WNDS)
```

Return Values

Table 105–3 NORMAL Function Parameters

Parameter	Description
number	Returns a random number.

RANDOM Procedure

This procedure generates a random number (but see Usage Notes).

Syntax

```
DBMS_RANDOM.RANDOM
   RETURN binary_integer;
```

Pragmas

```
PRAGMA restrict_references (random, WNDS)
```

Return Values

Table 105–4 RANDOM Procedure Parameters

Parameter	Description
`binary_integer`	Returns a random integer greater or equal to -power(2,31) and less than power(2,31).

Usage Notes

This procedure is obsolete and, although it is currently supported, it should not be used.

SEED Procedures

This procedure resets the seed.

Syntax

```
DBMS_RANDOM.SEED (
   seed  IN  BINARY_INTEGER);

DBMS_RANDOM.SEED (
   seed  IN  VARCHAR2);
```

Pragmas

```
PRAGMA restrict_references (seed, WNDS);
```

Parameters

Table 105–5 SEED Procedure Parameters

Parameter	Description
seed	Seed number or string used to generate a random number.

Usage Notes

The seed can be a string up to length 2000.

STRING Function

This function gets a random string.

Syntax

```
DBMS_RANDOM.STRING
   opt  IN  CHAR,
   len  IN  NUMBER)
  RETURN VARCHAR2;
```

Pragmas

```
PRAGMA restrict_references (string, WNDS)
```

Parameters

Table 105–6 STRING Function Parameters

Parameter	Description
opt	Specifies what the returning string looks like: ■ 'u', 'U' - returning string in uppercase alpha characters ■ 'l', 'L' - returning string in lowercase alpha characters ■ 'a', 'A' - returning string in mixed case alpha characters ■ 'x', 'X' - returning string in uppercase alpha-numeric characters ■ 'p', 'P' - returning string in any printable characters. Otherwise the returning string is in uppercase alpha characters.
len	The length of the returning string.

Return Values

Table 105–7 STRING Function Return Values

Parameter	Description
VARCHAR2	Returns a VARCHAR2.

TERMINATE Procedure

When you are finished with the package, call the TERMINATE procedure (but see Usage Notes)

Syntax

```
DBMS_RANDOM.TERMINATE
```

Usage Notes

This procedure performs no function and, although it is currently supported, it is obsolete and should not be used.

VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number x, where x is greater than or equal to `low` and less than `high`.

Syntax

```
DBMS_RANDOM.VALUE
  RETURN NUMBER;

DBMS_RANDOM.VALUE(
  low  IN  NUMBER,
  high IN  NUMBER)
RETURN NUMBER;
```

Parameters

Table 105–8 VALUE Function Parameters

Parameter	Description
`low`	The lowest number in a range from which to generate a random number. The number generated may be equal to `low`.
`high`	The highest number below which to generate a random number. The number generated will be less than `high`.

Return Values

Table 105–9 VALUE Function Return Values

Parameter	Description
`NUMBER`	Returns an Oracle Number.

106

DBMS_RECTIFIER_DIFF

The `DBMS_RECTIFIER_DIFF` package provides an interface used to detect and resolve data inconsistencies between two replicated sites.

- Documentation of DBMS_RECTIFIER_DIFF

Documentation of DBMS_RECTIFIER_DIFF

For a complete description of this package within the context of Replication, see DBMS_RECTIFIER_DIFF in the *Oracle Database Advanced Replication Management API Reference*.

107

DBMS_REDEFINITION

The `DBMS_REDEFINITION` package provides an interface to perform an online redefinition of tables.

> **See Also:** *Oracle Database Administrator's Guide* for more information about online redefinition of tables

This chapter contains the following topics:

- Using DBMS_REDEFINITION
  - Overview
  - Constants
  - Operational Notes
- Summary of DBMS_REDEFINITION Subprograms

Using DBMS_REDEFINITION

- Overview
- Constants
- Operational Notes

Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

Constants

The DBMS_REDEFINITION package uses the constantsshown in Table 107–1, " DBMS_REDEFINITION Constants":

Table 107–1 DBMS_REDEFINITION Constants

Constant	Type	Value	Description
CONS_CONSTRAINT	PLS_INTEGER	3	Used to specify that dependent object type is a constraint
CONS_INDEX	PLS_INTEGER	2	Used to specify that dependent object type is a index
CONS_MVLOG	PLS_INTEGER	10	Used to (un)register a materialized view log, as a dependent object of the table, through the REGISTER_DEPENDENT_OBJECT Procedureand the UNREGISTER_DEPENDENT_OBJECT Procedure.
CONS_ORIG_PARAMS	PLS_INTEGER	1	Used to specify that indexes should be cloned with their original storage parameters
CONS_TRIGGER	PLS_INTEGER	4	Used to specify that dependent object type is a trigger
CONS_USE_PK	BINARY_INTEGER	1	Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having not-NULL constraints)
CONS_USE_ROWID	BINARY_INTEGER	2	Used to indicate that the redefinition should be done using rowids

Operational Notes

- CONS_USE_PK and CONS_USE_ROWID are constants used as input to the "options_flag" parameter in both the START_REDEF_TABLE Procedure and CAN_REDEF_TABLE Procedure. CONS_USE_ROWID is used to indicate that the redefinition should be done using rowids while CONS_USE_PK implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).
- CONS_INDEX, CONS_MVLOG,CONS_TRIGGER and CONS_CONSTRAINT are used to specify the type of the dependent object being (un)registered in REGISTER_DEPENDENT_OBJECT Procedure and UNREGISTER_DEPENDENT_OBJECT Procedure (parameter "dep_type").

  CONS_INDEX ==> dependent object is of type INDEX

  CONS_TRIGGER ==> dependent object is of type TRIGGER

  CONS_CONSTRAINT==> dependent object type is of type CONSTRAINT

  CONS_MVLOG ==> dependent object is of type MATERIALIZED VIEW LOG
- CONS_ORIG_PARAMS as used as input to the "copy_indexes" parameter in COPY_TABLE_DEPENDENTS Procedure. Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

Rules and Limits

For information about various rules and limits that apply to implementation of this package, see the *Oracle Database Administrator's Guide*.

Summary of DBMS_REDEFINITION Subprograms

Table 107–2 DBMS_REDEFINITION Package Subprograms

Subprogram	Description
ABORT_REDEF_TABLE Procedure on page 107-8	Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process
CAN_REDEF_TABLE Procedure on page 107-9	Determines if a given table can be redefined online
COPY_TABLE_DEPENDENTS Procedure on page 107-10	Copies the dependent objects of the original table onto the interim table
FINISH_REDEF_TABLE Procedure on page 107-12	Completes the redefinition process.
REGISTER_DEPENDENT_OBJECT Procedure on page 107-13	Registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table
START_REDEF_TABLE Procedure on page 107-14	Initiates the redefinition process
SYNC_INTERIM_TABLE Procedure on page 107-15	Keeps the interim table synchronized with the original table
UNREGISTER_DEPENDENT_OBJECT Procedure on page 107-16	Unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table

ABORT_REDEF_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process. This procedure can also be used to terminate the redefinition process any time after the START_REDEF_TABLE Procedure has been called and before the FINISH_REDEF_TABLE Procedure is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

Syntax

```
DBMS_REDEFINITION.ABORT_REDEF_TABLE (
   uname       IN VARCHAR2,
   orig_table  IN VARCHAR2,
   int_table   IN VARCHAR2,
  part_name    IN  VARCHAR2 := NULL);
```

Parameters

Table 107–3 ABORT_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

CAN_REDEF_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

Syntax

```
DBMS_REDEFINITION.CAN_REDEF_TABLE (
   uname         IN  VARCHAR2,
   tname        IN  VARCHAR2,
   options_flag  IN  PLS_INTEGER := 1,
   part_name     IN  VARCHAR2 := NULL);
```

Parameters

Table 107–4 CAN_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the table
tname	The name of the table to be re-organized
options_flag	Indicates the type of redefinition method to use. ■ If dbms_redefinition.cons_use_pk, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys. ■ If dbms_redefinition.cons_use_rowid, the redefinition is done using rowids.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

COPY_TABLE_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

Syntax

```
DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS(
   uname                   IN  VARCHAR2,
   orig_table              IN  VARCHAR2,
   int_table               IN  VARCHAR2,
   copy_indexes            IN  PLS_INTEGER := 1,
   copy_triggers           IN  BOOLEAN     := TRUE,
   copy_constraints        IN  BOOLEAN     := TRUE,
   copy_privileges         IN  BOOLEAN     := TRUE,
   ignore_errors           IN  BOOLEAN     := FALSE,
   num_errors              OUT PLS_INTEGER,
   copy_statistics         IN  BOOLEAN     := FALSE,
   copy_mvlog              IN  BOOLEAN     := FALSE);
```

Parameters

Table 107–5 COPY_TABLE_DEPENDENTS Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table being redefined.
int_table	The name of the interim table.
copy_indexes	A flag indicating whether to copy the indexes ■ 0 - do not copy any index ■ dbms_redefinition.cons_orig_params – copy the indexes using the physical parameters of the source indexes
copy_triggers	TRUE = clone triggers, FALSE = do nothing
copy_constraints	TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2 or higher, then clone CHECK and NOT NULL constraints
copy_privileges	TRUE = clone privileges, FALSE = do nothing
ignore_errors	TRUE = if an error occurs while cloning a particular dependent object, then skip that object and continue cloning other dependent objects. FALSE = that the cloning process should stop upon encountering an error.
num_errors	The number of errors that occurred while cloning dependent objects
copy_statistics	TRUE = copy statistics, FALSE = do nothing
copy_mvlog	TRUE = copy materialized view log, FALSE = do nothing

Usage Notes

- The user must check the column `num_errors` before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the COPY_TABLE_DEPENDENTS Procedure again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the REGISTER_DEPENDENT_OBJECT Procedure.
- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.

FINISH_REDEF_TABLE Procedure

This procedure completes the redefinition process. Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (
   uname       IN VARCHAR2,
   orig_table  IN VARCHAR2,
   int_table   IN VARCHAR2,
   part_name   IN  VARCHAR2 := NULL);
```

Parameters

Table 107–6 FINISH_REDEF_TABLE Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

REGISTER_DEPENDENT_OBJECT Procedure

This procedure registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same

Syntax

```
DBMS_REDEFINITION.REGISTER_DEPEPENDENT_OBJECT(
   uname             IN VARCHAR2,
   orig_table        IN VARCHAR2,
   int_table         IN VARCHAR2,
   dep_type          IN  PLS_INTEGER,
   dep_owner         IN VARCHAR2,
   dep_orig_name     IN VARCHAR2,
   dep_int_name      IN  VARCHAR2);
```

Parameters

Table 107–7 REGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

Usage Notes

- Attempting to register an already registered object will raise an error.
- Registering a dependent object will automatically remove that object from DBA_REDEFINITION_ERRORS if an entry exists for that object.

START_REDEF_TABLE Procedure

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

Syntax

```
DBMS_REDEFINITION.START_REDEF_TABLE (
   uname          IN VARCHAR2,
   orig_table     IN VARCHAR2,
   int_table      IN VARCHAR2,
   col_mapping    IN VARCHAR2 := NULL,
   options_flag   IN BINARY_INTEGER := 1,
   orderby_cols   IN VARCHAR2 := NULL,
   part_name     IN  VARCHAR2 := NULL);
```

Parameters

Table 107–8 START_REDEF_TABLE Procedure Parameters

Parameter	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
col_mapping	The mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the SELECT clause of a query.) If NULL, all the columns in the original table are selected and have the same name after redefinition.
options_flag	Indicates the type of redefinition method to use. ■ If dbms_redefinition.cons_use_pk, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys. ■ If dbms_redefinition.cons_use_rowid, the redefinition is done using rowids.
orderby_cols	This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)
part_name	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.

SYNC_INTERIM_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

Syntax

```
DBMS_REDEFINITION.SYNC_INTERIM_TABLE (
   uname          IN  VARCHAR2,
   orig_table     IN  VARCHAR2,
   int_table      IN  VARCHAR2,
   part_name      IN  VARCHAR2 := NULL);
```

Parameters

Table 107–9 SYNC_INTERIM_TABLE Procedure Parameters

Parameter	Description
`uname`	The schema name of the table.
`orig_table`	The name of the table to be redefined.
`int_table`	The name of the interim table.
`part_name`	The name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. `NULL` implies the entire table is being redefined.

Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the FINISH_REDEF_TABLE Procedure before completing the online redefinition.
- This procedure can be called between long running operations (such as `CREATE INDEX`) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

UNREGISTER_DEPENDENT_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

```
DBMS_REDEFINITION.UNREGISTER_DEPEPENDENT_OBJECT(
   uname              IN VARCHAR2,
   orig_table        IN VARCHAR2,
   int_table         IN VARCHAR2,
   dep_type          IN PLS_INTEGER,
   dep_owner         IN VARCHAR2,
   dep_orig_name     IN VARCHAR2,
   dep_int_name      IN  VARCHAR2);
```

Parameters

Table 107–10 UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

Parameters	Description
uname	The schema name of the tables.
orig_table	The name of the table to be redefined.
int_table	The name of the interim table.
dep_type	The type of the dependent object.
dep_owner	The owner of the dependent object.
dep_orig_name	The name of the original dependent object.
dep_int_name	The name of the interim dependent object.

108

DBMS_REFRESH

The DBMS_REFRESH package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time.

- Documentation of DBMS_REFRESH

Documentation of DBMS_REFRESH

For a complete description of this package within the context of Replication, see `DBMS_REFRESH` in the *Oracle Database Advanced Replication Management API Reference*.

109

DBMS_REPAIR

The DBMS_REPAIR package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

> **See Also:** For detailed information about using the DBMS_REPAIR package, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

- Using DBMS_REPAIR
  - Overview
  - Security Model
  - Constants
  - Operating Notes
  - Exceptions
  - Examples
- Summary of DBMS_REPAIR Subprograms

Using DBMS_REPAIR

- Overview
- Security Model
- Constants
- Operating Notes
- Exceptions
- Examples

Overview

Note: The DBMS_REPAIR package is intended for use by database administrators only. It is not intended for use by application developers.

Security Model

The package is owned by `SYS`. Execution privilege is not granted to other users.

Constants

The DBMS_REPAIR package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_REPAIR.TABLE_OBJECT.

Table 109–1 lists the parameters and the enumerated constants.

Table 109–1 DBMS_REPAIR Parameters with Enumerated Constants

Parameter	Option	Type	Description
object_type	■ TABLE_OBJECT ■ INDEX_OBJECT ■ CLUSTER_OBJECT	BINARY_ INTEGER	-
action	■ CREATE_ACTION ■ DROP_ACTION ■ PURGE_ACTION	BINARY_ INTEGER	-
table_type	■ REPAIR_TABLE ■ ORPHAN_TABLE	BINARY_ INTEGER	-
flags	■ SKIP_FLAG ■ NOSKIP_FLAG	BINARY_ INTEGER	-
object_id	■ ALL_INDEX_ID := 0	BINARY_ INTEGER	Clean up all objects that qualify
wait_for_lock	■ LOCK_WAIT := 1 ■ LOCK_NOWAIT := 0	BINARY_ INTEGER	Specifies whether to try getting DML locks on underlying table [[sub]partition] object

Note: The default table_name will be REPAIR_TABLE when table_type is REPAIR_TABLE, and will be ORPHAN_KEY_TABLE when table_type is ORPHAN_TABLE.

Operating Notes

The procedure to create the ORPHAN_KEYS_TABLE is similar to the one used to create the REPAIR_TABLE.

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;
```

The DBA would create the repair and orphan keys tables once. Subsequent executions of the CHECK_OBJECT Procedure would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the 'REPAIR_' prefix, and the name of the orphan keys table must begin with the 'ORPHAN_' prefix. The following code is also legal:

```
CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE,
                              DBMS_REPAIR.CREATE_ACTION);
DESCRIBE ORPHAN_FOOBAR;
DESCRIBE REPAIR_ABCD;
SELECT * FROM ORPHAN_FOOBAR;
SELECT * FROM REPAIR_ABCD;
```

When invoking the CHECK_OBJECT Procedure the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the ADMIN_TABLES Procedure or CREATE_ACTION.

Other actions in the ADMIN_TABLES Procedure can be used to purge/delete the REPAIR_TABLE and the ORPHAN_KEYS_TABLE.

Exceptions

Table 109–2 DBMS_REPAIR Exceptions

Exception	Description	Action
942	Reported by DBMS_REPAIR.ADMIN_TABLES during a DROP_ACTION when the specified table doesn't exist.	-
955	Reported by DBMS_REPAIR.CREATE_ACTION when the specified table already exists.	-
24120	An invalid parameter was passed to the specified DBMS_REPAIR procedure.	Specify a valid parameter value or use the parameter's default.
24122	An incorrect block range was specified.	Specify correct values for the BLOCK_START and BLOCK_END parameters.
24123	An attempt was made to use the specified feature, but the feature is not yet implemented.	Do not attempt to use the feature.
24124	An invalid ACTION parameter was specified.	Specify CREATE_ACTION, PURGE_ACTION or DROP_ACTION for the ACTION parameter.
24125	An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since DBMS_REPAIR.CHECK_OBJECT was run.	Use DBMS_REPAIR.ADMIN_TABLES to purge the repair table and run DBMS_REPAIR.CHECK_OBJECT to determine whether there are any corrupt blocks to be fixed.
24127	TABLESPACE parameter specified with an ACTION other than CREATE_ACTION.	Do not specify TABLESPACE when performing actions other than CREATE_ACTION.
24128	A partition name was specified for an object that is not partitioned.	Specify a partition name only if the object is partitioned.
24129	An attempt was made to pass a table name parameter without the specified prefix.	Pass a valid table name parameter.
24130	An attempt was made to specify a repair or orphan table that does not exist.	Specify a valid table name parameter.
24131	An attempt was made to specify a repair or orphan table that does not have a correct definition.	Specify a table name that refers to a properly created table.
24132	An attempt was made to specify a table name is greater than 30 characters long.	Specify a valid table name parameter.

Examples

```
/* Fix the bitmap status for all the blocks in table mytab in schema sys */

EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');

/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/

EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT,1, 45, 1);
```

Summary of DBMS_REPAIR Subprograms

Table 109–3 DBMS_REPAIR Package Subprograms

Subprogram	Description
ADMIN_TABLES Procedure on page 109-10	Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions
CHECK_OBJECT Procedure on page 109-11	Detects and reports corruptions in a table or index
DUMP_ORPHAN_KEYS Procedure on page 109-13	Reports on index entries that point to rows in corrupt data blocks
FIX_CORRUPT_BLOCKS Procedure on page 109-14	Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT
ONLINE_INDEX_CLEAN Function on page 109-15	Performs a manual cleanup of failed or interrupted online index builds or rebuilds
REBUILD_FREELISTS Procedure on page 109-16	Rebuilds an object's freelists
SEGMENT_FIX_STATUS Procedure on page 109-17	Fixes the corrupted state of a bitmap entry
SKIP_CORRUPT_BLOCKS Procedure on page 109-18	Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered

ADMIN_TABLES Procedure

This procedure provides administrative functions for the DBMS_REPAIR package repair and orphan key tables.

Syntax

```
DBMS_REPAIR.ADMIN_TABLES (
   table_name  IN   VARCHAR2,
   table_type  IN   BINARY_INTEGER,
   action      IN   BINARY_INTEGER,
   tablespace  IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 109–4 ADMIN_TABLES Procedure Parameters

Parameter	Description
table_name	Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.
table_type	Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See "Constants" on page 109-5.
action	Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_<table_name> is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See "Constants" on page 109-5.
tablespace	Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.

CHECK_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

Syntax

```
DBMS_REPAIR.CHECK_OBJECT (
   schema_name       IN  VARCHAR2,
   object_name       IN  VARCHAR2,
   partition_name    IN  VARCHAR2       DEFAULT NULL,
   object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
   repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
   flags             IN  BINARY_INTEGER DEFAULT NULL,
   relative_fno      IN  BINARY_INTEGER DEFAULT NULL,
   block_start       IN  BINARY_INTEGER DEFAULT NULL,
   block_end         IN  BINARY_INTEGER DEFAULT NULL,
   corrupt_count     OUT BINARY_INTEGER);
```

Parameters

Table 109–5 CHECK_OBJECT Procedure Parameters

Parameter	Description
schema_name	Schema name of the object to be checked.
object_name	Name of the table or index to be checked.
partition_name	Partition or subpartition name to be checked. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See "Constants" on page 109-5.
repair_table_name	Name of the repair table to be populated. The table must exist in the SYS schema. Use the ADMIN_TABLES Procedure to create a repair table. The default name is REPAIR_TABLE.
flags	Reserved for future use.
relative_fno	Relative file number: Used when specifying a block range.
block_start	First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.
block_end	Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of block_start or block_end is specified, then the other defaults to the first or last block in the file respectively.
corrupt_count	Number of corruptions reported.

Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.

DUMP_ORPHAN_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

Syntax

```
DBMS_REPAIR.DUMP_ORPHAN_KEYS (
   schema_name       IN  VARCHAR2,
   object_name       IN  VARCHAR2,
   partition_name    IN  VARCHAR2       DEFAULT NULL,
   object_type       IN  BINARY_INTEGER DEFAULT INDEX_OBJECT,
   repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
   orphan_table_name IN  VARCHAR2       DEFAULT 'ORPHAN_KEYS_TABLE',
   flags             IN  BINARY_INTEGER DEFAULT NULL,
   key_count         OUT BINARY_INTEGER);
```

Parameters

Table 109–6 DUMP_ORPHAN_KEYS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Object name.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. The default is INDEX_OBJECT See "Constants" on page 109-5.
repair_table_name	Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.
orphan_table_name	Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.
flags	Reserved for future use.
key_count	Number of index entries processed.

FIX_CORRUPT_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the CHECK_OBJECT Procedure.

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

Syntax

```
DBMS_REPAIR.FIX_CORRUPT_BLOCKS (
   schema_name       IN  VARCHAR2,
   object_name       IN  VARCHAR2,
   partition_name    IN  VARCHAR2       DEFAULT NULL,
   object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
   repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
   flags             IN  BINARY_INTEGER DEFAULT NULL,
   fix_count         OUT BINARY_INTEGER);
```

Parameters

Table 109–7 FIX_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Name of the object with corrupt blocks to be fixed.
partition_name	Partition or subpartition name to be processed. If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See "Constants" on page 109-5.
repair_table_name	Name of the repair table with the repair directives. Must exist in the SYS schema.
flags	Reserved for future use.
fix_count	Number of blocks fixed.

ONLINE_INDEX_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds. This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns `TRUE` if all indexes specified were cleaned up and `FALSE` if one or more indexes could not be cleaned up.

Syntax

```
DBMS_REPAIR.ONLINE_INDEX_CLEAN (
   object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
   wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
 RETURN BOOLEAN;
```

Parameters

Table 109–8 ONLINE_INDEX_CLEAN Function Parameters

Parameter	Description
`object_id`	Object id of index to be cleaned up. The default cleans up all object ids that qualify.
`wait_for_lock`	This parameter specifies whether to try getting DML locks on underlying table [[sub]partition] object. The default retries up to an internal retry limit, after which the lock get will give up. If `LOCK_NOWAIT` is specified, then the lock get does not retry.

REBUILD_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object. All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

Syntax

```
DBMS_REPAIR.REBUILD_FREELISTS (
   schema_name    IN VARCHAR2,
   object_name    IN  VARCHAR2,
   partition_name IN VARCHAR2 DEFAULT NULL,
   object_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

Parameters

Table 109–9 REBUILD_FREELISTS Procedure Parameters

Parameter	Description
schema_name	Schema name.
object_name	Name of the object whose freelists are to be rebuilt.
partition_name	Partition or subpartition name whose freelists are to be rebuilt. If this is a partitioned object, and partition_name is not specified, then all partitions and subpartitions are processed. If this is a partitioned object, and the specified partition contains subpartitions, then all subpartitions are processed.
object_type	Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT. See"Constants" on page 109-5.

SEGMENT_FIX_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

Syntax

```
DBMS_REPAIR.SEGMENT_FIX_STATUS (
   segment_owner   IN VARCHAR2,
   segment_name    IN VARCHAR2,
   segment_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
   file_number     IN BINARY_INTEGER DEFAULT NULL,
   block_number    IN BINARY_INTEGER DEFAULT NULL,
   status_value    IN BINARY_INTEGER DEFAULT NULL,
   partition_name  IN VARCHAR2 DEFAULT NULL,);
```

Parameters

Table 109–10 SEGMENT_FIX_STATUS Procedure Parameters

Parameter	Description
schema_owner	Schema name of the segment.
segment_name	Segment name.
partition_name	Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.
segment_type	Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.
file_number	(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
block_number	(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.
status_value	(optional) The value to which the block status described by the file_number and block_number will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values: ■ 1 = block is full ■ 2 = block is 0-25% free ■ 3 = block is 25-50% free ■ 4 = block is 50-75% free ■ 5 = block is 75-100% free The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.

SKIP_CORRUPT_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

> **Note:** When Oracle performs an index range scan on a corrupt index after DBMS_REPAIR.SKIP_CORRUPT_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (
   schema_name  IN VARCHAR2,
   object_name  IN VARCHAR2,
   object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
   flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

Parameters

Table 109–11 SKIP_CORRUPT_BLOCKS Procedure Parameters

Parameter	Description
`schema_name`	Schema name of the object to be processed.
`object_name`	Name of the object.
`object_type`	Type of the object to be processed. This must be either `TABLE_OBJECT` (default) or `CLUSTER_OBJECT`. See "Constants" on page 109-5.
`flags`	If `SKIP_FLAG` is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If `NOSKIP_FLAG` is specified, then scans that encounter software corrupt blocks return an `ORA-1578`. See"Constants" on page 109-5.

110

DBMS_REPCAT

The DBMS_REPCAT package provides routines to administer and update the replication catalog and environment.

- Documentation of DBMS_REPCAT

Documentation of DBMS_REPCAT

For a complete description of this package within the context of Replication, see `DBMS_REPCAT` in the *Oracle Database Advanced Replication Management API Reference.*

111

DBMS_REPCAT_ADMIN

The DBMS_REPCAT_ADMIN package enables you to create users with the privileges needed by the symmetric replication facility.

- Documentation of DBMS_REPCAT_ADMIN

Documentation of DBMS_REPCAT_ADMIN

For a complete description of this package within the context of Replication, see `DBMS_REPCAT_ADMIN` in the *Oracle Database Advanced Replication Management API Reference*.

112

DBMS_REPCAT_INSTANTIATE

The `DBMS_REPCAT_INSTANTIATE` package instantiates deployment templates.

- Documentation of DBMS_REPCAT_INSTANTIATE

Documentation of DBMS_REPCAT_INSTANTIATE

For a complete description of this package within the context of Replication, see `DBMS_REPCAT_INSTANTIATE` in the *Oracle Database Advanced Replication Management API Reference*.

113

DBMS_REPCAT_RGT

The `DBMS_REPCAT_RGT` package controls the maintenance and definition of refresh group templates.

- Documentation of DBMS_REPCAT_RGT

Documentation of DBMS_REPCAT_RGT

For a complete description of this package within the context of Replication, see `DBMS_REPCAT_RGT` in the *Oracle Database Advanced Replication Management API Reference*.

114

DBMS_REPUTIL

The `DBMS_REPUTIL` package contains subprograms to generate shadow tables, triggers, and packages for table replication, as well as subprograms to generate wrappers for replication of standalone procedure invocations and packaged procedure invocations. This package is referenced only by the generated code.

- Documentation of DBMS_REPUTIL

Documentation of DBMS_REPUTIL

For a complete description of this package within the context of Replication, see `DBMS_REPUTIL` in the *Oracle Database Advanced Replication Management API Reference*.

115

DBMS_RESCONFIG

The DBMS_RESCONFIG package provides an interface to operate on the resource configuration list, and to retrieve listener information for a resource.

> **See Also:** *Oracle XML DB Developer's Guide* for more information about "Resource Configuration".

This chapter contains the following topics:

- Using DBMS_RESCONFIG
  - Overview
- Summary of DBMS_RESCONFIG Subprograms

Using DBMS_RESCONFIG

- Overview

Overview

The DBMS_RESCONFIG package contains functions and procedures to manage the resource configuration lists of individual resources and the repository.

Summary of DBMS_RESCONFIG Subprograms

This table list the package subprograms in alphabetical order.

Table 115–1 DBMS_RESCONFIG Package Subprograms

Subprogram	Description
ADDREPOSITORYRESCONFIG Procedure on page 115-5	Inserts the resource configuration specified by absolute path at the given position of the repository's configuration list
ADDRESCONFIG Procedure on page 115-6	Inserts the resource configuration specified by the absolute path at the given position in the target resource's configuration list
APPENDRESCONFIG Procedure on page 115-7	Appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list
DELETEREPOSITORYRESCONFIG Procedure on page 115-8	Removes the configuration at the given position in the repository's configuration list.
DELETERESCONFIG Procedures on page 115-9	Removes the configuration at the given position in the target resource's configuration list. I
GETLISTENERS Function on page 115-10	Returns the list of listeners applicable for a given resource
GETREPOSITORYRESCONFIG Function on page 115-11	Returns the resource configuration at the specified position of the repository's configuration list
GETREPOSITORYRESCONFIGPATHS Function on page 115-12	Returns a list of resource configuration paths defined for the repository
GETRESCONFIG Function on page 115-13	Returns the resource configuration at the specified position of the target resource's configuration list
GETRESCONFIGPATHS Function on page 115-14	Returns a list of resource configuration paths defined in the target resource's configuration list
PATCHREPOSITORYRESCONFIGLIST Procedure on page 115-15	Removes invalid references from the repository resource configuration list, and makes the repository available

ADDREPOSITORYRESCONFIG Procedure

This procedure inserts the resource configuration specified by absolute path of the resource configuration at the specified position of the repository's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDREPOSITORYRESCONFIG(
   rcpath     IN   VARCHAR2,
   pos        IN   PLS_INTEGER := NULL);
```

Parameters

Table 115–2 ADDREPOSITORYRESCONFIG Function Parameters

Parameter	Description
rcpath	Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.
pos	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range (pos < 0 or pos > the size of the target resource's configuration list).

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have XDBADMIN role and READ privilege on the resource configuration to be inserted; otherwise, an error is returned.

ADDRESCONFIG Procedure

This procedure inserts the resource configuration specified by the absolute path of the resource configuration at the given position in the target resource's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(
   respath    IN   VARCHAR2,
   rcpath     IN   VARCHAR2,
   pos        IN   PLS_INTEGER := NULL);
```

Parameters

Table 115–3 ADDRESCONFIG Function Parameters

Parameter	Description
`respath`	Absolute path of the target resource
`rcpath`	Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.
`pos`	Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range (`pos` < 0 or `pos` > the size of the target resource's configuration list).

Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig.xsd` schema.
- Users must have `WRITE-CONFIG` privilege on the target resource and read privilege on the resource configuration to be inserted; otherwise, an error is returned.

APPENDRESCONFIG Procedure

This procedure appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list.

Syntax

```
DBMS_RESCONFIG.ADDRESCONFIG(
   respath       IN   VARCHAR2,
   rcpath        IN   VARCHAR2,
   appendOption  IN   PLS_INTEGER);
```

Parameters

Table 115–4 ADDRESCONFIG Function Parameters

Parameter	Description
respath	Absolute path of the target resource
`rcpath`	Absolute path of the resource configuration to be appended at the end of the target's configuration list. If `rcpath` already exists in the list then nothing is appended.
`appendOption`	Either `APPEND_RESOURCE` or `APPEND_RECURSIVE`. If `APPEND_RESOURCE` is specified then only the target resource is affected. If `APPEND_RECURSIVE` is specified then the target resource and all its descendents will be affected.

Usage Notes

- An error is raised if the document referenced by `rcpath` is not based on `XDBResConfig`.xsd schema.
- Users must have `WRITE-CONFIG` privilege on all affected resources and required read privilege on the resource configuration to be inserted; otherwise, an error is returned.

DELETEREPOSITORYRESCONFIG Procedure

This procedure removes the configuration at the given position in the repository's configuration list. It shifts any subsequent elements to the left.

Syntax

```
DBMS_RESCONFIG.DELETEREPOSITORYRESCONFIG(
   pos           IN   PLS_INTEGER);
```

Parameters

Table 115–5 DELETEREPOSITORYRESCONFIG Function Parameters

Parameter	Description
`pos`	The index of the configuration to be removed. An exception is raised if the index is out of range (`pos` < 0 or `pos` >= the size of the target resource's configuration list).

Usage Notes

- Users must have `XDBADMIN` role to execute this.
- This statement is treated as if it is a DDL statement. This means the system will implicitly commit before and after this statement.

DELETERESCONFIG Procedures

This procedure removes the configuration at the given position in the target resource's configuration list. It shifts any subsequent elements to the left. Users can use the overloaded for recursive deletion.

Syntax

```
DBMS_RESCONFIG.DELETERESCONFIG(
   respath       IN   VARCHAR2,
   pos           IN   PLS_INTEGER);

DBMS_RESCONFIG.DELETERESCONFIG(
   respath        IN  VARCHAR2,
   rcpath         IN  VARCHAR2,
   deleteOption   IN  PLS_INTEGER);
```

Parameters

Table 115–6 DELETERESCONFIG Procedure Parameters

Parameter	Description
`respath`	Absolute path of the target resource
`pos`	The index of the configuration to be removed. An exception is raised if the index is out of range (`pos` < 0 or `pos` >= the size of the target resource's configuration list).
`rcpath`	Absolute path of the resource configuration to be deleted if found in list.
`deleteOption`	Either `DELETE_RESOURCE` or `DELETE_RECURSIVE`. If `DELETE_RESOURCE` is specified then only the configuration list of the target resource is affected. If `DELETE_RECURSIVE` is specified then the configuration list of the target resource and all its descendents will be affected.

Usage Notes

Users must have `WRITE-CONFIG` privilege on the target resource to execute this.

GETLISTENERS Function

This function returns the list of listeners applicable for a given resource.

The value returned by this function is an XML document containing the `<event-listeners>` element of the `XDBResconfig.xsd` schema. It contains all the listeners applicable to the target resource, including repository-level listeners. From the returned XML document users can use the `EXTRACT` operator to retrieve the listeners defined for a specific event.

Syntax

```
DBMS_RESCONFIG.GETLISTENERS(
   path    IN   VARCHAR2)
 RETURN XMLTYPE;
```

Parameters

Table 115–7 GETLISTENERS Function Parameters

Parameter	Description
`path`	Absolute path of the target resource

Usage Notes

Users must have the required access privilege on all resource configurations referenced by the repository and the target resource; otherwise, an error is returned.

GETREPOSITORYRESCONFIG Function

This function returns the resource configuration at the specified position of the repository's configuration list.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIG(
   pos    IN   PLS_INTEGER)
 RETURN XMLTYPE;
```

Parameters

Table 115–8 GETREPOSITORYRESCONFIG Function Parameters

Parameter	Description
pos	Index of element to return. An exception is raised if the index is out of range (pos < 0 or pos >= the size of the repository's configuration list).

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

GETREPOSITORYRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined for the repository.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIGPATHS
 RETURN XDB$STRING_LIST_T;
```

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

GETRESCONFIG Function

This function returns the resource configuration at the specified position of the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIG(
   respath IN VARCHAR2,
   pos IN PLS_INTEGER)
 RETURN XMLTYPE;
```

Parameters

Table 115–9 GETRESCONFIG Function Parameters

Parameter	Description
`respath`	Absolute path of the target resource
`pos`	Index of element to return. An exception is raised if the index is out of range (`pos` < 0 or `pos` >= the size of the target resource's configuration list).

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

GETRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined in the target resource's configuration list.

Syntax

```
DBMS_RESCONFIG.GETRESCONFIGPATHS(
   respath IN VARCHAR2)
 RETURN XDB$STRING_LIST_T;
```

Parameters

Table 115–10 GETRESCONFIGPATHS Function Parameters

Parameter	Description
`respath`	Absolute path of the target resource

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.

PATCHREPOSITORYRESCONFIGLIST Procedure

Under normal circumstances, deletion of a resource configuration resource cannot be performed if it is part of the repository resource configuration list. If, for some reason, the deletion of a resource configuration resource that is part of the repository resource configuration list succeeds, then any repository operation results in a 'dangling reference' error. This procedure removes invalid references from the repository resource configuration list, and makes the repository available. This procedure must be run as `SYS`.

Syntax

```
DBMS_RESCONFIG.PATCHREPOSITORYRESCONFIGLIST;
```

116

DBMS_RESOURCE_MANAGER

The DBMS_RESOURCE_MANAGER package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

> **See Also:** For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

- Using DBMS_RESOURCE_MANAGER
  - Deprecated Subprograms
  - Security Model
  - Constants
- Summary of DBMS_RESOURCE_MANAGER Subprograms

Using DBMS_RESOURCE_MANAGER

- Deprecated Subprograms
- Security Model
- Constants

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11*g*:

- SET_INITIAL_CONSUMER_GROUP Procedure

Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures. The procedures to grant and revoke this privilege are in the package Chapter 117, "DBMS_RESOURCE_MANAGER_PRIVS".

Constants

Table 116–1 DBMS_RESOURCE_MANAGER Constants

Constant	Type	Value	Description
CLIENT_MACHINE	VARCHAR2(30)	CLIENT_MACHINE	Name of the computer from which the client is making the connection
CLIENT_OS_USER	VARCHAR2(30)	CLIENT_OS_USER	Operating system user name of the client that is logging in
CLIENT_PROGRAM	VARCHAR2(30)	CLIENT_PROGRAM	Name of the client program used to log in to the server
MODULE_NAME	VARCHAR2(30)	MODULE_NAME	Module name in the currently running application as set by the SET_MODULE Procedure in the DBMS_APPLICATION_INFO package, or the equivalent OCI attribute setting
MODULE_NAME_ACTION	VARCHAR2(30)	MODULE_NAME_ACTION	A combination of the current module and the action being performed as set by either of the following procedures in the DBMS_APPLICATION_INFO package, or their equivalent OCI attribute setting: ■ SET_MODULE Procedure ■ SET_ACTION Procedure The attribute is specified as the module name followed by a period (.), followed by the action name (*module_name.action_name*).
ORACLE_FUNCTION	VARCHAR2(30)	ORACLE_FUNCTION	Function the session is currently executing. Valid functions are the BACKUP, COPY, and DATALOAD. BACKUP is set for sessions that are doing backup operations using RMAN. COPY is set for sessions that are doing image copies via RMAN. DATALOAD is set for sessions that are loading data using datapump.
ORACLE_USER	VARCHAR2(30)	ORACLE_USER	Oracle Database user name
SERVICE_MODULE	VARCHAR2(30)	SERVICE_MODULE	Combination of service and module names in this form: *service_name.module_name*
SERVICE_MODULE_ACTION	VARCHAR2(30)	SERVICE_MODULE_ACTION	Combination of service name, module name, and action name, in this form: *service_name.module_name.action_name*
SERVICE_NAME	VARCHAR2(30)	SERVICE_NAME	Service name used by the client to establish a connection

Table 116–1 (Cont.) DBMS_RESOURCE_MANAGER Constants

Constant	Type	Value	Description
PERFORMANCE_CLASS	VARCHAR2(30)	PERFORMANCE_CLASS	Oracle Database user name

Summary of DBMS_RESOURCE_MANAGER Subprograms

Table 116–2 DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
CALIBRATE_IO Procedure on page 116-9	Calibrates the I/O capabilities of storage
CLEAR_PENDING_AREA Procedure on page 116-12	Clears the work area for the resource manager
CREATE_CATEGORY Procedure on page 116-13	Creates a new resource consumer group category
CREATE_CONSUMER_GROUP Procedure on page 116-14	Creates entries which define resource consumer groups
CREATE_PENDING_AREA Procedure on page 116-15	Creates a work area for changes to resource manager objects
CREATE_PLAN Procedure on page 116-17	Creates entries which define resource plans
CREATE_PLAN_DIRECTIVE Procedure on page 116-18	Creates resource plan directives
CREATE_SIMPLE_PLAN Procedure on page 116-22	Creates a single-level resource plan containing up to eight consumer groups in one step
DELETE_CATEGORY Procedure on page 116-24	Deletes an existing resource consumer group category
DELETE_CONSUMER_GROUP Procedure on page 116-25	Deletes entries which define resource consumer groups
DELETE_PLAN Procedure on page 116-26	Deletes the specified plan as well as all the plan directives it refers to
DELETE_PLAN_CASCADE Procedure on page 116-27	Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups)
DELETE_PLAN_DIRECTIVE Procedure on page 116-28	Deletes resource plan directives
SET_CONSUMER_GROUP_MAPPING Procedure on page 116-29	Adds, deletes, or modifies entries for the login and run-time attribute mappings
SET_CONSUMER_GROUP_MAPPING_PRI Procedure on page 116-30	Creates the session attribute mapping priority list
SET_INITIAL_CONSUMER_GROUP Procedure on page 116-31	Assigns the initial resource consumer group for a user (Caution: Deprecated Subprogram)
SUBMIT_PENDING_AREA Procedure on page 116-32	Submits pending changes for the resource manager
SWITCH_CONSUMER_GROUP_FOR_SESS Procedure on page 116-33	Changes the resource consumer group of a specific session
SWITCH_CONSUMER_GROUP_FOR_USER Procedure on page 116-34	Changes the resource consumer group for all sessions with a given user name

Table 116–2 (Cont.) DBMS_RESOURCE_MANAGER Package Subprograms

Subprogram	Description
SWITCH_PLAN Procedure on page 116-35	Sets the current resource manager plan
UPDATE_CATEGORY Procedure on page 116-36	Updates an existing resource consumer group category
UPDATE_CONSUMER_ GROUP Procedure on page 116-37	Updates entries which define resource consumer groups
UPDATE_PLAN Procedure on page 116-38	Updates entries which define resource plans
UPDATE_PLAN_DIRECTIVE Procedure on page 116-39	Updates resource plan directives
VALIDATE_PENDING_AREA Procedure on page 116-43	Validates pending changes for the resource manager

CALIBRATE_IO Procedure

This procedure calibrates the I/O capabilities of storage. Calibration status is available from the V$IO_CALIBRATION_STATUS view and results for a successful calibration run are located in DBA_RSRC_IO_CALIBRATE table.

Syntax

```
DBMS_RESOURCE_MANAGER.CALIBRATE_IO (
   num_physical_disks      IN  PLS_INTEGER DEFAULT 1,
   max_latency             IN  PLS_INTEGER DEFAULT 20,
   max_iops                OUT PLS_INTEGER,
   max_mbps                OUT PLS_INTEGER,
   actual_latency          OUT PLS_INTEGER);
```

Parameters

Table 116–3 CALIBRATE_IO Procedure Parameters

Parameter	Description
num_physical_disks	Approximate number of physical disks in the database storage
max_latency	Maximum tolerable latency in milliseconds for database-block-sized IO requests
max_iops	Maximum number of I/O requests per second that can be sustained. The I/O requests are randomly-distributed, database-block-sized reads.
max_mbps	Maximum throughput of I/O that can be sustained, expressed in megabytes per second. The I/O requests are randomly-distributed, 1 megabyte reads.
actual_latency	Average latency of database-block-sized I/O requests at max_iops rate, expressed in milliseconds

Usage Notes

- Only users with the SYSDBA privilege can run this procedure. Qualified users must also turn on timed_statistics, and ensure asynch_io is enabled for datafiles. This can be achieved by setting filesystemio_options to either ASYNCH or SETALL. One can also query the asynch_io status by means of the following SQL statement:

```
col name format a50
SELECT name, asynch_io FROM v$datafile f,v$iostat_file i
  WHERE f.file#        = i.file_no
  AND   filetype_name  = 'Data File'
 /
```

- Only one calibration can be run at a time. If another calibration is initiated at the same time, it will fail.
- For an Oracle Real Application Clusters (RAC) database, the workload is simultaneously generated from all instances.

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about calibration

Examples

Example of using I/O Calibration procedure

```
SET SERVEROUTPUT ON
DECLARE
  lat  INTEGER;
  iops INTEGER;
  mbps INTEGER;
BEGIN
-- DBMS_RESOURCE_MANAGER.CALIBRATE_IO (<DISKS>, <MAX_LATENCY>, iops, mbps, lat);
   DBMS_RESOURCE_MANAGER.CALIBRATE_IO (2, 10, iops, mbps, lat);

  DBMS_OUTPUT.PUT_LINE ('max_iops = ' || iops);
  DBMS_OUTPUT.PUT_LINE ('latency  = ' || lat);
  dbms_output.put_line('max_mbps = ' || mbps);
end;
/
```

View for I/O calibration results

```
SQL> desc V$IO_CALIBRATION_STATUS
  Name                                      Null?    Type
  ----------------------------------------- -------- ----------------------------
  STATUS                                             VARCHAR2(13)
  CALIBRATION_TIME                                   TIMESTAMP(3)

SQL> desc gv$io_calibration_status
  Name                                      Null?    Type
  ----------------------------------------- -------- ----------------------------
  INST_ID                                            NUMBER
  STATUS                                             VARCHAR2(13)
  CALIBRATION_TIME                                   TIMESTAMP(3)

Column explanation:
-------------------
STATUS:
  IN PROGRESS   : Calibration in Progress (Results from previous calibration
                  run displayed, if available)
  READY         : Results ready and available from earlier run
  NOT AVAILABLE : Calibration results not available.

CALIBRATION_TIME: End time of the last calibration run
```

DBA table that stores I/O Calibration results

```
SQL> desc DBA_RSRC_IO_CALIBRATE
  Name                                      Null?    Type
  ----------------------------------------- -------- ----------------------------
  START_TIME                                         TIMESTAMP(6)
  END_TIME                                           TIMESTAMP(6)
  MAX_IOPS                                           NUMBER
  MAX_MBPS                                           NUMBER
  MAX_PMBPS                                          NUMBER
  LATENCY                                            NUMBER
  NUM_PHYSICAL_DISKS                                 NUMBER

comment on table DBA_RSRC_IO_CALIBRATE is
'Results of the most recent I/O calibration'
/
comment on column DBA_RSRC_IO_CALIBRATE.START_TIME is

```

CLEAR_PENDING_AREA Procedure

This procedure clears pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;
```

CREATE_CATEGORY Procedure

This procedure creates a new consumer group category. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans. The view DBA_RSRC_CATEGORIES defines the currently defined categories. The ADMINISTRATIVE, INTERACTIVE, BATCH, MAINTENANCE, and OTHER categories are available out-of-the-box.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CATEGORY (
   category    IN    VARCHAR2,
   comment     IN    VARCHAR2);
```

Parameters

Table 116–4 CREATE_CATEGORY Procedure Parameters

Parameter	Description
category	Name of consumer group category
comment	User's comment

CREATE_CONSUMER_GROUP Procedure

This procedure creates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (
   consumer_group  IN VARCHAR2,
   comment         IN VARCHAR2,
   cpu_mth         IN VARCHAR2 DEFAULT NULL,
   mgmt_mth        IN VARCHAR2 DEFAULT 'ROUND-ROBIN',
   category        IN VARCHAR2 DEFAULT 'OTHER');
```

Parameters

Table 116–5 CREATE_CONSUMER_GROUP Procedure Parameters

Parameter	Description
`consumer_group`	Name of the consumer group
`comment`	User's comment
`cpu_mth`	Name of CPU resource allocation method (deprecated)
`mgmt_mth`	Name of CPU resource allocation method
`category`	Describes the category of the consumer group. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans. The view `DBA_RSRC_CATEGORIES` defines the currently defined categories. Categories can be modified, using the CREATE_CATEGORY Procedure, UPDATE_CATEGORY Procedure, and DELETE_CATEGORY Procedure.

CREATE_PENDING_AREA Procedure

This procedure makes changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;
```

Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the `VALIDATE` procedure to confirm whether the changes you has made are valid. You do not have to do your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

> **Note:** Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.

The following rules must be adhered to, and they are checked whenever the validate or submit procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- For Oracle8*i*, the plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 28 plan directives coming from any given plan (that is, no plan can have more than 28 children).
- There cannot be more than 28 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROUPS` somewhere in any active plan schema.This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROUPS` directive.

If any of the preceding rules are broken when checked by the `VALIDATE` or `SUBMIT` procedures, then an informative error message is returned. You may then make changes to fix the problem(s) and reissue the validate or submit procedures.

CREATE_PLAN Procedure

This procedure creates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN (
   plan                      IN   VARCHAR2,
   comment                   IN   VARCHAR2,
   cpu_mth                   IN   VARCHAR2 DEFAULT NULL, -- deprecated
   active_sess_pool_mth      IN   VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',
   parallel_degree_limit_mth IN   VARCHAR2 DEFAULT
                                     'PARALLEL_DEGREE_LIMIT_ABSOLUTE',
   queueing_mth              IN   VARCHAR2 DEFAULT 'FIFO_TIMEOUT',
   mgmt_mth                  IN   VARCHAR2 DEFAULT 'EMPHASIS',
   sub_plan                  IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 116–6 CREATE_PLAN Procedure Parameters

Parameter	Description
plan	Name of the resource plan
comment	User's comment
cpu_mth	Allocation method for CPU resources (deprecated)
active_sess_pool_mth	Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.
parallel_degree_limit_mth	Resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.
queueing_mth	Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available
mgmt_mth	Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets ■ EMPHASIS - for multi-level plans that use percentages to specify how I/O is resources are distributed among consumer groups ■ RATIO - for single-level plans that use ratios to specify how I/O is resources are distributed
sub_plan	If TRUE, indicates that this plan is only intended for use as a sub-plan. Sub-plans are not required to have an OTHER_GROUPS directive. Default is FALSE.

Usage Notes

If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

CREATE_PLAN_DIRECTIVE Procedure

This procedure creates resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (
   plan                      IN VARCHAR2,
   group_or_subplan          IN VARCHAR2,
   comment                   IN VARCHAR2,
   cpu_p1                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p2                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p3                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p4                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p5                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p6                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p7                    IN NUMBER   DEFAULT NULL, -- deprecated
   cpu_p8                    IN NUMBER   DEFAULT NULL, -- deprecated
   active_sess_pool_p1       IN NUMBER   DEFAULT NULL,
   queueing_p1               IN NUMBER   DEFAULT NULL,
   parallel_degree_limit_p1  IN NUMBER   DEFAULT NULL,
   switch_group              IN VARCHAR2 DEFAULT NULL,
   switch_time               IN NUMBER   DEFAULT NULL,
   switch_estimate           IN BOOLEAN  DEFAULT FALSE,
   max_est_exec_time         IN NUMBER   DEFAULT NULL,
   undo_pool                 IN NUMBER   DEFAULT NULL,
   max_idle_time             IN NUMBER   DEFAULT NULL,
   max_idle_blocker_time     IN NUMBER   DEFAULT NULL,
   switch_time_in_call       IN NUMBER   DEFAULT NULL, -- deprecated
   mgmt_p1                   IN NUMBER   DEFAULT NULL,
   mgmt_p2                   IN NUMBER   DEFAULT NULL,
   mgmt_p3                   IN NUMBER   DEFAULT NULL,
   mgmt_p4                   IN NUMBER   DEFAULT NULL,
   mgmt_p5                   IN NUMBER   DEFAULT NULL,
   mgmt_p6                   IN NUMBER   DEFAULT NULL,
   mgmt_p7                   IN NUMBER   DEFAULT NULL,
   mgmt_p8                   IN NUMBER   DEFAULT NULL,
   switch_io_megabytes       IN NUMBER   DEFAULT NULL,
   switch_io_reqs            IN NUMBER   DEFAULT NULL,
   switch_for_call           IN BOOLEAN  DEFAULT NULL,
   max_utilization_limit     IN NUMBER   DEFAULT NULL);
```

Parameters

Table 116–7 CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
`plan`	Name of the resource plan
`group_or_subplan`	Name of the consumer group or subplan
`comment`	Comment for the plan directive
`cpu_p1`	-- deprecated: use `mgmt_p1` instead
`cpu_p2`	-- deprecated: use `mgmt_p2` instead)
`cpu_p3`	-- deprecated: use `mgmt_p3` instead)
`cpu_p4`	-- deprecated: use `mgmt_p4` instead)

Table 116–7 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
cpu_p5	-- deprecated: use mgmt_p5 instead)
cpu_p6	-- deprecated: use mgmt_p6 instead)
cpu_p7	-- deprecated: use mgmt_p7 instead)
cpu_p8	-- deprecated: use mgmt_p8 instead)
active_sess_pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
parallel_degree_ limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
switch_group	Specifies consumer group to switch to, once a switch condition is met. If the group name is 'CANCEL_SQL', then the current call is canceled when the switch condition is met. If the group name is 'KILL_SESSION', then the session is killed when the switch condition is met. Default is NULL.
switch_time	Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
max_est_exec_time	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
undo_pool	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.
max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
max_idle_blocker_ time	Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource
switch_time_in_call	Deprecated. If this parameter is specified, switch_time will be effectively set to switch_time_in_call and switch_ for_call will be effectively set to TRUE.
mgmt_p1	Resource allocation value for level 1 (replaces cpu_p1): ■ EMPHASIS - specifies the resource percentage at the first level ■ RATIO - specifies the weight of resource usage
mgmt_p2	Resource allocation value for level 2 (replaces cpu_p2) ■ EMPHASIS - specifies the resource percentage at the second level ■ RATIO - non-applicable

Table 116–7 (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
mgmt_p3	Resource allocation value for level 3 (replaces cpu_p3) ■ EMPHASIS - specifies the resource percentage at the third level ■ RATIO - non-applicable
mgmt_p4	Resource allocation value for level 4 (replaces cpu_p4) ■ EMPHASIS - specifies the resource percentage at the fourth level ■ RATIO - non-applicable
mgmt_p5	Resource allocation value for level 5 (replaces cpu_p5) ■ EMPHASIS - specifies the resource percentage at the fifth level ■ RATIO - non-applicable
mgmt_p6	Resource allocation value for level 6 (replaces cpu_p6) ■ EMPHASIS - specifies the resource percentage at the sixth level ■ RATIO - non-applicable
mgmt_p7	Resource allocation value for level 7 (replaces cpu_p7) ■ EMPHASIS - specifies the resource percentage at the seventh level ■ RATIO - non-applicable
mgmt_p8	Resource allocation value for level 8 (replaces cpu_p8) ■ EMPHASIS - specifies the resource percentage at the eighth level ■ RATIO - non-applicable
switch_io_megabytes	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited.
switch_io_reqs	Specifies the number of I/O requests that a session can issue before an action is taken. Default is NULL, which means unlimited.
switch_for_call	Specifies that if an action is taken because of the switch_time, switch_io_megabytes, or switch_io_reqs parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is FALSE, which means that the original consumer group is not restored at the end of the top call.
max_utilization_limit	Specifies absolute maximum CPU utilization percentage permitted for the consumer group. This value overrides any level allocations for CPU (mgmt_p1 through mgmt_p8), and also imposes a limit on total CPU utilization when unused allocations are redistributed. You can specify this attribute and leave mgmt_p1 through mgmt_p8 NULL. You cannot specify this attribute for a subplan.

Usage Notes

- All parameters default to NULL. However, for the EMPHASIS CPU resource allocation method, this case would starve all the users.

- For `max_idle_time` and `max_idle_blocker_time`, `PMON` will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using `switch_time_in_call`, the resource usage of one client will not affect a future client that happens to be executed on the same session.

CREATE_SIMPLE_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the CREATE_CONSUMER_GROUP and CREATE_RESOURCE_PLAN_DIRECTIVES procedures separately.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (
   simple_plan      IN  VARCHAR2  DEFAULT NULL,
   consumer_group1  IN  VARCHAR2  DEFAULT NULL,
   group1_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group2  IN  VARCHAR2  DEFAULT NULL,
   group2_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group3  IN  VARCHAR2  DEFAULT NULL,
   group3_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group4  IN  VARCHAR2  DEFAULT NULL,
   group4_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group5  IN  VARCHAR2  DEFAULT NULL,
   group5_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group6  IN  VARCHAR2  DEFAULT NULL,
   group6_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group7  IN  VARCHAR2  DEFAULT NULL,
   group7_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   consumer_group8  IN  VARCHAR2  DEFAULT NULL,
   group8_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated
   group1_percent   IN  NUMBER    DEFAULT NULL,
   group2_percent   IN  NUMBER    DEFAULT NULL,
   group3_percent   IN  NUMBER    DEFAULT NULL,
   group4_percent   IN  NUMBER    DEFAULT NULL,
   group5_percent   IN  NUMBER    DEFAULT NULL,
   group6_percent   IN  NUMBER    DEFAULT NULL,
   group7_percent   IN  NUMBER    DEFAULT NULL,
   group8_percent   IN  NUMBER    DEFAULT NULL);
```

Parameters

Table 116–8 CREATE_SIMPLE_PLAN Procedure Parameters

Parameter	Description
simple_plan	Name of the resource plan
consumer_group1	Name of the consumer group
group1_cpu	Percentage for group (deprecated)
consumer_group2	Name of the consumer group
group2_cpu	Percentage for group (deprecated)
consumer_group3	Name of the consumer group
group3_cpu	Percentage for group (deprecated)
consumer_group4	Name of the consumer group
group4_cpu	Percentage for group (deprecated)
consumer_group5	Name of the consumer group
group5_cpu	Percentage for group (deprecated)

Table 116–8 (Cont.) CREATE_SIMPLE_PLAN Procedure Parameters

Parameter	Description
consumer_group6	Name of the consumer group
group6_cpu	Percentage for group (deprecated)
consumer_group7	Name of the consumer group
group7_cpu	Percentage for group (deprecated)
consumer_group8	Name of the consumer group
group8_cpu	Percentage for group (deprecated)
group1_percent	Percentage of resources allocated for this consumer group
group2_percent	Percentage of resources allocated for this consumer group
group3_percent	Percentage of resources allocated for this consumer group
group4_percent	Percentage of resources allocated for this consumer group
group5_percent	Percentage of resources allocated for this consumer group
group6_percent	Percentage of resources allocated for this consumer group
group7_percent	Percentage of resources allocated for this consumer group
group8_percent	Percentage of resources allocated for this consumer group

DELETE_CATEGORY Procedure

This procedure deletes an existing resource consumer group category.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CATEGORY (
   category        IN    VARCHAR2,
   new_comment     IN    VARCHAR2  DEFAULT NULL);
```

Parameters

Table 116–9 DELETE_CATEGORY Procedure Parameters

Parameter	Description
`category`	Name of consumer group category

DELETE_CONSUMER_GROUP Procedure

This procedure delete entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (
   consumer_group IN VARCHAR2);
```

Parameters

Table 116–10 DELETE_CONSUMER_GROUP Procedure Parameters

Parameters	Description
consumer_group	Name of the consumer group to be deleted

DELETE_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN (
   plan IN VARCHAR2);
```

Parameters

Table 116–11 DELETE_PLAN Procedure Parameters

Parameter	Description
plan	Name of the resource plan to delete

DELETE_PLAN_CASCADE Procedure

This procedure deletes the specified plan and all of its descendants (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (
   plan IN VARCHAR2);
```

Parameters

Table 116–12 DELETE_PLAN_CASCADE Procedure Parameters

Parameters	Description
plan	Name of the plan

Usage Notes

If DELETE_PLAN_CASCADE encounters any error, then it rolls back, and nothing is deleted.

DELETE_PLAN_DIRECTIVE Procedure

This procedure deletes resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (
   plan              IN VARCHAR2,
   group_or_subplan  IN VARCHAR2);
```

Parameters

Table 116–13 DELETE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
`plan`	Name of the resource plan
`group_or_subplan`	Name of the group or subplan

SET_CONSUMER_GROUP_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING(
   attribute        IN VARCHAR2,
   value            IN VARCHAR2,
   consumer_group   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 116–14 SET_CONSUMER_GROUP_MAPPING Procedure Parameters

Parameters	Description
attribute	Mapping attribute to add/modify. It can be one of the Constants listed.
value	Attribute value to match
consumer_group	Name of the mapped consumer group, or NULL to delete a mapping

Usage Notes

If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the consumer_group argument is NULL, then any mapping from the given attribute and value will be deleted.

SET_CONSUMER_GROUP_MAPPING_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI(
   explicit               IN NUMBER,
   oracle_user            IN NUMBER,
   service_name           IN NUMBER,
   client_os_user         IN NUMBER,
   client_program         IN NUMBER,
   client_machine         IN NUMBER,
   module_name            IN NUMBER,
   module_name_action     IN NUMBER,
   service_module         IN NUMBER,
   service_module_action  IN NUMBER);
```

Parameters

Table 116–15 SET_CONSUMER_GROUP_MAPPING_PRI Procedure Parameters

Parameters	Description
`explicit`	Priority of the explicit mapping
`oracle_user`	Priority of the Oracle user name mapping
`service_name`	Priority of the client service name mapping
`client_os_user`	Priority of the client operating system user name mapping
`client_program`	Priority of the client program mapping
`client_machine`	Priority of the client machine mapping
`module_name`	Priority of the application module name mapping
`module_name_action`	Priority of the application module name and action mapping
`service_module`	Priority of the service name and application module name mapping
`module_name_action`	Priority of the service name, application module name, and application action mapping

Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
  - `DBMS_SESSION.SWITCH_CURRENT_CONSUMER_GROUP`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER`
- Each priority value must be a unique integer from 1 to 10. Together, they establish an ordering where 1 is the highest priority and 10 is the lowest.

SET_INITIAL_CONSUMER_GROUP Procedure

> **Note:** This procedure is deprecated in Release 11gR1. While the procedure remains available in the package, Initial Consumer Group is set by the session-to-consumer group mapping rules.

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs. This procedure sets the initial resource consumer group for a user.

Syntax

```
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
   user             IN   VARCHAR2,
   consumer_group   IN   VARCHAR2);
```

Parameters

Table 116–16 SET_INITIAL_CONSUMER_GROUP Procedure Parameters

Parameters	Description
`user`	Name of the user
`consumer_group`	User's initial consumer group

Usage Notes

The `ADMINISTER_RESOURCE_MANAGER` or the `ALTER USER` system privilege are required to be able to execute this procedure. The user, or `PUBLIC`, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

> **Note:** These semantics are similar to those for `ALTER USER DEFAULT ROLE`.

If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: `DEFAULT_CONSUMER_GROUP`.

`DEFAULT_CONSUMER_GROUP` has switch privileges granted to `PUBLIC`; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have `DEFAULT_CONSUMER_GROUP` as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to `DEFAULT_CONSUMER_GROUP`.

SUBMIT_PENDING_AREA Procedure

This procedure submits pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

> **Note:** A call to SUBMIT_PENDING_AREA may fail even if VALIDATE_PENDING_AREA succeeds. This may happen if a plan being deleted is loaded by an instance after a call to VALIDATE_PENDING_AREA, but before a call to SUBMIT_PENDING_AREA.

Syntax

```
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

SWITCH_CONSUMER_GROUP_FOR_SESS Procedure

This procedure changes the resource consumer group of a specific session. It also changes the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (
   session_id      IN NUMBER,
   session_serial  IN NUMBER,
   consumer_group  IN VARCHAR2);
```

Parameters

Table 116–17 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure Parameters

Parameter	Description
session_id	SID column from the view V$SESSION
session_serial	SERIAL# column from view V$SESSION.
consumer_group	Name of the consumer group to which to switch

SWITCH_CONSUMER_GROUP_FOR_USER Procedure

This procedure changes the resource consumer group for all sessions with a given user ID. It also change the consumer group of any (PQ) slave sessions that are related to the top user session.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (
   user            IN VARCHAR2,
   consumer_group  IN VARCHAR2);
```

Parameters

Table 116–18 SWITCH_CONSUMER_GROUP_FOR_USER Procedure Parameters

Parameter	Description
`user`	Name of the user
`consumer_group`	Name of the consumer group to which to switch

Usage Notes

The SWITCH_CONSUMER_GROUP_FOR_SESS Procedure and `SWITCH_CONSUMER_GROUP_FOR_USER` procedures let you to raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the `nice` command on UNIX.

These procedures cause the session to be moved into the newly specified consumer group immediately.

SWITCH_PLAN Procedure

This procedure sets the current resource manager plan.

Syntax

```
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
   plan_name                     IN   VARCHAR2,
   sid                           IN   VARCHAR2 DEFAULT '*',
   allow_scheduler_plan_switches IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 116–19 SWITCH_PLAN Procedure Parameters

Parameter	Description
plan_name	Name of the plan to which to switch. Passing in an empty string ('') for the plan_name, disables the resource manager
sid	The sid parameter is relevant only in a Oracle Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the sid of the instance where you want to change the plan. Or specify '*' if you want Oracle to change the plan for all instances.
allow_scheduler_ plan_switches	FALSE - disables automated plan switches by the job scheduler at window boundaries. To re-enable automated plan switches, switch_plan must be called again by the administrator with allow_scheduler_plan_switches set to TRUE. By default automated plan switches by the job scheduler are enabled.

UPDATE_CATEGORY Procedure

This procedure updates an existing resource consumer group category.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CATEGORY (
   category        IN    VARCHAR2,
   new_comment     IN    VARCHAR2  DEFAULT NULL);
```

Parameters

Table 116–20 UPDATE_CATEGORY Procedure Parameters

Parameter	Description
`category`	Name of consumer group category
`new_comment`	User's comment

UPDATE_CONSUMER_GROUP Procedure

This procedure updates entries which define resource consumer groups.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (
   consumer_group  IN VARCHAR2,
   new_comment     IN VARCHAR2 DEFAULT NULL,
   new_cpu_mth     IN VARCHAR2 DEFAULT NULL,
   new_mgmt_mth    IN VARCHAR2 DEFAULT NULL,
   new_category    IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 116–21 UPDATE_CONSUMER_GROUP Procedure Parameter

Parameter	Description
consumer_group	Name of consumer group
new_comment	New user's comment
new_cpu_mth	Name of new method for CPU resource allocation (deprecated)
new_mgmt_mth	Name of new method for CPU resource allocation
new_category	New consumer group category

Usage Notes

If the parameters to the UPDATE_CONSUMER_GROUP procedure are not specified, then they remain unchanged in the data dictionary.

UPDATE_PLAN Procedure

This procedure updates entries which define resource plans.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
   plan                                IN VARCHAR2,
   new_comment                         IN VARCHAR2 DEFAULT NULL,
   new_cpu_mth                         IN VARCHAR2 DEFAULT NULL, -- deprecated
   new_active_sess_pool_mth            IN VARCHAR2 DEFAULT NULL,
   new_parallel_degree_limit_mth       IN VARCHAR2 DEFAULT NULL,
   new_queueing_mth                    IN VARCHAR2 DEFAULT NULL,
   new_queueing_mth                    IN VARCHAR2 DEFAULT NULL,
   new_mgmt_mth                        IN VARCHAR2 DEFAULT NULL,
   new_sub_plan                        IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 116–22 UPDATE_PLAN Procedure Parameters

Parameter	Description
plan	Name of resource plan
new_comment	New user's comment
new_cpu_mth	Name of new allocation method for CPU resources (deprecated)
new_active_sess_pool_mth	Name of new method for maximum active sessions
new_parallel_degree_limit_mth	Name of new method for degree of parallelism
new_queueing_mth	Specifies type of queuing policy to use with active session pool feature
new_mgmt_mth	Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets ▪ EMPHASIS - for multi-level plans that use percentages to specify how I/O is resources are distributed among consumer groups. ▪ RATIO - for single-level plans that use ratios to specify how I/O is resources are distributed.
new_sub_plan	New setting for whether the plan is only intended for use as a sub-plan

Usage Notes

- If the parameters to UPDATE_PLAN Procedure are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need not specify it when creating or updating a plan.

UPDATE_PLAN_DIRECTIVE Procedure

This procedure updates resource plan directives.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
   plan                          IN VARCHAR2,
   group_or_subplan              IN VARCHAR2,
   new_comment                   IN VARCHAR2 DEFAULT NULL,
   new_cpu_p1                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p2                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p3                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p4                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p5                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p6                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p7                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_cpu_p8                    IN NUMBER   DEFAULT NULL, -- deprecated
   new_active_sess_pool_p1       IN NUMBER   DEFAULT NULL,
   new_queueing_p1               IN NUMBER   DEFAULT NULL,
   new_parallel_degree_limit_p1  IN NUMBER   DEFAULT NULL,
   new_switch_group              IN VARCHAR2 DEFAULT NULL,
   new_switch_time               IN NUMBER   DEFAULT NULL,
   new_switch_estimate           IN BOOLEAN  DEFAULT FALSE,
   new_max_est_exec_time         IN NUMBER   DEFAULT NULL,
   new_undo_pool                 IN NUMBER   DEFAULT NULL,
   new_max_idle_time             IN NUMBER   DEFAULT NULL,
   new_max_idle_blocker_time     IN NUMBER   DEFAULT NULL,
   switch_time_in_call           IN NUMBER   DEFAULT NULL, -- deprecated
   new_mgmt_p1                   IN NUMBER   DEFAULT NULL,
   new_mgmt_p2                   IN NUMBER   DEFAULT NULL,
   new_mgmt_p3                   IN NUMBER   DEFAULT NULL,
   new_mgmt_p4                   IN NUMBER   DEFAULT NULL,
   new_mgmt_p5                   IN NUMBER   DEFAULT NULL,
   new_mgmt_p6                   IN NUMBER   DEFAULT NULL,
   new_mgmt_p7                   IN NUMBER   DEFAULT NULL,
   new_mgmt_p8                   IN NUMBER   DEFAULT NULL,
   new_switch_io_megabytes       IN NUMBER   DEFAULT NULL,
   new_switch_io_reqs            IN NUMBER   DEFAULT NULL,
   new_switch_for_call           IN BOOLEAN  DEFAULT NULL,
   new_max_utilization_limit     IN NUMBER DEFAULT NULL);
```

Parameters

Table 116–23 UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
plan	Name of the resource plan
group_or_subplan	Name of the consumer group or subplan
new_comment	Comment for the plan directive
new_cpu_p1	First parameter for the CPU resources allocation method ((deprecated - use new_mgmt_p1 instead)
new_cpu_p2	Parameter for the CPU resources allocation method ((deprecated - use new_mgmt_p2 instead)
new_cpu_p3	Parameter for the CPU resources allocation method (deprecated - use new_mgmt_p3 instead)

Table 116–23 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
new_cpu_p4	Parameter for the CPU resources allocation method (deprecated- use new_mgmt_p4 instead)
new_cpu_p5	Parameter for the CPU resources allocation method (deprecated - use new_mgmt_p5 instead)
new_cpu_p6	Parameter for the CPU resources allocation method (deprecated- use new_mgmt_p6 instead)
new_cpu_p7	Parameter for the CPU resources allocation method (deprecated- use new_mgmt_p7 instead)
new_cpu_p8	Parameter for the CPU resources allocation method (deprecated- use new_mgmt_p8 instead)
new_active_sess_ pool_p1	Specifies maximum number of concurrently active sessions for a consumer group. Default is NULL, which means unlimited.
new_queueing_p1	Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.
new_parallel_degree_ limit_p1	Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.
new_switch_group	Specifies consumer group to which this session is switched if other switch criteria is met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.
new_switch_time	Specifies time (in seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.
new_switch_estimate	If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.
new_max_est_exec_ time	Specifies the maximum execution time (in seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.
new_undo_pool	Sets a maximum in kilobytes (K) on the total amount of undo generated by a consumer group. Default is NULL, which means unlimited.
new_max_idle_time	Indicates the maximum session idle time. Default is NULL, which means unlimited.
new_max_idle_ blocker_time	Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource
new_switch_time_in_ call	Deprecated. If this parameter is specified, new_switch_time will be effectively set to new_switch_time_in_call and new_switch_for_call will be effectively set to TRUE.
new_mgmt_p1	Resource allocation value for level 1 (replaces new_cpu_p1): ■ EMPHASIS - specifies the resource percentage at the first level ■ RATIO - specifies the weight of resource usage

Table 116–23 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

Parameter	Description
new_mgmt_p2	Resource allocation value for level 2 (replaces new_cpu_p2) ■ EMPHASIS - specifies the resource percentage at the second level ■ RATIO - non-applicable
new_mgmt_p3	Resource allocation value for level 3 (replaces new_cpu_p3) ■ EMPHASIS - specifies the resource percentage at the third level ■ RATIO - non-applicable
new_mgmt_p4	Resource allocation value for level 4 (replaces new_cpu_p4) ■ EMPHASIS - specifies the resource percentage at the fourth level ■ RATIO - non-applicable
new_mgmt_p5	Resource allocation value for level 5 (replaces new_cpu_p5) ■ EMPHASIS - specifies the resource percentage at the fifth level ■ RATIO - non-applicable
new_mgmt_p6	Resource allocation value for level 6 (replaces new_cpu_p6) ■ EMPHASIS - specifies the resource percentage at the sixth level ■ RATIO - non-applicable
new_mgmt_p7	Resource allocation value for level 7 (replaces new_cpu_p7) ■ EMPHASIS - specifies the resource percentage at the seventh level ■ RATIO - non-applicable
new_mgmt_p8	Resource allocation value for level 8 (replaces new_cpu_p8) ■ EMPHASIS - specifies the resource percentage at the eighth level ■ RATIO - non-applicable
new_switch_io_megabytes	Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited.
new_switch_io_reqs	Specifies the number of I/O requests that a session can issue before an action is taken. Default is NULL, which means unlimited.
new_switch_for_call	Specifies that if an action is taken because of the new_switch_time, new_switch_io_megabytes, or new_switch_io_reqs parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is FALSE, which means that the original consumer group is not restored at the end of the top call.
new_max_utilization_limit	Specifies absolute maximum CPU utilization percentage permitted for the consumer group. This value overrides any level allocations for CPU (mgmt_p1 through mgmt_p8), and also imposes a limit on total CPU utilization when unused allocations are redistributed. You can specify this attribute and leave mgmt_p1 through mgmt_p8 NULL. You cannot specify this attribute for a subplan.

Usage Notes

- If the parameters for `UPDATE_PLAN_DIRECTIVE` are left unspecified, then they remain unchanged in the data dictionary.
- For `new_max_idle_time` and `new_max_idle_blocker_time`, `PMON` will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter `new_switch_time_in_call` is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on `new_switch_time_in_call`, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.
- To clear (zero or nullify) any numeric parameter in a resource plan directive, set it to `-1` using the `UPDATE_PLAN_DIRECTIVE` Procedure.

VALIDATE_PENDING_AREA Procedure

This procedure validates pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```

117

DBMS_RESOURCE_MANAGER_PRIVS

The `DBMS_RESOURCE_MANAGER_PRIVS` package maintains privileges associated with the Resource Manager.

> **See Also:** For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide.*

This chapter contains the following topics:

- Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

Table 117–1 DBMS_RESOURCE_MANAGER_PRIVS Package Subprograms

Subprogram	Description
GRANT_SWITCH_ CONSUMER_GROUP Procedure on page 117-3	Grants the privilege to switch to resource consumer groups
GRANT_SYSTEM_PRIVILEGE Procedure on page 117-4	Performs a grant of a system privilege
REVOKE_SWITCH_ CONSUMER_GROUP Procedure on page 117-5	Revokes the privilege to switch to resource consumer groups.
REVOKE_SYSTEM_PRIVILEGE Procedure on page 117-6	Performs a revoke of a system privilege

GRANT_SWITCH_CONSUMER_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
   grantee_name   IN VARCHAR2,
   consumer_group IN VARCHAR2,
   grant_option   IN BOOLEAN);
```

Parameters

Table 117–2 GRANT_SWITCH_CONSUMER_GROUP Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
consumer_group	Name of consumer group.
grant_option	TRUE if grantee should be allowed to grant access, FALSE otherwise.

Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the grant_option parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

See Also: Chapter 116, "DBMS_RESOURCE_MANAGER"

Examples

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
 'scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
  dbms_resource_manager.oracle_user, 'scott','mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/
```

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
   grantee_name   IN VARCHAR2,
   privilege_name  IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
   admin_option   IN BOOLEAN);
```

Parameters

Table 117–3 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
grantee_name	Name of the user or role to whom privilege is to be granted.
privilege_name	Name of the privilege to be granted.
admin_option	TRUE if the grant is with admin_option, FALSE otherwise.

Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: ADMINISTER_RESOURCE_MANAGER. Database administrators have this system privilege with the ADMIN option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the ADMIN option can also grant this privilege to others.

Examples

The following call grants this privilege to a user called scott without the ADMIN option:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
 grantee_name => 'scott',
 privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
 admin_option => FALSE);
END;
/
```

REVOKE_SWITCH_CONSUMER_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
   revokee_name   IN VARCHAR2,
   consumer_group IN VARCHAR2);
```

Parameters

Table 117–4 REVOKE_SWITCH_CONSUMER_GROUP Procedure Parameter

Parameter	Description
revokee_name	Name of user/role from which to revoke access.
consumer_group	Name of consumer group.

Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.

If you revoke the initial consumer group from a user, then that user will automatically be part of the DEFAULT_CONSUMER_GROUP consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from PUBLIC, then any users who could previously only use the consumer group through PUBLIC will not be able to switch to that consumer group.

Examples

The following example revokes the privileges to switch to mail_maintenance_group from Scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP (
 'scott', 'mail_maintenance_group');
END;
/
```

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (
   revokee_name   IN VARCHAR2,
   privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

Parameters

Table 117–5 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`revokee_name`	Name of the user or role from whom privilege is to be revoked.
`privilege_name`	Name of the privilege to be revoked.

Examples

The following call revokes the `ADMINISTER_RESOURCE_MANAGER` from user scott:

```
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');
END;
/
```

118

DBMS_RESULT_CACHE

The DBMS_RESULT_CACHE package provides an interface to allow the DBA to administer that part of the shared pool that is used by the SQL result cache and the PL/SQL function result cache. Both these caches use the same infrastructure. Therefore, for example, DBMS_RESULT_CACHE.BYPASS determines whether both caches are bypassed or both caches are used, and DBMS_RESULT_CACHE.FLUSH flushes both all the cached results for SQL queries and all the cached results for PL/SQL functions.

See Also:

- *Oracle Database PL/SQL Language Reference* for more information about "Using the Cross-Session PL/SQL Function Result Cache"
- *Oracle Database Performance Tuning Guide* for more information about "Result Cache Concepts"

This chapter contains the following topics:

- Using DBMS_RESULT_CACHE
  - Constants
- Summary of DBMS_RESULT_CACHE Subprograms

Using DBMS_RESULT_CACHE

- Constants

Constants

Table 118–1 DBMS_RESULT_CACHE Constants

Constant	Definition
STATUS_BYPS	CONSTANT VARCHAR(10) := 'BYPASS';
STATUS_DISA	CONSTANT VARCHAR(10) := 'DISABLED';
STATUS_ENAB	CONSTANT VARCHAR(10) := 'ENABLED';
STATUS_SYNC	CONSTANT VARCHAR(10) := 'SYNC';

Summary of DBMS_RESULT_CACHE Subprograms

Table 118–2 DBMS_RESULT_CACHE Package Subprograms

Subprogram	Description
BYPASS Procedure on page 118-5	Sets the bypass mode for the Result Cache
FLUSH Function & Procedure on page 118-6	Attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics
INVALIDATE Functions & Procedures on page 118-7	Invalidates all the result-set objects that dependent upon the specified dependency object
INVALIDATE_OBJECT Functions & Procedures on page 118-8	Invalidates the specified result-set object(s)
MEMORY_REPORT Procedure on page 118-9	Produces the memory usage report for the Result Cache
STATUS Function on page 118-10	Checks the status of the Result Cache

BYPASS Procedure

This procedure sets the bypass mode for the Result Cache:

- When bypass mode is turned on, it implies that cached results are no longer used and that no new results are saved in the cache.
- When bypass mode is turned off, the cache resumes normal operation.

Syntax

```
DBMS_RESULT_CACHE.BYPASS (
   bypass_mode IN BOOLEAN);
```

Parameters

Table 118–3 BYPASS Procedure Parameters

Parameter	Description
bypass_mode	■ TRUE => Result Cache usage is bypassed ■ FALSE => Result Cache usage is turned on

Usage Notes

This operation is database instance specific.

Examples

This operation can be used when there is a need to hot patch PL/SQL code in a running system. If a code-patch is applied to a PL/SQL module on which a result cached function directly or transitively depends, then the cached results associated with the result cache function are not automatically flushed (if the instance is not restarted/bounced). This must be manually achieved.

To ensure correctness during the patching process follow these steps:

1. Place the result cache in bypass mode, and flush existing result.

   ```
   BEGIN
      DBMS_RESULT_CACHE.BYPASS(TRUE);
      DBMS_RESULT_CACHE.FLUSH;
   END;
   /
   ```

   This step must be performed on each instance if in a Oracle Real Application Clusters environment.

2. Apply the PL/SQL code patches.
3. Resume use of the result cache, by turning off the cache bypass mode.

   ```
   BEGIN
      DBMS_RESULT_CACHE.BYPASS(FALSE);
   END;
   /
   ```

   This step must be performed on each instance if in a Oracle Real Application Clusters environment.

FLUSH Function & Procedure

This function and procedure attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.

Syntax

```
DBMS_RESULT_CACHE.FLUSH (
   retainMem  IN  BOOLEAN DEFAULT FALSE,
   retainSta  IN  BOOLEAN DEFAULT FALSE)
  RETURN BOOLEAN;

DBMS_RESULT_CACHE.FLUSH (
   retainMem  IN  BOOLEAN DEFAULT FALSE,
   retainSta  IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 118–4 FLUSH Function & Procedure Parameters

Parameter	Description
`retainMem`	■ `TRUE` => retains the free memory in the cache ■ `FALSE` (default) => releases the free memory to the system
`retainSta`	■ `TRUE` => retains the existing cache statistics ■ `FALSE` (default) => clears the existing cache statistics

Return Values

`TRUE` if successful in removing all the objects.

INVALIDATE Functions & Procedures

This function and procedure invalidates all the result-set objects that dependent upon the specified dependency object.

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE (
   owner        IN  VARCHAR2,
   name         IN  VARCHAR2)
 RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE (
   owner       IN  VARCHAR2,
   name        IN  VARCHAR2);

DBMS_RESULT_CACHE.INVALIDATE (
  object_id    IN BINARY_INTEGER)
 RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE (
   object_id    IN BINARY_INTEGER);
```

Parameters

Table 118–5 INVALIDATE Function & Procedure Parameters

Parameter	Description
owner	Schema name
name	Object name
object_id	Dictionary object number

Return Values

The number of objects invalidated.

INVALIDATE_OBJECT Functions & Procedures

This function and procedure invalidates the specified result-set object(s).

Syntax

```
DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
   id          IN  BINARY_INTEGER)
 RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
   id          IN  BINARY_INTEGER);

DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
  cache_id     IN  VARCHAR2)
 RETURN NUMBER;

DBMS_RESULT_CACHE.INVALIDATE_OBJECT (
   cache_id   IN  VARCHAR2);
```

Parameters

Table 118–6 INVALIDATE Function & Procedure Parameters

Parameter	Description
`id`	Address of the cache object in the Result Cache
`cache_id`	Cache-id

Return Values

The number of objects invalidated.

MEMORY_REPORT Procedure

This procedure produces the memory usage report for the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.MEMORY_REPORT (
   detailed   IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 118–7 MEMORY_REPORT Procedure Parameters

Parameter	Description
`detailed`	■ `TRUE` => produces a more detailed report ■ `FALSE` (default) => produces the standard report

Usage Notes

Invoking this procedure from SQL*Plus requires that the serveroutput be turned on.

STATUS Function

This function checks the status of the Result Cache.

Syntax

```
DBMS_RESULT_CACHE.STATUS
   RETURN VARCHAR2;
```

Return Values

One of the following values:

- `STATUS_DISA` - Cache is not available
- `STATUS_ENAB` - Cache is available
- `STATUS_BYPS`: Cache has been made temporarilyunavailable.
- `STATUS_SYNC` - Cache is available, but synchronizing with RAC nodes

119

DBMS_RESUMABLE

With the `DBMS_RESUMABLE` package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- Using DBMS_RESUMABLE
  - Operational Notes
- Summary of DBMS_RESUMABLE Subprograms

Using DBMS_RESUMABLE

- Operational Notes

Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

Summary of DBMS_RESUMABLE Subprograms

Table 119–1 DBMS_RESUMABLE Package Subprograms

Subprogram	Description
ABORT Procedure on page 119-5	Aborts a suspended resumable space allocation
GET_SESSION_TIMEOUT Function on page 119-6	Returns the current timeout value of the resumable space allocations for a session with `session_id`
GET_TIMEOUT Function on page 119-7	Returns the current timeout value of resumable space allocations for the current session
SET_SESSION_TIMEOUT Procedure on page 119-8	Sets the timeout of resumable space allocations for a session with `session_id`
SET_TIMEOUT Procedure on page 119-9	Sets the timeout of resumable space allocations for the current session
SPACE_ERROR_INFO Function on page 119-10	Looks for space-related errors in the error stack, otherwise returning `FALSE`

ABORT Procedure

This procedure aborts a suspended resumable space allocation. The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

Syntax

```
DBMS_RESUMABLE.ABORT (
   session_id  IN NUMBER);
```

Parameters

Table 119–2 ABORT Procedure Parameters

Parameter	Description
`session_id`	The session identifier of the resumable space allocation.

Usage Notes

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

GET_SESSION_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

Syntax

```
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (
   session_id  IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 119–3 GET_SESSION_TIMEOUT Function Parameters

Parameter	Description
`session_id`	The session identifier of the resumable space allocation.

Return Values

Table 119–4 GET_SESSION_TIMEOUT Function Return Values

Return Value	Description
`NUMBER`	The current timeout value of resumable space allocations for a session with `session_id`. The timeout is returned in seconds.

Usage Notes

If `session_id` does not exist, the `GET_SESSION_TIMEOUT` function returns -1.

GET_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

Syntax

```
DBMS_RESUMABLE.GET_TIMEOUT
 RETURN NUMBER;
```

Return Values

Table 119–5 GET_TIMEOUT Function Return Values

Return Value	Description
NUMBER	The current timeout value of resumable space allocations for the current session. The returned value is in seconds.

Usage Notes

If the current session is not resumable enabled, the GET_TIMEOUT function returns -1.

SET_SESSION_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with `session_id`. The new timeout setting applies to the session immediately. If `session_id` does not exist, no operation occurs.

Syntax

```
DBMS_RESUMABLE.SET_SESSION_TIMEOUT (
   session_id  IN NUMBER,
   timeout     IN NUMBER);
```

Parameters

Table 119–6 SET_SESSION_TIMEOUT Procedure Parameters

Parameter	Description
`session_id`	The session identifier of the resumable space allocation.
`timeout`	The timeout of the resumable space allocation.

SET_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (
   timeout  IN NUMBER);
```

Parameters

Table 119–7 SET_TIMEOUT Procedure Parameters

Parameter	Description
timeout	The timeout of the resumable space allocation.

SPACE_ERROR_INFO Function

This function looks for space-related errors in the error stack. If it cannot find a space related error, it will return `FALSE`. Otherwise, `TRUE` is returned and information about the particular object that causes the space error is returned.

Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
   error_type        OUT VARCHAR2,
   object_type       OUT VARCHAR2,
   object_owner      OUT VARCHAR2,
   table_space_name  OUT VARCHAR2,
   object_name       OUT VARCHAR2,
   sub_object_name   OUT VARCHAR2)
RETURN BOOLEAN;
```

Parameters

Table 119–8 SPACE_ERROR_INFO Function Parameters

Parameter	Description
`error_type`	The space error type. It will be one of the following: ■ `NO MORE SPACE` ■ `MAX EXTENTS REACHED` ■ `SPACE QUOTA EXCEEDED`
`object_type`	The object type. It will be one of the following: ■ TABLE ■ INDEX ■ CLUSTER ■ TABLE SPACE ■ ROLLBACK SEGMENT ■ UNDO SEGMENT ■ LOB SEGMENT ■ TEMP SEGMENT ■ INDEX PARTITION ■ TABLE PARTITION ■ LOB PARTITION ■ TABLE SUBPARTITION ■ INDEX SUBPARTITION ■ LOB SUBPARTITION The type can also be `NULL` if it does not apply.
`object_owner`	The owner of the object. `NULL` if it cannot be determined.
`table_space_name`	The table space where the object resides. `NULL` if it cannot be determined.
`object_name`	The name of rollback segment, temp segment, table, index, or cluster.
`sub_object_name`	The partition name or sub-partition name of `LOB, TABLE,` or `INDEX. NULL` if it cannot be determined.

120

DBMS_RLMGR

The DBMS_RLMGR package contains various procedures to create and manage rules and rule sessions by the Rules Manager.

> **See Also:** *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information.

This chapter contains the following topic:

- Summary of Rules Manager Subprograms

Summary of Rules Manager Subprograms

Table 120–1 describes the subprograms in the DBMS_RLMGR package.

All the values and names passed to the procedures defined in the DBMS_RLMGR package are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 120–1 DBMS_RLMGR Package Subprograms

Subprogram	Description
ADD_ELEMENTARY_ATTRIBUTE Procedures	Adds the specified attribute to the event structure and the Expression Filter attribute set
ADD_EVENT Procedure	Adds an event to a rule class in an active session
ADD_FUNCTIONS Procedure	Adds a Function, a Type, or a Package to the approved list of functions with an event structure and to the Expression Filter attribute set
ADD_RULE Procedure	Adds a rule to the rule class
CONDITION_REF Function	Retrieves the primitive rule condition reference from a rule condition for composite events
CONSUME_EVENT Function	Consumes an event using its identifiers and prepares the corresponding rule for action execution
CONSUME_PRIM_EVENTS Function	Consumes one or more primitive events with all or none semantics
CREATE_CONDITIONS_TABLE Procedure	Creates a repository for the primitive rule conditions that can be shared by multiple rules from the same or different rule classes
CREATE_EVENT_STRUCT Procedure	Creates an event structure
CREATE_EXPFIL_INDEXES Procedure	Creates expression filter indexes for the rule class if the default indexes have been dropped
CREATE_INTERFACE Procedure	Creates a rule class interface package to directly operate on the rule class
CREATE_RULE_CLASS Procedure	Creates a rule class
DELETE_RULE Procedure	Deletes a rule from a rule class
DROP_CONDITIONS_TABLE Procedure	Drops the conditions table
DROP_EVENT_STRUCT Procedure	Drops an event structure
DROP_EXPFIL_INDEXES Procedure	Drops Expression Filter indexes for the rule conditions
DROP_INTERFACE Procedure	Drops the rule class interface package
DROP_RULE_CLASS Procedure	Drops a rule class
EXTEND_EVENT_STRUCT Procedure	Adds an attribute to the primitive event structure
GET_AGGREGATE_VALUE Function	Retrieves the aggregate value computed for a collection event
GRANT_PRIVILEGE Procedure	Grants a privilege on a rule class to another user
PROCESS_RULES Procedure	Process the rules for a given event

Table 120–1 (Cont.) DBMS_RLMGR Package Subprograms

Subprogram	Description
PURGE_EVENTS Procedure	Resets the rule class by removing all the events associated with the rule class and purging any state information pertaining to rules matching some events
RESET_SESSION Procedure	Starts a new rule session within a database session
REVOKE_PRIVILEGE Procedure	Revokes a privilege on a rule class from a user
SYNC_TEXT_INDEXES Procedure	Synchronizes the indexes defined to process the predicates involving the `CONTAINS` operator in rule conditions

ADD_ELEMENTARY_ATTRIBUTE Procedures

This procedure adds the specified attribute to an event structure, which is also the Expression Filter attribute set. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds the specified elementary attribute to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
              event_struct   IN   VARCHAR2,
              attr_name      IN   VARCHAR2,
              attr_type      IN   VARCHAR2,
              attr_defvl     IN   VARCHAR2 default NULL);
```

Identifies the elementary attributes that are table aliases and adds them to the event structure:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
              event_struct   IN   VARCHAR2,
              attr_name      IN   VARCHAR2,
              tab_alias      IN   rlm$table_alias);
```

Allows addition of text attributes to the attribute set:

```
DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
              event_struct   IN   VARCHAR2,
              attr_name      IN   VARCHAR2,
              attr_type      IN   VARCHAR2,
              text_pref      IN   EXF$TEXT);
```

Parameters

Table 120–2 ADD_ELEMENTARY_ATTRIBUTE Procedure Parameters

Parameter	Description
`event_struct`	Name of the event structure or attribute set to which this attribute is added
`attr_name`	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
`attr_type`	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
`tab_alias`	The type that identifies the database table to which the attribute is aliased
`attr_defv1`	Default value for the elementary attribute
`text_pref`	Text preferences such as LEXER and WORDLIST specification

Usage Notes

- This procedure adds an elementary attribute to an event structure. The event structure is internally managed as the Expression Filter attribute set. If the event structure was originally created from an existing object type, then additional attributes cannot be added.

Elementary attributes cannot be added to an attribute set that is already assigned to a column storing expressions, which is equivalent to an event structure that is used for a rule class.

- One or more, or all elementary attributes in an attribute set can be table aliases. If an elementary attribute is a table alias, then the value assigned to the elementary attribute is a `ROWID` from the corresponding table. An attribute set with one or more table alias attributes cannot be created from an existing object type. For more information about table aliases, see *Oracle Database Rules Manager and Expression Filter Developer's Guide*.
- You cannot add elementary attributes to an attribute set that is already assigned to a column storing expressions.
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding elementary attributes.
- Related views: `USER_EXPFIL_ATTRIBUTE_SETS` and `USER_EXPFIL_ATTRIBUTES`.
- This procedure with a text preference bound to the `text_pref` argument creates a text attribute in the attribute set. The data type for such an attribute should be a `VARCHAR2` or a `CLOB`. The preferences specified for a text attribute are used to process the predicates involving `CONTAINS` operator on the attributes. The valid preferences are those that are valid in the `PARAMETERS` clause of `CTXRULE` index creation. See *Oracle Text Application Developer's Guide* for the syntax.

Examples

The following command adds two elementary attributes to an attribute set:

```
BEGIN
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'HRAttrSet',
                        ATTR_NAME => 'HRREP',
                        attr_type => 'VARCHAR2');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'HRAttrSet',
                        ATTR_NAME => 'DEPT',
                        TAB_ALIAS => RLM$TABLE_ALIAS('DEPT'));
END;
```

The following commands create an attribute set with each hotel reservation including some additional information, described as the `AddlInfo` attribute of `CLOB` datatype. Rule conditions specified for this event structure can include text predicates on this attribute.

```
BEGIN
  DBMS_RLMGR.CREATE_EVENT_STRUCT (EVENT_STRUCT => 'AddFlight');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'AddHotel',
                        ATTR_NAME => 'CustId',
                        ATTR_TYPE => 'NUMBER');
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'AddHotel',
                        ATTR_NAME => 'Type',
                        ATTR_TYPE => 'VARCHAR2(20)');
  . . .
  DBMS_RLMGR.ADD_ELEMENTARY_ATTRIBUTE (
                        EVENT_STRUCT => 'AddHotel',
```

```
                                ATTR_NAME => 'AddlInfo',
                                ATTR_TYPE => 'CLOB',
                                TEXT_PREF => EXF$TEXT('LEXER hotelreserv_lexer'));
END;
```

ADD_EVENT Procedure

This procedure adds a primitive event to a rule class in an active rule session. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Adds a string representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
   rule_class      IN VARCHAR2,
   event_inst      IN VARCHAR2,
   event_type      IN VARCHAR2 default null);
```

Adds an AnyData representation of the primitive event instance to a rule class:

```
DBMS_RLMGR.ADD_EVENT (
   rule_class      IN VARCHAR2,
   event_inst      IN sys.AnyData);
```

Parameters

Table 120–3 ADD_EVENT Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_inst	String or AnyData representation of the event instance being added to the rule class
event_type	Type of event instance assigned to the event_inst argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to add a primitive or a simple event to a rule class within an active rule session. By default, a rule session is the same as the database session. Optionally, multiple (sequential) rule sessions can be started within a database session by using the RESET_SESSION or PROCESS_RULES procedures.
- When the rule class is configured for simple events (consisting of only one primitive event structure), the event_type argument for the ADD_EVENT procedure can be ignored. Also, when the AnyData format of the event instance is passed, the event type information is embedded in the AnyData instance. In all other cases, the name of the primitive event structure being added to the rule class should be assigned to the event_type argument.
- For a valid event instance, the ADD_EVENT procedure processes the rules in the rule class and captures the results in the rule class results view (configured at the time of rule class creation). These results are preserved until the end of the rule session.
- When schema extended name is used for the rule class, you should have PROCESS RULES privilege on the rule class. See the GRANT_PRIVILEGE Procedure for additional information. The value specified for the event_type argument is always resolved in the rule class owner's schema and should not use schema extended names. When a composite event structure is configured with a table alias

primitive event type, the name of the corresponding table should be assigned to the `event_type` argument.

Examples

The following commands add two events to the `CompTravelPromo` rule class that is configured for two types of primitive events (`AddFlight` and `AddRentalCar`).

```
BEGIN
 DBMS_RLMGR.ADD_EVENT(rule_class => 'CompTravelPromo',
                      event_inst =>
                         AddFlight.getVarchar(987, 'Abcair', 'Boston',
                                              'Orlando', '01-APR-2003', '08-APR-2003'),
                      event_type => 'AddFlight');

DBMS_RLMGR.ADD_EVENT(rule_class => 'Scott.CompTravelPromo',
                      event_inst =>
                         AnyData.convertObject(
                                        AddRentalCar(987, 'Luxury', '03-APR-2003',
                                                     '08-APR-2003', NULL)));
END;
/
```

ADD_FUNCTIONS Procedure

This procedure adds a user-defined function, package, or type representing a set of functions to the event structure, which is also the Expression Filter attribute set.

Syntax

```
DBMS_RLMGR.ADD_FUNCTIONS (
   event_struct   IN   VARCHAR2,
   funcs_name     IN   VARCHAR2);
```

Parameters

Table 120–4 ADD_FUNCTIONS Procedure Parameters

Parameter	Description
event_struct	Name of the event structure to which the functions are added
funcs_name	Name of a function, package, or type (representing a function set) or its synonyms

Usage Notes

- By default, an attribute set implicitly allows references to all Oracle Database-supplied SQL functions for use in the rule conditions. If the expression set refers to a user-defined function, the expression set must be explicitly added to the attribute set.
- The ADD_FUNCTIONS procedure adds a user-defined function or a package (or type) representing a set of functions to the attribute set. Any new or modified expressions are validated using this list.
- You can specify the function or the package name with a schema extension. If you specify a function name without a schema extension, only such references in the rule condition are considered valid. You can restrict the conditional expression to use a synonym to a function or a package by adding the corresponding synonym to the attribute set. This preserves the portability of the expression set to other schemas.
- See the section on defining attribute sets in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for more information about adding functions to an attribute set.
- Related views: USER_EXPFIL_ATTRIBUTE_SETS and USER_EXPFIL_ASET_FUNCTIONS

Examples

The following command adds two functions to the attribute set:

```
BEGIN
  DBMS_RLMGR.ADD_FUNCTIONS (attr_set   => 'Car4Sale',
                            funcs_name => 'HorsePower');
  DBMS_RLMGR.ADD_FUNCTIONS (attr_set   => 'Car4Sale',
                            funcs_name => 'Scott.CrashTestRating');
END;
/
```

ADD_RULE Procedure

This procedure adds new rules to a rule class.

Syntax

```
DBMS_RLMGR.ADD_RULE (
   rule_class      IN  VARCHAR2,
   rule_id         IN  VARCHAR2,
   rule_cond       IN  VARCHAR2,
   actprf_nml      IN  VARCHAR2 DEFAULT NULL,
   actprf_vall     IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 120–5 ADD_RULE Procedure Parameters

Parameter	Description
`rule_class`	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
`rule_id`	Unique identifier for the rule within the rule class
`rule_cond`	The condition for the rule. The condition uses the variables defined in the rule class's event structure.
`actprf_nml`	The list of action preference names for which values will be assigned through the `actprf_vall` argument
`actprf_vall`	The list of action preference values for the names list assigned to the `actprf_nml` argument

Usage Notes

- This procedure is used to add new rules to the rule class. The rule condition passed to the `ADD_RULE` procedure is validated using the event structure associated with the rule class. The action preferences names list is a subset of action preference categories configured during rule class creation.
- When schema extended name is used for the rule class, you should have `ADD RULE` privilege on the rule class. See the GRANT_PRIVILEGE Procedure for more information.
- Alternately, the owner of the rule class can add the rules using SQL `INSERT` statement on the rule class table (that shares the same name as the rule class). Note that the owner of the rule class can also grant direct DML privileges on the rule class table to other users.

  Note: The `AUTOCOMMIT` property of the rule class is ignored if the new rules are added using the SQL `INSERT` statement instead of the `ADD_RULE` procedure.

- See the CREATE_RULE_CLASS Procedure procedure for the structure of the rule class table.

Examples

The following command adds a rule to the rule class.

```
BEGIN
DBMS_RLMGR.ADD_RULE (
           rule_class => 'CompTravelPromo',
           rule_id => 'AB_AV_FL',
           rule_cond =>
             '<condition>
                 <and join="Flt.CustId = Car.CustId">
                    <object name="Flt">
                      Airline=''Abcair'' and ToCity=''Orlando''
                    </object>
                    <object name="Car">
                      CarType = ''Luxury''
                    </object>
                  </and>
               </condition>' ,
             actprf_nml => 'PromoType, OfferedBy',
             actprf_vall => '''RentalCar'', ''Acar''');
END;
```

With proper privileges, the following SQL `INSERT` statement can be used to add the rule to the rule class.

```
INSERT INTO CompTravelPromo (rlm$ruleid, rlm$rulecond, PromoType, OfferedBy)
  VALUES ('AB_AV_FL',
          '<condition>
             <and join="Flt.CustId = Car.CustId">
               <object name="Flt">
                   Airline=''Abcair'' and ToCity=''Orlando''
               </object>
               <object name="Car">
                   CarType = ''Luxury''
               </object>
             </and>
           </condition>',
          'RentalCar','Acar');
```

CONDITION_REF Function

This function retrieves the primitive rule condition reference from a rule condition for composite events.

Syntax

```
DBMS_RLMGR.CONDITION_REF (
     rule_cond IN   VARCHAR2,
     eventnm   IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 120–6 CONDITION_REF Function Parameters

Parameter	Description
`rule_cond`	Rule condition in XML format
`eventnm`	Name of the event for which the reference should be retrieved

Usage Notes

- For a rule condition in XML format, with a root `<condition>` element, this function retrieves the reference to a shared conditional expression on a particular primitive event.
- Use this function in a query operating on the rule class table to find all the references to a given primitive rule condition. To speed-up such queries, one or more functional indexes are defined on the `rlm$rulecond` column of the rule class table using this function signature. In order to make use of the index for a lookup query, the value assigned to the `eventnm` argument should be case sensitive.

Examples

The following command joins the rule class table with the primitive conditions table to identify all the rule conditions that have references to the shareable primitive conditions (the query uses a functional index defined on the `rlm$rulecond` column). This query identifies all the rule conditions that refer to any shared conditions stored in the `FlightConditions` table.

```
select ctp.rlm$ruleid from CompTravelPromo ctp, FlightConditions fc
where dbms_rlmgr.condition_ref(ctp.rlm$rulecond, 'FLT') = fc.rlm$condid;
```

CONSUME_EVENT Function

This function consumes an event and prepares the corresponding rule for action execution. This is required only when the action (or rule execution) is carried by the user's application and not in the callback.

Syntax

```
DBMS_RLMGR.CONSUME_EVENT (
   rule_class       IN VARCHAR2,
   event_ident      IN VARCHAR2)
 RETURN NUMBER;
```

Parameters

Table 120–7 CONSUME_EVENT Function Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_ident	Event identifier obtained from the corresponding rule class results view (or arguments of the action callback procedure in the case of rule class configured for RULE based consumption policy)

Returns

The function returns:

- 1 -- If the event is successfully consumed.
- 0 -- If the event is expired (owing to duration policy) or consumed by another session prior to this call.

Usage Notes

- When an EXCLUSIVE consumption policy is set for the events in a rule class, an event must be deleted from the system immediately after the rule it matched is executed (action is executed). When the rule action is carried in the rule class callback procedure by calling the PROCESS_RULES procedure, the rule manager automatically handles the consumption of the events. However, when you request the results from matching events with rules in a rule class results view using the ADD_EVENT procedure, you should take appropriate action to indicate the exact rule-event combination that is to be used for rule execution. The CONSUME_EVENT function performs the required housekeeping services when the unique identifier for the event used in a rule execution is passed in.
- Because there could be a time lag between fetching the rule class matching results and the execution of the user initiated action, the application must execute the action only if the CONSUME_EVENT call succeeds in consuming the event. This avoids any race condition with parallel sessions trying to consume the same events. When the event is successfully consumed, this call returns 1. In all other cases, it returns 0. A return value of 0 implies that the event is already consumed by another session and hence it is not available for this session.
- The CONSUME_EVENT function deletes the events configured with EXCLUSIVE consumption policy and does nothing for events configured for 4 consumption policy.

- Unlike the EXCLUSIVE and SHARED consumption policies, which are determined at the rule class level, you use a RULE consumption policy to determine the consumption of an event on a rule by rule basis. That is a subset of the rules in a rule class may be configured such that when they are matched, the event is deleted from the system. At the same time the other set of rules could leave the event in the system even after executing the corresponding action. In this scenario, the action callback procedure implemented by the application developer can call CONSUME_EVENT function (with appropriate arguments) to conditionally consume the event for certain rules. Also see the use of CONSUME_PRIM_EVENTS Function for rule classes configured for RULE consumption policy

Examples

The following commands identify an event that is used for a rule execution and consumes it using its identifier.

```
var eventid VARCHAR(40);
var evtcnsmd NUMBER;

BEGIN
  SELECT rlm$eventid INTO :eventid FROM MatchingPromos WHERE rownum < 2;

  -- carry the required action for a rule matched by the above event --
  :evtcnsmd := DBMS_RLMGR.CONSUME_EVENT(rule_class  => 'TravelPromotion',
                                        event_ident => :eventid);
END;
```

CONSUME_PRIM_EVENTS Function

This function consumes a set of primitive events with all or nothing semantics in the case of a rule class configured with RULE based consumption policy.

Syntax

```
DBMS_RLMGR.CONSUME_PRIM_EVENTS (
   rule_class       IN VARCHAR2,
   event_idents     IN RLM$EVENTIDS)
 RETURN NUMBER;
```

Parameters

Table 120–8 CONSUME_PRIM_EVENTS Function Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
event_ident	Event identifiers obtained from the corresponding rule class results view or the arguments of the action callback procedure

Returns

The function returns:

- 1 -- If all the events, the identifiers for which are passed in, are successfully consumed.
- 0 -- If one or more primitive event could not be consumed.

Usage Notes

- When you configure the rule class for RULE based consumption policy, it uses the CONSUME_PRIM_EVENTS function to consume one or more primitive events that constitute a composite event. This operation succeeds only when all the events passed in are still valid and are available for consumption. Any user initiated action must be implemented after checking the return value of the CONSUME_ PRIM_EVENTS call.

Examples

The following commands show the body of the action callback procedure for a rule class configured for RULE consumption policy. This demonstrates the use of CONSUME_PRIM_EVENTS function to consume the events before executing the action for the matched rules.

```
create or replace procedure PromoAction (
      Flt        AddFlight,
      Flt_EvtId  ROWID,    --- rowid for the flight primitive event
      Car        AddRentalCar,
      Car_EvtId  ROWID,
      rlm$rule   TravelPromotions%ROWTYPE) is
  evtcnsmd   NUMBER;
BEGIN
  evtcnsmd := DBMS_RLMGR.CONSUME_PRIM_EVENTS(
                   rule_class   => 'TravelPromotions',
                   event_idents => RLM$EVENTIDS(Flt_EvtId, Car_EvtId));
```

```
  if (evtcnsmd = 1) then
    -- consume operation was successful; perform the action ---
    OfferPromotion (Flt.CustId, rlm$rule.PromoType, rlm$rule.OfferedBy);
  end if;
END;
/
```

CREATE_CONDITIONS_TABLE Procedure

This procedure creates a conditions table, which is a repository for the primitive rule conditions that can be shared by multiple rules from the same or different rule classes. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Creates a conditions table to store shareable primitive conditions defined for a primitive event.

```
DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
     cond_table    IN  VARCHAR2,
     pevent_struct IN  VARCHAR2,
     stg_clause    IN  VARCHAR2 DEFAULT NULL);
```

Creates a conditions table to store shareable primitive conditions defined for a relational table identified through table aliases.

```
DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
     cond_table    IN  VARCHAR2,
     tab_alias     IN  rlm$table_alias,
     stg_clause    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 120–9 CREATE_CONDITIONS_TABLE Procedure Parameters

Parameter	Description
pevent_struct	Primitive event structure for which the shareable primitive rule conditions are defined
cond_table	Name of the table storing the primitive rule conditions
stg_clause	Storage clause for the conditions table
tab_alias	Type that identifies the database table for which the shareable primitive rule conditions are defined

Usage Notes

- This procedure creates a relational table to store the primitive rule conditions that can be shared by multiple rules. It creates the table with the user specified name and it has a VARCHAR2 column to store the unique identifier for each primitive rule condition (rlm$condid), an expression data type column to store the conditional expressions (rlm$condition), and a VARCHAR2 column to store the descriptions for the primitive rule conditions in plain text (rlm$conddesc).
- Once it creates the table, the primitive rule condition can be added or modified using standard DML operations on the conditions table. The conditions table is configured to validate the primitive rule conditions (in the rlm$condition column) using the primitive event structure specified for the pevent_struct argument.
- A rule class configured with a primitive event structure can include some rule conditions that refer to rows in the conditions table using corresponding identifiers.

Examples

The following command creates a conditions table that can store shareable primitive rule conditions for the `AddRentalCar` event structure:

```
BEGIN
  DBMS_RLMGR.CREATE_CONDITIONS_TABLE (
    cond_table    => 'FlightConditions',
    pevent_struct => 'AddFlight',
    stg_clause    => 'TABLESPACE TBS_1');
END;
/
```

CREATE_EVENT_STRUCT Procedure

This procedure creates an event structure.

Syntax

```
DBMS_RLMGR.CREATE_EVENT_STRUCT  (
   event_struct  IN  VARCHAR2);
```

Parameters

Table 120–10 CREATE_EVENT_ STRUCT Procedure Parameter

Parameter	Description
event_struct	Name of the event structure to be created in the current schema

Usage Notes

- This procedure creates a dummy event structure in the current schema. One or more attributes can be added to this event structure using the ADD_ELEMENTARY_ATTRIBUTE procedure.

Examples

The following command creates the event structure.

```
BEGIN
  DBMS_RLMGR.CREATE_EVENT_STRUCT(event_struct => 'AddFlight');
END;
```

CREATE_EXPFIL_INDEXES Procedure

This procedure creates expression filter indexes for the rule class if the default indexes have been dropped. If a representative set of rules is stored in the rule class table, the indexes can be tuned for these expressions by collecting statistics.

Syntax

```
DBMS_RLMGR.CREATE_EXPFIL_INDEXES  (
   rule_class  IN  VARCHAR2,
   coll_stats  IN  VARCHAR2 default 'NO');
```

Parameters

Table 120–11 CREATE_EXPFIL_INDEXES Procedure Parameter

Parameter	Description
rule_class	Name of the rule class
coll_stats	To collect expression statistics for building the indexes

Usage Notes

- Expression filter indexes are used to identify the rule conditions in a rule class for appropriate events. The default indexes created at the time of rule class creation assume that all types of predicates (equality, inequality, and so forth) involving scalar attributes in an event structure are equally likely. The performance of a rule class can be improved by tuning the expression filter indexes for a specific workload. This is achieved either by collecting statistics on a representative workload or by identifying the most common predicate constructs with some domain knowledge.
- The default expression filter indexes created for the rule class can be dropped using the DBMS_RLMGR.DROP_EXPFIL_INDEXES procedure. Once the indexes are dropped, they can be recreated using the DBMS_RLMGR.CREATE_EXPFIL_INDEXES procedure. When the coll_stats argument of the CREATE_EXPFIL_INDEXES procedure is set to YES, rule condition statistics are collected for the most common predicate constructs and the indexes are created using these statistics. Alternately, a domain expert can manually set the index parameters by identifying the most common and discriminating predicate constructs and then create the indexes with these parameters. Note that the index parameters can be set for each of the primitive event structures associated with the rule class. The index parameters can be assigned to the event structure (which is also the Expression Filter attribute set) using the DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS procedure. When the coll_stats argument of the CREATE_EXPFIL_INDEXES procedure is set to NO, the expression filter indexes created for the rule class make use of the default index parameters associated with each primitive event structure. (See the chapter on indexing expressions in *Oracle Database Rules Manager and Expression Filter Developer's Guide* for additional information on tuning the Expression Filter indexes for better performance).
- Related view: USER_EXPFIL_DEF_INDEX_PARAMS

Examples

The following commands collect the statistics for the rules defined in the `CompTravelPromo` rule class and create the expression filter indexes that are based on the most common predicates in the set.

```
BEGIN
DBMS_RLMGR.CREATE_EXPFIL_INDEXES (rule_class => 'CompTravelPromo',
                                  coll_stats => 'yes');
END;
/
```

This is an Expression Filter tuning example where the domain knowledge is used to assign specific index parameters. The following commands associate specific index parameters to the `AddFlight` event structure such that the expression filter index created for corresponding expressions are optimized accordingly. The subsequent `CREATE_EXPFIL_INDEXES` step makes use of these index parameters.

```
BEGIN
  DBMS_EXPFIL.DEFAULT_INDEX_PARAMETERS('AddFlight',
    exf$attribute_list (
       exf$attribute (attr_name => 'Airline',
                      attr_oper => exf$indexoper('='),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'ToCity',
                      attr_oper => exf$indexoper('='),
                      attr_indexed => 'TRUE'),
       exf$attribute (attr_name => 'Depart',
                      attr_oper => exf$indexoper('=','<','>','>=','<='),
                      attr_indexed => 'FALSE')
    )
  );
  -- create the indexes after assigning the index parameters --
  DBMS_RLMGR.CREATE_EXPFIL_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

CREATE_INTERFACE Procedure

This procedure creates a rule class interface package that can be used to directly operate on the rule class for efficiency and ease of use.

Syntax

```
DBMS_RLMGR.CREATE_INTERFACE  (
   rule_class   IN  VARCHAR2,
   interface_nm IN  VARCHAR2);
```

Parameters

Table 120–12 CREATE_INTERFACE Procedure Parameter

Parameter	Description
rule_class	Name of the rule class for which the interface package is created
interface_nm	Name of the PL/SQL package that acts as the interface to the rule application

Usage Notes

- The common set of DBMS_RLMGR procedures used for runtime operations such as processing the rules for some events, consuming the events and resetting the session make use of the rule class name passed in as one of the arguments and associate them to the corresponding operations on the rule class. You can the overhead involved in this step by creating a rule class interface package that is used to directly operate on the rule class.
- The rule class interface package is a PL/SQL package that has procedures or functions to process rules (PROCESS_RULES), add event (ADD_EVENT), consume events (CONSUME_EVENT, CONSUME_PRIM_EVENTS) and reset rule session (RESET_SESSION). The operational characteristics of these procedures and functions are the same as those of DBMS_RLMGR procedures and functions with matching names with two exceptions. Since the rule class interface package is created for a specific rule class, the rule class name is implicit and it need not be passed in as an argument to the procedures and functions of the rule class interface package. Additionally, the rule class interface package has separate PROCESS_RULES and ADD_EVENT procedures to accept each primitive event type configured with the rule class. This is in contrast to the same procedures in the DBMS_RLMGR package, which are generalized to accept the event instances only as a VARCHAR or an AnyData instance.

Examples

The following commands create the rule class interface package for the CompTravelPromo rule class.

```
BEGIN
  DBMS_RLMGR.CREATE_INTERFACE  (rule_class   => 'CompTravelPromo',
                                interface_nm => 'TravelPromoRules');
END;
```

The following commands make use of the interface created in previous step to process the rules for an instance of AddFlight event.

```
BEGIN
```

```
  TravelPromoRules.process_rules (event_inst =>
            AddFlight(987, 'Abcair', 'Boston', 'Orlando',
                                     '01-APR-2009', '08-APR-2009');
END;
```

CREATE_RULE_CLASS Procedure

This procedure creates a rule class.

Syntax

```
DBMS_RLMGR.CREATE_RULE_CLASS  (
   rule_class      IN  VARCHAR2,
   event_struct    IN  VARCHAR2,
   action_cbk      IN  VARCHAR2,
   actprf_spec     IN  VARCHAR2  default null,
   rslt_viewnm     IN  VARCHAR2  default null,
   rlcls_prop      IN  VARCHAR2  default <simple/>);
```

Parameters

Table 120–13 CREATE_RULE_CLASS Procedure Parameters

Parameter	Description
rule_class	Name of the rule class to be created in the current schema
event_struct	Name of the object type or an Expression Filter attribute set in the current schema that represents the event structure for the rule class
action_cbk	Name of the action callback procedure to be created for the rule class
actprf_spec	Specification (name and SQL datatype pairs) for the action preferences associated with the rule class
rlst_viewnm	Name of rule class results view that lists the matching events and rules within a session. A view with this name is created in the current schema.
rlcls_prop	XML document for setting the rule class properties. By default, the rule class created is for simple events (non-composite).

Usage Notes

- For successful creation of a rule class, you must have sufficient privileges to create views, object types, tables, packages, and procedures.
- This command creates the rule class and its dependent objects in the user's schema. For this operation to succeed the name specified for the event structure must refer to an existing object type or an Expression Filter attribute set in the user's schema. When an object type is used for an event structure, the CREATE_RULE_CLASS procedure implicitly creates an attribute set for the object type. In the case of a rule class configured for composite events, the previous procedure also creates attribute sets for the object types that are directly embedded in the event structure's object type (or the attribute set). A maximum of 32 embedded objects (and or or table aliases) can be specified with an event structure that is used for a composite rule class. The types of dependent objects created with this procedure and their structure depend on the properties of the rule class and its event structure. The minimum set of dependent objects created for a rule class is as follows:
  - Rule class table – A rule class table that shares the name of the rule class is created in the user's schema to store the rule definitions (rule identifiers, rule conditions, rule descriptions, and action preferences). This table implicitly has four columns, rlm$ruleid, rlm$rulecond, rlm$enabled, and rlm$ruledesc to store the rule identifiers, rule conditions, rule states, and rule descriptions respectively. In addition to these four columns, the rule class

table has few columns according to the action preference specification for the rule class. For example, if a TravelPromotion rule class uses 'PromoType VARCHAR(20), OfferedBy VARCHAR(20)' as its action preference specification (assigned to actpref_spec argument), the rule class table is created with the following structure.

```
TABLE TravelPromotion (
      rlm$ruleid VARCHAR(100),     -- rule identifier column --
      PromoType VARCHAR(20),       -- action preference 1 --
      OfferedBy VARCHAR(20),       -- action preference 2 --
      rlm$rulecond VARCHAR(4000),  -- rule condition --
      rlm$ruledesc VARCHAR(1000),  -- rule description --
      rlm$enabled CHAR(1));        -- rule status --
```

The rule class table structure varies from one rule class to another based on the exact list of action preference categories specified for the rule class.

– Action Callback Procedure – You create the skeleton for the action callback procedure with the given name in the user's schema and it is associated with the rule class. During rule evaluation, the callback procedure is called for each matching rule and event. You must implement the body of the action callback procedure to perform the appropriate action for each rule. The exact action for a rule can be determined based on the event that matched the rule and rule definition along with its action preferences. This information is passed to the action callback procedure through its arguments. Hence, the argument list for the action callback procedure depends on the event structure associated with the rule class and the rule class itself.

  In the case of a rule class configured for simple events (<simple/> assigned to the properties of the rule class), the event that matches a rule is passed through a rlm$event argument that is declared to be of the same type as the event structure. Additionally, the rule definitions are passed to the action callback procedure using an rlm$rule argument that is declared as ROWTYPE of the corresponding rule class table. For example, the structure of the PromoAction action callback procedure created for a TravelPromotion rule class configured for a simple (non-composite) AddFlight event structure is as follows:

```
PROCEDURE PromoAction (rlm$event AddFlight,
                       rlm$rule TravlePromotion%ROWTYPE);
```

  In the case of a rule class created for composite events (<composite/> assigned to the properties of the rule class), the action callback procedure is created to pass each primitive event as a separate argument. For example, the CompPromoAction action callback procedure created for a rule class CompTravelPromo configured for a composite event with AddFlight and AddRentalCar primitive events are shown as follows:

```
-- composite event structure --
TYPE TSCompEvent (Flt AddFlight,
                  Car AddRentalCar);
-- corresponding action callback procedure --
PROCEDURE PromoAction (Flt AddFlight,
                       Car AddRentalCar,
                       rlm$rule CompTravelPromo%ROWTYPE)
```

  The action callback procedure includes additional arguments when the rule class is configured for the RULE consumption policy or when the rule class is enabled for one or more collection events. The arguments in these cases

include the identifiers for the events (ROWID data type) in addition to the event instances. You can use these event identifiers to further operate on the matched rules. For example, in the case of the rule class configured for rule consumption, the event identifiers are used to consume the events with DBMS_RLMGR.CONSUME_PRIM_EVENTS function. In the case of rule class enabled for collection events, the same identifiers for the collection events can be used to fetch specific aggregate values with the DBMS_RLMGR.GET_AGGREGATE_VALUE function.

– Rule class results view – A view to display the results from matching some events with rules is created in the same schema as the rule class. By default, this view is created with a system-generated name. Optionally, the rule class creator can specify a name for this view with the rlst_viewnm argument of the CREATE_RULE_CLASS procedure. When the events are added to the rule manager within a rule session using the ADD_EVENT procedure, the list of matching events and rules are displayed in the rule class results view.

  The structure of the view defined for the rule class results depends on the event structure and the action preferences configured with the rule class. Minimally, the view has three columns to display the system generated event identifier (rlm$evenetid), the identifier of the rule it matches (rlm$ruleid), and the rule condition (rlm$rulecond). Additionally, it has columns to display the event information and the rule action preferences.

  In the case of a rule class configured for simple events, the event information is displayed as rlm$event that is declared to be of the event structure type. So, a MatchingPromos view created for the TravelPromotion rule class configured for a simple AddFlight event structure is as follows:

```
VIEW MatchingPromos (
    rlm$eventid ROWID,
    rlm$event AddFlight,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30), -- action preference 1 --
    OffredBy VARCHAR(30), -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

  In the case of a rule class configured for composite events, the primitive events matching a rule are displayed separately using corresponding columns. For the above CompTravelPromo rule class, a MatchingCompPromos view is created with the following structure.

```
VIEW MatchingCompPromos (
    rlm$eventid ROWID,
    Flt AddFlight,
    Car AddRentalCar,
    rlm$ruleid VARCHAR(100),
    PromoType VARCHAR(30),   -- action preference 1 --
    OffredBy VARCHAR(30),    -- action preference 2 --
    rlm$rulecond VARCHAR(4000),
    rlm$ruledesc VARCHAR(1000)
);
```

  The values from the rlm$eventid column are used to enforce rule class consumption policies when the corresponding rule is executed. See the CONSUME_EVENT Function for more information.

Examples

The following commands create a rule class for simple events (of `AddFlight` type).

```
CREATE or REPLACE TYPE AddFlight AS OBJECT (
                  CustId NUMBER,
                  Airline VARCHAR(20),
                  FromCity VARCHAR(30),
                  ToCity VARCHAR(30),
                  Depart DATE,
                  Return DATE);
BEGIN
  DBMS_RLMGR.CREATE_RULE_CLASS (
              rule_class   => 'TravelPromotion', -- rule class name --
              event_struct => 'AddFlight', -- event struct name --
              action_cbk    => 'PromoAction', -- callback proc name --
              rslt_viewnm   => 'MatchingPromos', -- results view --
              actprf_spec   => 'PromoType VARCHAR(20),
                                OfferedBy VARCHAR(20)');
END;
```

The following commands create a rule class for composite events consisting of two primitive events (`AddFlight` and `AddRentalCar`).

```
CREATE or REPLACE TYPE TSCompEvent (Flt AddFlight,
                                    Car AddRentalCar);
BEGIN
  DBMS_RLMGR.CREATE_RULE_CLASS (
              rule_class    => 'CompTravelPromo', -- rule class name --
              event_struct  => 'TSCompEvent', -- event struct name --
              action_cbk    => 'CompPromoAction', -- callback proc name --
              rslt_viewnm   => 'MatchingCompPromos', -- results view --
              actprf_spec   => 'PromoType VARCHAR(20),
                                OfferedBy VARCHAR(20)',
              properties    => '<composite/>');
END;
```

DELETE_RULE Procedure

This procedure deletes a rule from a rule class.

Syntax

```
DBMS_RLMGR.DELETE_RULE (
   rule_class    IN    VARCHAR2,
   rule_id       IN    VARCHAR2);
```

Parameters

Table 120–14 DELETE_RULE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
rule_id	Identifier for the rule to be deleted

Usage Notes

- Use this procedure to delete a rule from the rule class. The identifier for the rule to be deleted can be obtained by querying the rule class table (that shares the same name as the rule class). Alternately, the owner of the rule class can use a SQL DELETE statement on one rule class table to delete a rule.
- When you use the schema extended name for the rule class, you must have the DELETE RULE privilege on the rule class. See the GRANT_PRIVILEGE Procedure for more information.

> **Note:** AUTOCOMMIT property of the rule class is ignored if the rules are deleted with the SQL DELETE statement instead of the DELETE_RULE procedure.

- See the CREATE_RULE_CLASS Procedure for the structure of the rule class table.

Examples

The following command deletes a rule from the rule class.

```
BEGIN
  DBMS_RLMGR.DELETE_RULE (
           rule_class  => 'CompTravelPromo',
           rule_id     => 'AB_AV_FL');
END;
```

Alternately, you can issue the following SQL DELETE statement to delete the above rule from the rule class.

```
DELETE FROM CompTravelPromo WHERE rlm$ruleid = 'AB_AV_FL';
```

DROP_CONDITIONS_TABLE Procedure

This procedure drops the conditions table.

Syntax

```
DBMS_RLMGR.DROP_CONDITIONS_TABLE (
     cond_table IN   VARCHAR2);
```

Parameters

Table 120–15 DROP_CONDITIONS_TABLE Procedure Parameters

Parameter	Description
cond_table	Name of conditions table in the user schema

Usage Notes

- This procedure drops the table that stores the shareable conditional expressions. If one of the conditional expressions in this table is used to form a rule condition in a rule class, the drop operation fails with an appropriate error.

Examples

The following command drops the conditions table:

```
BEGIN
  DBMS_RLMGR.DROP_CONDITIONS_TABLE (cond_table => 'FlightConditions');
END;
/
```

DROP_EVENT_STRUCT Procedure

This procedure drops an event structure.

Syntax

```
DBMS_RLMGR.DROP_EVENT_STRUCT  (
   event_struct  IN  VARCHAR2);
```

Parameters

Table 120–16 DROP_EVENT_ STRUCT Procedure Parameter

Parameter	Description
event_struct	Name of event structure in the current schema

Usage Notes

- This procedure drops the event structure from the current schema. This drops all the dependent objects created to manage the event structure.

Examples

The following command drops the event structure.

```
BEGIN
  DBMS_RLMGR.DROP_EVENT_STRUCT(event_struct => 'AddFlight');
END;
```

DROP_EXPFIL_INDEXES Procedure

This procedure drops the expression filter indexes created for a rule class.

Syntax

```
DBMS_RLMGR.DROP_EXPFIL_INDEXES  (
   rule_class  IN  VARCHAR2);
```

Parameters

Table 120–17 DROP_EXPFIL_INDEXES Procedure Parameter

Parameter	Description
rule_class	Name of the rule class

Usage Notes

This procedure drops all the expression filter indexes associated with a rule class. You can recreate the indexes using the DBMS_RLMGR.CREATE_EXPFIL_INDEXES call.

Examples

The following command drops the expression filter indexes created for the CompTravelPromo rule class.

```
BEGIN
DBMS_RLMGR.DROP_EXPFIL_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

DROP_INTERFACE Procedure

This procedure drops the rule class interface package created for a rules application.

Syntax

```
DBMS_RLMGR.DROP_INTERFACE  (
   interface_nm  IN  VARCHAR2);
```

Parameters

Table 120–18 DROP_INTERFACE Procedure Parameter

Parameter	Description
interface_nm	Name of the PL/SQL package that acts as the interface to the rule application

Usage Notes

This procedure drops the rule class interface package created with the DBMS_RLMGR.CREATE_INTERFACE call.

Examples

The following command drops the rule class interface package TravelPromoRules.

```
BEGIN
  DBMS_RLMGR.DROP_INTERFACE (interface_nm => 'TravelPromoRules'
END;
```

DROP_RULE_CLASS Procedure

This procedure drops a rule class.

Syntax

```
DBMS_RLMGR.DROP_RULE_CLASS  (
   rule_class  IN  VARCHAR2);
```

Parameters

Table 120–19 DROP_RULE_CLASS Procedure Parameter

Parameter	Description
rule_class	Name of rule class in the current schema

Usage Notes

- This procedure drops the rule class from the current schema. This drops all the dependent objects created to manage the rule class. Because an event structure in a user's schema can be shared across multiple rule classes, the event structure is not dropped with this command. You must use the DROP_EVENT_STRUCTURE procedure for the composite event as well as the individual primitive events to cleanup unused event structures.

Examples

The following command drops the rule class.

```
BEGIN
  DBMS_RLMGR.DROP_RULE_CLASS(rule_class => 'CompTravelPromo');
END;
```

EXTEND_EVENT_STRUCT Procedure

This is used to extend the primitive event structure used by one or more rule classes by adding a new attribute.

Syntax

```
DBMS_RLMGR.EXTEND_EVENT_STRUCT (
          event_struct    IN   VARCHAR2,
          attr_name       IN   VARCHAR2,
          attr_type       IN   VARCHAR2,
          attr_defvl      IN   VARCHAR2 default NULL);
```

Parameters

Table 120–20 EXTEND_EVENT_ STRUCT Procedure Parameter

Parameter	Description
event_struct	Name of the event structure to which this attribute is added
attr_name	Name of the elementary attribute to be added. No two attributes in a set can have the same name.
attr_type	Datatype of the attribute. This argument accepts any standard SQL datatype or the name of an object type that is accessible to the current user.
attr_defvl	Default value for the elementary attribute

Usage Notes

- This procedure extends a primitive event structure already associated with a rule class to include a new attribute. You can use this procedure mostly to migrate a fully developed rules application to use extended event structures and you should not use it in the place of the ADD_ELEMENTARY_ATTRIBUTE call. Unlike the ADD_ELEMENTARY_ATTRIBUTE call, which builds an event structure one attribute at a time, the EXTEND_EVENT_STRUCT call evolves the object type associated with the event structure to include the new attributes and performs some maintenance operations on the dependent objects.
- The usage of the EXTEND_EVENT_STRUCT call is similar to that of the ADD_ELEMENTARY_ATTRIBUTE call with the same set of arguments. Table alias attributes and attributes of text and spatial data types cannot be added to the event structure using the EXTEND_EVENT_STRUCT call.

Examples

The following commands add an attribute to the AddRentalCar event structure that is used by the CompTravelPromo rule class.

```
BEGIN
  DBMS_RLMGR.EXTEND_EVENT_STRUCT (
        event_struct   => 'AddRentalCar',
        attr_name      => 'PrefMemberId',
        attr_type      => 'VARCHAR2(30)');
END;
```

GET_AGGREGATE_VALUE Function

This function retrieves the aggregate value computed for a collection event.

Syntax

```
DBMS_RLMGR.GRANT_PRIVILEGE  (
   rule_class      IN  VARCHAR2,
   event_ident     IN  VARCHAR2,
   aggr_func       IN  VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 120–21 GET_AGGREGATE_VALUE Function Parameters

Parameter	Description
rule_class	Name of the rule class for the collection event
event_ident	System-generated identifier for the collection event
aggr_func	Signature for the aggregate value to be retrieved

Usage Notes

- When a rule condition with collection construct matches a set of events, an instance representing the collection event and a system-generated identifier for the collection event are passed into the action callback procedure. This event identifier can be used to fetch any aggregate values that are computed as part of the collection event evaluation.
- Within a collection construct in a rule condition, the aggregate functions can be included in the HAVING clause or in the COMPUTE clause. For example, the following rule condition computes three aggregate values for sum(amount), count(*), and max(amount). At the time of action execution, these values can be obtained using the identifier for the collection event that represents all the instances of BankTransaction with the same subjectId (the attribute on which the events are grouped).

  ```
  <condition>
     <collection name="bank" groupby="subjectId"
                 having="sum(amount) > 10000"
                 compute="max(amount), count(*)"/>
  </condition>
  ```

- The signature for the aggregate function is bound to the aggr_func argument of the GET_AGGREGATE_VALUE function to fetch the specific aggregate value. If the value is a NUMBER or a DATE datatype, it returns the equivalent VARCHAR representation. It returns a NULL value if an attempt was made to fetch an aggregate value that is never computed as part of the collection event.

Examples

The following example shows a sample implementation of the action callback procedure that prints the computed aggregate values as part of action execution. In this particular case, the BankTransaction primitive event is enabled for collections.

```
CREATE OR REPLACE PROCEDURE LAWENFORCEMENTCBK (
   bank                banktransaction,
   bankcollid          rowid,
```

```
   transport            transportation,
   fldrpt               fieldreport,
   rlm$rule             LawEnforcementRC%ROWTYPE) IS
   aggrval              VARCHAR(30);
begin
  dbms_ouput.put_line('Mathing Rule :'||rlm$rule.rlm$ruleid||chr(10));

  if (bank is not null) then
   dbms_ouput.put_line('-->Bank Transactions by ('||bank.subjectId||')'||chr(10);

   aggrval := dbms_rlmgr.get_aggregate_value(rule_class  =>'LawEnforcementRC',
                                             event_ident => bankcollid,
                                             aggr_func   => 'sum(amount)');
   if (aggrval is not null) then
     dbms_ouput.put_line('---> Sum of the amounts is :'||aggrval||chr(10));
   end if;
   . . .
  end if;
end;
```

GRANT_PRIVILEGE Procedure

This procedure grants privileges on a rule class to another user.

Syntax

```
DBMS_RLMGR.GRANT_PRIVILEGE  (
   rule_class      IN  VARCHAR2,
   priv_type       IN  VARCHAR2,
   to_user         IN  VARCHAR2);
```

Parameters

Table 120–22 GRANT_PRIVILEGE Procedure Parameters

Parameter	Description
rule_class	Name of the rule class in the current schema
priv_type	Type of rule class privilege to be granted
to_user	User to whom the privilege is to be granted

Usage Notes

- This procedure grants appropriate privileges to a user who is not the owner of the rule class. The types of privileges that can be granted to a user are:
  - PROCESS RULES: A user with PROCESS RULES privilege on a rule class can process the rules in the rule class using the PROCESS_RULES procedure or the ADD_EVENT procedure. Also, the user with this privilege can select from the corresponding rule class results view.
  - ADD RULE: A user with ADD RULE privilege on a rule class can add rules to a rule class. Alternatively, the owner of the rule class can grant the INSERT privilege on one rule class table to other users.
  - DELETE RULE: A user with DELETE RULE privilege on a rule class can delete rules from a rule class. Alternatively, the owner of the rule class can grant the DELETE privilege on one rule class table to other users.
  - ALL: Granting the ALL privilege on a rule class is equivalent to granting all the above privileges on the rule class to the user.
- The owner of the rule class always has privileges to drop a rule class, process rules in a rule class, add rules and delete rules from a rules class. Only the owner of the rule class can drop a rule class and this privilege cannot be granted to another user.
- You must have the EXECUTE privilege on the primitive event types associated with a rule class before you make use of the corresponding rule class results view.

Examples

The following command grants PROCESS RULES privilege on TravelPromo rule class to the user SCOTT.

```
BEGIN
  DBMS_RLMGR.GRANT_PRIVILEGE(rule_class => 'TravelPromo',
                             priv_type => 'PROCESS RULES',
                             to_user => 'SCOTT');
END;
```

PROCESS_RULES Procedure

This procedure processes the rules for a given event. The procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Processes the rules for a string representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES  (
   rule_class    IN  VARCHAR2,
   event_inst    IN  VARCHAR2,
   event_type    IN  VARCHAR2 default null);
```

Processes the rules for an AnyData representation of the event instance being added to the rule class:

```
DBMS_RLMGR.PROCESS_RULES  (
   rule_class    IN  VARCHAR2,
   event_inst    IN  sys.AnyData);
```

Parameters

Table 120–23 PROCESS_RULES Procedure Parameters

Parameter	Description
`rule_class`	Name of the rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.
`event_inst`	String or AnyData representation of the event instance being added to the rule class
`event_type`	Type of event instance assigned to the `event_inst` argument when the string representation of the event instance is used for a rule class configured for composite events

Usage Notes

- This procedure is used to process the rules in a rule class for an event instance assigned to the `event_inst` argument.
- In the case of a rule class configured for simple events (non-composite), the event instance is an instantiation of the corresponding event structure. The rules are evaluated (conclusively) for this event and the corresponding action callback procedure is called for each matching rule. If the event does not match any rule, no further action is performed. If the event matches two or more rules, the ordering clause configured for the rule class is used to order them accordingly to invoke the action callback procedure. If the rule class is configured for `EXCLUSIVE` consumption policy, once the first rule in this order is executed (and the corresponding action callback procedure is called), the rest of the rules that matched the event are ignored.
- In the case of a rule class configured for composite events, the event instance assigned to the `event_inst` argument is an instantiation of one of the primitive type within the composite event. When the instance is represented as a string, the corresponding type name should be assigned to the `event_type` argument. The `PROCESS_RULES` call on a rule class configured for composite events performs

various actions depending on the state of the rule class and the kind of rules in the rule class. Note the following.

- The rules operating only on the primitive event passed in are evaluated conclusively and the action callback procedure is called for the matching rules, as described in previous paragraph.
- In the case of a rule operating on more than one primitive event, the event instance passed through `PROCESS_RULES` procedure could match only a part of the rule.
  * If there are other primitive event instances that matches the rest of the rule, the current event instance is combined with the other instances to form a complete composite event that matches a rule in the rule class. So, the event instance assigned to the `event_inst` argument of the `PROCESS_RULES` procedure could be combined with various other primitive events (previously processed) to evaluate one or more rules conclusively. The action callback procedure for the rule class is called for each such combination of primitive events (composite event) and the rule. The ordering clause for the rule class and the consumption policy for the primitive events in taken into account while invoking the action callback procedure.
  * If there is no other primitive event that matches the rest of the rule, the current event instance and its (incremental) evaluation results are recorded in the database. These results are preserved until either the event is consumed or deleted from the system owing to the duration policy used for the rule class.

Examples

The following command processes the rules in the `TravelPromotion` rule class for the given events.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES (
               rule_class => 'TravelPromotion',
               event_inst =>
                 AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                                      '01-APR-2003', '08-APR-2003'));
END;
```

The following commands process the rules in the `CompTravelPromo` rule class for the two primitive events shown.

```
BEGIN
  DBMS_RLMGR.PROCESS_RULES(
               rule_class => 'CompTravelPromo',
               event_inst =>
                 AddFlight.getVarchar(987, 'Abcair', 'Boston', 'Orlando',
                                      '01-APR-2003', '08-APR-2003'),
               event_type => 'AddFlight');
  DBMS_RLMGR.PROCESS_RULES(
               rule_class => 'Scott.CompTravelPromo',
               event_inst =>
                  AnyData.convertObject(AddRentalCar(987, 'Luxury', '03-APR-2003',
                                        '08-APR-2003', NULL)));
END;
```

PURGE_EVENTS Procedure

This procedure resets the incremental state maintained by the rule class by removing all the events associated with the rule class and purging any state information pertaining to rules matching some events.

Syntax

```
DBMS_RLMGR.PURGE_EVENTS (
     rule_class IN   VARCHAR2);
```

Parameters

Table 120–24 PURGE_EVENTS Procedure Parameters

Parameter	Description
`rule_class`	Name of rule class in the current schema

Usage Notes

- Use this procedure while developing rules applications using Rules Manager. You can test the rules defined in the rule class with hypothetical events and then remove all these events by issuing this procedure call. This call cleans up all the events in the events repository and purges any partial state information associated with the matching rules.

Examples

The following command removes the events associated with the `CompTravelPromo` rule class:

```
BEGIN
  DBMS_RLMGR.PURGE_EVENTS (rule_class => 'CompTravelPromo');
END;
/
```

RESET_SESSION Procedure

This procedure starts a new session and thus discards the results in the rule class results view.

Syntax

```
DBMS_RLMGR.RESET_SESSION  (
   rule_class  IN  VARCHAR2);
```

Parameters

Table 120–25 RESET_SESSION Procedure Parameter

Parameter	Description
rule_class	Name of rule class. A schema extended rule class name can be used to refer to a rule class that does not belong to the current schema.

Usage Notes

- When you use the ADD_EVENT procedure to add events to the rule class, the results from matching rules with events are recorded in the rule class results view. By default, these results are reset at the end of the database session. Alternately, you can use the RESET_SESSION Procedure to reset and start a new rule session within a database session.
- This procedure is only applicable while using ADD_EVENT Procedure to evaluate the rules.

Examples

The following command resets a rule class session.

```
BEGIN
  DBMS_RLMGR.RESET_SESSION(
             rule_class => 'CompTravelPromo');
END;
```

REVOKE_PRIVILEGE Procedure

This procedure revokes privileges on a rule class from another user.

Syntax

```
DBMS_RLMGR.REVOKE_PRIVILEGE  (
   rule_class      IN  VARCHAR2,
   priv_type       IN  VARCHAR2,
   from_user       IN  VARCHAR2);
```

Parameters

Table 120–26 REVOKE_PRIVILEGE Procedure Parameters

Parameter	Description
`rule_class`	Name of the rule class in the current schema
`priv_type`	Type of rule class privilege to be revoked
`from_user`	User from whom the privilege is to be revoked

Usage Notes

- This procedure revokes appropriate privileges from a user. The types of privileges that can be revoked are the same as the types listed in the description of the GRANT_PRIVILEGE Procedure. Rule class privileges cannot be revoked from the owner of the rule class.

Examples

The following command revokes `PROCESS RULES` privilege on `TravelPromo` rule class from the user `SCOTT`.

```
BEGIN
  DBMS_RLMGR.REVOKE_PRIVILEGE(rule_class  => 'TravelPromo',
                              priv_type   => 'PROCESS RULES',
                              from_user   => 'SCOTT');
END;
```

SYNC_TEXT_INDEXES Procedure

This procedure synchronizes the indexes defined to process the predicates involving the CONTAINS operator in rule conditions.

Syntax

```
DBMS_RLMGR.SYNC_TEXT_INDEXES (
     rule_class IN   VARCHAR2);
```

Parameters

Table 120–27 SYNC_TEXT_INDEXES Procedure Parameters

Parameter	Description
rule_class	Name of the rule class in the current schema

Usage Notes

- When a rule class is configured for events with one or more text attributes, the text predicates in the corresponding rule conditions are processed using CTXRULE indexes. Unlike other types of indexes (bitmap for scalar and XML predicates or spatial for spatial predicates) used to process other types of predicates in the rule conditions, the CTXRULE indexes are not transactional in nature. That is, if the text predicates in a rule condition are modified in a database transaction, the new predicates are not automatically reflected in the corresponding CTXRULE index. This could result in inconsistent results while matching events with the rule conditions. All the CTXRULE indexes associated with a rule class can be synchronized with the latest rule conditions using this procedure.

  You must have EXECUTE privilege on the CTX_DDL package for successful synchronization of the text indexes.

Examples

The following command synchronizes any text indexes associated CompTravelPromo rule class:

```
BEGIN
  DBMS_RLMGR.SYNC_TEXT_INDEXES (rule_class => 'CompTravelPromo');
END;
/
```

121

DBMS_RLS

The DBMS_RLS package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD). DBMS_RLS is available with the Enterprise Edition only.

> **See Also:** *Oracle Database Security Guide* for usage information on DBMS_RLS.

This chapter contains the following topics:

- Using DBMS_RLS
  - Overview
  - Security Model
  - Operational Notes
- Summary of DBMS_RLS Subprograms

Using DBMS_RLS

- Overview
- Security Model
- Operational Notes

Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```
DBMS_RLS.ADD_POLICY (
   'hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select');
```

Whenever the EMPLOYEES table, under the HR schema, is referenced in a query or subquery (SELECT), the server calls the EMP_SEC function (under the HR schema). This function returns a predicate specific to the current user for the EMP_POLICY policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: INDEX, SELECT, INSERT, UPDATE, or DELETE.

The server then produces a transient view with the text:

```
SELECT * FROM hr.employees WHERE P1
```

Here, P1 (for example, where SAL > 10000, or even a subquery) is the predicate returned from the EMP_SEC function. The server treats the EMPLOYEES table as a view and does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require EXECUTE privilege on the policy function, because the server makes the call with the function definer's right.

> **Note:** The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no JOIN, ORDER BY, GROUP BY, and so on.

DBMS_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the EMP_POLICY with the following PL/SQL statements:

```
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', FALSE);
```

Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

Operational Notes

The DBMS_RLS procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS_RLS procedures are part of the DDL transaction.

For example, you may create a trigger for CREATE TABLE. Inside the trigger, you may add a column through ALTER TABLE, and you can add a policy through DBMS_RLS. All these operations are in the same transaction as CREATE TABLE, even though each one is a DDL statement. The CREATE TABLE succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from v$vpd_policies.

A synonym can reference only a view or a table.

Summary of DBMS_RLS Subprograms

Table 121–1 DBMS_RLS Package Subprograms

Subprogram	Description
ADD_GROUPED_POLICY Procedure on page 121-7	Adds a policy associated with a policy group
ADD_POLICY Procedure on page 121-9	Adds a fine-grained access control policy to a table, view, or synonym
ADD_POLICY_CONTEXT Procedure on page 121-13	Adds the context for the active application
CREATE_POLICY_GROUP Procedure on page 121-14	Creates a policy group
DELETE_POLICY_GROUP Procedure on page 121-15	Deletes a policy group
DISABLE_GROUPED_POLICY Procedure on page 121-16	Disables a row-level group security policy
DROP_GROUPED_POLICY Procedure on page 121-17	Drops a policy associated with a policy group
DROP_POLICY Procedure on page 121-18	Drops a fine-grained access control policy from a table, view, or synonym
DROP_POLICY_CONTEXT Procedure on page 121-19	Drops a driving context from the object so that it will have one less driving context
ENABLE_GROUPED_POLICY Procedure on page 121-20	Enables or disables a row-level group security policy
ENABLE_POLICY Procedure on page 121-21	Enables or disables a fine-grained access control policy
REFRESH_GROUPED_POLICY Procedure on page 121-22	Reparses the SQL statements associated with a refreshed policy
REFRESH_POLICY Procedure on page 121-23	Causes all the cached statements associated with the policy to be reparsed

ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

Syntax

```
DBMS_RLS.ADD_GROUPED_POLICY(
   object_schema         IN VARCHAR2 NULL,
   object_name           IN VARCHAR2,
   policy_group          IN VARCHAR2 'SYS_DEFAULT',
   policy_name           IN VARCHAR2,
   function_schema       IN VARCHAR2 NULL,
   policy_function       IN VARCHAR2,
   statement_types       IN VARCHAR2 NULL,
   update_check          IN BOOLEAN FALSE,
   enable                IN BOOLEAN TRUE,
   static_policy         IN BOOLEAN  FALSE,
   policy_type           IN BINARY_INTEGER NULL,
   long_predicate           BOOLEAN  FALSE,
   sec_relevant_cols     IN VARCHAR2,
   sec_relevant_cols_opt IN BINARY_INTEGER NULL);
```

Parameters

Table 121–2 ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym. The default is NULL, which means that the current user schema is used as the object_schema.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.
policy_name	The name of the policy; must be unique for the same table or view.
function_schema	The schema owning the policy function. The default is NULL, which means that the current user schema is used as the function_ schema.
policy_function	The name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	For INSERT and UPDATE statements only, setting update_check to TRUE causes the server to check the policy against the value after INSERT or UPDATE.
enable	Indicates if the policy is enable when it is added. The default is TRUE.
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privilege user who has the EXEMPT ACCESS POLICY privilege.

Table 121–2 (Cont.) ADD_GROUPED_POLICY Procedure Parameters

Parameter	Description
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 121–4. Specifying any of these policy types overrides the value of static_policy.
long_predicate	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes.Policies existing prior to the availability of this parameter retain a 32K limit.
sec_relevant_cols	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
sec_relevant_cols_opt	Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See "Usage Notes" on page 121-11 for restrictions and additional information about this option.

Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the CREATE_POLICY_GROUP Procedure on page 121-14.
- The policy name must be unique within a policy group for a specific object.
- Policies from the default policy group, SYS_DEFAULT, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with EXEMPT ACCESS POLICY system privilege.
- If no object_schema is specified, the current user's schema is assumed.
- If no function_schema is specified, the current user's schema is assumed.

ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 121-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ADD_POLICY (
   object_schema            IN VARCHAR2 NULL,
   object_name              IN VARCHAR2,
   policy_name              IN VARCHAR2,
   function_schema          IN VARCHAR2 NULL,
   policy_function          IN VARCHAR2,
   statement_types          IN VARCHAR2 NULL,
   update_check             IN BOOLEAN  FALSE,
   enable                   IN BOOLEAN  TRUE,
   static_policy            IN BOOLEAN  FALSE,
   policy_type              IN BINARY_INTEGER NULL,
   long_predicate           IN BOOLEAN  FALSE,
   sec_relevant_cols        IN VARCHAR2 NULL,
   sec_relevant_cols_opt    IN BINARY_INTEGER NULL);
```

Parameters

Table 121–3 ADD_POLICY Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym. If no object_schema is specified, the current user's schema is assumed.
object_name	Name of table, view, or synonym to which the policy is added.
policy_name	Name of policy to be added. It must be unique for the same table or view.
function_schema	Schema of the policy function (current default schema, if NULL). If no function_schema is specified, the current user's schema is assumed.
policy_function	Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.
statement_types	Statement types to which the policy applies. It can be any combination of INDEX, SELECT, INSERT, UPDATE, or DELETE. The default is to apply to all of these types except INDEX.
update_check	Optional argument for INSERT or UPDATE statement types. The default is FALSE. Setting update_check to TRUE causes the server to also check the policy against the value after insert or update.
enable	Indicates if the policy is enabled when it is added. The default is TRUE.

Table 121–3 (Cont.) ADD_POLICY Procedure Parameters

Parameter	Description
static_policy	The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privileged user who has the EXEMPT ACCESS POLICY privilege.
policy_type	Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 121–4. Specifying any of these policy types overrides the value of static_policy.
long_predicate	Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes.Policies existing prior to the availability of this parameter retain a 32K limit.
sec_relevant_cols	Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.
sec_relevant_cols_opt	Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See "Usage Notes" on page 121-11 for restrictions and additional information about this option.

Table 121–4 DBMS_RLS.ADD_POLICY Policy Types

Policy Type	Description
STATIC	Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as SYS_CONTEXT or SYSDATE. Applies to only one object.
SHARED_STATIC	Same as STATIC except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.
CONTEXT_SENSITIVE	Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.
SHARED_CONTEXT_SENSITIVE	Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.
DYNAMIC	The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function upon each statement parsing and execution. Applies to only one object.

Usage Notes

- SYS is free of any security policy.
- If no object_schema is specified, the current user's schema is assumed.
- If no function_schema is specified, the current user's schema is assumed.
- The policy functions are called by the server. Following is the interface for the function:

```
FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2)
    RETURN VARCHAR2
--- object_schema is the schema owning the table or view.
--- object_name is the name of table, view, or synonym to which the policy
applies.
```

- The policy functions must have the purity level of WNDS (write no database state).

  See Also: The *Oracle Database Advanced Application Developer's Guide* has more details about the RESTRICT_REFERENCES pragma.

- Predicates generated from different VPD policies for the same object have the combined effect of a conjunction (ANDed) of all the predicates.
- The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.
- If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.
- When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

```
"select c1, c2, ... from tab tab where <predicate>"
```

- Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.
- Column-level VPD column masking behavior (specified with sec_relevant_cols_opt => dbms_rls.ALL_ROWS) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as NULL. The restrictions for this option are as follows:
  - Only applies to SELECT statements
  - Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.
  - If your application performs calculations, or does not expect NULL values, then you should use the default behavior of column-level VPD, which is specified with the sec_relevant_cols parameter.
  - If you use UPDATE AS SELECT with this option, then only the values in the columns you are allowed to see will be updated.
  - This option may prevent some rows from displaying. For example:

```
select * from employees
where salary = 10
```

This query may not return rows if the `salary` column returns a `NULL` value because the column masking option has been set.

Examples

As the first of two examples, the following creates a policy that applies to the `hr.employee` table. This is a column-level VPD policy that will be enforced only if a `SELECT` or an `INDEX` statement refers to the `salary`, `birthdate`, or `SSN` columns of the table explicitly, or implicitly through a view. It is also a `CONTEXT_SENSITIVE` policy, so the server will invoke the policy function `hr.hrfun` at parse time. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the `long_predicate` parameter is omitted from the call.

```
BEGIN
dbms_rls.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hr_policy',
function_schema =>'hr',
policy_function => 'hrfun',
statement_types =>'select,index',
policy_type => dbms_rls.CONTEXT_SENSITIVE,
sec_relevant_cols=>'salary,birthdate,ssn');
END;
/
```

As the second example, the following command creates another policy that applies to the same object for hosting, so users can access only data based on their subscriber ID. Since it is defined as a `SHARED_STATIC` policy type, the server will first try to find the predicate in the SGA cache. The server will only invoke the policy function, `subfun`, if that search fails.

```
BEGIN
dbms_rls.add_policy(object_schema => 'hr',
object_name => 'employee',
policy_name => 'hosting_policy',
function_schema =>'hr',
policy_function => 'subfun',
policy_type => dbms_rls.SHARED_STATIC);
END;
/
```

ADD_POLICY_CONTEXT Procedure

This procedure adds the context for the active application.

Syntax

```
DBMS_RLS.ADD_POLICY_CONTEXT (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   namespace       IN VARCHAR2,
   attribute       IN VARCHAR2);
```

Parameters

Table 121–5 ADD_POLICY_CONTEXT Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
namespace	The namespace of the driving context
attribute	The attribute of the driving context.

Usage Notes

Note the following:

- This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.
- If no object_schema is specified, the current user's schema is assumed.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.
- To add a policy to table hr.employees in group access_control_group, the following command is issued:

```
DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_
group','policy1','SYS', 'HR.ACCESS');
```

CREATE_POLICY_GROUP Procedure

This procedure creates a policy group.

Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   policy_group    IN VARCHAR2);
```

Parameters

Table 121–6 CREATE_POLICY_GROUP Procedure Parameters

Parameter	Description
object_schema	Schema containing the table, view, or synonym.
object_name	Name of the table, view, or synonym to which the policy is added.
policy_group	Name of the policy group that the policy belongs to.

Usage Notes

The group must be unique for each table or view.

DELETE_POLICY_GROUP Procedure

This procedure deletes a policy group.

Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (
  object_schema   IN VARCHAR2 NULL,
  object_name     IN VARCHAR2,
  policy_group    IN VARCHAR2);
```

Parameters

Table 121–7 DELETE_POLICY_GROUP Procedure Parameters

Parameter	Description
object_schema	The schema containing the table, view, or synonym.
object_name	The name of the table, view, or synonym to which the policy is added.
policy_group	The name of the policy group that the policy belongs to.

Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
- No policy can be in the policy group.

DISABLE_GROUPED_POLICY Procedure

This procedure disables a row-level group security policy.

Syntax

```
DBMS_RLS.DISABLE_GROUPED_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   group_name      IN VARCHAR2,
   policy_name     IN VARCHAR2);
```

Parameters

Table 121–8 ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym with which the policy is associated.
`group_name`	The name of the group of the policy.
`policy_name`	The name of the policy to be enabled or disabled.

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is disabled when this procedure is executed or when the ENABLE_GROUPED_POLICY procedure is executed with "enable" set to FALSE.

DROP_GROUPED_POLICY Procedure

This procedure drops a policy associated with a policy group.

Syntax

```
DBMS_RLS.DROP_GROUPED_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   policy_group    IN VARCHAR2 'SYS_DEFAULT',
   policy_name     IN VARCHAR2);
```

Parameters

Table 121–9 DROP_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym.
`object_name`	The name of the table, view, or synonym to which the policy is dropped.
`policy_group`	The name of the policy group that the policy belongs to.
`policy_name`	The name of the policy.

DROP_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 121-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.DROP_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   policy_name     IN VARCHAR2);
```

Parameters

Table 121–10 DROP_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view or synonym. If no `object_schema` is specified, or `NULL` is provided, then the current user's schema is assumed.
`object_name`	Name of the table, view, or synonym for which the policy is dropped.
`policy_name`	Name of policy to be dropped from table, view, or synonym.

DROP_POLICY_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

Syntax

```
DBMS_RLS.DROP_POLICY_CONTEXT (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   namespace       IN VARCHAR2,
   attribute       IN VARCHAR2);
```

Parameters

Table 121–11 DROP_POLICY_CONTEXT Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym. If no `object_schema` is specified, or `NULL` is provided, then the current user's schema is assumed.
`object_name`	The name of the table, view, or synonym to which the policy is dropped.
`namespace`	The namespace of the driving context.
`attribute`	The attribute of the driving context.

ENABLE_GROUPED_POLICY Procedure

This procedure enables or disables a row-level group security policy.

Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2,
   group_name      IN VARCHAR2,
   policy_name     IN VARCHAR2,
   enable          IN BOOLEAN TRUE);
```

Parameters

Table 121–12 ENABLE_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym. If no `object_schema` is specified, or `NULL` is provided, then the current user's schema is assumed.
`object_name`	The name of the table, view, or synonym with which the policy is associated.
`group_name`	The name of the group of the policy.
`policy_name`	The name of the policy to be enabled or disabled.
`enable`	`TRUE` enables the policy; `FALSE` disables the policy.

Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

ENABLE_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 121-5

A `COMMIT` is also performed at the end of the operation.

Syntax

```
DBMS_RLS.ENABLE_POLICY (
   object_schema IN VARCHAR2 NULL,
   object_name   IN VARCHAR2,
   policy_name   IN VARCHAR2,
   enable        IN BOOLEAN TRUE);
```

Parameters

Table 121–13 ENABLE_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing table, view, or synonym. If no `object_schema` is specified, or `NULL` is provided, then the current user's schema is assumed.
`object_name`	Name of table, view, or synonym with which the policy is associated.
`policy_name`	Name of policy to be enabled or disabled.
`enable`	`TRUE` to enable the policy, `FALSE` to disable the policy.

REFRESH_GROUPED_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

Syntax

```
DBMS_RLS.REFRESH_GROUPED_POLICY (
   object_schema   IN VARCHAR2 NULL,
   object_name     IN VARCHAR2 NULL,
   group_name      IN VARCHAR2 NULL,
   policy_name     IN VARCHAR2 NULL);
```

Parameters

Table 121–14 REFRESH_GROUPED_POLICY Procedure Parameters

Parameter	Description
`object_schema`	The schema containing the table, view, or synonym. If no `object_schema` is specified, or `NULL` is provided, then the current user's schema is assumed.
`object_name`	The name of the table, view, or synonym with which the policy is associated.
`group_name`	The name of the group of the policy.
`policy_name`	The name of the policy.

Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.

REFRESH_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also: Operational Notes on page 121-5

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.REFRESH_POLICY (
   object_schema IN VARCHAR2 NULL,
   object_name   IN VARCHAR2 NULL,
   policy_name   IN VARCHAR2 NULL);
```

Parameters

Table 121–15 REFRESH_POLICY Procedure Parameters

Parameter	Description
`object_schema`	Schema containing the table, view, or synonym. If no `object_schema` is specified, or `NULL` is provided, then the current user's schema is assumed.
`object_name`	Name of table, view, or synonym with which the policy is associated.
`policy_name`	Name of policy to be refreshed.

Usage Notes

The procedure returns an error if it tries to refresh a disabled policy.

122

DBMS_ROWID

The DBMS_ROWID package lets you create ROWIDs and obtain information about ROWIDs from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other ROWID components without writing code to interpret the base-64 character external ROWID. DBMS_ROWID is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

> **Note:** DBMS_ROWID is not to be used with universal ROWIDs (UROWIDs).

This chapter contains the following topics:

- Using DBMS_ROWID
  - Security Model
  - Types
  - Exceptions
  - Operational Notes
  - Examples
- Summary of DBMS_ROWID Subprograms

Using DBMS_ROWID

- Security Model
- Types
- Exceptions
- Operational Notes
- Examples

Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

Types

- Extension and Restriction Types
- Verification Types
- Object Types
- Conversion Types

Extension and Restriction Types

The types are as follows:

- RESTRICTED—restricted ROWID
- EXTENDED—extended ROWID

For example:

```
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

Note: Extended ROWIDs are only used in Oracle database version 8.X*i* and higher.

Verification Types

Table 122–1 Verification Types

Result	Description
VALID	Valid ROWID
INVALID	Invalid ROWID

For example:

```
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

Object Types

Table 122–2 Object Types

Result	Description
UNDEFINED	Object Number not defined (for restricted ROWIDs)

For example:

```
rowid_object_undefined constant integer := 0;
```

Conversion Types

Table 122–3 Conversion Types

Result	Description
INTERNAL	Convert to/from column of ROWID type

Table 122–3 (Cont.) Conversion Types

Result	Description
EXTERNAL	Convert to/from string format

For example:

```
rowid_convert_internal constant integer := 0;
rowid_convert_external constant integer := 1;
```

Exceptions

Table 122–4 Exceptions

Exception	Description
ROWID_INVALID	Invalid rowid format
ROWID_BAD_BLOCK	Block is beyond end of file

For example:

```
ROWID_INVALID exception;
   pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
   pragma exception_init(ROWID_BAD_BLOCK, -28516);
```

Operational Notes

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SLQ ROWID, either restricted or extended, as required.
- You can call the DBMS_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

> **Note:** ROWID_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID_BLOCK_NUMBER function is used to return just the block number of a single row in the EMP table:

```
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
   FROM emp
   WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram '%s' violates its associated pragma' for pragma restrict_references, it could mean the violation is due to:
  - A problem with the current procedure or function
  - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
  - Calling a package procedure or function that touches the initialization code in a package or that sets the default values

Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID_OBJECT function in the DBMS_ROWID package, then displays the object number:

```
DECLARE
  object_no   INTEGER;
  row_id      ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
    WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...
```

Summary of DBMS_ROWID Subprograms

Table 122–5 DBMS_ROWID Package Subprograms

Subprogram	Description
ROWID_BLOCK_NUMBER Function on page 122-10	Returns the block number of a `ROWID`
ROWID_CREATE Function on page 122-11	Creates a `ROWID`, for testing only
ROWID_INFO Procedure on page 122-12	Returns the type and components of a `ROWID`
ROWID_OBJECT Function on page 122-13	Returns the object number of the extended `ROWID`
ROWID_RELATIVE_FNO Function on page 122-14	Returns the file number of a `ROWID`
ROWID_ROW_NUMBER Function on page 122-15	Returns the row number
ROWID_TO_ABSOLUTE_FNO Function on page 122-16	Returns the absolute file number associated with the `ROWID` for a row in a specific table
ROWID_TO_EXTENDED Function on page 122-17	Converts a `ROWID` from restricted format to extended
ROWID_TO_RESTRICTED Function on page 122-19	Converts an extended `ROWID` to restricted format
ROWID_TYPE Function on page 122-20	Returns the `ROWID` type: 0 is restricted, 1 is extended
ROWID_VERIFY Function on page 122-21	Checks if a `ROWID` can be correctly extended by the `ROWID_TO_EXTENDED` function

ROWID_BLOCK_NUMBER Function

This function returns the database block number for the input ROWID.

Syntax

```
DBMS_ROWID.ROWID_BLOCK_NUMBER (
   row_id      IN   ROWID,
   ts_type_in  IN   VARCHAR2 DEFAULT 'SMALLFILE')
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 122–6 ROWID_BLOCK_NUMBER Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs.

Examples

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')
   FROM some_table
   WHERE key_value = 42);
```

ROWID_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

Syntax

```
DBMS_ROWID.ROWID_CREATE (
   rowid_type    IN NUMBER,
   object_number IN NUMBER,
   relative_fno  IN NUMBER,
   block_number  IN NUMBER,
   row_number    IN NUMBER)
  RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 122–7 ROWID_CREATE Function Parameters

Parameter	Description
rowid_type	Type (restricted or extended). Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID. If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.
object_number	Data object number (rowid_object_undefined for restricted).
relative_fno	Relative file number.
block_number	Block number in this file.
row_number	Returns row number in this block.

Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj_number now contains 9999.

ROWID_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID. This is a procedure, and it cannot be used in a SQL statement.

Syntax

```
DBMS_ROWID.ROWID_INFO (
   rowid_in         IN   ROWID,
   rowid_type       OUT  NUMBER,
   object_number    OUT  NUMBER,
   relative_fno     OUT  NUMBER,
   block_number     OUT  NUMBER,
   row_number       OUT  NUMBER);
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 122–8 ROWID_INFO Procedure Parameters

Parameter	Description
rowid_in	ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.
rowid_type	Returns type (restricted/extended).
object_number	Returns data object number (rowid_object_undefined for restricted).
relative_fno	Returns relative file number.
block_number	Returns block number in this file.
row_number	Returns row number in this block.

See Also: "ROWID_TYPE Function" on page 122-20

Examples

This example reads back the values for the ROWID that you created in the ROWID_CREATE:

```
DBMS_ROWID.ROWID_INFO (
   my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

ROWID_OBJECT Function

This function returns the data object number for an extended ROWID. The function returns zero if the input ROWID is a restricted ROWID.

Syntax

```
DBMS_ROWID.ROWID_OBJECT (
   rowid_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_object,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 122–9 ROWID_OBJECT Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Note: The ROWID_OBJECT_UNDEFINED constant is returned for restricted ROWIDs.

Examples

```
SELECT dbms_rowid.rowid_object(ROWID)
   FROM emp
   WHERE empno = 7499;
```

ROWID_RELATIVE_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

Syntax

```
DBMS_ROWID.ROWID_RELATIVE_FNO (
   rowid_id      IN   ROWID,
   ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 122–10 ROWID_RELATIVE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
ts_type_in	The type of the tablespace (bigfile/smallfile) to which the row belongs.

Examples

The example PL/SQL code fragment returns the relative file number:

```
DECLARE
   file_number    INTEGER;
   rowid_val      ROWID;
BEGIN
   SELECT ROWID INTO rowid_val
     FROM dept
     WHERE loc = 'Boston';
   file_number :=
     dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
    ...
```

ROWID_ROW_NUMBER Function

This function extracts the row number from the `ROWID IN` parameter.

Syntax

```
DBMS_ROWID.ROWID_ROW_NUMBER (
   row_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 122–11 ROWID_ROW_NUMBER Function Parameters

Parameter	Description
`row_id`	`ROWID` to be interpreted.

Examples

Select a row number:

```
SELECT dbms_rowid.rowid_row_number(ROWID)
   FROM emp
   WHERE ename = 'ALLEN';
```

ROWID_TO_ABSOLUTE_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table. The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

Syntax

```
DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (
   row_id      IN ROWID,
   schema_name IN VARCHAR2,
   object_name IN VARCHAR2)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
```

Parameters

Table 122–12 ROWID_TO_ABSOLUTE_FNO Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.
schema_name	Name of the schema which contains the table.
object_name	Table name.

Examples

```
DECLARE
   abs_fno        INTEGER;
   rowid_val      CHAR(18);
   object_name    VARCHAR2(20) := 'EMP';
BEGIN
    SELECT ROWID INTO rowid_val
     FROM emp
     WHERE empno = 9999;
     abs_fno := dbms_rowid.rowid_to_absolute_fno(
     rowid_val, 'SCOTT', object_name);
```

Note: For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

ROWID_TO_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format. Later, it may be removed from this package into a different place.

Syntax

```
DBMS_ROWID.ROWID_TO_EXTENDED (
   old_rowid       IN ROWID,
   schema_name     IN VARCHAR2,
   object_name     IN VARCHAR2,
   conversion_type IN INTEGER)
  RETURN ROWID;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
```

Parameters

Table 122–13 ROWID_TO_EXTENDED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted.
schema_name	Name of the schema which contains the table (optional).
object_name	Table name (optional).
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

Return Values

ROWID_TO_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID_COL that holds ROWIDs (restricted), and a column TABLE_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

```
UPDATE SCOTT.RIDS
   SET rowid_col =
   dbms_rowid.rowid_to_extended (
      rowid_col, 'SCOTT", TABLE_COL, 0);
```

Usage Notes

If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID_TO_EXTENDED returns a value, however, does not guarantee that the

converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.

If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.

If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the INVALID_ROWID exception is raised. If they do match, the input ROWID is returned.

> **See Also:** The ROWID_VERIFY Function has a method to determine if a given ROWID can be converted to the extended format.

ROWID_TO_RESTRICTED Function

This function converts an extended ROWID into restricted ROWID format.

Syntax

```
DBMS_ROWID.ROWID_TO_RESTRICTED (
   old_rowid       IN ROWID,
   conversion_type IN INTEGER)
  RETURN ROWID;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 122–14 ROWID_TO_RESTRICTED Function Parameters

Parameter	Description
old_rowid	ROWID to be converted.
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

ROWID_TYPE Function

This function returns 0 if the ROWID is a restricted ROWID, and 1 if it is extended.

Syntax

```
DBMS_ROWID.ROWID_TYPE (
   rowid_id IN ROWID)
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_type,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 122–15 ROWID_TYPE Function Parameters

Parameter	Description
row_id	ROWID to be interpreted.

Examples

```
IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN
   my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

ROWID_VERIFY Function

This function verifies the ROWID. It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

> **Note:** You can use this function in a WHERE clause of a SQL statement, as shown in the example.

Syntax

```
DBMS_ROWID.ROWID_VERIFY (
   rowid_in        IN ROWID,
   schema_name     IN VARCHAR2,
   object_name     IN VARCHAR2,
   conversion_type IN INTEGER
  RETURN NUMBER;
```

Pragmas

```
   pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

Table 122–16 ROWID_VERIFY Function Parameters

Parameter	Description
rowid_in	ROWID to be verified.
schema_name	Name of the schema which contains the table.
object_name	Table name.
conversion_type	The following constants are defined: rowid_convert_internal (:=0) rowid_convert_external (:=1)

Examples

Considering the schema in the example for the ROWID_TO_EXTENDED function, you can use the following statement to find bad ROWIDs prior to conversion. This enables you to fix them beforehand.

```
SELECT ROWID, rowid_col
   FROM SCOTT.RIDS
   WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) =1;
```

DBMS_RULE

The DBMS_RULE package contains subprograms that enable the evaluation of a rule set for a specified event.

See Also:

- Chapter 253, "Rule TYPEs" for more information about the types used with the DBMS_RULE package
- Chapter 124, "DBMS_RULE_ADM" and *Oracle Streams Concepts and Administration* for more information about this package and rules

This chapter contains the following topics:

- Using DBMS_RULE
  - Security Model
- Summary of DBMS_RULE Subprograms

Using DBMS_RULE

This section contains topics which relate to using the `DBMS_RULE` package.

- Security Model

Security Model

PUBLIC is granted EXECUTE privilege on this package.

Summary of DBMS_RULE Subprograms

Table 123–1 DBMS_RULE Package Subprograms

Subprogram	Description
CLOSE_ITERATOR Procedure on page 123-5	Closes an open iterator
EVALUATE Procedures on page 123-6	Evaluates the rules in the specified rule set that use the evaluation context specified
GET_NEXT_HIT Function on page 123-10	Returns the next rule that evaluated to `TRUE` from a true rules iterator, or returns the next rule that evaluated to `MAYBE` from a maybe rules iterator; returns `NULL` if there are no more rules that evaluated to `TRUE` or `MAYBE`.

CLOSE_ITERATOR Procedure

This procedure closes an open iterator.

Syntax

```
DBMS_RULE.CLOSE_ITERATOR(
  iterator  IN  BINARY_INTEGER);
```

Parameter

Table 123–2 CLOSE_ITERATOR Procedure Parameter

Parameter	Description
iterator	The iterator to be closed

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.

See Also: "EVALUATE Procedures" on page 123-6

EVALUATE Procedures

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The `true_rules` and `maybe_rules` parameters are mutually exclusive with the `true_rules_iterator` and `maybe_rules_iterator` parameters. In addition, the procedure with the `true_rules` and `maybe_rules` parameters includes the `stop_on_first_hit` parameter, but the other procedure does not.

Syntax

```
DBMS_RULE.EVALUATE(
  rule_set_name         IN   VARCHAR2,
  evaluation_context    IN   VARCHAR2,
  event_context         IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values          IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values         IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values       IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values      IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  stop_on_first_hit     IN   BOOLEAN                      DEFAULT FALSE,
  simple_rules_only     IN   BOOLEAN                      DEFAULT FALSE,
  true_rules            OUT  SYS.RE$RULE_HIT_LIST,
  maybe_rules           OUT  SYS.RE$RULE_HIT_LIST);

DBMS_RULE.EVALUATE(
  rule_set_name          IN   VARCHAR2,
  evaluation_context     IN   VARCHAR2,
  event_context          IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values           IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values          IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values        IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values       IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  simple_rules_only      IN   BOOLEAN                      DEFAULT FALSE,
  true_rules_iterator    OUT  BINARY_INTEGER,
  maybe_rules_iterator   OUT  BINARY_INTEGER);
```

Parameters

Table 123–3 EVALUATE Procedure Parameters

Parameter	Description
`rule_set_name`	Name of the rule set in the form `[`*`schema_name`*`.]`*`rule_set_name`*. For example, to evaluate all of the rules in a rule set named `hr_rules` in the `hr` schema, enter `hr.hr_rules` for this parameter. If the schema is not specified, then the schema of the current user is used.
`evaluation_context`	An evaluation context name in the form `[`*`schema_name`*`.]`*`evaluation_context_name`*. If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.
`event_context`	A list of name-value pairs that identify events that cause evaluation

Table 123–3 (Cont.) EVALUATE Procedure Parameters

Parameter	Description
table_values	Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.
column_values	Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in table_values.
variable_values	A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.
attribute_values	Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in variable_values.
stop_on_first_hit	If TRUE, then the rules engine stops evaluation as soon as it finds a TRUE rule. If TRUE and there are no TRUE rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to TRUE given more data. If FALSE, then the rules engine continues to evaluate rules even after it finds a TRUE rule.
simple_rules_only	If TRUE, then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If FALSE, then evaluates all rules.
true_rules	Receives the output of the EVALUATE procedure into a varray of RE$RULE_HIT_LIST type. If no rules evaluate to TRUE, then true_rules is empty. If at least one rule evaluates to TRUE and stop_on_first_hit is TRUE, then true_rules contains one rule that evaluates to TRUE. If stop_on_first_hit is FALSE, then true_rules contains all rules that evaluate to TRUE.
maybe_rules	If all rules can be evaluated completely, without requiring any additional data, then maybe_rules is empty. If stop_on_first_hit is TRUE, then if there is at least one rule that may evaluate to TRUE given more data, and no rules evaluate to TRUE, then maybe_rules contains one rule that may evaluate to TRUE. If stop_on_first_hit is FALSE, then maybe_rules contains all rules that may evaluate to TRUE given more data.
true_rules_iterator	Contains the iterator for accessing rules that are TRUE
maybe_rules_iterator	Contains the iterator for accessing rules that may be TRUE given additional data or the ability to issue SQL

Usage Notes

> **Note:** Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for `table_values`, `column_values`, `variable_values`, and `attribute_values`. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using `stop_on_first_hit`, if evaluation must stop as soon as the first `TRUE` rule or the first `MAYBE` rule (if there are no `TRUE` rules) is found.

The caller may also specify, using `simple_rules_only`, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as `MAYBE` rules.

Partial evaluation is supported. The `EVALUATE` procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as `MAYBE` rules, unless they can be determined to be `TRUE` or `FALSE` based on the values of one or more simple expressions within the rule. For example, given a value of `1` for attribute `"a.b"` of variable `"x"`, a rule with the following rule condition can be returned as `TRUE`, without a value for table `"tab"`:

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:

- `TRUE` rules, which is the list of rules that evaluate to `TRUE` based on the given data. These rules are returned either in the `OUT` parameter `true_rules`, which returns all of the rules that evaluate to `TRUE`, or in the `OUT` parameter `true_rules_iterator`, which returns each rule that evaluates to `TRUE` one at a time.
- `MAYBE` rules, which is the list of rules that could not be evaluated for one of the following reasons:
  - The rule refers to data that was unavailable. For example, a variable attribute `"x.a.b"` is specified, but no value is specified for the variable `"x"`, the attribute `"a"`, or the attribute `"a.b"`.
  - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as `TRUE`, or partial data is available.

  Maybe rules are returned either in the `OUT` parameter `maybe_rules`, which returns all of the rules that evaluate to `MAYBE`, or in the `OUT` parameter `maybe_rules_iterator`, which returns each rule that evaluates to `MAYBE` one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to `TRUE` and `MAYBE` for the event or an iterator for rules that evaluate to `TRUE` and `MAYBE`. A true rules iterator enables the client to fetch each rule that evaluates to `TRUE` one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to `MAYBE` one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to `TRUE` or `MAYBE` from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free

resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

- The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.
- The iterator returns `NULL` because no more rules evaluate to `TRUE` or `MAYBE`.
- The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

- Have `EXECUTE_ON_RULE_SET` privilege on the rule set
- Have `EXECUTE_ANY_RULE_SET` system privilege
- Be the rule set owner

Note: The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.

- Chapter 253, "Rule TYPEs" for more information about the types used with the `DBMS_RULE` package
- "GET_NEXT_HIT Function" on page 123-10
- "CLOSE_ITERATOR Procedure" on page 123-5

GET_NEXT_HIT Function

This function returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator. The function returns NULL if there are no more rules that evaluated to TRUE or MAYBE.

Syntax

```
DBMS_RULE.GET_NEXT_HIT(
  iterator  IN  BINARY_INTEGER)
RETURN SYS.RE$RULE_HIT;
```

Parameter

Table 123–4 GET_NEXT_HIT Function Parameter

Parameter	Description
iterator	The iterator from which the rule that evaluated to TRUE or MAYBE is retrieved

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns NULL, it is closed automatically. If an open iterator is no longer needed, then use the CLOSE_ITERATOR procedure in the DBMS_RULE package to close it.

Note: This function raises an error if the rule set being evaluated was modified after the call to the DBMS_RULE.EVALUATE procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

DBMS_RULE_ADM

The DBMS_RULE_ADM package provides the subprograms for creating and managing rules, rule sets, and rule evaluation contexts.

See Also:

- Chapter 253, "Rule TYPEs" for more information about the types used with the DBMS_RULE_ADM package
- Chapter 123, "DBMS_RULE" and *Oracle Streams Concepts and Administration* for more information about this package and rules

This chapter contains the following topics:

- Using DBMS_RULE_ADM
  - Security Model
- Summary of DBMS_RULE_ADM Subprograms

Using DBMS_RULE_ADM

This section contains topics which relate to using the `DBMS_RULE_ADM` package.

- Security Model

Security Model

User group PUBLIC is granted EXECUTE privilege on this package.

See Also: *Oracle Database Security Guide* for more information about user group PUBLIC

Summary of DBMS_RULE_ADM Subprograms

Table 124–1 DBMS_RULE_ADM Package Subprograms

Subprogram	Description
ADD_RULE Procedure on page 124-5	Adds the specified rule to the specified rule set
ALTER_EVALUATION_CONTEXT Procedure on page 124-7	Alters a rule evaluation context
ALTER_RULE Procedure on page 124-10	Changes one or more aspects of the specified rule
CREATE_EVALUATION_CONTEXT Procedure on page 124-12	Creates a rule evaluation context
CREATE_RULE Procedure on page 124-14	Creates a rule with the specified name
CREATE_RULE_SET Procedure on page 124-16	Creates a rule set with the specified name
DROP_EVALUATION_CONTEXT Procedure on page 124-17	Drops the rule evaluation context with the specified name
DROP_RULE Procedure on page 124-18	Drops the rule with the specified name
DROP_RULE_SET Procedure on page 124-19	Drops the rule set with the specified name
GRANT_OBJECT_PRIVILEGE Procedure on page 124-20	Grants the specified object privilege on the specified object to the specified user or role
GRANT_SYSTEM_PRIVILEGE Procedure on page 124-22	Grants the specified system privilege to the specified user or role
REMOVE_RULE Procedure on page 124-24	Removes the specified rule from the specified rule set
REVOKE_OBJECT_PRIVILEGE Procedure on page 124-26	Revokes the specified object privilege on the specified object from the specified user or role
REVOKE_SYSTEM_PRIVILEGE Procedure on page 124-27	Revokes the specified system privilege from the specified user or role

Note: All subprograms commit unless specified otherwise.

ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```
DBMS_RULE_ADM.ADD_RULE(
   rule_name           IN  VARCHAR2,
   rule_set_name       IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2   DEFAULT NULL,
   rule_comment        IN  VARCHAR2   DEFAULT NULL);
```

Parameters

Table 124–2 ADD_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are adding to the rule set, specified as [*schema_name.*]*rule_name*. For example, to add a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set to which you are adding the rule, specified as [*schema_name.*]*rule_set_name*. For example, to add the rule to a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context	An evaluation context name in the form [*schema_name.*]*evaluation_context_name*. If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.
rule_comment	Optional description, which can contain the reason for adding the rule to the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- Have EXECUTE_ON_RULE privilege on the rule
- Have EXECUTE_ANY_RULE system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

ALTER_EVALUATION_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  remove_table_aliases         IN  BOOLEAN                    DEFAULT FALSE,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  remove_variable_types        IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
  remove_evaluation_function   IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL,
  remove_eval_context_comment  IN  BOOLEAN                    DEFAULT FALSE);
```

Parameters

Table 124–3 ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are altering, specified as [*schema_name.*]*evaluation_context_name*. For example, to alter an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	If NULL and remove_table_aliases is FALSE, then the procedure retains the existing table aliases. If NULL and remove_table_aliases is TRUE, then the procedure removes the existing table aliases. If non-NULL, then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
remove_table_aliases	If TRUE and table_aliases is NULL, then the procedure removes the existing table aliases for the evaluation context. If TRUE and table_aliases is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove table aliases.
variable_types	If NULL and remove_variable_types is FALSE, then the procedure retains the variable types. If NULL and remove_variable_types is TRUE, then the procedure removes the existing variable types. If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.

Table 124–3 (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
remove_variable_types	If TRUE and variable_types is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and variable_types is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the variable types.
evaluation_function	If NULL and remove_evaluation_function is FALSE, then the procedure retains the existing evaluation function. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation function. If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function. An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See "CREATE_EVALUATION_CONTEXT Procedure" on page 124-12for more information about evaluation functions.
remove_evaluation_function	If TRUE and evaluation_function is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and evaluation_function is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation function.
evaluation_context_comment	If NULL and remove_eval_context_comment is FALSE, then the procedure retains the existing evaluation context comment. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation context comment. If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment. An evaluation context comment is an optional description of the rule evaluation context.
remove_eval_context_comment	If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation context comment.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL_ON_EVALUATION_CONTEXT or ALTER_ON_EVALUATION_CONTEXT object privilege on an evaluation context owned by another user

- Have `ALTER_ANY_EVALUATION_CONTEXT` system privilege

See Also: Chapter 253, "Rule TYPEs" for more information about the types used with the `DBMS_RULE_ADM` package

ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```
DBMS_RULE_ADM.ALTER_RULE(
   rule_name                  IN  VARCHAR2,
   condition                  IN  VARCHAR2        DEFAULT NULL,
   evaluation_context         IN  VARCHAR2        DEFAULT NULL,
   remove_evaluation_context  IN  BOOLEAN         DEFAULT FALSE,
   action_context             IN  SYS.RE$NV_LIST  DEFAULT NULL,
   remove_action_context      IN  BOOLEAN         DEFAULT FALSE,
   rule_comment               IN  VARCHAR2        DEFAULT NULL,
   remove_rule_comment        IN  BOOLEAN         DEFAULT FALSE);
```

Parameters

Table 124–4 ALTER_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are altering, specified as [*schema_name.*]*rule_name*. For example, to alter a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.
evaluation_context	An evaluation context name in the form [*schema_name.*]*evaluation_context_name*. If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.
remove_evaluation_context	If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the evaluation_context parameter is non-NULL, then this parameter should be set to FALSE.
action_context	If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
remove_action_context	If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the action_context parameter is non-NULL, then this parameter should be set to FALSE.
rule_comment	If non-NULL, then the existing comment of the rule is replaced by the specified comment.

Table 124–4 (Cont.) ALTER_RULE Procedure Parameters

Parameter	Description
remove_rule_comment	If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule. If FALSE, then the procedure retains any comment for the specified rule. If the rule_comment parameter is non-NULL, then this parameter should be set to FALSE.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE privilege on the rule
- Have ALTER_ANY_RULE system privilege
- Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

> **See Also:** Chapter 253, "Rule TYPEs" for more information about the types used with the DBMS_RULE_ADM package

CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
  evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL);
```

Parameters

Table 124–5 CREATE_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are creating, specified as [*schema_name.*]*evaluation_context_name*. For example, to create an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
table_aliases	Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.
variable_types	A list of variables for the evaluation context
evaluation_function	An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See "Usage Notes" for more information about the evaluation function.
evaluation_context_comment	An optional description of the rule evaluation context.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have CREATE_EVALUATION_CONTEXT_OBJ system privilege
- Have CREATE_ANY_EVALUATION_CONTEXT system privilege

> **See Also:** Chapter 253, "Rule TYPEs" for more information about the types used with the DBMS_RULE_ADM package

The evaluation function must have the following signature:

```
FUNCTION evaluation_function_name(
  rule_set_name       IN   VARCHAR2,
```

```
  evaluation_context  IN   VARCHAR2,
  event_context       IN   SYS.RE$NV_LIST               DEFAULT NULL,
  table_values        IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
  column_values       IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
  variable_values     IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
  attribute_values    IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
  stop_on_first_hit   IN   BOOLEAN                      DEFAULT FALSE,
  simple_rules_only   IN   BOOLEAN                      DEFAULT FALSE,
  true_rules          OUT  SYS.RE$RULE_HIT_LIST,
  maybe_rules         OUT  SYS.RE$RULE_HIT_LIST);
RETURN BINARY_INTEGER;
```

Note: Each parameter is required and must have the specified data type. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- `DBMS_RULE_ADM.EVALUATION_SUCCESS`: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the results of the evaluation obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.
- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.
- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

CREATE_RULE Procedure

This procedure creates a rule.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE(
   rule_name           IN  VARCHAR2,
   condition           IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2        DEFAULT NULL,
   action_context      IN  SYS.RE$NV_LIST  DEFAULT NULL,
   rule_comment        IN  VARCHAR2        DEFAULT NULL);
```

Parameters

Table 124–6 CREATE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are creating, specified as [*schema_name.*]*rule_name*. For example, to create a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
condition	The condition to be associated with the rule. A condition evaluates to TRUE or FALSE and can be any condition allowed in the WHERE clause of a SELECT statement. For example, the following is a valid rule condition: `department_id = 30` Ensure that the proper case is used for text in rule conditions. **Note:** Do not include the word "WHERE" in the condition.
evaluation_context	An optional evaluation context name in the form [*schema_name.*]*evaluation_context_name*, which is associated with the rule. If the schema is not specified, then the current user is the default. If evaluation_context is not specified, then the rule inherits the evaluation context from its rule set.
action_context	The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.
rule_comment	An optional description of the rule

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule being created and have the CREATE_RULE_OBJ system privilege
- Have CREATE_ANY_RULE system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- Have EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS.

- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

> **See Also:** Chapter 253, "Rule TYPEs" for more information about the types used with the `DBMS_RULE_ADM` package

CREATE_RULE_SET Procedure

This procedure creates a rule set.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
   rule_set_name       IN  VARCHAR2,
   evaluation_context  IN  VARCHAR2  DEFAULT NULL,
   rule_set_comment    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 124–7 CREATE_RULE_SET Procedure Parameters

Parameter	Description
`rule_set_name`	The name of the rule set you are creating, specified as `[`*`schema_name.`*`]`*`rule_set_name`*. For example, to create a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default.
`evaluation_context`	An optional evaluation context name in the form `[`*`schema_name.`*`]`*`evaluation_context_name`*, which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.
`rule_set_comment`	An optional description of the rule set

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
- Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
- Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
- Be the evaluation context owner

DROP_EVALUATION_CONTEXT Procedure

This procedure drops a rule evaluation context.

Syntax

```
DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT(
   evaluation_context_name  IN  VARCHAR2,
   force                    IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 124–8 DROP_EVALUATION_CONTEXT Procedure Parameters

Parameter	Description
evaluation_context_name	The name of the evaluation context you are dropping, specified as [*schema_name.*]*evaluation_context_name*. For example, to drop an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.
force	If TRUE, then the procedure removes the rule evaluation context from all rules and rule sets that use it. If FALSE and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context. If FALSE and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception. **Caution:** Setting force to TRUE can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the ADD_RULE procedure, then the rule cannot be evaluated.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context
- Have DROP_ANY_EVALUATION_CONTEXT system privilege

DROP_RULE Procedure

This procedure drops a rule.

Syntax

```
DBMS_RULE_ADM.DROP_RULE(
   rule_name  IN  VARCHAR2,
   force      IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 124–9 DROP_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are dropping, specified as [*schema_name.*]*rule_name*. For example, to drop a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
force	If TRUE, then the procedure removes the rule from all rule sets that contain it. If FALSE and no rule sets contain the rule, then the procedure drops the rule. If FALSE and one or more rule sets contain the rule, then the procedure raises an exception.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have DROP_ANY_RULE system privilege

Note:

- To remove a rule from a rule set without dropping the rule from the database, use the REMOVE_RULE procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

DROP_RULE_SET Procedure

This procedure drops a rule set.

Syntax

```
DBMS_RULE_ADM.DROP_RULE_SET(
   rule_set_name  IN  VARCHAR2,
   delete_rules   IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 124–10 DROP_RULE_SET Procedure Parameters

Parameter	Description
rule_set_name	The name of the rule set you are dropping, specified as [*schema_name.*]*rule_set_name*. For example, to drop a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
delete_rules	If TRUE, then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If FALSE, then the procedure does not drop the rules in the rule set.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have DROP_ANY_RULE_SET system privilege
- Be the owner of the rule set

> **Note:** The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
   privilege     IN  BINARY_INTEGER,
   object_name   IN  VARCHAR2,
   grantee       IN  VARCHAR2,
   grant_option  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 124–11 GRANT_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the object privilege to grant to the grantee on the object. See "Usage Notes" on page 124-20 for the available object privileges.
`object_name`	The name of the object for which you are granting the privilege to the grantee, specified as `[`*`schema_name`*`.]`*`object_name`*. For example, to grant the privilege on a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
`grantee`	The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.
`grant_option`	If `TRUE`, then the specified user or users granted the specified privilege can grant this privilege to others. If `FALSE`, then the specified user or users granted the specified privilege cannot grant this privilege to others.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have `EXECUTE` privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

Table 124–12 lists the object privileges.

Table 124–12 Object Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT	Alter and execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE	Alter and execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALL_ON_RULE_SET	Alter and execute a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_EVALUATION_CONTEXT	Alter a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE	Alter a particular rule in another user's schema
SYS.DBMS_RULE_ADM.ALTER_ON_RULE_SET	Alter a particular rule set in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT	Execute a particular evaluation context in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE	Execute a particular rule in another user's schema
SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET	Execute a particular rule set in another user's schema

Examples

For example, to grant the HR user the privilege to alter a rule named hr_dml in the strmadmin schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name  => 'strmadmin.hr_dml',
    grantee      => 'hr',
    grant_option => FALSE);
END;
/
```

GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
   privilege     IN  BINARY_INTEGER,
   grantee       IN  VARCHAR2,
   grant_option  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 124–13 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the system privilege to grant to the grantee.
`grantee`	The name of the user or role for which the privilege is granted
`grant_option`	If `TRUE`, then the specified user or users granted the specified privilege can grant the system privilege to others. If `FALSE`, then the specified user or users granted the specified privilege cannot grant the system privilege to others.

Usage Notes

Table 124–14 lists the system privileges.

Table 124–14 System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
`SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT`	Alter any evaluation context owned by any user
`SYS.DBMS_RULE_ADM.ALTER_ANY_RULE`	Alter any rule owned by any user
`SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET`	Alter any rule set owned by any user
`SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT`	Create a new evaluation context in any schema
`SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ`	Create a new evaluation context in the grantee's schema
`SYS.DBMS_RULE_ADM.CREATE_ANY_RULE`	Create a new rule in any schema
`SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ`	Create a new rule in the grantee's schema
`SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET`	Create a new rule set in any schema
`SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ`	Create a new rule set in the grantee's schema
`SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT`	Drop any evaluation context in any schema
`SYS.DBMS_RULE_ADM.DROP_ANY_RULE`	Drop any rule in any schema
`SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET`	Drop any rule set in any schema

Table 124–14 (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets

Privilege	Description
SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT	Execute any evaluation context owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE	Execute any rule owned by any user
SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET	Execute any rule set owned by any user

For example, to grant the strmadmin user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee      => 'strmadmin',
    grant_option => FALSE);
END;
/
```

Note: When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object will allow access to any schema, including SYS.

REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
   rule_name                IN  VARCHAR2,
   rule_set_name            IN  VARCHAR2,
   evaluation_context       IN  VARCHAR2  DEFAULT NULL,
   all_evaluation_contexts  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 124–15 REMOVE_RULE Procedure Parameters

Parameter	Description
rule_name	The name of the rule you are removing from the rule set, specified as [*schema_name.*]*rule_name*. For example, to remove a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.
rule_set_name	The name of the rule set from which you are removing the rule, specified as [*schema_name.*]*rule_set_name*. For example, to remove the rule from a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.
evaluation_context_name	The name of the evaluation context associated with the rule you are removing, specified as [*schema_name.*]*evaluation_context_name*. For example, to specify an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default. If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the ADD_RULE procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error. Specify NULL if you did not specify an evaluation context when you added the rule to the rule set. If you specify NULL and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.
all_evaluation_contexts	If TRUE, then the procedure removes the rule from the rule set with all of its associated evaluation contexts. If FALSE, then the procedure only removes the rule with the specified evaluation context. This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Note: This procedure does not drop a rule from the database. To drop a rule from the database, use the DROP_RULE procedure.

REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE(
   privilege    IN  BINARY_INTEGER,
   object_name  IN  VARCHAR2,
   revokee      IN  VARCHAR2);
```

Parameters

Table 124–16 REVOKE_OBJECT_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the object privilege on the object to revoke from the revokee. See "GRANT_OBJECT_PRIVILEGE Procedure" on page 124-20 for a list of the object privileges.
`object_name`	The name of the object for which you are revoking the privilege from the revokee, specified as `[`*`schema_name.`*`]`*`object_name`*. For example, to revoke an object privilege on a rule set named `apply_rules` in the `hr` schema, enter `hr.apply_rules` for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.
`revokee`	The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.

REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(
   privilege  IN  BINARY_INTEGER,
   revokee    IN  VARCHAR2);
```

Parameters

Table 124–17 REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

Parameter	Description
`privilege`	The name of the system privilege to revoke from the revokee. See "GRANT_SYSTEM_PRIVILEGE Procedure" on page 124-22 for a list of the system privileges.
`revokee`	The name of the user or role from which the privilege is revoked

125

DBMS_SCHEDULER

The DBMS_SCHEDULER package provides a collection of scheduling functions and procedures that are callable from any PL/SQL program.

> **See Also:** *Oracle Database Administrator's Guide* for more information regarding how to use DBMS_SCHEDULER

This chapter contains the following topics:

- Data Structures
- Using DBMS_SCHEDULER
  - Rules and Limits
  - Operational Notes
- Summary of DBMS_SCHEDULER Subprograms

Data Structures

The DBMS_SCHEDULER package defines OBJECT types and TABLE types.

OBJECT Types

- JOBARG Object Type
- JOB Object Type
- JOB_DEFINITION Object Type
- JOBATTR Object Type
- SCHEDULER$_STEP_TYPE Object Type
- SCHEDULER$_EVENT_INFO Object Type
- SCHEDULER_FILEWATCHER_RESULT Object Type
- SCHEDULER_FILEWATCHER_REQUEST Object Type

TABLE Types

- JOBARG_ARRAY Table Type
- JOB_ARRAY Table Type
- JOB_DEFINITION_ARRAY Table Type
- JOBATTR_ARRAY Table Type
- SCHEDULER$_STEP_TYPE_LIST Table Type

JOBARG Object Type

This type is used by the JOB and JOBATTR object types. It represents a job argument in a batch of job arguments.

Syntax

```
TYPE jobarg IS OBJECT (
   arg_position         NUMBER,
   arg_text_value       VARCHAR2(4000),
   arg_anydata_value    ANYDATA,
   arg_operation        VARCHAR2(5));
```

Attributes

Table 125–1 JOBARG Object Type Attributes

Attribute	Description
arg_position	Position of the argument
arg_text_value	Value of the argument if the type is VARCHAR2
arg_anydata_value	Value of the argument if the type is AnyData
arg_operation	Type of the operation: ■ SET ■ RESET

JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs a job argument with a text value.

```
constructor function jobarg (
   arg_position        IN POSITIVEN,
   arg_value           IN VARCHAR2)
   RETURN SELF AS RESULT;
```

Constructs a job argument with an AnyData value.

```
constructor function jobarg (
   arg_position        IN POSITIVEN,
   arg_value           IN ANYDATA)
   RETURN SELF AS RESULT;
```

Constructs a job argument with a NULL value.

```
constructor function jobarg (
   arg_position        IN POSITIVEN,
   arg_reset           IN BOOLEAN DEFAULT FALSE)
   RETURN SELF AS RESULT;
```

Parameters

Table 125–2 JOBARG Constructor Function Parameters

Parameter	Description
`arg_position`	Position of the argument
`arg_value`	Value of the argument
`arg_reset`	If `arg_reset` is `TRUE`, then the argument at that position is reset. Setting `arg_reset` to `FALSE` (which is the default) will create an argument with a NULL value.

JOBARG_ARRAY Table Type

Syntax

```
TYPE jobarg_array IS TABLE OF jobarg;
```

JOB Object Type

**** **Deprecated**. Use the `JOB_DEFINITION` object type instead.

JOB_ARRAY Table Type

*** **Deprecated**. Use the `JOB_DEFINITION_ARRAY` table type instead.

JOB_DEFINITION Object Type

This type is used by the CREATE_JOBS procedure and represents a job in a batch of jobs.

Syntax

```
TYPE job_definition IS OBJECT (
  job_name                       VARCHAR2(100),
  job_class                      VARCHAR2(32),
  job_style                      VARCHAR2(11),
  program_name                   VARCHAR2(100),
  job_action                     VARCHAR2(4000),
  job_type                       VARCHAR2(20),
  schedule_name                  VARCHAR2(65),
  repeat_interval                VARCHAR2(4000),
  schedule_limit                 INTERVAL DAY TO SECOND,
  start_date                     TIMESTAMP WITH TIME ZONE,
  end_date                       TIMESTAMP WITH TIME ZONE,
  event_condition                VARCHAR2(4000),
  queue_spec                     VARCHAR2(100),
  number_of_arguments            NUMBER,
  arguments                      SYS.JOBARG_ARRAY,
  job_priority                   NUMBER,
  job_weight                     NUMBER,
  max_run_duration               INTERVAL DAY TO SECOND,
  max_runs                       NUMBER,
  max_failures                   NUMBER,
  logging_level                  NUMBER,
  restartable                    VARCHAR2(5),
  stop_on_window_close           VARCHAR2(5),
  raise_events                   NUMBER,
  comments                       VARCHAR2(240),
  auto_drop                      VARCHAR2(5),
  enabled                        VARCHAR2(5),
  follow_default_timezone        VARCHAR2(5),
  parallel_instances             VARCHAR2(5),
  aq_job                         VARCHAR2(5),
  instance_id                    NUMBER,
  credential_name                VARCHAR2(65),
  destination                    VARCHAR2(4000),
  database_role                  VARCHAR2(20),
  allow_runs_in_restricted_mode  VARCHAR2(5));
```

Object Attributes

Table 125–3 provides brief descriptions of the attributes of the JOB_DEFINITION object type. For more complete information about these attributes, see the "CREATE_JOB Procedure" on page 125-54 and the "SET_ATTRIBUTE Procedure" on page 125-122.

Table 125–3 JOB_DEFINITION Object Type Attributes

Attribute	Description
job_name	Name of the job
job_class	Name of the job class

Table 125–3 (Cont.) JOB_DEFINITION Object Type Attributes

Attribute	Description
job_style	Style of the job: ■ REGULAR ■ LIGHTWEIGHT
program_name	Name of the program run by the job
job_action	Inline action of the job. This is either the code for an anonymous PL/SQL block or the name of a stored procedure, external execuable, or chain.
job_type	Job action type ('PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', or 'CHAIN')
schedule_name	Name of the schedule that specifies when the job has to execute
repeat_interval	Inline time-based schedule
schedule_limit	Maximum delay time between scheduled and actual job start before a job run is canceled.
start_date	Start date and time of the job
end_date	End date and time of the job
event_condition	Event condition for event-based jobs
queue_spec	File watcher name or queue specification for event-based jobs
number_of_args	Number of job arguments
arguments	Array of job arguments
priority	Job priority
job_weight	Weight of the job for parallel execution. For expert users of parallel technology only.
max_run_duration	Maximum run duration of the job
max_runs	Maximum number of runs before the job is marked as completed
max_failures	Maximum number of failures to tolerate before the job is marked as broken
logging_level	Job logging level
restartable	Indicates whether the job is restartable (TRUE) or not (FALSE)
stop_on_window_exit	Indicates whether the job should be stopped when the window it is running in ends (TRUE) or not (FALSE). Equivalent to the stop_on_window_close job attribute described in the SET_ATTRIBUTE Procedure.
raise_events	State changes on which events should be raised
comments	Comments on the job
auto_drop	If TRUE (the default), indicates that the job should be dropped once completed
enabled	Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE)
follow_default_tz	If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.

Table 125–3 (Cont.) JOB_DEFINITION Object Type Attributes

Attribute	Description
parallel_instances	For event-based jobs only. If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel. If FALSE, then if an event is raised while the job that handles that event is already running, the event is discarded.
aq_job	For internal use only
instance_id	The instance ID of the instance that the job must run on.
credential_name	The credential to use for a single destination or the default credential for a group of destinations.
destination	The name of a single external destination or database destination, or a group name of type external destination or database destination
database_role	In an Oracle Data Guard environment, the database role ('PRIMARY' or 'LOGICAL STANDBY') for which the job runs
allow_runs_in_ restricted_mode	If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode

JOB_DEFINITION Constructor Function

This constructor function constructs a job_definition object.

Syntax

```
constructor function job_definition (
    job_name                IN     VARCHAR2,
    job_style               IN     VARCHAR2 DEFAULT 'REGULAR',
    program_name            IN     VARCHAR2 DEFAULT NULL,
    job_action              IN     VARCHAR2 DEFAULT NULL,
    job_type                IN     VARCHAR2 DEFAULT NULL,
    schedule_name           IN     VARCHAR2 DEFAULT NULL,
    repeat_interval         IN     VARCHAR2 DEFAULT NULL,
    event_condition         IN     VARCHAR2 DEFAULT NULL,
    queue_spec              IN     VARCHAR2 DEFAULT NULL,
    start_date              IN     TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    end_date                IN     TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    number_of_arguments     IN     NATURAL DEFAULT NULL,
    arguments               IN     SYS.JOBARG_ARRAY DEFAULT NULL,
    job_class               IN     VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
    schedule_limit          IN     INTERVAL DAY TO SECOND DEFAULT NULL,
    job_priority            IN     NATURAL DEFAULT NULL,
    job_weight              IN     NATURAL DEFAULT NULL,
    max_run_duration        IN     INTERVAL DAY TO SECOND DEFAULT NULL,
    max_runs                IN     NATURAL DEFAULT NULL,
    max_failures            IN     NATURAL DEFAULT NULL,
    logging_level           IN     NATURALN DEFAULT 64,
    restartable             IN     BOOLEAN DEFAULT FALSE,
    stop_on_window_close    IN     BOOLEAN DEFAULT FALSE,
    raise_events            IN     NATURAL DEFAULT NULL,
    comments                IN     VARCHAR2 DEFAULT NULL,
    auto_drop               IN     BOOLEAN DEFAULT TRUE,
    enabled                 IN     BOOLEAN DEFAULT FALSE,
    follow_default_timezone IN     BOOLEAN DEFAULT FALSE,
    parallel_instances      IN     BOOLEAN DEFAULT FALSE,
    aq_job                  IN     BOOLEAN DEFAULT FALSE,
```

```
instance_id             IN     NATURAL DEFAULT NULL,
credential_name         IN     VARCHAR2 DEFAULT NULL,
destination             IN     VARCHAR2 DEFAULT NULL,
database_role           IN     VARCHAR2 DEFAULT NULL,
allow_runs_in_restricted_mode IN BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;
```

JOB_DEFINITION_ARRAY Table Type

Syntax

```
TYPE job_definition_array IS TABLE OF job_definition;
```

JOBATTR Object Type

This type is used by the SET_JOB_ATTRIBUTES procedure and represents a job attribute in a batch of job attributes.

Syntax

```
TYPE jobattr IS OBJECT (
   job_name             VARCHAR2(100),
   attr_name            VARCHAR2(30),
   char_value           VARCHAR2(4000),
   char_value2          VARCHAR2(4000),
   args_value           JOBARG_ARRAY,
   num_value            NUMBER,
   timestamp_value      TIMESTAMP(6) WITH TIME ZONE,
   interval_value       INTERVAL DAY(2) TO SECOND(6));
```

Attributes

Table 125–4 JOBATTR Object Type Attributes

Attribute	Description
job_name	Name of the job
attr_name	Name of the attribute
char_value	Value of the argument if the type is VARCHAR2
char_value2	Second VARCHAR2 attribute value
args_value	Value of the argument if the type is a JOBARG array
num_value	Value of the argument if the type is NUMBER
timestamp_value	Value of the argument if the type is TIMESTAMP WITH TIME ZONE
interval_value	Value of the argument if the type is INTERVAL DAY TO SECOND

JOBATTR Constructor Function

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: VARCHAR2, NUMBER, TIMESTAMP WITH TIME ZONE, INTERVAL DAY TO SECOND, and an array of JOBARG types.

Syntax

```
constructor function jobattr (
   job_name             IN VARCHAR2,
   attr_name            IN VARCHAR2,
   attr_value           IN VARCHAR2,
   attr_value2          IN VARCHAR2 DEFAULT NULL)
   RETURN SELF AS RESULT;

constructor function jobattr (
   job_name             IN VARCHAR2,
   attr_name            IN VARCHAR2,
   attr_value           IN [NUMBER, BOOLEAN,
                            TIMESTAMP WITH TIME ZONE,
                            INTERVAL DAY TO SECOND, JOBARG_ARRAY])
```

```
   RETURN SELF AS RESULT;

constructor function jobattr (
   job_name            IN VARCHAR2,
   attr_name           IN VARCHAR2)
   RETURN SELF AS RESULT;
```

Parameters

Table 125–5 JOBATTR Constructor Function Parameters

Parameter	Description
job_name	Name of the job
attr_name	Name of the argument
attr_value	Value of the argument
attr_value2	Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value.

JOBATTR_ARRAY Table Type

Syntax

```
TYPE jobattr_array IS TABLE OF jobattr;
```

SCHEDULER$_STEP_TYPE Object Type

This type is used by RUN_CHAIN to return a List of chain steps with an initial state.

Syntax

```
TYPE scheduler$_step_type IS OBJECT (
   step_name  VARCHAR2(32),
   step_type  VARCHAR2(32));
```

Attributes

Table 125–6 SCHEDULER$_STEP_TYPE Object Type Attributes

Attribute	Description
step_name	Name of the step
step_type	State of the step

SCHEDULER$_STEP_TYPE_LIST Table Type

Syntax

```
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```

SCHEDULER$_EVENT_INFO Object Type

This the data type of the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE, from which your application consumes job state events raised by the Scheduler. It is a secure queue and is owned by SYS.

Syntax

```
TYPE SCHEDULER$_EVENT_INFO IS OBJECT (
  event_type         VARCHAR2(4000),
  object_owner       VARCHAR2(4000),
  object_name        VARCHAR2(4000),
  event_timestamp    TIMESTAMP WITH TIME ZONE,
  error_code         NUMBER,
  error_msg          VARCHAR2(4000),
  event_status       NUMBER,
  log_id             NUMBER,
  run_count          NUMBER,
  failure_count      NUMBER,
  retry_count        NUMBER,
  spare1             NUMBER,
  spare2             NUMBER,
  spare3             VARCHAR2(4000),
  spare4             VARCHAR2(4000),
  spare5             TIMESTAMP WITH TIME ZONE,
  spare6             TIMESTAMP WITH TIME ZONE,
  spare7             RAW(2000),
  spare8             RAW(2000));
```

Attributes

Table 125–7 SCHEDULER_EVENT_INFO Object Type Attributes

Attribute	Description
event_type	One of "JOB_STARTED", "JOB_SUCCEEDED", "JOB_FAILED", "JOB_BROKEN", "JOB_COMPLETED", "JOB_STOPPED", "JOB_SCH_LIM_REACHED", "JOB_DISABLED", "JOB_CHAIN_STALLED", "JOB_OVER_MAX_DUR". For descriptions of these event types, see Table 125–80, " Event Types Raised by the Scheduler" on page 125-129.
object_owner	Owner of the job that raised the event.
object_name	Name of the job that raised the event.
event_timestamp	Time at which the event occurred.
error_code	Applicable only when an error is thrown during job execution. Contains the top-level error code.
error_msg	Applicable only when an error is thrown during job execution. Contains the entire error stack.

Table 125–7 (Cont.) SCHEDULER_EVENT_INFO Object Type Attributes

Attribute	Description
event_status	Adds further qualification to the event type. If event_type is "JOB_STARTED," a status of 1 indicates that it is a normal start, and a status of 2 indicates that it is a retry. If event_type is "JOB_FAILED," a status of 4 indicates that it was a failure due to an error that was thrown during job execution, and a status of 8 indicates that it was an abnormal termination of some kind. If event_type is "JOB_STOPPED," a status of 16 indicates that it was a normal stop, and a status of 32 indicates that it was a stop with the FORCE option set to TRUE.
log_id	Points to the ID in the scheduler job log from which additional information can be obtained. Note that there need not always be a log entry corresponding to an event. In such cases, log_id is NULL.
run_count	Run count for the job when the event was raised.
failure_count	Failure count for the job when the event was raised.
retry_count	Retry count for the job when the event was raised.
spare1 – spare8	Currently not implemented

SCHEDULER_FILEWATCHER_RESULT Object Type

This is the data type of a file arrival event message. You access the event message as a parameter of an event-based job (or a parameter of a program referenced by an event-based job). The message contains information needed to locate and process a file that arrived on a local or remote system.

Syntax

```
TYPE scheduler_filewatcher_result IS OBJECT (
  destination         VARCHAR2(4000),
  directory_path      VARCHAR2(4000),
  actual_file_name    VARCHAR2(4000),
  file_size           NUMBER,
  file_timestamp      TIMESTAMP WITH TIME ZONE,
  ts_ms_from_epoch    NUMBER,
  matching_requests   SYS.SCHEDULER_FILEWATCHER_REQ_LIST);
```

Attributes

Table 125–8 SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

Attribute	Description
`destination`	Destination at which the file was found, expressed as a host name or IP address.
`directory_path`	Absolute path of directory in which the file was found
`actual_file_name`	Actual name of the file that was found. If the file name specified in the file watcher did not contain wildcards, then this is the same as the name specified in the file watcher.
`file_size`	Size of the file that was found, in bytes
`file_timestamp`	Timestamp assigned to the file when the file watcher considered the file found, based on the minimum file size and steady state duration attributes.
`ts_ms_from_epoch`	For internal use only
`matching_requests`	List of matching requests. This is a `TABLE` of objects of type `SCHEDULER_FILEWATCHER_REQUEST`. Each matching request corresponds to a file watcher whose `destination`, `directory_path`, and `file_name` attributes matched the arrived file. See "SCHEDULER_FILEWATCHER_REQUEST Object Type" on page 125-16.

SCHEDULER_FILEWATCHER_REQUEST Object Type

This type is returned in the `matching_requests` attribute of the SCHEDULER_FILEWATCHER_RESULT Object Type. Its attributes are similar to the attributes of a file watcher.

Syntax

```
TYPE scheduler_filewatcher_request IS OBJECT (
  owner                VARCHAR2(4000),
  name                 VARCHAR2(4000),
  requested_path_name  VARCHAR2(4000),
  requested_file_name  VARCHAR2(4000),
  credential_owner     VARCHAR2(4000),
  credential_name      VARCHAR2(4000),
  min_file_size        NUMBER,
  steady_state_dur     NUMBER);
```

Attributes

Table 125–9 SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

Attribute	Description
`owner`	Owner of the file watcher that matched
`name`	Name of the file watcher that matched
`requested_path_name`	Value of the `directory_path` attribute of the file watcher that matched
`requested_file_name`	Value of the `file_name` attribute of the file watcher that matched
`credential_owner`	Owner of the credential referenced by the file watcher that matched
`credential_name`	Name of the credential referenced by the file watcher that matched
`min_file_size`	Value of the `min_file_size` attribute of the file watcher that matched
`steady_state_dur`	Value of the `steady_state_duration` attribute of the file watcher that matched

Using DBMS_SCHEDULER

This section contains:

- Rules and Limits
- Operational Notes

Rules and Limits

The following rules apply when using the DBMS_SCHEDULER package:

- Only SYS can do anything in SYS schema.
- Several of the procedures accept comma-delimited lists of object names. When a list of names is provided, the Scheduler will stop executing the list on the very first object that returns an error. This means that the Scheduler will not perform the task on the objects in the list after the one that caused the error. For example, consider the statement DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3, sys.jobclass1, sys.jobclass2, sys.jobclass3'); If job3 could not be stopped, then job1 and job2 will be stopped, but the jobs in jobclass1, jobclass2, and jobclass3 will not be stopped.
- Performing an action on an object that does not exist returns a PL/SQL exception stating that the object does not exist.

Operational Notes

The Scheduler uses a rich **calendaring syntax** to enable you to define repeating schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second Wednesday of every month." This calendaring syntax is used in calendaring expressions in the `repeat_interval` argument of a number of package subprograms. Evaluating a calendaring expression results in a set of discrete timestamps.

See *Oracle Database Administrator's Guide* for examples of the calendaring syntax.

Calendaring Syntax

In the following calendaring syntax, * means 0 or more.

```
repeat_interval = regular_schedule | combined_schedule

regular_schedule = frequency_clause
[";" interval_clause] [";" bymonth_clause] [";" byweekno_clause]
[";" byyearday_clause] [";" bydate_clause] [";" bymonthday_clause]
[";" byday_clause] [";" byhour_clause] [";" byminute_clause]
[";" bysecond_clause] [";" bysetpos_clause] [";" include_clause]
[";" exclude_clause] [";" intersect_clause][";" periods_clause]

```

Table 125–10 Values for repeat_interval

Name	Description
FREQ	This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.
INTERVAL	This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 99.
BYMONTH	This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.

Table 125–10 (Cont.) Values for repeat_interval

Name	Description
BYWEEKNO	This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. That last definition is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th. The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year. As an example, in the year 1998 the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01; and January 1st, 1999, is in the ISO week 1998-53. byweekno is only valid for YEARLY. Examples of invalid specifications are "FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12" and "FREQ=YEARLY;BYWEEKNO=53;BYMONTH=1".
BYYEARDAY	This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.
BYDATE	This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause is the following: BYDATE=0115,0315,0615,0915,1215,20060115 The following SPAN example is equivalent to BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10: BYDATE=0110+SPAN:5D The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the "^" sign indicates a span of n days or weeks centered around the supplied date. If n is an even number, it is adjusted up to the next odd number. Offsets adjust the supplied date by adding or subtracting n days or weeks. BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET: keyword is optional), which is also equivalent to BYDATE=0122.
BYMONTHDAY	This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.
BYDAY	This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.
BYHOUR	This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.
BYMINUTE	This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.

Table 125–10 (Cont.) Values for repeat_interval

Name	Description
BYSECOND	This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.
BYSETPOS	This selects one or more items by position in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be: `FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1` Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies. The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.
INCLUDE	This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure.
EXCLUDE	This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the CREATE_SCHEDULE procedure.

INTERSECT	This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps.
	For example, assume that the named schedule last_sat indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule end_qtr indicates the last day of each quarter in 2005:
	`3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005`
	The following calendaring expression results in these dates:
	`3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005`
	`FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr`
	In this example, the terms FREQ=MONTHLY; BYMONTHDAY=-1 indicate the last day of each month.

Table 125–10 (Cont.) Values for repeat_interval

Name	Description
PERIODS	This identifies the number of periods that together form one cycle of a user defined frequency. It is used in the repeat_interval expression of the schedule that defines the user defined frequency. It is mandatory when the repeat_interval expression in the main schedule contains a BYPERIOD clause. The following example defines the quarters of a fiscal year. FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
BYPERIOD	This selects periods from a user defined frequency. For example, if a main schedule names a user defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause BYPERIOD=2,4 in the main schedule selects the 2nd and 4th fiscal quarters.

Combining Schedules There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules

  For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule. You can follow the initial list of individual schedules with include, exclude, and intersect clauses to create more complex combinations.

- Embedding other schedules into the main schedule using include, exclude, and intersect clauses

  With this method, the embedded schedules inherit certain attributes from the main schedule.

  – Timestamps generated by the INCLUDE clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the INTERVAL clause, the BYPERIOD clause, or the BYMONTH clause for freq=monthly.

  – Days that are added by the INCLUDE clause follow the hourly/minutely/secondly execution pattern of the main schedule.

  – When the INCLUDE clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See "Start Dates and Repeat Intervals", later in this section.) For example, a repeat_interval of FREQ=MONTHLY;INCLUDE=HOLIDAY executes only on holidays and not on the month/day defaults retrieved from the start date.

  The following is an example:

```
BEGIN
dbms_scheduler.create_schedule('embed_sched', repeat_interval =>
  'FREQ=YEARLY;BYDATE=0130,0220,0725');
dbms_scheduler.create_schedule('main_sched', repeat_interval =>
  'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

  In this example, the dates 1/30, 2/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the INTERVAL clause. If the start date of the main schedule is 1/1/2005, then 2/20 isn't added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m.

on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

User Defined Frequencies Instead of using predefined frequencies like DAILY, WEEKLY, MONTHLY, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following repeat_interval expression is used in a schedule named fiscal_year that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the fiscal_year schedule as a user defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user defined frequency do not have to be equal in length. In the main schedule, the BYSETPOS clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the BYPERIOD clause in the main schedule. To enable this, the schedule that is used as the user defined frequency must include a PERIODS clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.

As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the repeat_interval clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

Start Dates and Repeat Intervals The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the repeat_interval. For example, if the specified frequency is yearly and there is no BYMONTH or BYMONTHDAY clause in the repeat interval, the month and day on which to run the job are retrieved from the start date. Similarly, if frequency is monthly but there is no BYMONTHDAY clause in the repeat interval, the day of the month on which to run the job is retrieved from the start date. If present, BYHOUR, BYMINUTE, and BYSECOND defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the INCLUDE, EXCLUDE, or INTERSECT clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are.

The following are some examples:

```
start_date:      4/15/05 9:00:00
repeat_interval: freq=yearly

is expanded internally to:

freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule S1 has a repeat_interval of FREQ=YEARLY;BYDATE=0701.

```
start_date:      01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1

is expanded internally to:
```

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an INCLUDE clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

General Rules When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semi-colon, and each clause can be present at most once, with the exception of the include, exclude, and intersect clauses.
- Spaces are allowed between syntax elements and the strings are case insensitive.
- The list of values for a specific BY clause do not need to be ordered.
- When not enough BY clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "FREQ=YEARLY" with a start date of 02/15/2003 becomes "FREQ=YEARLY;BYMONTH=FEB; BYMONTHDAY=15", which means every year on the 15th of February.

  "FREQ=YEARLY;BYMONTH=JAN,JUL" with start date 01/21/2003 becomes "FREQ=YEARLY;BYMONTH=JAN,JUL;BYMONTHDAY=21", which means every year on January 21 and July 21.
- The byweekno clause is only allowed if the frequency is YEARLY. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a BYDAY clause. For example, "FREQ=YEARLY;BYWEEKNO=2" with a start date of 01/01/2003 will return:

  ```
  01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003,
  01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.
  ```

  Note that when the byweekno clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "FREQ=YEARLY;BYWEEKNO=1,53" for the specified week numbers in 2004, it will return the dates:

  ```
  12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04,
  12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05
  ```

- For those BY clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying BYMONTHDAY=31 will not give you the last day of every month, because not every month has 31 days. Instead, BYMONTHDAY=-1 will give you the last day of the month.

  This is not supported for BY clauses that are fixed in size. In other words, BYMONTH, BYHOUR, BYMINUTE, and BYSECOND are not supported.
- The basic values for the BYDAY clause are the days of the week. When the frequency is YEARLY, or MONTHLY, you are allowed to specify a positive or negative number in front of each day of the week. In the case of YEARLY, BYDAY=40MON, indicates the 40th Monday of the year. In the case of MONTHLY, BYDAY=-2SAT, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

- The first day of the week is Monday.
- Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.
- The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the `start_date` argument. If jobs must follow daylight savings adjustments you must make sure that you specify a region name for the time zone of the `start_date`. For example specifying the `start_date` time zone as '`US/Eastern`' in New York will make sure that daylight saving adjustments are automatically applied. If instead the time zone of the `start_date` is set to an absolute offset, such as '`-5:00`', daylight savings adjustments are not followed and your job execution will be off by an hour half of the year.
- When `start_date` is `NULL`, the Scheduler will determine the time zone for the repeat interval as follows:

  1. It will check whether the session time zone is a region name. The session time zone can be set by either:
     - Issuing an `ALTER SESSION` statement, for example:

       ```
       SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';
       ```

     - Setting the `ORA_SDTZ` environment variable.
  2. If the session time zone is an absolute offset instead of a region name, the Scheduler will use the value of the `DEFAULT_TIMEZONE` Scheduler attribute. For more information, see the SET_SCHEDULER_ATTRIBUTE Procedure.
  3. If the `DEFAULT_TIMEZONE` attribute is `NULL`, the Scheduler will use the time zone of `systimestamp` when the job or window is enabled.

BYSETPOS Clause Rules The following are rules for the `BYSETPOS` clause.

- The `BYSETPOS` clause is the last clause to be evaluated. It is processed after all other `BY` clauses and the `INCLUDE`, `EXCLUDE` and `INTERSECT` clauses have been evaluated.
- The `INTERVAL` clause does not change the size of the period to which the `BYSETPOS` clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which `BYSETPOS` is applied is generated from a month, not a quarter. The only impact of the `INTERVAL` clause is to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

```
FREQ=MONTHLY;INTERVAL=3;BYDAY=MON,TUE,WED,THU,FRI;BYSETPOS=-2
```

provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which BYSETPOS is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

  ```
  FREQ=MONTHLY;BYDAY=MON,TUE,FRI;BYSETPOS=1,3
  ```

  on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.

BYDATE Clause Rules The following are rules for the BYDATE clause.

- If dates in the BYDATE clause do not have their optional year component, the job runs on those dates every year.
- The job execution times on the included dates are derived from the BY clauses in the calendaring expression. For example, if repeat_interval is defined as

  ```
  freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922
  ```

  then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

EXCLUDE Clause Rules Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, jan_fifteen is a named schedule that resolves to the single date of 01/15:

```
freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;
     exclude=jan_fifteenth
```

In this case, all three instances of the job are removed for 01/15.

OFFSET Rules You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute JOB2 exactly 15 days after every occurrence of JOB1, add +OFFSET:15D to the schedule of JOB1, as follows:

```
BEGIN
dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
  'job1_schedule+OFFSET:15D');
END;
/
```

Note that negative offsets to named schedules are not supported.

Example 125–1 Putting It All Together

This example demonstrates the use of user defined frequencies, spans, offsets, and the BYSETPOS and INCLUDE clauses. (Note that the OFFSET: keyword in an offset clause is optional.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```
begin
 dbms_scheduler.create_schedule('year_start', repeat_interval=>
```

```
       'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
 dbms_scheduler.create_schedule('retail_fiscal_year',
        to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
         'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end;
/
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing `holiday` schedule.

```
begin
 dbms_scheduler.create_schedule('fifth_day_off', repeat_interval=>
  'FREQ=retail_fiscal_year;BYDAY=SAT,SUN;INCLUDE=holiday;
    BYPERIOD=2,4;BYSETPOS=5');
end;
/
```

Summary of DBMS_SCHEDULER Subprograms

Table 125–11 DBMS_SCHEDULER Package Subprograms

Subprogram	Description
ADD_EVENT_QUEUE_SUBSCRIBER Procedure on page 125-33	Adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE
ADD_GROUP_MEMBER Procedure on page 125-34	Adds one or more members to an existing group.
ADD_JOB_EMAIL_NOTIFICATION Procedure on page 125-35	Adds e-mail notifications for a job for a list of recipients and a list of job state events
ADD_WINDOW_GROUP_MEMBER Procedure on page 125-38	***Deprecated. Use CREATE_GROUP and ADD_GROUP_MEMBER instead.
ALTER_CHAIN Procedure on page 125-39	Alters specified steps of a chain
ALTER_RUNNING_CHAIN Procedure on page 125-41	Alters specified steps of a running chain
CLOSE_WINDOW Procedure on page 125-43	Closes an open window prematurely
COPY_JOB Procedure on page 125-44	Copies an existing job
CREATE_CHAIN Procedure on page 125-45	Creates a chain, which is a named series of programs that are linked together for a combined objective
CREATE_CREDENTIAL Procedure on page 125-46	Creates a credential
CREATE_DATABASE_DESTINATION Procedure on page 125-47	Creates a database destination for use with remote database jobs
CREATE_EVENT_SCHEDULE Procedure on page 125-48	Creates an event schedule, which is a schedule that starts a job based on the detection of an event
CREATE_FILE_WATCHER Procedure on page 125-50	Creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job
CREATE_GROUP Procedure on page 125-52	Creates a group
CREATE_JOB Procedure on page 125-54	Creates a single job
CREATE_JOB_CLASS Procedure on page 125-61	Creates a job class, which provides a way to group jobs for resource allocation and prioritization
CREATE_JOBS Procedure on page 125-63	Creates multiple jobs
CREATE_PROGRAM Procedure on page 125-64	Creates a program
CREATE_SCHEDULE Procedure on page 125-66	Creates a schedule
CREATE_WINDOW Procedure on page 125-67	Creates a window, which provides a way to automatically activate different resource plans at different times
CREATE_WINDOW_GROUP Procedure on page 125-69	*** Deprecated. Use CREATE_GROUP.

Table 125–11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
DEFINE_ANYDATA_ARGUMENT Procedure on page 125-70	Defines a program argument whose value is of a complex type and must be passed encapsulated in an `AnyData` object
DEFINE_CHAIN_EVENT_STEP Procedure on page 125-71	Adds or replaces a chain step and associates it with an event schedule or inline event. See also: `DEFINE_CHAIN_STEP`.
DEFINE_CHAIN_RULE Procedure on page 125-72	Adds a rule to an existing chain
DEFINE_CHAIN_STEP Procedure on page 125-75	Defines a chain step, which can be a program or another (nested) chain. See also: `DEFINE_CHAIN_EVENT_STEP`.
DEFINE_METADATA_ARGUMENT Procedure on page 125-76	Defines a special metadata argument for the program. You can retrieve specific metadata through this argument
DEFINE_PROGRAM_ARGUMENT Procedure on page 125-78	Defines a program argument whose value can be passed as a string literal to the program
DISABLE Procedure on page 125-80	Disables a program, job, chain, window, database destination, external destination, file watcher, or group
DROP_AGENT_DESTINATION Procedure on page 125-83	Drops one or more external destinations. Use only when the preferred method of dropping external destinations—unregistering the Scheduler agent with the database—fails.
DROP_CHAIN Procedure on page 125-84	Drops an existing chain
DROP_CHAIN_RULE Procedure on page 125-85	Removes a rule from an existing chain
DROP_CHAIN_STEP Procedure on page 125-86	Drops a chain step
DROP_CREDENTIAL Procedure on page 125-87	Drops a credential
DROP_DATABASE_DESTINATION Procedure on page 125-88	Drops one or more database destinations
DROP_FILE_WATCHER Procedure on page 125-89	Drops one or more file watchers
DROP_GROUP Procedure on page 125-90	Drops one or more groups
DROP_JOB Procedure on page 125-91	Drops a job or all jobs in a job class
DROP_JOB_CLASS Procedure on page 125-92	Drops a job class
DROP_PROGRAM Procedure on page 125-93	Drops a program
DROP_PROGRAM_ARGUMENT Procedure on page 125-94	Drops a program argument
DROP_SCHEDULE Procedure on page 125-95	Drops a schedule
DROP_WINDOW Procedure on page 125-96	Drops a window
DROP_WINDOW_GROUP Procedure on page 125-97	*** Deprecated. Use `CREATE_GROUP` and `DROP_GROUP` instead.

Table 125–11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
ENABLE Procedure on page 125-98	Enables a program, job, chain, window, database destination, external destination, file watcher, or group
END_DETACHED_JOB_RUN Procedure on page 125-100	Ends a running detached job
EVALUATE_CALENDAR_STRING Procedure on page 125-101	Evaluates the calendar string and tells you what the next execution date of a job or window will be
EVALUATE_RUNNING_CHAIN Procedure on page 125-103	Forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied
GENERATE_JOB_NAME Function on page 125-104	Generates a unique name for a job. This enables you to identify jobs by adding a prefix, so, for example, Sally's jobs would be named `sally1`, `sally2`, and so on
GET_ATTRIBUTE Procedure on page 125-105	Retrieves the value of an attribute of an object
GET_FILE Procedure on page 125-106	Retrieves a file from a host
GET_SCHEDULER_ATTRIBUTE Procedure on page 125-108	Retrieves the value of a Scheduler attribute
OPEN_WINDOW Procedure on page 125-109	Opens a window prematurely. The window is opened immediately for the duration
PURGE_LOG Procedure on page 125-110	Purges specific rows from the job and window logs
PUT_FILE Procedure on page 125-111	Saves a file to one or more hosts
REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure on page 125-112	Unsubscribes a user from the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`
REMOVE_GROUP_MEMBER Procedure on page 125-113	Removes one or more members from a group
REMOVE_JOB_EMAIL_NOTIFICATION Procedure on page 125-114	Removes e-mail notifications for a job
REMOVE_WINDOW_GROUP_MEMBER Procedure on page 125-115	***Deprecated. Use `CREATE_GROUP` and `REMOVE_GROUP_MEMBER` instead
RESET_JOB_ARGUMENT_VALUE Procedure on page 125-116	Resets the current value assigned to an argument defined with the associated program
RUN_CHAIN Procedure on page 125-117	Immediately runs a chain by creating a run-once job
RUN_JOB Procedure on page 125-119	Runs a job immediately
SET_AGENT_REGISTRATION_PASS Procedure on page 125-121	Sets the agent registration password for a database
SET_ATTRIBUTE Procedure on page 125-122	Changes an attribute of a job, schedule, or other Scheduler object
SET_ATTRIBUTE_NULL Procedure on page 125-135	Changes an attribute of an object to `NULL`
SET_JOB_ANYDATA_VALUE Procedure on page 125-136	Sets the value of a job argument encapsulated in an `AnyData` object
SET_JOB_ARGUMENT_VALUE Procedure on page 125-137	Sets the value of a job argument

Table 125–11 (Cont.) DBMS_SCHEDULER Package Subprograms

Subprogram	Description
SET_JOB_ATTRIBUTES Procedure on page 125-138	Sets the value of a job attribute
SET_SCHEDULER_ATTRIBUTE Procedure on page 125-139	Sets the value of a Scheduler attribute
STOP_JOB Procedure on page 125-140	Stops a currently running job or all jobs in a job class

ADD_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE, and grants the user permission to dequeue from this queue using the designated agent.

Syntax

```
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER (
   subscriber_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–12 ADD_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Streams Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If NULL, an agent is created and assigned the user name of the calling user.

Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

ADD_GROUP_MEMBER Procedure

This procedure adds one or more members to an existing group.

Syntax

```
DBMS_SCHEDULER.ADD_GROUP_MEMBER (
   group_name               IN VARCHAR2,
   member                   IN VARCHAR2);
```

Parameters

Table 125–13 ADD_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the group.
member	A comma-separated list of members to add to the group. Members must match the group type. A group of the same type can be a member. The Scheduler immediately expands the included group name into its list of members. An error is returned if any of the members does not exist. A member that is already in the group is skipped, and no error is generated. The keyword LOCAL can be included as a member for database destination or external destination groups. See the "CREATE_GROUP Procedure" on page 52 for information about this keyword.

Usage Notes

The following users may add members to a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to add a member to a group of type WINDOW.

See Also: "CREATE_GROUP Procedure" on page 125-52

ADD_JOB_EMAIL_NOTIFICATION Procedure

This procedure adds e-mail notifications for a job. E-mails are then sent to the specified list of recipients whenever any of the specified job state events is raised.

Syntax

```
DBMS_SCHEDULER.ADD_JOB_EMAIL_NOTIFICATION (
    job_name             IN VARCHAR2,
    recipients           IN VARCHAR2,
    sender               IN VARCHAR2 DEFAULT NULL,
    subject              IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_SUBJECT,
    body                 IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_BODY,
    events               IN VARCHAR2 DEFAULT 'JOB_FAILED,JOB_BROKEN,JOB_SCH_LIM_REACHED,
                            JOB_CHAIN_STALLED,JOB_OVER_MAX_DUR',
    filter_condition     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–14 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
job_name	Name of the job for which to add e-mail notifications. Cannot be NULL.
recipients	Comma-separated list of e-mail addresses to which to send notifications. E-mail notifications for all listed events are sent to all recipients. Cannot be NULL.
sender	e-mail address to use as the sender address (the From: address) in the e-mail header. If NULL or omitted, the e-mail address specified in the Scheduler attribute email_sender is used. See *Oracle Database Administrator's Guide* for more information on this Scheduler attribute.
subject	The subject to use in the e-mail header. Table 125–15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If subject is omitted, the default subject is used. The default subject is the following text, where text enclosed in the '%' character represents a variable: 'Oracle Scheduler Job Notification - %job_owner%.%job_name%.%job_subname% %event_type%'
body	The body of the e-mail message. Table 125–15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If body is omitted, the default body is used. The default body is the following text, where text enclosed in the '%' character represents a variable: 'Job: %job_owner%.%job_name%.%job_subname% Event: %event_type% Date: %event_timestamp% Log id: %log_id% Job class: %job_class_name% Run count: %run_count% Failure count: %failure_count% Retry count: %retry_count% Error code: %error_code% Error message: %error_message%'

Table 125–14 (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
events	Comma-separate list of job state events for which to send e-mail notifications. Cannot be NULL. A notification is sent to all recipients if any of the listed events is raised. Table 125–80 on page 125-129 lists the valid events for this parameter. If events is omitted, notifications are sent for the following default events: JOB_FAILED,JOB_BROKEN,JOB_SCH_LIM_REACHED,JOB_CHAIN_STALLED,JOB_OVER_MAX_DUR
filter_condition	Used to filter events for which e-mail notifications are sent. If NULL, all occurrences of the specified events cause e-mail notifications to be sent. filter_condition must be a boolean SQL WHERE clause that may refer to the :event bind variable. This bind variable is automatically bound to an object of type SCHEDULER$_EVENT_INFO that represents the raised event. For example, to send an e-mail notification only when the error number in an event is 600 or 700, use the following filter_condition: :event.error_code=600 or :event.error_code=700 See "SCHEDULER$_EVENT_INFO Object Type" on page 125-13.

Table 125–15 lists the variables that you can use in the subject and body arguments.

Table 125–15 Variables Used in the SUBJECT and BODY Parameters

Variable	Comment
%job_owner%	Schema in which job was created
%job_name%	-
%job_subname%	Present for event-based jobs with the parallel_instances attribute set and for chain steps
%event_type%	See Table 125–80 on page 125-129
%event_timestamp%	-
%log_id%	Refers to the LOG_ID column in views *_SCHEDULER_JOB_LOG and *_SCHEDULER_JOB_RUN_DETAILS
%error_code%	-
%error_message%	-
%run_count%	-
%failure_count%	-
%retry_count%	-

Usage Notes

You can call ADD_JOB_EMAIL_NOTIFICATION once for each different set of notifications that you want to configure for a particular job. For example, you may want to send notifications for the JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED, and JOB_CHAIN_STALLED events to the principle DBA and all senior DBAs, but send a notification for the JOB_OVER_MAX_DUR event only to the principle DBA.

This procedure succeeds only if the Scheduler attribute email_server is set to a valid SMTP server. See *Oracle Database Administrator's Guide* for more information.

To call this procedure, you must be the job owner or have the `CREATE ANY JOB` system privilege or have the `ALTER` object privilege on the job.

ADD_WINDOW_GROUP_MEMBER Procedure

***** Deprecated in Oracle Database 11*g* Release 2. Use ADD_GROUP_MEMBER instead**.

This procedure adds one or more windows to an existing window group.

Syntax

```
DBMS_SCHEDULER.ADD_WINDOW_GROUP_MEMBER (
   group_name              IN VARCHAR2,
   window_list             IN VARCHAR2);
```

Parameters

Table 125–16 ADD_WINDOW_GROUP_MEMBER Procedure Parameters

Parameter	Description
`group_name`	The name of the window group
`window_list`	The name of the window or windows

Usage Notes

If an already open window is added to a window group, the Scheduler will not pick up jobs that point to this window group until the next window in the window group opens.

Adding a window to a group requires the `MANAGE SCHEDULER` privilege.

Note that a window group cannot be a member of another window group.

ALTER_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects all future runs of the specified steps, both in the currently running chain job and in future runs of the same chain job or other chain jobs that point to the chain.

Syntax

Alters the value of a boolean attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   attribute               IN VARCHAR2,
   value                   IN BOOLEAN);
```

Alters the value of a character attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   attribute               IN VARCHAR2,
   char_value              IN VARCHAR2);
```

Parameters

Table 125–17 ALTER_CHAIN Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to alter
`step_name`	The name of the step or a comma-separated list of steps to alter. This cannot be `NULL`.

Table 125–17 (Cont.) ALTER_CHAIN Procedure Parameters

Parameter	Description
attribute	The attribute of the steps to change. Must be one of the following: ■ 'PAUSE'—If set to TRUE for a step, after the step has run, its state will be changed to PAUSED (and the completed attribute will remain FALSE). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state will be set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute will be set to TRUE. Setting PAUSE will have no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. ■ 'SKIP'—If set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED. ■ 'RESTART_ON_FAILURE' - If set to TRUE for a step, then if the step fails due to an application error, the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED. If this attribute is set to FALSE (the default), a failed chain step is immediately marked FAILED. ■ 'RESTART_ON_RECOVERY'—If set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If this attribute is set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. ■ 'DESTINATION_NAME'—The name of an existing database destination or external destination. You can view external destination names in the view ALL_SCHEDULER_EXTERNAL_DESTS, and database destination names in the views *_SCHEDULER_DB_DESTS. You cannot specify a destination group for this attribute. This parameter is NULL by default. ■ 'CREDENTIAL_NAME'— The credential to use when running this step. NULL by default.
value	The value to set for the attribute (for a boolean attribute).
char_value	The value to set for the attribute (for a character attribute).

Usage Notes

Altering a chain requires ALTER privileges on the chain either by being the owner of the chain, or by having the ALTER object privilege on the chain or by having the CREATE ANY JOB system privilege.

ALTER_RUNNING_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects only steps of the instance of the chain for the specified running chain job.

Syntax

```
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (
   job_name               IN VARCHAR2,
   step_name              IN VARCHAR2,
   attribute              IN VARCHAR2,
   value                  IN {BOOLEAN|VARCHAR2});
```

Parameters

Table 125–18 ALTER_RUNNING_CHAIN Procedure Parameters

Parameter	Description
job_name	The name of the job that is running the chain
step_name	The name of the step or a comma-separated list of steps to alter. If this is set to NULL and attribute is PAUSE or SKIP, then all steps of the running chain will be altered.
attribute	The attribute of the steps to change. This must be one of: 'PAUSE', 'SKIP', 'RESTART_ON_RECOVERY', or 'STATE'. ■ 'PAUSE'—If the PAUSE attribute is set TRUE for a step, after the step has run, its state will be changed to PAUSED (and the completed attribute will remain false). If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state will be set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute will be set to TRUE. Setting PAUSE will have no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps. If step_name is set to NULL, PAUSE will be set to TRUE for all steps of this running chain. ■ 'SKIP'—If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If step_name is set to NULL, SKIP will be set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step will immediately change to state PAUSED. ■ 'RESTART_ON_RECOVERY'—If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered. If this attribute is set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues. ■ 'STATE'—This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following: 'NOT_STARTED', 'SUCCEEDED', 'FAILED *error_code*' If the state is being changed to FAILED, an error code must be included (this must be a positive integer).
value	The value to set for the attribute. This must be one of: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED *error_code*'

Usage Notes

Altering a running chain requires alter privileges on the job which is running (either by being the owner, or by having `ALTER` privileges on the job or by having the `CREATE ANY JOB` system privilege).

CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler will switch the resource plan to the one that was in effect outside the window or in the case of overlapping windows to another window.

Syntax

```
DBMS_SCHEDULER.CLOSE_WINDOW (
   window_name             IN VARCHAR2);
```

Parameters

Table 125–19 CLOSE_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running will not stop when the window it is running in closes unless the attribute stop_on_window_close was set to TRUE for the job. However, the resources allocated to the job may change because the resource plan may change.

When a running job has a group of type WINDOW as its schedule, the job will not be stopped when its window is closed if another window that is also a member of the same window group then becomes active. This is the case even if the job has the attribute stop_on_window_close set to TRUE.

Closing a window requires the MANAGE SCHEDULER privilege.

COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```
DBMS_SCHEDULER.COPY_JOB (
   old_job                IN VARCHAR2,
   new_job                IN VARCHAR2);
```

Parameters

Table 125–20 COPY_JOB Procedure Parameters

Parameter	Description
old_job	The name of the existing job
new_job	The name of the new job

Usage Notes

Copying a job requires privileges to create a job in the schema of the new job (the CREATE JOB system privilege if it is in the user's own schema, and the CREATE ANY JOB system privilege otherwise). If the old job is not in the user's own schema, then he needs to additionally have ALTER privileges on the old job or the CREATE ANY JOB system privilege.

CREATE_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, `myschema.myname`).

A chain is always created disabled and must be enabled with the ENABLE Procedure before it can be used.

Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
   chain_name              IN VARCHAR2,
   rule_set_name           IN VARCHAR2 DEFAULT NULL,
   evaluation_interval     IN INTERVAL DAY TO SECOND DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–21 CREATE_CHAIN Procedure Parameters

Parameter	Description
`chain_name`	The name to assign to the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, so there must not already be a table or other object with this name and schema.
`rule_set_name`	In the normal case, no rule set should be passed in. The Scheduler will automatically create a rule set and associated empty evaluation context. You then use `DEFINE_CHAIN_RULE` to add rules and `DROP_CHAIN_RULE` to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created will be of the form `SCHED_RULESET${N}` and the evaluation context created will be of the form `SCHED_EVCTX${N}` See *Oracle Streams Concepts and Administration* for information on rules and rule sets.
`evaluation_interval`	If this is `NULL`, reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non-`NULL` value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at `NULL` if possible. `evaluation_interval` cannot be less than a minute or greater than a day.
`comments`	An optional comment describing the purpose of the chain

Usage Notes

Creating a chain in one's own schema requires the `CREATE JOB` system privilege. Creating a chain in a different schema requires the `CREATE ANY JOB` system privilege. If no `rule_set_name` is given, a rule set and evaluation context will be created in the schema that the chain is being created in, so the user will need to have the privileges required to create these objects. See the `DBMS_RULE_ADM.CREATE_RULE_SET` and `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedures for more information.

CREATE_CREDENTIAL Procedure

This procedure creates a stored username/password pair. Credentials are assigned to jobs so that they can authenticate with a local or remote host operating system or a remote Oracle database.

Syntax

```
DBMS_SCHEDULER.CREATE_CREDENTIAL (
   credential_name         IN VARCHAR2,
   username                IN VARCHAR2,
   password                IN VARCHAR2,
   database_role           IN VARCHAR2 DEFAULT NULL,
   windows_domain          IN VARCHAR2 DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–22 CREATE_CREDENTIAL Procedure Parameters

Parameter	Description
`credential_name`	The name to assign to the credential. It can optionally be prefixed with a schema name. This cannot be set to `NULL`. It is converted to upper case unless enclosed in double-quotes.
`username`	The user name to use for login to the host operating system or remote Oracle database. This cannot be set to `NULL` and is case sensitive. It cannot contain double quotes or spaces.
`password`	The password for the user name. This cannot be set to `NULL` and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views.
`database_role`	Reserved for future use.
`windows_domain`	For a Windows remote executable target, this is the domain that the specified user belongs to. The domain is converted to uppercase automatically.
`comments`	This is a text string that can be used to describe the credential. This parameter is not used by the Scheduler.

Usage Notes

Credentials reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a credential in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

CREATE_DATABASE_DESTINATION Procedure

This procedure creates a database destination. A database destination represents an Oracle database on which remote database jobs run.

The host on which the remote database resides must have a running Scheduler agent that is registered with the database from which this procedure is called.

Syntax

```
DBMS_SCHEDULER.CREATE_DATABASE_DESTINATION (
   destination_name        IN VARCHAR2,
   agent                   IN VARCHAR2,
   tns_name                IN VARCHAR2,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–23 CREATE_DATABASE_DESTINATION Procedure Parameters

Parameter	Description
`destination_name`	The name to assign to the database destination. It can optionally be prefixed with a schema name. Cannot be `NULL`. It is converted to upper case unless enclosed in double-quotes.
`agent`	The external destination name that indicates the Scheduler agent to which to connect. Equivalent to an agent name. The external destination must already exist. The external destination representing an agent is created automatically on a database instance when the agent registers with that instance. An agent's name is specified in its agent configuration file. If not specified, it defaults to the first part (before the first period) of the name of the host on which it resides.
`tns_name`	An Oracle Net connect identifier that gets resolved to the Oracle database instance to which to connect. The exact syntax depends on the Oracle Net configuration. The connect identifier can be a complete Oracle Net connect descriptor (network address and database service name) or a *net service name*, which is an alias for a connect descriptor. The alias must be resolved in the tnsnames.ora file on the local computer. The maximum size for `tns_name` is 2000 characters. If `tns_name` is `NULL`, the agent connects to the default Oracle database on its host. You specify the default database by assigning values to the `ORACLE_HOME` and `ORACLE_SID` parameters in the agent configuration file, schagent.conf, located in the agent home directory. See *Oracle Database Net Services Administrator's Guide* for more information on connect identifiers.
`comments`	A text string used to describe the database destination. This argument is not used by the Scheduler.

Usage Notes

Database destinations reside in a particular schema and can be created by any user with the `CREATE JOB` system privilege. To create a database destination in a schema other than your own, you must have the `CREATE ANY JOB` privilege.

CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (
   schedule_name           IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   event_condition         IN VARCHAR2 DEFAULT NULL,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–24 CREATE_EVENT_SCHEDULE Parameters

Parameter	Description
schedule_name	The name to assign to the schedule. The name has to be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the date and time on which this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule.
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with tab.user_data. For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.
queue_spec	This argument specifies either a file watcher name or the queue into which events that start this particular job will be enqueued (the **source queue**). If the source queue is a secure queue, the queue_spec argument is a string containing a pair of values of the form *queue_name*, *agent name*. For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
end_date	The date and time after which jobs will not run and windows will not open. An event schedule that has no end_date is valid forever. end_date has to be after the start_date. If this is not the case, then an error will be generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in one's own schema or the CREATE ANY JOB privilege to create a schedule in someone else's schema by specifying schema.schedule_name. Once a schedule has been created, it

can be used by other users. The schedule is created with access to `PUBLIC`. Therefore, there is no need to explicitly grant access to the schedule.

See Also: "CREATE_FILE_WATCHER Procedure" on page 125-50

CREATE_FILE_WATCHER Procedure

This procedure creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job. After you create a file watcher, you reference it in an event-based job or event schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_FILE_WATCHER (
   file_watcher_name            IN VARCHAR2,
   directory_path               IN VARCHAR2,
   file_name                    IN VARCHAR2,
   credential_name              IN VARCHAR2,
   destination                  IN VARCHAR2  DEFAULT NULL,
   min_file_size                IN PLS_INTEGER DEFAULT 0,
   steady_state_duration        IN INTERVAL DAY TO SECOND DEFAULT NULL,
   comments                     IN VARCHAR2 DEFAULT NULL,
   enabled                      IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 125–25 CREATE_FILE_WATCHER Parameters

Parameter	Description
file_watcher_name	The name to assign to the file watcher. The name has to be unique in the SQL namespace. For example, a a file watcher cannot have the same name as a table in a schema. This can optionally be prefixed with a schema name. Cannot be NULL.
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.
file_name	Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid Scheduler credential object. The credential is used to authenticate with the host operating system to access the watched-for file. The file watcher owner must have EXECUTE privileges on the credential. Cannot be NULL.
destination	Name of an external destination. You create an external destination by registering a remote Scheduler agent with the database. See the view ALL_SCHEDULER_EXTERNAL_DESTS for valid external destination names. If this parameter is NULL, the file watcher is created on the local host.
min_file_size	Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0.
steady_state_ duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. Cannot exceed one hour. If NULL, an internal value is used.
comments	Optional comment.
enabled	If TRUE (the default), the file watcher is enabled.

Usage Notes

You must have the CREATE JOB system privilege to create a file watcher in your own schema. You require the CREATE ANY JOB system privilege to create a file watcher in a schema different from your own (except the SYS schema, which is disallowed).

CREATE_GROUP Procedure

This procedure creates a group. Groups contain members, which you can specify when you create the group or at a later time. There are three types of groups: window groups, database destination groups, and external destination groups.

You can use a group name in other DBMS_SCHEDULER package procedures to specify a list of objects. For example, to specify multiple destinations for a remote database job, you provide a group name for the job's DESTINATION_NAME parameter.

Syntax

```
DBMS_SCHEDULER.CREATE_GROUP (
   group_name           IN VARCHAR2,
   group_type           IN VARCHAR2,
   member               IN VARCHAR2 DEFAULT NULL,
   comments             IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–26 CREATE_GROUP Procedure Parameters

Parameter	Description
group_name	The name to assign to the group. It can optionally be prefixed with a schema name. Cannot be NULL. It is converted to upper case unless enclosed in double-quotes.
group_type	The type of members in the group. All members must be of the same type. Possible types are: ■ 'DB_DEST'—(Database destination) Members are database destinations, for running remote database jobs. ■ 'EXTERNAL_DEST'—(External destination) Members are external destinations, for running remote external jobs. ■ 'WINDOW'—Members are Scheduler windows. You must have the MANAGE SCHEDULER privilege to create a group of this type. Members in database destination and external destination groups have the following format: [[*schema.*]*credential*@][*schema.*]*destination* where: ■ *credential* is the name of an existing credential. ■ *destination* is the name of an existing database destination or external destination. The credential portion of a destination member is optional. If omitted, the job using this destination member uses its default credential. Members in window groups are window names. Because all Scheduler windows reside in the SYS schema, you do not specify a schema name for windows.

Table 125–26 (Cont.) CREATE_GROUP Procedure Parameters

Parameter	Description
member	Optional comma-separated list of group members. The default is NULL. If NULL, use the ADD_GROUP_MEMBER procedure to add members. You can also use ADD_GROUP_MEMBER to add additional members at a later time. The keyword LOCAL can be used as a member in database destination groups and external destination groups. ■ In database destination groups, LOCAL represents the source database on which the job is created. It cannot be preceded with a credential. ■ In external destination groups, LOCAL represents the host on which the source database resides. It can be optionally preceded with a credential name. If no credential is provided, the job that uses this group as its destination must have a default credential.
comments	A text string used to describe the group. This argument is not used by the Scheduler.

Usage Notes

Groups reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a group in a schema other than your own, you must have the CREATE ANY JOB privilege. The group name must be unique among all Scheduler objects.

You can grant the SELECT privilege on a group so that other users can reference the group when creating jobs or schedules. To enable other users to modify a group, you can grant the ALTER privilege on the group.

Each group member must be unique within the group. For destination groups, the credential/destination name pairs must be unique within the group. An error is generated if any of the group members does not exist. For destination groups, both the credential and destination portions of a member must exist.

Another group of the same type can be a group member. The Scheduler immediately expands the included group name into its list of members.

Groups are created enabled, but you can disable them.

This procedure supersedes the procedure CREATE_WINDOW_GROUP, which is deprecated in Oracle Database 11*g* Release 2.

Example

The following PL/SQL block creates a group named production_dest1, whose members are database destinations for a collection of production databases.

```
BEGIN
  DBMS_SCHEDULER.CREATE_GROUP(
    GROUP_NAME    => 'production_dest1',
    GROUP_TYPE    => 'DB_DEST',
    MEMBER        => 'LOCAL, oracle_cred@prodhost1, prodhost2',
    COMMENTS      => 'All sector1 production machines');
END;
```

CREATE_JOB Procedure

This procedure creates a single job (regular or lightweight). If you create the job enabled by setting the `enabled` attribute to `TRUE`, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the SET_ATTRIBUTE Procedure.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

Syntax

Creates a job in a single call without using an existing program or schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name             IN VARCHAR2,
   job_type             IN VARCHAR2,
   job_action           IN VARCHAR2,
   number_of_arguments  IN PLS_INTEGER              DEFAULT 0,
   start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval      IN VARCHAR2                 DEFAULT NULL,
   end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class            IN VARCHAR2                 DEFAULT 'DEFAULT_JOB_CLASS',
   enabled              IN BOOLEAN                  DEFAULT FALSE,
   auto_drop            IN BOOLEAN                  DEFAULT TRUE,
   comments             IN VARCHAR2                 DEFAULT NULL,
   credential_name      IN VARCHAR2                 DEFAULT NULL,
   destination_name     IN VARCHAR2                 DEFAULT NULL);
```

Creates a job using a named schedule object and a named program object:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name               IN VARCHAR2,
   program_name           IN VARCHAR2,
   schedule_name          IN VARCHAR2,
   job_class              IN VARCHAR2              DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                IN BOOLEAN               DEFAULT FALSE,
   auto_drop              IN BOOLEAN               DEFAULT TRUE,
   comments               IN VARCHAR2              DEFAULT NULL,
   job_style              IN VARCHAR2              DEFAULT 'REGULAR',
   credential_name        IN VARCHAR2              DEFAULT NULL,
   destination_name       IN VARCHAR2              DEFAULT NULL);
```

Creates a job using a named program object and an inlined schedule:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name             IN VARCHAR2,
   program_name         IN VARCHAR2,
   start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval      IN VARCHAR2                 DEFAULT NULL,
   end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class            IN VARCHAR2                 DEFAULT 'DEFAULT_JOB_CLASS',
   enabled              IN BOOLEAN                  DEFAULT FALSE,
   auto_drop            IN BOOLEAN                  DEFAULT TRUE,
   comments             IN VARCHAR2                 DEFAULT NULL,
   job_style            IN VARCHAR2                 DEFAULT 'REGULAR',
   credential_name      IN VARCHAR2                 DEFAULT NULL,
   destination_name     IN VARCHAR2                 DEFAULT NULL);
```

Creates a job using a named schedule object and an inlined program:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   schedule_name           IN VARCHAR2,
   job_type                IN VARCHAR2,
   job_action              IN VARCHAR2,
   number_of_arguments     IN PLS_INTEGER       DEFAULT 0,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL,
   credential_name         IN VARCHAR2          DEFAULT NULL,
   destination_name        IN VARCHAR2          DEFAULT NULL);
```

Creates a job using an inlined program and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   job_type                IN VARCHAR2,
   job_action              IN VARCHAR2,
   number_of_arguments     IN PLS_INTEGER       DEFAULT 0,
   start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   event_condition         IN VARCHAR2          DEFAULT NULL,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL,
   credential_name         IN VARCHAR2          DEFAULT NULL,
   destination_name        IN VARCHAR2          DEFAULT NULL);
```

Creates a job using a named program object and an event:

```
DBMS_SCHEDULER.CREATE_JOB (
   job_name                IN VARCHAR2,
   program_name            IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE,
   job_class               IN VARCHAR2          DEFAULT 'DEFAULT_JOB_CLASS',
   enabled                 IN BOOLEAN           DEFAULT FALSE,
   auto_drop               IN BOOLEAN           DEFAULT TRUE,
   comments                IN VARCHAR2          DEFAULT NULL,
   job_style               IN VARCHAR2          DEFAULT 'REGULAR',
   credential_name         IN VARCHAR2          DEFAULT NULL,
   destination_name        IN VARCHAR2          DEFAULT NULL);
```

Parameters

Table 125–27 CREATE_JOB Procedure Parameters

Parameter	Description
job_name	The name to assign to the job. The name has to be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name. If job_name is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the GENERATE_JOB_NAME procedure to generate a name and then use the output in the CREATE_JOB procedure. The GENERATE_JOB_NAME procedure call generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See "GENERATE_JOB_NAME Function" on page 125-104 for more information.
job_type	This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. The supported values are: ■ 'PLSQL_BLOCK' This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0. ■ 'STORED_PROCEDURE' This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. ■ 'EXECUTABLE' This specifies that the job is a job external to the database. External jobs are anything that can be executed from the operating system's command line. Anydata arguments are not supported with a job or program type of EXECUTABLE. The job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run. ■ 'CHAIN' This specifies that the job is a chain. Arguments are not supported for a chain, so number_of_arguments must be 0.

Table 125–27 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
job_action	This attribute specifies the action of the job. The following actions are possible: For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semi-colon. For example, `my_proc();` or `BEGIN my_proc(); END;` or `DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END;`. Note that the Scheduler wraps `job_action` in its own block and passes the following to PL/SQL for execution: `DECLARE ... BEGIN job_action END;` This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except `event_message` in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 125–39 on page 125-76 for details on available metadata attributes. For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. PL/SQL procedures with `INOUT` or `OUT` arguments are not supported as `job_action` when the job or program type is `STORED_PROCEDURE`. For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance. For a chain, the action is the name of a Scheduler chain object. You have to specify the schema of the chain if it resides in a different schema than the job. If `job_action` is not specified for an inline program, an error is generated when creating the job.
number_of_arguments	This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.
program_name	The name of the program associated with this job. If the program is of type `EXECUTABLE`, the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.
start_date	This attribute specifies the first date and time on which this job is scheduled to start. If `start_date` and `repeat_interval` are left null, then the job is scheduled to run as soon as the job is enabled. For repeating jobs that use a calendaring expression to specify the repeat interval, `start_date` is used as a reference date. The first time the job will be scheduled to run is the first match of the calendaring expression that is on or after the current date and time. The Scheduler cannot guarantee that a job will execute on an exact time because the system may be overloaded and thus resources unavailable.
event_condition	This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with `tab.user_data`. For more information on rules, see the `DBMS_AQADM.ADD_SUBSCRIBER` procedure.

Table 125–27 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
queue_spec	This argument specifies either a file watcher name or the queue into which events that start this particular job will be enqueued (the **source queue**). If the source queue is a secure queue, the queue_spec argument is a string containing a pair of values of the form *queue_name*, *agent name*. For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.
repeat_ interval	This attribute specifies how often the job should repeat. You can specify the repeat interval by using calendaring or PL/SQL expressions. The expression specified is evaluated to determine the next time the job should run. If repeat_interval is not specified, the job will run only once at the specified start date. See "Calendaring Syntax" on page 125-19 for further information.
schedule_ name	The name of the schedule, window, or window group associated with this job.
job_class	The class this job is associated with.
end_date	This attribute specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED. If no value for end_date is specified, the job repeats forever unless max_ runs or max_failures is set, in which case the job stops when either value is reached. The value for end_date must be after the value for start_date. If it is not, an error is generated when the job is enabled.
comments	This attribute specifies a comment about the job. By default, this attribute is NULL.
job_style	Style of the job to create. This argument can have one of the following values: ■ 'REGULAR' - a regular job will be created. This is the default. ■ 'LIGHTWEIGHT' - a lightweight job is created. This value is permitted only when the job references a program object. Use lightweight jobs when you have many short-duration jobs that run frequently. Under certain circumstances, using lightweight jobs can deliver a small performance gain.
credential_ name	The default credential to use with the job. Applicable only to remote database jobs, remote external jobs, local external jobs, and event-based jobs that process file arrival events. The credential must exist. For local database jobs, must be NULL. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See *Oracle Database Administrator's Guide* for information about preferred credentials for local external jobs. See also: "CREATE_CREDENTIAL Procedure" on page 125-46

Table 125–27 (Cont.) CREATE_JOB Procedure Parameters

Parameter	Description
destination_name	The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be NULL. Can be a single destination name or the name of a group of type 'EXTERNAL_DEST' or 'DB_DEST'. The single destination or group must already exist. If a database destination, it must have been created by the CREATE_DATABASE_DESTINATION Procedure. If an external destination, it must have been implicitly created by registering a remote Scheduler agent with the local database. If a group, each member of the group must exist. If a group, the job runs on all destinations named in the group. destination_name cannot reference a destination group when: ■ The job type is 'CHAIN' ■ The job style is 'LIGHTWEIGHT' If the credential_name argument of CREATE_JOB is NULL, each destination must be preceded by a credential, in the following format: *credential.destination* The credential must already exist. If the credential_name argument is provided, then it serves as the default credential for every destination that is not preceded by a credential. Query the views *_SCHEDULER_DB_DESTS and ALL_SCHEDULER_EXTERNAL DESTS to view existing destinations to use. Query the views *_SCHEDULER_GROUP_MEMBERS to view existing groups and their members. See also: "CREATE_GROUP Procedure" on page 125-52. *** This argument supersedes the destination job attribute, which is deprecated in Oracle Database 11*g*R2.
enabled	This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured and the job exists as a database object but the Scheduler will ignore it and the job coordinator will not pick the job for processing. In order for the job coordinator to process the job, the job has to be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.
auto_drop	This flag, if TRUE, causes a job to be automatically dropped after it has completed or has been automatically disabled. A job is considered completed if: ■ Its end date (or its schedule's end date) has passed. ■ It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. ■ It is not a repeating job and has run once. A job is disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE. If this flag is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure. By default, jobs are created with auto_drop set to TRUE.

Usage Notes

Jobs are created disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program

arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

To create a job in your own schema, you need to have the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires `EXECUTE` privileges for that class or program.

Not all possible job attributes can be set with `CREATE_JOB`. Some must be set after the job is created. For example, job arguments must be set with the SET_JOB_ARGUMENT_VALUE Procedure or the SET_JOB_ANYDATA_VALUE Procedure. Other job attributes, such as `job_priority` and `max_runs`, are set with the SET_ATTRIBUTE Procedure.

To create multiple jobs efficiently, use the `CREATE_JOBS` procedure.

Note: The Scheduler runs event-based jobs for each occurrence of an event that matches the job's event condition. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the SYS schema.

Syntax

```
DBMS_SCHEDULER.CREATE_JOB_CLASS (
   job_class_name            IN VARCHAR2,
   resource_consumer_group   IN VARCHAR2 DEFAULT NULL,
   service                   IN VARCHAR2 DEFAULT NULL,
   logging_level             IN PLS_INTEGER
                                DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,
   log_history               IN PLS_INTEGER DEFAULT NULL,
   comments                  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–28 CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
job_class_name	The name to assign to the job class. A schema other than SYS cannot be specified. This attribute specifies the name of the job class and uniquely identifies the job class. The name has to be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.
resource_consumer_group	This attribute specifies the resource consumer group this class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with will determine the resources that will be allocated to the job class. If the resource consumer group that a job class is associated with is dropped, the job class will then be associated with the default resource consumer group. If no resource consumer group is specified, the job class is associated with the default resource consumer group. If the specified resource consumer group does not exist when creating the job class, an error occurs.
service	This attribute specifies the database service that the jobs in this class will have affinity to. In a RAC environment, this means that the jobs in this class will only run on those database instances that are assigned to the specific service. Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING for details. If both the resource_consumer_group and service attributes are specified, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence. If no service is specified, the job class will belong to the default service, which means it will have no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service. If the specified service does not exist when creating the job class, then an error occurs.

Table 125–28 (Cont.) CREATE_JOB_CLASS Procedure Parameters

Parameter	Description
logging_level	This attribute specifies how much information is logged. The possible options are: ■ DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. ■ DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. ■ DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs that failed in this class. ■ DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so, an entry is recorded in the log.
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 999. If set to 0, no history is kept. If NULL (the default), retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).
comments	This attribute is for an optional comment about the job class. By default, this attribute is NULL.

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE SCHEDULER system privilege.

CREATE_JOBS Procedure

This procedure creates multiple jobs (regular or lightweight) and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (
   jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 125–29 CREATE_JOBS Procedure Parameters

Parameter	Description
jobdef_array	The array of job definitions. See "Data Structures" on page 125-2 for a description of the JOB_DEFINITION_ARRAY and JOB_DEFINITION data types.
commit_semantics	The commit semantics. The following types are supported: ■ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous creates that were successful are committed to disk. This is the default. ■ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. ■ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts to create the rest of the jobs on the list and commits all the creates that were successful. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs to create must be grouped into batches of sufficient size. Calling CREATE_JOBS with a small array size may not be much faster than calling CREATE_JOB once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the destination attribute of the job_definition object cannot reference a destination group.

CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (
   program_name             IN VARCHAR2,
   program_type             IN VARCHAR2,
   program_action           IN VARCHAR2,
   number_of_arguments      IN PLS_INTEGER DEFAULT 0,
   enabled                  IN BOOLEAN DEFAULT FALSE,
   comments                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–30 CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_name	The name to assign to the program. The name has to be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
program_type	This attribute specifies the type of program you are creating. If it is not specified then you will get an error. There are three supported values for program_type: ■ 'PLSQL_BLOCK' This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0. ■ 'STORED_PROCEDURE' This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with INOUT or OUT arguments are not supported. ■ 'EXECUTABLE' This specifies that the program is external to the database. External programs implies anything that can be executed from the operating system's command line. AnyData arguments are not supported with job or program type EXECUTABLE.

Table 125–30 (Cont.) CREATE_PROGRAM Procedure Parameters

Parameter	Description
program_action	This attribute specifies the action of the program. The following actions are possible: For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semi-colon. For example, `my_proc();` or `BEGIN my_proc(); END;` or `DECLARE arg pls_integer := 10; BEGIN my_proc2(arg); END;`. Note that the Scheduler wraps `job_action` in its own block and passes the following to PL/SQL for execution: `DECLARE ... BEGIN job_action END;` This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except `event_message` in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 125–39 on page 125-76 for details on available metadata attributes. For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance. If `program_action` is not specified, an error is generated If it is an anonymous block, special Scheduler metadata may be accessed using the following variable names: `job_name`, `job_owner`, `job_start`, `window_start`, `window_end`. For more information on these, see the information regarding `define_metadata_argument`.
number_of_arguments	This attribute specifies the number of arguments the program takes. If this parameter is not specified then the default will be 0. A program can have a maximum of 255 arguments. If the `program_type` is `PLSQL_BLOCK`, this parameter is ignored.
enabled	This flag specifies whether the program should be created enabled or not. If the flag is set to `TRUE`, then validity checks will be made and the program will be created `ENABLED` should all the checks be successful. By default, this flag is set to `FALSE`, which means that the program is not created enabled. You can also call the `ENABLE` procedure to enable the program before it can be used.
comments	A comment about the program. By default, this attribute is `NULL`.

Usage Notes

To create a program in his own schema, a user needs the `CREATE JOB` privilege. A user with the `CREATE ANY JOB` privilege can create a program in any schema. A program is created in a disabled state by default (unless the enabled parameter is set to `TRUE`). It cannot be executed by a job until it is enabled.

For other users to use your programs, they must have `EXECUTE` privileges, therefore once a program has been created, you have to grant `EXECUTE` privileges on it.

See Also: "DEFINE_PROGRAM_ARGUMENT Procedure" on page 125-78

CREATE_SCHEDULE Procedure

This procedure creates a schedule.

Syntax

```
DBMS_SCHEDULER.CREATE_SCHEDULE (
   schedule_name           IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
   repeat_interval         IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–31 CREATE_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name to assign to the schedule. The name has to be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.
start_date	This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for start_date is a reference date. In this case, the start of the schedule is not the start_date; it depends on the repeat interval specified. start_date is used to determine the first instance of the schedule. If start_date is specified in the past and no value for repeat_interval is specified, the schedule is invalid. For a repeating job or window, start_date can be derived from the repeat_interval if it is not specified. If start_date is null, then the date that the job or window is enabled is used. start_date and repeat_interval cannot both be null.
repeat_interval	This attribute specifies how often the schedule should repeat. It is expressed using calendaring syntax. See "Calendaring Syntax" on page 125-19 for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.
end_date	The date and time after which jobs will not run and windows will not open. A non-repeating schedule that has no end_date will be valid forever. end_date has to be after the start_date. If this is not the case, then an error will be generated when the schedule is created.
comments	This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.

Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in one's own schema or the CREATE ANY JOB privilege to create a schedule in someone else's schema by specifying schema.schedule_name. Once a schedule has been created, it can be used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

CREATE_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. The window can then be used to schedule jobs, which run under the associated resource plan. Windows are created in the SYS schema.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```
DBMS_SCHEDULER.CREATE_WINDOW (
   window_name             IN VARCHAR2,
   resource_plan           IN VARCHAR2,
   schedule_name           IN VARCHAR2,
   duration                IN INTERVAL DAY TO SECOND,
   window_priority         IN VARCHAR2 DEFAULT 'LOW',
   comments                IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```
DBMS_SCHEDULER.CREATE_WINDOW (
   window_name             IN VARCHAR2,
   resource_plan           IN VARCHAR2,
   start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   repeat_interval         IN VARCHAR2,
   end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   duration                IN INTERVAL DAY TO SECOND,
   window_priority         IN VARCHAR2 DEFAULT 'LOW',
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–32 CREATE_WINDOW Procedure Parameters

Parameter	Description
window_name	The name to assign to the window. The name has to be unique in the SQL namespace. All windows are in the SYS schema, so you can optionally preface the window name with 'SYS.'
resource_plan	This attribute specifies the resource plan that is automatically activated when the window opens. When the window closes, the system switches to the appropriate resource plan, which in most cases is the resource plan that was in effect before the window opened, but can also be the resource plan of yet another window. Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window. If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.

Table 125–32 (Cont.) CREATE_WINDOW Procedure Parameters

Parameter	Description
start_date	This attribute specifies the first date and time on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created. For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.
duration	This attribute specifies how long the window will be open for. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if none is specified when creating the window, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.
schedule_name	The name of the schedule associated with the window.
repeat_interval	This attribute specifies how often the window should repeat. It is expressed using the Scheduler's calendaring syntax. See "Calendaring Syntax" on page 125-19 for more information. A PL/SQL expression cannot be used to specify the repeat interval for a window. The expression specified is evaluated to determine the next time the window should open. If no repeat_interval is specified, the window will open only once at the specified start date.
end_date	This attribute specifies the date and time after which the window will no longer open. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window will be set to FALSE. A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified then the window will keep repeating forever. The end_date has to be after the start_date. If this is not the case, then an error is generated when the window is created.
window_priority	This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority will be used to determine which window will be opened. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, which implies that the low priority window does not open if it overlaps with a high priority window. By default, a window is created with a priority of 'LOW'.
comments	This attribute specifies an optional comment about the window. By default, this attribute is NULL.

Usage Notes

Creating a window requires the MANAGE SCHEDULER privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the ALTER SYSTEM SET RESOURCE_MANAGER_PLAN statement or the DBMS_RESOURCE_MANAGER.SWITCH_PLAN package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see *Oracle Database Administrator's Guide* and "SWITCH_PLAN Procedure" on page 116-35.

CREATE_WINDOW_GROUP Procedure

***** Deprecated in Oracle Database 11*g* Release 2. Use CREATE_GROUP instead.**

This procedure creates a new window group. A window group is defined by a list of Scheduler windows. You can assign a window group as a job schedule. The job then runs when any of the windows in the group become active.

Window groups are created in the SYS schema.

Syntax

```
DBMS_SCHEDULER.CREATE_WINDOW_GROUP (
   group_name            IN VARCHAR2,
   window_list           IN VARCHAR2 DEFAULT NULL,
   comments              IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–33 CREATE_WINDOW_GROUP Procedure Parameters

Parameter	Description
group_name	The name to assign to the window group
window_list	A list of the windows assigned to the window group. If a window that does not exist is specified, an error is generated and the window group is not created. Windows can also be added using the ADD_WINDOW_GROUP_MEMBER procedure. A window group cannot be a member of another window group. Can be NULL.
comments	A comment about the window group

Usage Notes

Creating a window group requires the MANAGE SCHEDULER privilege. Window groups, like windows, are created with access to PUBLIC, therefore, no privileges are required to access window groups.

A window group cannot contain another window group.

DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an ANYDATA object. A job that references the program can override the default value.

Syntax

```
DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_name           IN VARCHAR2 DEFAULT NULL,
   argument_type           IN VARCHAR2,
   default_value           IN SYS.ANYDATA,
   out_argument            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–34 DEFINE_ANYDATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique, so it will replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedure.
argument_type	The data type of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.
default_value	The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

Usage Notes

All program arguments from 1 to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

See Also:

- "DEFINE_PROGRAM_ARGUMENT Procedure" on page 125-78
- "SET_JOB_ANYDATA_VALUE Procedure" on page 125-136

DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event. Once started in a running chain, this step will not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step will replace the old one.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   event_schedule_name     IN VARCHAR2,
   timeout                 IN INTERVAL DAY TO SECOND DEFAULT NULL);

DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   event_condition         IN VARCHAR2,
   queue_spec              IN VARCHAR2,
   timeout                 IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

Parameters

Table 125–35 DEFINE_CHAIN_EVENT_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain that the step is in
step_name	The name of the step
event_schedule_name	The name of the event schedule that the step waits for
timeout	This parameter is reserved for future use
event_condition	See the CREATE_EVENT_SCHEDULE Procedure
queue_spec	See the CREATE_EVENT_SCHEDULE Procedure

Usage Notes

Defining a chain step requires ALTER privileges on the chain either by being the owner of the chain, or by having the ALTER object privilege on the chain or by having the CREATE ANY JOB system privilege.

See Also: "DEFINE_CHAIN_STEP Procedure" on page 125-75

DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax, and indicates the prerequisites for the action to occur. The action specifies what is to be done as a result of the condition being met.

An actual rule object is created to store the rule in the schema in which the chain resides. If a rule name is given, this name will be used for the rule object. If a rule name is given and a rule already exists with this name in the chain's schema, the existing rule will be altered. (A schema different than the chain's schema cannot be specified). If no rule name is given, one will be generated of the form `SCHED_RULE${N}`.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_RULE (
   chain_name              IN VARCHAR2,
   condition               IN VARCHAR2,
   action                  IN VARCHAR2,
   rule_name               IN VARCHAR2 DEFAULT NULL,
   comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–36 DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to alter
`condition`	A boolean expression expressed using either SQL or the Scheduler chain condition syntax. (Scheduler chain condition syntax is described below.) The expression must evaluate to `TRUE` for the action to be performed. If the condition is expressed with SQL, it must use the syntax of a `SELECT` statement `WHERE` clause. You can refer to chain step attributes by using the chain step name as a bind variable. The bind variable syntax is `:`*`step_name.attribute`*. (*`step_name`* refers to a typed object.) Possible attributes are: `completed`, `state`, `start_date`, `end_date`, `error_code`, and `duration`. Possible values for the `state` attribute include: `'NOT_STARTED'`, `'SCHEDULED'`, `'RUNNING'`, `'PAUSED'`, `'STALLED'`, `'SUCCEEDED'`, `'FAILED'`, and `'STOPPED'`. If a step is in the state `'SUCCEEDED'`, `'FAILED'`, or `'STOPPED'`, its `completed` attribute is set to `'TRUE'`, otherwise `completed` is `'FALSE'`. Every chain must have a rule that evaluates to `TRUE` to start the chain. For this purpose, you can use a rule that has `'TRUE'` as its condition if you are using Schedule chain condition syntax, or `'1=1'` as its condition if you are using SQL syntax.

Table 125–36 (Cont.) DEFINE_CHAIN_RULE Procedure Parameters

Parameter	Description
action	The action to be performed when the rule evaluates to TRUE. The action must consist of at least a keyword with an optional value and an optional delay clause. Possible actions include: ■ [AFTER *delay_interval*] START *step_1*[,*step_2* ...] ■ STOP *step_1*[,*step_2* ...] ■ END [{*end_value*|*step_name.error_code*}] At the beginning of the START action, a delay clause can be given which specifies a delay interval to wait before performing the action. *delay_interval* is a formatted datetime interval of the form HH:MM:SS. The END action ends the chain with an error code equal to either the supplied end_value or the error code that step_name completed with. The default error code is 0, indicating a successful chain run.
rule_name	The name of the rule that will be created. If no rule_name is given, one will be generated of the form SCHED_RULE$_{N}.
comments	An optional comment describing the rule. This will be stored in the rule object created.

Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain. The following are the available constructs, all of which are boolean expressions:

```
TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer
```

The following boolean operators are available to create more complex conditions:

```
expression AND expression
expression OR expression
NOT (expression)
```

integer can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the NOT operator.

PL/SQL code that runs as part of a step can set the value of ERROR_CODE for that step with the RAISE_APPLICATION_ERROR statement.

Usage Notes

Defining a chain rule requires ALTER privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in *Oracle Database Administrator's Guide* for more information.

Examples

The following are examples of using rule conditions and rule actions.

Rule Conditions Using Scheduler Chain Condition Syntax

```
'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7)'
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7
```

Rule Conditions Using SQL Syntax

```
':step1.completed = ''TRUE'' AND :step1.end_date >SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

':step1.duration > interval ''5'' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to
complete
```

Rule Actions

```
'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has
not completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.
```

DEFINE_CHAIN_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a nested chain. When the chain step is started, the specified program or chain is run. If a step already exists with the name supplied in the `chain_name` argument, the new step replaces the old one.

The chain owner must have `EXECUTE` privileges on the program or chain associated with the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the `ALTER_CHAIN` procedure to set additional chain step attributes, such as `credential_name` and `destination_name`.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   program_name            IN VARCHAR2);
```

Parameters

Table 125–37 DEFINE_CHAIN_STEP Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to alter.
`step_name`	The name of the step being defined. If a step already exists with this name, the new step will replace the old one.
`program_name`	The name of a program or chain to run during this step. The chain owner must have `EXECUTE` privileges on this program or chain.

Usage Notes

Defining a chain step requires `ALTER` privileges on the chain (either by being the owner, or by having `ALTER` privileges on the chain or by having the `CREATE ANY JOB` system privilege).

See Also:

- "ALTER_CHAIN Procedure" on page 125-39
- "DEFINE_CHAIN_EVENT_STEP Procedure" on page 125-71

DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (
  program_name            IN VARCHAR2,
  metadata_attribute      IN VARCHAR2,
  argument_position       IN PLS_INTEGER,
  argument_name           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–38 DEFINE_METADATA_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered
metadata_attribute	The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'. Table Table 125–39 describes these attributes in detail.
argument_position	The position of the argument as it is passed to the executable. This cannot be greater than the number_of_arguments specified for the program. This must be unique, so it will replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures.

Table 125–39 Metadata Attributes

Metadata Attribute	Data Type	Description
job_name	VARCHAR2	Name of the currently running job
job_subname	VARCHAR2	Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.
job_owner	VARCHAR2	Owner of the currently running job
job_scheduled_start	TIMESTAMP WITH TIME ZONE	When the currently running job was scheduled to start
job_start	TIMESTAMP WITH TIME ZONE	When the currently running job started

Table 125–39 (Cont.) Metadata Attributes

Metadata Attribute	Data Type	Description
window_start	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window opened
window_end	TIMESTAMP WITH TIME ZONE	If the job was started by a window, the time that the window is scheduled to close
event_message	(See Description)	For an event-based job, the message content of the event that started the job. The data type of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table. In the case of a file arrival event, event_message is of type SYS.SCHEDULER_FILEWATCHER_RESULT. See "SCHEDULER_FILEWATCHER_RESULT Object Type" on page 15.

Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except event_message can also be used in PL/SQL blocks that you enter into the job_action or program_action attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

```
PROCEDURE define_program_argument(
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_name           IN VARCHAR2 DEFAULT NULL,
   argument_type           IN VARCHAR2,
   out_argument            IN BOOLEAN DEFAULT FALSE);
```

Defines a program argument with a default value:

```
PROCEDURE define_program_argument(
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_name           IN VARCHAR2 DEFAULT NULL,
   argument_type           IN VARCHAR2,
   default_value           IN VARCHAR2,
   out_argument            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–40 DEFINE_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_position	The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique so it will replace any argument already defined at this position.
argument_name	The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedure.
argument_type	The data type of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument. Any valid SQL data type is allowed.
default_value	The default value to be assigned to the argument if none is specified by the job.
out_argument	This parameter is reserved for future use. It must be set to FALSE.

Usage Notes

All program arguments from 1 to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

See Also:

- "DEFINE_ANYDATA_ARGUMENT Procedure" on page 125-70
- "SET_JOB_ARGUMENT_VALUE Procedure" on page 125-137

DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its `enabled` attribute is set to `FALSE`.

Syntax

```
DBMS_SCHEDULER.DISABLE (
   name              IN VARCHAR2,
   force             IN BOOLEAN DEFAULT FALSE,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 125–41 DISABLE Procedure Parameters

Parameter	Description
`name`	The name of the object being disabled. Can be a comma-delimited list. If a job class name is specified, then all the jobs in the job class are disabled. The job class is not disabled. If a group name is specified, then the group is disabled, but the enabled state of the group members is unaffected.
`force`	If `TRUE`, objects are disabled even if other objects depend on them. See the usage notes for more information.
`commit_semantics`	The commit semantics. The following types are supported: ▪ `STOP_ON_FIRST_ERROR` - The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default. ▪ `TRANSACTIONAL` - This value permitted only when disabling jobs. The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when `force` is set to `TRUE`. ▪ `ABSORB_ERRORS` - This value permitted only when disabling jobs. The procedure tries to absorb any errors and attempts disabling the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view `SCHEDULER_BATCH_ERRORS` for details. This type is only supported when disabling a job or a list of jobs.

Usage Notes

Windows must be preceded by `SYS`.

Disabling an object that is already disabled does not generate an error.

The purpose of the `force` option is to point out dependencies. No dependent objects are altered.

To run `DISABLE` for a window or a group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege.

Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its `state` in the job queue is changed to `disabled`.

If `force` is set to `FALSE` and the job is currently running, an error is returned.

If `force` is set to `TRUE`, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

Programs

When a program is disabled, the status is changed to disabled. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the `DISABLE` call, and are allowed to continue

Any argument that pertains to the program will not be affected when the program is disabled.

File Watchers

If `force` is set to `FALSE`, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If `force` is set to `FALSE`, the window must not be open or referenced by any job otherwise an error will occur.

If `force` is set to `TRUE`, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is re-enabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Groups

When a group of type `WINDOW` is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If `force` is set to `FALSE`, the window group must not have any members that are open or referenced by any job otherwise an error will occur.

If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run.

If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur.

If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime.

Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

Database Destinations

When you disable a database destination:

- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

External Destinations

When you disable an external destination:

- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

Groups

If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.

DROP_AGENT_DESTINATION Procedure

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination—using the `schagent` utility to unregister a Scheduler agent with a database—is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE SCHEDULER` privilege.

> **Note:** External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable `CREATE_AGENT_DESTINATION` procedure.

Syntax

```
DBMS_SCHEDULER.DROP_AGENT_DESTINATION (
   destination_name        IN VARCHAR2);
```

Parameters

Table 125–42 DROP_AGENT_DESTINATION Procedure Parameters

Parameter	Description
`destination_name`	A comma-separated list of external destinations to drop. Because user `SYS` owns all external destinations, do not prefix them with a schema name. The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped. Cannot be `NULL`.

Usage Notes

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their `agent` attribute is set to `NULL`.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.

DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN (
   chain_name              IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–43 DROP_CHAIN Procedure Parameters

Parameter	Description
chain_name	The name of a chain to drop. Can also be a comma-delimited list of chains.
force	If force is set to FALSE, the chain must not be referenced by any job otherwise an error will occur. If force is set to TRUE, all jobs pointing to the chain are disabled before dropping the chain. Running jobs that point to this chain will be stopped before the chain is dropped.

Usage Notes

Dropping a chain requires alter privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user needs to have the privileges required to do this. See the DBMS_RULE_ADM.DROP_RULE_SET and DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT procedures for more information.

If force is FALSE, no jobs may be using this chain. If force is TRUE, any jobs that use this chain will be disabled before dropping the chain (and any of these jobs that are running will be stopped).

DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_RULE (
   chain_name              IN VARCHAR2,
   rule_name               IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–44 DROP_CHAIN_RULE Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
rule_name	The name of the rule to drop
force	If force is set to TRUE, the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If force is set to FALSE and the chain is running, an error is generated.

Usage Notes

Dropping a chain rule requires alter privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so the user needs to have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.

DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```
DBMS_SCHEDULER.DROP_CHAIN_STEP (
   chain_name              IN VARCHAR2,
   step_name               IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–45 DROP_CHAIN_STEP Procedure Parameters

Parameter	Description
chain_name	The name of the chain to alter
step_name	The name of the step being dropped. Can be a comma-separated list.
force	If force is set to TRUE, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If force is set to FALSE and this chain is currently running, an error is thrown.

Usage Notes

Dropping a chain step requires ALTER privileges on the chain (either by being the owner, or by having ALTER privileges on the chain or by having the CREATE ANY JOB system privilege).

DROP_CREDENTIAL Procedure

This procedure drops a credential.

Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (
   credential_name         IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–46 DROP_CREDENTIAL Procedure Parameters

Parameter	Description
`credential_name`	The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to `NULL`.
`force`	If set to `FALSE`, the credential must not be referenced by any job, or an error will occur. If set to `TRUE`, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.

Usage Notes

Only the owner of a credential or a user with the `CREATE ANY JOB` system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

See Also: "CREATE_CREDENTIAL Procedure" on page 125-46

DROP_DATABASE_DESTINATION Procedure

This procedure drops one or more database destinations.

Syntax

```
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (
   destination_name        IN VARCHAR2);
```

Parameters

Table 125–47 DROP_DATABASE_DESTINATION Procedure Parameters

Parameter	Description
`destination_name`	A comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name. The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped. Cannot be `NULL`.

Usage Notes

Only the owner or a user with the `CREATE ANY JOB` system privilege may drop the database destination.

When a database destination is dropped:

- All job instances in the `*_SCHEDULER_JOB_DESTS` views that refer to the destination are also dropped.
- Jobs running against the destination are stopped.
- Members of database destination groups that refer to the destination are removed from the group.

See Also: CREATE_DATABASE_DESTINATION Procedure on page 125-47

DROP_FILE_WATCHER Procedure

This procedure drops one or more file watchers.

Syntax

```
DBMS_SCHEDULER.DROP_FILE_WATCHER (
   file_watcher_name       IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–48 DROP_FILE_WATCHER Procedure Parameters

Parameter	Description
file_watcher_name	A comma-separated list of file watchers to drop. Each file watcher name can optionally be prefixed with a schema name. Cannot be NULL.
force	If set to FALSE, the file watcher must not be referenced by any job, or an error occurs. If set to TRUE, the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled.

Usage Notes

Only the owner of a file watcher or a user with the CREATE ANY JOB system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

See Also: "CREATE_FILE_WATCHER Procedure" on page 125-50

DROP_GROUP Procedure

This procedure drops one or more groups.

Syntax

```
DBMS_SCHEDULER.DROP_GROUP (
   group_name       IN VARCHAR2,
   force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–49 DROP_GROUP Procedure Parameters

Parameter	Description
group_name	A comma-separated list of group names. Each group name can optionally be prefixed with a schema name. The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped. Cannot be NULL.
force	If FALSE, the group must not be referenced by any job, otherwise an error occurs. If TRUE, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the *_SCHEDULER_JOB_DESTS views.

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop a group. You must have the MANAGE SCHEDULER privilege to drop a group of type WINDOW.

See Also: "CREATE_FILE_WATCHER Procedure" on page 125-50

DROP_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

Syntax

```
DBMS_SCHEDULER.DROP_JOB (
   job_name                IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE,
   defer                   IN BOOLEAN DEFAULT FALSE,
   commit_semantics        IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 125–50 DROP_JOB Procedure Parameters

Parameter	Description
job_name	The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified. If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.
force	If force is set to TRUE, the Scheduler first attempts to stop the running job instances (by issuing the STOP_JOB call with the force flag set to false), and then drops the jobs.
defer	If defer is set to TRUE, the Scheduler allows the running jobs to complete and then drops the jobs.
commit_semantics	The commit semantics. The following types are supported: ■ STOP_ON_FIRST_ERROR - the procedure returns on the first error and the previous drop operations that were successful are committed to disk. This is the default. ■ TRANSACTIONAL - the procedure returns on the first error and everything that happened before that error is rolled back. This type is not supported when force is set to TRUE. ■ ABSORB_ERRORS - the procedure tries to absorb any errors, attempts dropping the rest of the jobs, and commits all the drops that were successful. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. Only STOP_ON_FIRST_ERROR is permitted when job classes are included in the job_name list.

Usage Notes

If both force and defer are set to FALSE and a job is running at the time of the call, the attempt to drop that job fails. The entire call to DROP_JOB may then fail, depending on the setting of commit_semantics.

Setting both force and defer to TRUE results in an error.

Dropping a job requires ALTER privileges on the job either by being the owner of the job, or by having the ALTER object privilege on the job or by having the CREATE ANY JOB system privilege.

DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

```
DBMS_SCHEDULER.DROP_JOB_CLASS (
   job_class_name          IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–51 DROP_JOB_CLASS Procedure Parameters

Parameter	Description
`job_class_name`	The name of the job class. Can be a comma-delimited list.
`force`	If `force` is set to `FALSE`, a class must not be referenced by any jobs to be dropped otherwise an error will occur. If `force` is set to `TRUE`, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful will the class be dropped. Running jobs that belong to the job class are not affected.

Usage Notes

Dropping a job class requires the `MANAGE SCHEDULER` system privilege.

DROP_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

Syntax

```
DBMS_SCHEDULER.DROP_PROGRAM (
   program_name            IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–52 DROP_PROGRAM Procedure Parameters

Parameter	Description
program_name	The name of the program to be dropped. Can be a comma-delimited list.
force	If force is set to FALSE, the program must not be referenced by any job otherwise an error will occur. If force is set to TRUE, all jobs referencing the program are disabled before dropping the program. Running jobs that point to the program are not affected by the DROP_PROGRAM call, and are allowed to continue.

Usage Notes

Dropping a program requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program if you have the CREATE ANY JOB privilege.

DROP_PROGRAM_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

Syntax

Drops a program argument by position:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
   program_name            IN VARCHAR2,
   argument_position       IN PLS_INTEGER);
```

Drops a program argument by name:

```
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (
   program_name            IN VARCHAR2,
   argument_name           IN VARCHAR2);
```

Parameters

Table 125–53 DROP_PROGRAM_ARGUMENT Procedure Parameters

Parameter	Description
program_name	The name of the program to be altered. A program with this name must exist.
argument_name	The name of the argument being dropped
argument_ position	The position of the argument to be dropped

Usage Notes

Dropping a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program argument if you have the CREATE ANY JOB privilege.

DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```
DBMS_SCHEDULER.DROP_SCHEDULE (
   schedule_name    IN VARCHAR2,
   force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–54 DROP_SCHEDULE Procedure Parameters

Parameter	Description
schedule_name	The name of the schedule. Can be a comma-delimited list.
force	If force is set to FALSE, the schedule must not be referenced by any job or window otherwise an error will occur. If force is set to TRUE, any jobs or windows that use this schedule will be disabled before the schedule is dropped Running jobs and open windows that point to the schedule are not affected.

Usage Notes

You must be the owner of the schedule being dropped or have ALTER privileges for the schedule or the CREATE ANY JOB privilege.

DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW (
   window_name             IN VARCHAR2,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–55 DROP_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window. Can be a comma-delimited list.
force	If force is set to FALSE, the window must be not be open or referenced by any job otherwise an error will occur. If force is set to TRUE, the window will be dropped and those jobs that have the window as their schedule will be disabled. However, jobs that have a window group of which the dropped window was a member as their schedule will not be disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply. Running jobs that have the window as their schedule will be allowed to continue, unless the stop_on_window_close flag was set to TRUE for the job. If this is the case, the job will be stopped when the window is dropped.

Usage Notes

Dropping a window requires the MANAGE SCHEDULER privilege.

DROP_WINDOW_GROUP Procedure

***** Deprecated in Oracle Database 11*g* Release 2. Use DROP_GROUP instead**.

This procedure drops a window group but not the windows that are members of this window group.

Syntax

```
DBMS_SCHEDULER.DROP_WINDOW_GROUP (
   group_name              IN VARCHAR2
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–56 DROP_WINDOW_GROUP Procedure Parameters

Parameter	Description
group_name	The name of the window group
force	If force is set to FALSE, the window group must not be referenced by any job otherwise an error will occur. If force is set to TRUE, the window group will be dropped and those jobs that have the window group as their schedule will be disabled. Running jobs that have the window group as their schedule are allowed to continue, even if the stop_on_window_close flag was set to TRUE when for the job. If a member of the window group that is being dropped is open, the window group can still be dropped.

Usage Notes

If you want to drop all the windows that are members of this group but not the window group itself, you can use the DROP_WINDOW procedure and provide the name of the window group to the call.

To drop a window group, you must have the MANAGE SCHEDULER privilege.

ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is enabled, its `enabled` attribute is set to `TRUE`. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the job `RUN_COUNT`, `FAILURE_COUNT` and `RETRY_COUNT`, all of which are columns in the `*_SCHEDULER_JOBS` data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (
   name              IN VARCHAR2,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 125–57 ENABLE Procedure Parameters

Parameter	Description
`name`	The name of the Scheduler object being enabled. Can be a comma-delimited list of names. If a job class name is specified, then all the jobs in the job class are enabled. If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected.
`commit_semantics`	The commit semantics. The following types are supported: ■ `STOP_ON_FIRST_ERROR` - The procedure returns on the first error and the previous enable operations that were successful are committed to disk. This is the default. ■ `TRANSACTIONAL` - This value permitted only when enabling jobs. The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs. ■ `ABSORB_ERRORS` - This value permitted only when enabling jobs. The procedure tries to absorb any errors and attempts enabling the rest of the jobs and commits all the enable operations that were successful. If errors occur, you can query the view `SCHEDULER_BATCH_ERRORS` for details. This type is only supported when enabling a job or a list of jobs.

Usage Notes

Window names must be preceded by `SYS`.

To run `ENABLE` for a window or group of type `WINDOW`, you must have the `MANAGE SCHEDULER` privilege. For a job of type `EXECUTABLE` (or for a job that points to a program of type `EXECUTABLE`), the job owner must have the `CREATE EXTERNAL JOB` system privilege before the job can be enabled or run.

To enable a file watcher, the file watcher owner must have the `EXECUTE` privilege on the designated credential.

END_DETACHED_JOB_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the `detached` attribute set to `TRUE`. A detached job run does not end until this procedure or the STOP_JOB Procedure is called.

Syntax

```
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (
   job_name          IN VARCHAR2,
   error_number      IN PLS_INTEGER DEFAULT 0,
   additional_info   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–58 END_DETACHED_JOB_RUN Procedure Parameters

Parameter	Description
`job_name`	The name of the job to end. Must be a detached job that is running.
`error_number`	If zero, then the job run is logged as succeeded. If non-zero, then the job run is logged as failed with this error number. If -1013, then the job run is logged as stopped.
`additional_info`	This text is stored in the `additional_info` column of the `*_scheduler_job_run_details` views for this job run.

Usage Notes

This procedure requires that you be the owner of the job or have `ALTER` privileges on the job. You can also end any detached job run if you have the `CREATE ANY JOB` privilege.

> **See Also:** *Oracle Database Administrator's Guide* for information about detached jobs.

EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler's calendaring syntax. This procedure evaluates the calendar expression and tells you what the next execution date and time of a job or window will be. This is very useful for testing the correct definition of the calendar string without having to actually schedule the job or window.

This procedure can also be used to get multiple steps of the repeat interval by passing the `next_run_date` returned by one invocation as the `return_date_after` argument of the next invocation of this procedure.

Syntax

```
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (
   calendar_string    IN  VARCHAR2,
   start_date         IN  TIMESTAMP WITH TIME ZONE,
   return_date_after  IN  TIMESTAMP WITH TIME ZONE,
   next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 125–59 EVALUATE_CALENDAR_STRING Procedure Parameters

Parameter	Description
`calendar_string`	The calendar string to be evaluated. The string must be in the calendaring syntax described in "Operational Notes" on page 125-19.
`start_date`	The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be `NULL`.
`return_date_after`	With the `start_date` and the calendar string, the Scheduler has sufficient information to determine all valid execution dates. By setting this argument, the Scheduler knows which one of all possible matches to return. When a `NULL` value is passed for this argument, the Scheduler automatically fills in `systimestamp` as its value.
`next_run_date`	The first timestamp that matches the calendar string and start date that occurs after the value passed in for the `return_date_after` argument.

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
Session altered.

DECLARE
start_date        TIMESTAMP;
return_date_after TIMESTAMP;
next_run_date     TIMESTAMP;
BEGIN
start_date :=
  to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
return_date_after := start_date;
FOR i IN 1..5 LOOP
  DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING(
```

```
    'FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
    start_date, return_date_after, next_run_date);
DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
return_date_after := next_run_date;
END LOOP;
END;
/

next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM

PL/SQL procedure successfully completed.
```

Usage Notes

No specific Scheduler privileges are required.

EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must point to a chain and must be running. If the job is not running, an error is thrown. (RUN_JOB can be used to start the job.)

If any of the steps of the chain are themselves running chains, another EVALUATE_RUNNING_CHAIN is performed on each of the nested running chains.

Syntax

```
DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (
   job_name              IN VARCHAR2);
```

Parameters

Table 125–60 EVALUATE_RUNNING_CHAIN Procedure Parameter

Parameter	Description
job_name	The name of the running job (pointing to a chain) to reevaluate the rules for

Usage Notes

Running EVALUATE_RUNNING_CHAIN on a job requires alter privileges on the job (either by being the owner, or by having ALTER privileges on the job or by having the CREATE ANY JOB system privilege).

Note: The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with one of the event steps of the chain

For most chains, this is sufficient. EVALUATE_RUNNING_CHAIN should be used only under the following circumstances:

- After manual intervention of a running chain with the ALTER_RUNNING_CHAIN procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, EVALUATE_RUNNING_CHAIN may not be needed if you set the evaluation_interval attribute when you created the chain.

GENERATE_JOB_NAME Function

This function returns a unique name for a job. The name will be of the form {prefix}N where N is a number from a sequence. If no prefix is specified, the generated name will, by default, be JOB$_1, JOB$_2, JOB$_3, and so on. If 'SCOTT' is specified as the prefix, the name will be SCOTT1, SCOTT2, and so on.

Syntax

```
DBMS_SCHEDULER.GENERATE_JOB_NAME (
   prefix        IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

Table 125–61 GENERATE_JOB_NAME Function Parameter

Parameter	Description
prefix	The prefix to use when generating the job name

Usage Notes

If the prefix is explicitly set to NULL, the name will be just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the DBMS_SCHEDULER calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the GENERATE_JOB_NAME function will never return the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                       TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                       INTERVAL DAY TO SECOND});

DBMS_SCHEDULER.GET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          OUT VARCHAR2,
   value2         OUT VARCHAR2);
```

Parameters

Table 125–62 GET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being retrieved
value	The existing value of the attribute
value2	Most attributes have only one value associated with them, but some can have two. The value2 argument is for this optional second value.

Usage Notes

To run GET_ATTRIBUTE for a job class, you must have the MANAGE SCHEDULER privilege or have EXECUTE privileges on the class. For a schedule, window, or a group, no privileges are necessary. Otherwise, you must be the owner of the object or have ALTER or EXECUTE privileges on that object or have the CREATE ANY JOB privilege.

See the SET_ATTRIBUTE Procedure on page 125-122 for tables of attribute values that you can retrieve for the various Scheduler object types.

GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

This procedures differs from the equivalent UTL_FILE procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
   source_file                  IN VARCHAR2,
   source_host                  IN VARCHAR2,
   credential_name              IN VARCHAR2,
   file_contents                IN OUT NOCOPY {BLOB|CLOB});

DBMS_SCHEDULER.GET_FILE (
   source_file                  IN VARCHAR2,
   source_host                  IN VARCHAR2,
   credential_name              IN VARCHAR2,
   destination_file_name        IN VARCHAR2,
   destination_directory_object IN VARCHAR2,
   destination_permissions      IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–63 GET_FILE Procedure Parameters

Parameter	Description
source_file	Fully qualified path name of the file to retrieve from the operating system. The file name is case sensitive and is not converted to uppercase. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host. If the format of this parameter is *external_log_id*_stdout, then the stdout from the designated external job run is returned. If the format of this parameter is *external_log_id*_stderr, the error text from the designated external job run is returned. You obtain the value of *external_log_id* from the ADDITIONAL_INFO column of the *_SCHEDULER_JOB_RUN_DETAILS views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the external_log_id name/value pair, and then append either "_stdout" or "_stderr" to its value. The external job must have an associated credential. The credential_name parameter of GET_FILE must name the same credential that is used by the job, and the source_host parameter must be the same as the destination attribute of the job.

Table 125–63 (Cont.) GET_FILE Procedure Parameters

Parameter	Description
source_host	If the file is to be retrieved from a remote host, then this parameter must be a valid an external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.) If source_host is NULL or set to 'localhost', then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the schagent.conf file, which is located in the Scheduler agent home directory on the remote host.
credential_name	The name of the credential to use for accessing the file system.
file_contents	The contents of the file will be returned in this variable.
destination_ file_name	The contents of the file will be written into this file in the specified directory object.
destination_ directory_object	The contents of the file will be written into the directory specified by this directory object. The caller must have the necessary privileges on the directory object.
destination_ permissions	Reserved for future use

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (
   attribute      IN VARCHAR2,
   value          OUT VARCHAR2);
```

Parameters

Table 125–64 GET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
attribute	The name of the attribute
value	The existing value of the attribute

Usage Notes

To run GET_SCHEDULER_ATTRIBUTE, you must have the MANAGE SCHEDULER privilege.

Table 125–65 lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see Table 125–94 on page 125-139 and the section "Configuring the Scheduler" in *Oracle Database Administrator's Guide*.

Table 125–65 Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

Scheduler Attribute	Description
current_open_window	Name of the currently open window
default_timezone	Default time zone used by the Scheduler for repeat intervals and windows
email_sender	The default e-mail address of the sender for job state e-mail notifications
email_server	The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.
event_expiry_time	Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL.
log_history	Retention period in days for job and window logs
max_job_slave_processes	Maximum number of job slave processes that the Scheduler can start. May be NULL.

OPEN_WINDOW Procedure

This procedure opens a window independent of its schedule. This window will open and the resource plan associated with it, will take effect immediately for the duration specified or for the normal duration of the window if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (
   window_name             IN VARCHAR2,
   duration                IN INTERVAL DAY TO SECOND,
   force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 125–66 OPEN_WINDOW Procedure Parameters

Parameter	Description
window_name	The name of the window
duration	The duration of the window. It is of type interval day to second. If it is NULL, then the window will be opened for the regular duration as specified in the window metadata.
force	If force is set to FALSE, opening an already open window, will generate an error. If force is set to TRUE: You can open a window that is already open. The window stays open for the duration specified in the call, from the time the OPEN_WINDOW command was issued. Consider an example to illustrate this. window1 was created with a duration of four hours. It has how been open for two hours. If at this point you reopen window1 using the OPEN_WINDOW call and do not specify a duration, then window1 will be open for another four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes. The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority.

Usage Notes

If there are jobs running when the window opens, the resources allocated to them might change due to the switch in resource plan.

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated, and will be as determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the ALTER SYSTEM statement with the force option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the MANAGE SCHEDULER privilege.

PURGE_LOG Procedure

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The PURGE_LOG procedure is used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

Syntax

```
DBMS_SCHEDULER.PURGE_LOG (
   log_history             IN PLS_INTEGER  DEFAULT 0,
   which_log               IN VARCHAR2     DEFAULT 'JOB_AND_WINDOW_LOG',
   job_name                IN VARCHAR2     DEFAULT NULL);
```

Parameters

Table 125–67 PURGE_LOG Procedure Parameters

Parameter	Description
log_history	This specifies how much history (in days) to keep. The valid range is 0 - 999. If set to 0, no history is kept.
which_log	This specifies which type of log. Valid values for which_log are job_log, window_log, and job_and_window_log.
job_name	This specifies which job-specific entries must be purged from the jog log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log.

Usage Notes

This procedure requires the MANAGE SCHEDULER privilege.

Examples

The following will completely purge all rows from both the job log and the window log:

```
DBMS_SCHEDULER.PURGE_LOG();
```

The following will purge all rows from the window log that are older than 5 days:

```
DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');
```

The following will purge all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in jobclass1 and that are older than 1 day:

```
DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');
```

PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer. It differs from the equivalent UTL_FILE procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

```
DBMS_SCHEDULER.PUT_FILE (
   destination_file         IN VARCHAR2,
   destination_host         IN VARCHAR2,
   credential_name          IN VARCHAR2,
   file_contents            IN {BLOB|CLOB},
   destination_permissions  IN VARCHAR2 DEFAULT NULL);
DBMS_SCHEDULER.PUT_FILE (
   destination_file         IN VARCHAR2,
   destination_host         IN VARCHAR2,
   credential_name          IN VARCHAR2,
   source_file_name         IN VARCHAR2,
   source_directory_object  IN VARCHAR2,
   destination_permissions  IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–68 PUT_FILE Procedure Parameters

Parameter	Description
destination_file	Fully qualified path name of the file to save to the operating system file system. The file name is case sensitive. If the file name starts with a question mark ('?'), the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.
destination_host	If NULL or set to 'localhost', the file is saved to the file system of the local computer. For saving to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.)
credential_name	The name of the credential to use for accessing the destination file system.
file_contents	The contents of the file will be read from this variable.
source_file_name	The contents of the file will be read from this file.
source_directory_object	The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object.
destination_permissions	Reserved for future use

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE.

Syntax

```
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER (
   subscriber_name         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–69 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

Parameter	Description
subscriber_name	Name of the Oracle Streams Advanced Queuing (AQ) agent for which to remove the subscription. If NULL, the user name of the calling user is used.

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

REMOVE_GROUP_MEMBER Procedure

This procedure removes one or more members from an existing group.

Syntax

```
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (
   group_name               IN VARCHAR2,
   member                   IN VARCHAR2);
```

Parameters

Table 125–70 REMOVE_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the group.
member_name	Comma-separated list of members to remove from the group. An error is returned if any of the members is not part of the group. A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members. If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOB_DESTS views.

Usage Notes

The following users may remove members from a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE SCHEDULER privilege to remove a member from a group of type WINDOW.

See Also: "CREATE_GROUP Procedure" on page 125-52

REMOVE_JOB_EMAIL_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications, or remove notifications only for specified recipients or specified events.

Syntax

```
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (
    job_name             IN VARCHAR2,
    recipients           IN VARCHAR2 DEFAULT NULL,
    events               IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–71 ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

Parameter	Description
`job_name`	Name of the job for which to remove e-mail notifications. Cannot be `NULL`.
`recipients`	Comma-separated list of e-mail addresses for which to remove e-mail notifications.
`events`	Comma-separate list of job state events for which to remove e-mail notifications.

Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If `recipients` is `NULL`, e-mail notifications for the specified events are removed for all existing recipients. If `events` is `NULL`, notifications for all events are removed for the specified recipients. If both `recipients` and `events` are `NULL`, all e-mail notifications are removed for the job.

For example, if `recipients` is '`jsmith@example.com,rjones@example.com`' and `events` is '`JOB_FAILED,JOB_BROKEN`', then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for both jsmith and rjones. If `recipients` is `NULL`, then notifications for both the `JOB_FAILED` and `JOB_BROKEN` events are removed for jsmith, rjones, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or have the `CREATE ANY JOB` system privilege or have the `ALTER` object privilege on the job.

> **See Also:** "ADD_JOB_EMAIL_NOTIFICATION Procedure" on page 125-35

REMOVE_WINDOW_GROUP_MEMBER Procedure

***** Deprecated in Oracle Database 11*g* Release 2. Use REMOVE_GROUP_MEMBER instead**.

This procedure removes one or more windows from an existing window group.

Syntax

```
DBMS_SCHEDULER.REMOVE_WINDOW_GROUP_MEMBER (
   group_name              IN VARCHAR2,
   window_list             IN VARCHAR2);
```

Parameters

Table 125–72 REMOVE_WINDOW_GROUP_MEMBER Procedure Parameters

Parameter	Description
group_name	The name of the window group.
window_list	The name of the window or windows.

Usage Notes

If any of the windows specified is either invalid, does not exist, or is not a member of the given group, the call fails. Removing a window from a group requires the MANAGE SCHEDULER privilege.

Dropping an open window from a window group has no impact on running jobs that has the window as its schedule since the jobs would only be stopped when a window closes.

RESET_JOB_ARGUMENT_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job.

RESET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_position       IN PLS_INTEGER);
```

Clears a previously set job argument value by argument name:

```
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_name           IN VARCHAR2);
```

Parameters

Table 125–73 RESET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job being altered
argument_position	The position of the program argument being reset
argument_name	The name of the program argument being reset

Usage Notes

If the corresponding program argument has no default value, the job will be disabled. Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also reset a job argument value if you have the CREATE ANY JOB privilege.

RUN_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given. If no `job_name` is given, one will be generated of the form `RUN_CHAIN$_chainnameN`, where *`chainname`* is the first 8 characters of the chain name and *N* is an integer.

If a list of start steps is given, only those steps will be started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run). If `start_steps` is `NULL`, then the chain will start normally—that is, an initial evaluation will be done to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

```
DBMS_SCHEDULER.RUN_CHAIN (
   chain_name                IN VARCHAR2,
   start_steps               IN VARCHAR2,
   job_name                  IN VARCHAR2 DEFAULT NULL);
```

Runs a chain, with a list of initial step states.

```
DBMS_SCHEDULER.RUN_CHAIN (
   chain_name               IN VARCHAR2,
   step_state_list          IN SYS.SCHEDULER$_STEP_TYPE_LIST,
   job_name                 IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–74 RUN_CHAIN Procedure Parameters

Parameter	Description
`chain_name`	The name of the chain to run
`job_name`	The name of the job to create to run the chain
`start_steps`	Comma-separated list of the steps to start when the chain starts running
`step_state_list`	List of chain steps with an initial state (`SUCCEEDED` or `FAILED`) to set for each. Set the attributes of `sys.scheduler$_step_type` as follows: `step_name` The name of the step `step_type` '`SUCCEEDED`' or '`FAILED` *`error_number`*' where *error_number* is a positive or negative integer.

Usage Notes

Running a chain requires `CREATE JOB` if the job is being created in the user's schema, or `CREATE ANY JOB` otherwise. In addition, the owner of the job being created needs execute privileges on the chain (by being the owner of the chain, by having the `EXECUTE` privilege on the chain, or by having the `EXECUTE ANY PROGRAM` system privilege).

Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```
declare
  initial_step_states sys.scheduler$_step_type_list;
begin
  initial_step_states := sys.scheduler$_step_type_list(
    sys.scheduler$_step_type('step1', 'SUCCEEDED'),
    sys.scheduler$_step_type('step2', 'FAILED 27486'),
    sys.scheduler$_step_type('step3', 'SUCCEEDED'),
    sys.scheduler$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/
```

RUN_JOB Procedure

This procedure runs a job immediately.

It is not necessary to call RUN_JOB to run a job according to its schedule. Provided that that job is enabled, the Scheduler runs it automatically. Use RUN_JOB to run a job outside of its normal schedule.

Syntax

```
DBMS_SCHEDULER.RUN_JOB (
   job_name                IN VARCHAR2,
   use_current_session     IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 125–75 RUN_JOB Procedure Parameters

Parameter	Description
job_name	A comma-separate list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator. If you specify a multiple-destination job, the job runs on all destinations. In this case, the use_current_session argument must be FALSE.
use_current_ session	This specifies whether the job run should occur in the same session as the one that the procedure was invoked from. When use_current_session is set to TRUE: ■ The job runs as the user who called RUN_JOB, or in the case of a local external job with a credential, the user named in the credential. ■ You can test a job and see any possible errors on the command line. ■ run_count, last_start_date, last_run_duration, and failure_count are not updated. ■ RUN_JOB can be run in parallel with a regularly scheduled job run. When use_current_session is set to FALSE: ■ The job runs as the user who is the job owner. ■ You need to check the job log to find error information. ■ run_count, last_start_date, last_run_duration, and failure_count are updated. ■ RUN_JOB fails if a regularly scheduled job is running. If you specify a job that runs on multiple destinations, use_ current_session must be FALSE.

Usage Notes

The job does not have to be enabled. If the job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has EXECUTE privileges on the job class.
- If a program or chain is referenced, the program/chain exists.

- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the CREATE EXTERNAL JOB privilege if this is an external job.

A TRUE value for use_current_session is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the destination_name attribute
- Jobs that point to chains (chain jobs)

When use_current_session is TRUE, the call to RUN_JOB blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the RUN_JOB procedure. When use_current_session is FALSE, RUN_JOB returns immediately and the job is picked up by the job coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use RUN_JOB in their sessions simultaneously when use_current_session is set to TRUE.

RUN_JOB requires that you be the owner of the job or have ALTER privileges on that job. You can also run a job if you have the CREATE ANY JOB privilege.

Example

The following is an example of using RUN_JOB.

```
BEGIN
  DBMS_SCHEDULER.RUN_JOB(
    JOB_NAME            => 'EODJOB, DSS.ETLJOB',
    USE_CURRENT_SESSION => FALSE);
END;
```

SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database. A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (
   registration_password   IN VARCHAR2,
   expiration_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
   max_uses                IN NUMBER DEFAULT NULL);
```

Parameters

Table 125–76 SET_AGENT_REGISTRATION_PASS Procedure Parameters

Parameter	Description
registration_ password	This is the password that remote agents must specify in order to successfully register with the database. If this is NULL, then no agents will be able to register with the database.
expiration_date	If this is set to a non-NULL value, then the registration_password will not be valid after this date. After this date, no agents will be able to register with the database. This cannot be set to a date in the past.
max_uses	This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents will be able to register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the MANAGE SCHEDULER system privilege.

By default, max_uses is set to NULL which means that there will be no limit on the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to NULL if no new agents are being registered.

SET_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types. To set an attribute to NULL, use the SET_ATTRIBUTE_NULL procedure. The attributes that can be set depends on the object being altered. With the exception of the object name, all object attributes can be changed.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          IN {BOOLEAN|DATE|TIMESTAMP|
                      TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                      INTERVAL DAY TO SECOND});

DBMS_SCHEDULER.SET_ATTRIBUTE (
   name           IN VARCHAR2,
   attribute      IN VARCHAR2,
   value          IN VARCHAR2,
   value2         IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 125–77 SET_ATTRIBUTE Procedure Parameters

Parameter	Description
name	The name of the object
attribute	See Table 125–79 throughTable 125–89.
value	The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.
value2	Most attributes have only one value associated with them, but some can have two. The value2 argument is for this optional second value.

Table 125–78 is a directory of Scheduler object types and tables of attributes for the object types.

Table 125–78 Attribute Tables for Scheduler Object Types

Scheduler Object Type	Table of Attributes
Job	Table 125–79 on page 125-124
Program	Table 125–81 on page 125-130
Schedule	Table 125–82 on page 125-130
File Watcher	Table 125–83 on page 125-130
Job Class	Table 125–84 on page 125-131
Window	Table 125–85 on page 125-132
Chain	Table 125–86 on page 125-133
Database Destination	Table 125–87 on page 125-133
External Destination	Table 125–88 on page 125-133
Group	Table 125–89 on page 125-134

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler will first disable it, make the change and then re-enable it. If any errors are encountered during the enable process, the object is not re-enabled and an error is generated.

If an object is altered and it was in the disabled state, it will remain disabled after it is altered.

To run SET_ATTRIBUTE for a window, a group of type WINDOW, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

Job

If there is a running instance of the job when the SET_ATTRIBUTE call is made, it is not affected by the call. The change is only seen in future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run will be scheduled using the new schedule attributes. Schedule attributes of a job include schedule_name, start_date, end_date, and repeat_interval.

If any of the program attributes of a job are altered while the job is running, the new program attributes will take effect the next time the job runs. Program attributes of a job include program_name, job_action, job_type, and number_of_arguments. This is also the case for job argument values that have been set.

Granting ALTER on a job will let a user alter all attributes of that job except its program attributes (program_name, job_type, job_action, program_action, and number_of_arguments) and will not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column SYSTEM set to TRUE in job views.

Program

If any currently running jobs use the program that is altered, they will continue to run with the program definition prior to the alter. The job will run with the new program definition the next time the job executes.

Schedule

If a schedule is altered, the change will not affect running jobs and open windows that use this schedule. The change will only be in effect the next time the jobs runs or the window opens.

File Watcher

If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the MANAGE SCHEDULER privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.

Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan when a window opens that designates a resource plan, the Resource Manager activates with that plan.

Job Attribute Values

Table 125–79 lists attribute values for jobs.

> **Note:** See the CREATE_JOB procedure and the CREATE_JOBS procedure for more complete descriptions of the attributes in this table.

Table 125–79 Job Attribute Values

Name	Description
allow_runs_in_restricted_mode	If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. FALSE by default.
auto_drop	This attribute, if TRUE, causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if: ▪ Its end date (or its schedule's end date) has passed. ▪ It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE. ▪ It is not a repeating job and has run once. A job is automatically disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE. If this attribute is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure. By default, jobs are created with auto_drop set to TRUE.
comments	An optional comment.
credential_name	This attribute specifies the name of the Scheduler credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See *Oracle Database Administrator's Guide* for information about preferred credentials for local external jobs. See also: "CREATE_CREDENTIAL Procedure" on page 125-46
database_role	This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby. Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'.

Table 125–79 (Cont.) Job Attribute Values

Name	Description
destination	***** Deprecated in Oracle Database 11*g* Release 2. Use `destination_name` instead.** This attribute specifies a host on which to run a remote external job. It must be set to the host name or IP address of the destination host. It can optionally be followed by a port number, in the following format: *hostname*:*port* This attribute is set to NULL by default.
destination_name	The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. For jobs running on the local database or for local external jobs (executables), must be NULL. See Table 125–27 on page 125-56 for details about this attribute.
end_date	Specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED. If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached. The value for end_date must be after the value for start_date. If it is not, an error is generated when the job is enabled.
event_spec	This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For details on what these arguments should contain, see the descriptions for the event_condition and queue_spec arguments in the CREATE_JOB procedure.
follow_default_timezone	If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone. For example, if the job was set to run at 02:00 in the previous time zone, it will run at 02:00 in the new time zone. (If the job start_date is not null, then the time zone for the run date and time for the job is always specified by the time zone of the start_date.) If FALSE, the next start date and time for the job is not recomputed when the default_timezone scheduler attribute is changed. In this case, if the old time zone is three hours earlier than the new time zone, then a job scheduled to run at 02:00 in the old time zone runs at 05:00 in the new time zone. (Summer/winter transitions do not change the default time zone name.)
instance_id	Valid only in an Oracle Real Application Clusters environment. Indicates the instance on which the job is to be run.
instance_stickiness	This attribute should only be used for a database running in an Oracle Real Application Clusters (RAC) environment. By default, it is set to TRUE. If you set instance_stickiness to TRUE, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it will not start new jobs for a significant period of time, another instance will run the job. If the interval between runs is large, instance_stickiness will be ignored an the job will be handled as if it were a non-sticky job. If instance_stickiness is set to FALSE, each instance of the job runs on the first instance available. For non-RAC environments, this attribute is not useful because there is only one instance.

Table 125–79 (Cont.) Job Attribute Values

Name	Description
job_action	The action that the job performs, depending on the job_type attribute. For example, if job_type is 'STORED_PROCEDURE', job_action contains the name of the stored procedure.
job_class	The class this job is associated with.
job_priority	This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution. If no job priority is specified when creating a job, the default priority of 3 is assigned to it.
job_type	The type of this job. Can be any of: 'PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', and 'CHAIN'. If this is set, program_name must be NULL.
job_weight	This attribute is for expert users of parallel technology only. If your job will be using parallel technology, you can set the value of this attribute to the degree of parallelism of your SQL inside the job. job_weight has a range of 1-100, with 1 being the default
logging_level	This attribute specifies how much information is logged. The possible options are: DBMS_SCHEDULER.LOGGING_OFF (The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur. DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence. DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence. DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with SET_ATTRIBUTE), stop, and so on.
max_failures	This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its STATE is set to BROKEN in the *_SCHEDULER_JOB views. max_failures can be an integer between 1 to 1,000,000. By default, it is set to NULL, which indicates that new instances of the job will be started regardless of how many previous instances have failed.
max_run_duration	This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is INTERVAL DAY TO SECOND. If this attribute is set to a non-zero and non-NULL value, and job duration exceeds this value, the Scheduler raises an event of type JOB_OVER_MAX_DUR. It is then up to your event handler to decide whether or not to allow the job to continue.

Table 125–79 (Cont.) Job Attribute Values

Name	Description
max_runs	This attribute specifies the maximum number of consecutive scheduled runs of the job. Once max_runs is reached, the job is disabled and its state is changed to COMPLETED. max_runs can be an integer between 1 and 1,000,000. By default, it is set to NULL, which means that it will repeat forever or until end_date or max_failures is reached.
number_of_ arguments	The number of arguments if the program is inlined. If this is set, program_name should be NULL.
parallel_ instances	This is a boolean attribute that can be set only for event-based jobs. If FALSE (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored. If TRUE, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its *parent job*). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources. The lightweight jobs are not visible in any of the *_SCHEDULER_JOBS views. However, they are visible in the *_SCHEDULER_RUNNING_JOBS views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.
program_name	The name of a program object to use with this job. If this is set, job_ action, job_type and number_of_arguments should be NULL.
raise_events	This attribute tells the Scheduler at what stages of the job's execution events should be raised. It is a bit vector in which zero or more of the following bits can be set. Each bit has a package constant corresponding to it. ■ job_started CONSTANT PLS_INTEGER := 1 ■ job_succeeded CONSTANT PLS_INTEGER := 2 ■ job_failed CONSTANT PLS_INTEGER :=4 ■ job_broken CONSTANT PLS_INTEGER :=8 ■ job_completed CONSTANT PLS_INTEGER :=16 ■ job_stopped CONSTANT PLS_INTEGER :=32 ■ job_sch_lim_reached CONSTANT PLS_INTEGER :=64 ■ job_disabled CONSTANT PLS_INTEGER :=128 ■ job_chain_stalled CONSTANT PLS_INTEGER :=256 ■ job_all_events CONSTANT PLS_INTEGER := 511 ■ job_run_completed CONSTANT PLS_INTEGER := job_ succeeded + job_failed + job_stopped Table 125–80 describes these event types in detail.
repeat_ interval	Either a PL/SQL function returning the next date and time on which to run, or calendaring syntax expression. If this is set, schedule_name should be NULL. See "Calendaring Syntax" on page 125-19 for more information.

Table 125–79 (Cont.) Job Attribute Values

Name	Description
restartable	This attribute specifies whether a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to FALSE. Setting this to TRUE means that if a job fails while running, it will be restarted from the beginning point of the job. In the case of a chain job, if this attribute is TRUE, the chain is restarted from the beginning after an application failure. If this attribute is FALSE, or if there has been a database failure, the chain is restarted at the last running step. The restart_on_recovery attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.) Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job. Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries. The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler will retry the job a maximum of six times. The first time, it will wait for one second and multiply this wait time with a factor of 10 each time thereafter. Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1. The Scheduler will stop retrying a job when: ■ One of the retries succeeds. ■ All of its six retries have failed. ■ The next retry would occur after the next regularly scheduled run of the job. The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.
schedule_limit	In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m. If schedule_limit is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log will be made to reflect the skipped run.
schedule_name	The name of a schedule, window, or group of type WINDOW to use as the schedule for this job. If this is set, end_date, start_date and repeat_interval should all be NULL.
start_date	The original date and time on which this job started or will be scheduled to start. If this is set, schedule_name should be NULL.

Table 125–79 (Cont.) Job Attribute Values

Name	Description
stop_on_window_close	This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to TRUE implies that the job should be stopped once the associated window is closed. The job is stopped using the stop_job procedure with force set to FALSE. By default, stop_on_window_close is set to FALSE. Therefore, if you do not set this attribute, the job will be allowed to continue after the window closes. Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans.

Table 125–80 Event Types Raised by the Scheduler

Event Type	Description
job_all_events	Not an event, but a constant that provides an easy way for you to enable all events
job_broken	The job has been disabled and has changed to the BROKEN state because it exceeded the number of failures defined by the max_failures job attribute
job_chain_stalled	A job running a chain was put into the CHAIN_STALLED state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain evaluation_interval is set to NULL. No progress will be made in the chain unless there is manual intervention.
job_completed	The job completed because it reached its max_runs or end_date
job_disabled	The job was disabled by the Scheduler or by a call to SET_ATTRIBUTE
job_failed	The job failed, either by throwing an error or by abnormally terminating
job_over_max_dur	The job exceeded the maximum run duration specified by its max_run_duration attribute. (Note: you do not need to enable this event with the raise_events job attribute; it is always enabled.)
job_run_completed	A job run either failed, succeeded, or was stopped
job_sch_lim_reached	The job's schedule limit was reached. The job was not started because the delay in starting the job exceeded the value of the schedule_limit job attribute.
job_started	The job started
job_stopped	The job was stopped by a call to STOP_JOB
job_succeeded	The job completed successfully

Program Attribute Values

Table 125–81 lists program attribute values.

> **Note:** See the CREATE_PROGRAM procedure for more complete descriptions of the attributes in this table.

Table 125–81 Program Attribute Values

Name	Description
comments	An optional comment. This can describe what the program does, or give usage details.
detached	If TRUE, the program is a detached program. See *Oracle Database Administrator's Guide* for information about detached jobs and detached programs.
number_of_arguments	The number of arguments required by the stored procedure or other executable that the program invokes
program_action	The action that the program performs, depending on the program_type attribute. For example, if program_type is 'STORED_PROCEDURE', program_action contains the name of the stored procedure.
program_type	The type of program. This must be one of the following supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'.

Schedule Attribute Values

Table 125–82 lists schedule attribute values.

> **Note:** See the CREATE_SCHEDULE and CREATE_CALENDAR_SCHEDULE procedures for more complete descriptions of the attributes in this table.

Table 125–82 Schedule Attribute Values

Name	Description
comments	An optional comment.
end_date	The cutoff date and time after which the schedule will not specify any dates.
event_spec	This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For details on what these arguments should contain, see the descriptions for the event_condition and queue_spec arguments to the CREATE_JOB procedure.
repeat_interval	An expression using the calendaring syntax. See "Calendaring Syntax" on page 125-19 for more information.
source	The host name that the database is running on. This is used by remote agents to know where to send the job run details.
start_date	The start or reference date and time used by the calendaring syntax.

File Watcher Attribute Values

Table 125–83 lists file watcher attribute values.

Table 125–83 File Watcher Attribute Values

Parameter	Description
destination	Remote host name or IP address where the file is expected to arrive. If NULL, destination is the local host.

Table 125–83 (Cont.) File Watcher Attribute Values

Parameter	Description
directory_path	Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '?/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.
file_name	Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.
credential_name	Name of a valid Scheduler credential object. The credential is used to authenticate with the host operating system to access the watched-for file. The file watcher owner must have EXECUTE privileges on the credential. Cannot be NULL.
min_file_size	Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0.
steady_state_ duration	Minimum time interval that the file must remain unchanged before the file watcher considers the file found. If NULL, an internal value is used.
comments	Optional comment.

Job Class Attribute Values

Table 125–84 lists job class attribute values.

> **Note:** See the CREATE_JOB_CLASS procedure for more complete descriptions of the attributes in this table.

Table 125–84 Job Class Attribute Values

Name	Description
comments	An optional comment about the class.
log_history	This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 999. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).
logging_level	This attribute specifies how much information is logged. The possible options are: ■ DBMS_SCHEDULER.LOGGING_OFF No logging will be performed for any jobs in this class. ■ DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs in the class that failed, with the reason for failure. ■ DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. ■ DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log.

Table 125–84 (Cont.) Job Class Attribute Values

Name	Description
resource_ consumer_group	The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See *Oracle Database Administrator's Guide* for a description of resource consumer groups and the Database Resource Manager.
service	The database service that the jobs in the job class have affinity to. If both the resource_consumer_group and service attributes are set for a job class, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.

Window Attribute Values

Table 125–85 lists window attribute values.

> **Note:** See the CREATE_WINDOW procedure for more complete descriptions of the attributes in this table.

Table 125–85 Window Attribute Values

Name	Description
comments	An optional comment about the window.
duration	The duration of the window.
end_date	The date after which the window will no longer open. If this is set, schedule_name must be NULL.
repeat_interval	A string using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, schedule_name must be NULL. See "Calendaring Syntax" on page 125-19 for more information.
resource_plan	The resource plan to be associated with a window. When the window opens, the system will switch to this resource plan. When the window closes, the original resource plan will be restored. If a resource plan has been made active with the force option, no resource plan switch will occur. Only one resource plan can be associated with a window. It may be NULL or the empty string (""). When it is NULL, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.
schedule_name	The name of a schedule to use with this window. If this is set, start_date, end_date, and repeat_interval must all be NULL.
start_date	The next date and time on which this window is scheduled to open. If this is set, schedule_name must be NULL.
window_priority	The priority of the window. Must be one of 'LOW' (default) or 'HIGH'.

Chain Attribute Values

Table 125–86 lists chain attribute values.

> **Note:** See the CREATE_CHAIN procedure for more complete descriptions of the attributes in this table.

Table 125–86 Chain Attribute Values

Name	Description
comments	An optional comment describing the purpose of the chain.
evaluation_interval	If this is not NULL, evaluation of the chain occurs not only at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives), but also periodically at this interval. For most chains, the normal evaluation times are sufficient. Because evaluation of a large chain is CPU intensive, this attribute should be used only when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

Database Destination Attribute Values

Table 125–87 lists database destination attribute values.

> **Note:** See the CREATE_DATABASE_DESTINATION procedure for more complete descriptions of the attributes in this table.

Table 125–87 Database Destination Attribute Values

Name	Description
agent	The name of the external destination (also known as agent destination) that is used to connect to the remote database. Valid external destination names are obtained from the view ALL_SCHEDULER_EXTERNAL_DESTS.
connect_info	The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in tnsnames.ora that resolves to the connect descriptor. Note: This corresponds to the tns_name argument of CREATE_DATABASE_DESTINATION.
enabled	If TRUE, the database destination is enabled.
comments	An optional comment about the database destination.

External Destination Attribute Values

Table 125–88 lists external destination attribute values.

> **Note:** External destinations are created only implicitly by registering a remote Scheduler agent with the local database.

Table 125–88 External Destination Attribute Values

Name	Description
hostname	(GET_ATTRIBUTE only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides.
port	(GET_ATTRIBUTE only) The TCP port number on which the agent listens.
ip_address	(GET_ATTRIBUTE only) The IP address of the host on which the agent resides.
enabled	If TRUE, the external destination is enabled.
comments	An optional comment about the external destination.

Group Attribute Values

Table 125–89 lists group attribute values.

> **Note:** See the CREATE_GROUP procedure for more complete descriptions of the attributes in this table.

Table 125–89 Group Attribute Values

Name	Description
group_type	(GET_ATTRIBUTE only) The group type (either WINDOW, DB_DEST, or EXTERNAL_DEST).
member_name	Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use ADD_GROUP_MEMBER. Note: this attribute corresponds to the member argument of CREATE_GROUP.
enabled	If TRUE, the group is enabled.
comments	An optional comment about the group.
number_of_members	(GET_ATTRIBUTE only) The number of members in the group.

SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to NULL. What attributes can be set depends on the object being altered. If the object is enabled, it will be disabled before being altered and be reenabled afterward. If the object cannot be reenabled, an error is generated and the object will be left in a disabled state.

Syntax

```
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
   name              IN VARCHAR2,
   attribute         IN VARCHAR2);
```

Parameters

Table 125–90 SET_ATTRIBUTE_NULL Procedure Parameters

Parameter	Description
name	The name of the object
attribute	The attribute being changed

Usage Notes

To run SET_ATTRIBUTE_NULL for a window, group of type WINDOW, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

SET_JOB_ANYDATA_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an `AnyData` object. It overrides any default value set for the program argument. `NULL` is a valid assignment for a program argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the DEFINE_ANYDATA_ARGUMENT Procedure

No type checking of the argument is done at any time by the Scheduler.

`SET_JOB_ANYDATA_VALUE` is overloaded.

Syntax

Sets a program argument by its position.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
   job_name                IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_value          IN SYS.ANYDATA);
```

Sets a program argument by its name.

```
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
   job_name                IN VARCHAR2,
   argument_name           IN VARCHAR2,
   argument_value          IN SYS.ANYDATA);
```

Parameters

Table 125–91 SET_JOB_ANYDATA_VALUE Procedure Parameters

Parameter	Description
`job_name`	The name of the job to be altered
`argument_name`	The name of the program argument being set
`argument_position`	The position of the program argument being set
`argument_value`	The new value to be assigned to the program argument, encapsulated in an `AnyData` object

Usage Notes

`SET_JOB_ANYDATA_VALUE` requires that you be the owner of the job or have `ALTER` privileges on that job. You can also set a job argument value if you have the `CREATE ANY JOB` privilege.

`SET_JOB_ANYDATA_VALUE` does not apply to lightweight jobs because lightweight jobs cannot take AnyData arguments.

See Also:

- "SET_JOB_ARGUMENT_VALUE Procedure" on page 125-137
- "DEFINE_ANYDATA_ARGUMENT Procedure" on page 125-70

SET_JOB_ARGUMENT_VALUE Procedure

This procedure sets the value of an argument of the associated program for a job. It overrides any default value set for the program argument. NULL is a valid assignment for a program argument. The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the DEFINE_PROGRAM_ARGUMENT Procedure or the DEFINE_METADATA_ARGUMENT Procedure

No type checking of the argument is done at any time by the Scheduler.

SET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Sets an argument value by position:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_position       IN PLS_INTEGER,
   argument_value          IN VARCHAR2);
```

Sets an argument value by name:

```
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
   job_name                IN VARCHAR2,
   argument_name           IN VARCHAR2,
   argument_value          IN VARCHAR2);
```

Parameters

Table 125–92 SET_JOB_ARGUMENT_VALUE Procedure Parameters

Parameter	Description
job_name	The name of the job to be altered
argument_name	The name of the program argument being set
argument_position	The position of the program argument being set
argument_value	The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure.

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

See Also:

- "SET_JOB_ANYDATA_VALUE Procedure" on page 125-136
- "DEFINE_PROGRAM_ARGUMENT Procedure" on page 125-78

SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

```
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
   jobattr_array     IN JOBATTR_ARRAY,
   commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 125–93 SET_JOB_ATTRIBUTES Procedure Parameters

Parameter	Description
jobattr_array	The array of job attribute changes.
commit_semantics	The commit semantics. The following types are supported: ■ STOP_ON_FIRST_ERROR - this procedure returns on the first error and the previous attribute changes that were successful are committed to disk. This is the default. ■ TRANSACTIONAL - this procedure returns on the first error and everything that happened before that error is rolled back. ■ ABSORB_ERRORS - this procedure tries to absorb any errors and attempts the rest of the job attribute changes on the list and commits all the changes that were successful. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

Calling SET_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and re-enables the job. SET_JOB_ATTRIBUTES changes the attribute values in the context of a single transaction.

SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately.

Short attribute descriptions are provided in Table 125–94. For complete descriptions of these attributes, see the section entitled "Setting Scheduler Preferences" in *Oracle Database Administrator's Guide*.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (
   attribute      IN VARCHAR2,
   value          IN VARCHAR2);
```

Parameters

Table 125–94 SET_SCHEDULER_ATTRIBUTE Procedure Parameters

Parameter	Description
`attribute`	The name of the Scheduler attribute. Possible values are: ■ `'default_timezone'`: Repeating jobs and windows that use the calendaring syntax retrieve the time zone from this attribute when `start_date` is not specified. ■ `'email_server'`: The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is `NULL`. ■ `'email_sender'`: The default e-mail address of the sender for job state e-mail notifications. ■ `'event_expiry_time'`: The time in seconds before a job state event generated by the Scheduler expires from the Scheduler event queue. If `NULL`, job state events expire after 24 hours. ■ `'log_history'`: The number of days that log entries for both the job log and the window log are retained. Default is 30. ■ `'max_job_slave_processes'`: The maximum number of slave processes for a particular system configuration and load. The default value is `NULL`, and the valid range is 1-999.
`value`	The new value of the attribute

Usage Notes

To run `SET_SCHEDULER_ATTRIBUTE`, you must have the `MANAGE SCHEDULER` privilege.

> **See Also:** *Oracle Database Administrator's Guide* for more detailed descriptions of Scheduler attributes

STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class. After stopping the job, the state of a one-time job will be set to STOPPED whereas the state of a repeating job will be set to SCHEDULED or COMPLETED depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all steps of the running chain that are running are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, STOP_JOB stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

Syntax

```
DBMS_SCHEDULER.STOP_JOB (
   job_name         IN VARCHAR2
   force            IN BOOLEAN DEFAULT FALSE
   commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 125–95 STOP_JOB Procedure Parameters

Parameter	Description
job_name	A comma-separate list of entries, where each entry can be one of the following: ■ Job name—the name of an existing job, optionally preceded by a schema name and dot separator. ■ Job destination ID—a number, obtained from the JOB_DEST_ID column of the *_SCHEDULER_JOB_DESTS views, that represents the unique combination of a job, a credential, and a destination. ■ Job class—the name of a job class. Must be preceded by the SYS schema name and a dot separator. If you specify a job class, all jobs that belong to that job class are stopped. If you specify a job that was created with a destination group as its destination_name attribute, all job instances on all destinations are stopped.
force	If force is set to FALSE, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned. If force is set to TRUE, the Scheduler will immediately terminate the job slave. Oracle recommends that STOP_JOB with force set to TRUE be used only after a STOP_JOB with force set to FALSE has failed. Use of the force option requires the MANAGE SCHEDULER system privilege.

Table 125–95 (Cont.) STOP_JOB Procedure Parameters

Parameter	Description
commit_semantics	The commit semantics. The following two types are supported: ■ STOP_ON_FIRST_ERROR - the procedure returns on the first error and the previous stop operations that were successful are committed to disk. This is the default. ■ ABSORB_ERRORS - the procedure tries to absorb any errors and attempts stopping the rest of the jobs and commits all the stop operations that were successful. This type is available only if no job classes are specified in the job_name list. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.

Usage Notes

STOP_JOB without the force option requires that you be the owner of the job or have ALTER privileges on that job. You can also stop a job if you have the CREATE ANY JOB or MANAGE SCHEDULER privilege.

STOP_JOB with the force option requires that you have the MANAGE SCHEDULER privilege.

Example

The following is an example of using STOP_JOB.

```
BEGIN
  DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB, 984, 1223, SYS.ETL_JOBCLASS');
END;
```

126

DBMS_SERVER_ALERT

The DBMS_SERVER_ALERT package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- Using DBMS_SERVER_ALERT
- Summary of DBMS_SERVER_ALERT Subprograms

Using DBMS_SERVER_ALERT

This section contains topics which relate to using the `DBMS_SERVER_ALERT` package. The following topics define constants used in package procedures.

- Object Types
- Relational Operators
- Supported Metrics

Object Types

You qualify the metric by an individual object for the following object types.

Table 126–1 Object Types Defined as Constants

Constant	Description
OBJECT_TYPE_SYSTEM	Metrics collected on the system level for each instance.
OBJECT_TYPE_FILE	Metrics collected on the file level. These are used for AVERAGE_FILE_READ_TIME and AVERAGE_FILE_WRITE_TIME metrics.
OBJECT_TYPE_SERVICE	Metrics collected on the service level. Currently ELAPSED_TIME_PER_CALL and CPU_TIME_PER_CALL are collected.
OBJECT_TYPE_TABLESPACE	Metrics collected on the tablespace level.
OBJECT_TYPE_EVENT_CLASS	Metrics collected on wait event class level. Currently supported metrics are AVG_USERS_WAITING and DB_TIME_WAITING.
OBJECT_TYPE_SESSION	Metrics collected on the session level. Currently only BLOCKED_USERS is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.

Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

Table 126–2 Relational Operators Defined as Constants

Constant	Description
OPERATOR_CONTAINS	A metric value matching an entry in a list of threshold values is considered a violation.
OPERATOR_DO_NOT_CHECK	The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.
OPERATOR_EQ	A metric value equal to the threshold value is considered a violation.
OPERATOR_GE	A metric value greater than or equal to the threshold value is considered a violation.
OPERATOR_GT	A metric value greater than the threshold value is considered a violation.
OPERATOR_LE	A metric value less than or equal to the threshold value is considered a violation.
OPERATOR_LT	A metric value less than the threshold value is considered a violation.
OPERATOR_NE	A metric value not equal to the threshold value is considered a violation.

Supported Metrics

The following metrics are supported. All internal metric names are supplied as package constants.

Table 126–3 List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
SQL_SRV_RESPONSE_TIME	Service Response (for each execution)	Seconds
BUFFER_CACHE_HIT	Buffer Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_HIT	Library Cache Hit (%)	% of cache accesses
LIBRARY_CACHE_MISS	Library Cache Miss (%)	% of cache accesses
MEMORY_SORTS_PCT	Sorts in Memory (%)	% of sorts
REDO_ALLOCATION_HIT	Redo Log Allocation Hit	% of redo allocations
TRANSACTION_RATE	Number of Transactions (for each second)	Transactions for each Second
PHYSICAL_READS_SEC	Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_TXN	Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_SEC	Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_TXN	Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_DIR_SEC	Direct Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_DIR_TXN	Direct Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_DIR_SEC	Direct Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_DIR_TXN	Direct Physical Writes (for each transaction)	Writes for each Transaction
PHYSICAL_READS_LOB_SEC	Direct LOB Physical Reads (for each second)	Reads for each Second
PHYSICAL_READS_LOB_TXN	Direct LOB Physical Reads (for each transaction)	Reads for each Transaction
PHYSICAL_WRITES_LOB_SEC	Direct LOB Physical Writes (for each second)	Writes for each Second
PHYSICAL_WRITES_LOB_TXN	Direct LOB Physical Writes (for each transaction)	Writes for each Transaction
REDO_GENERATED_SEC	Redo Generated (for each second)	Redo Bytes for each Second
REDO_GENERATED_TXN	Redo Generated (for each transaction)	Redo Bytes for each Transaction
DATABASE_WAIT_TIME	Database Wait Time (%)	% of all database time
DATABASE_CPU_TIME	Database CPU Time (%)	% of all database time
LOGONS_SEC	Cumulative Logons (for each second)	Logons for each Second

Table 126–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
LOGONS_TXN	Cumulative Logons (for each transaction)	Logons for each Transaction
LOGONS_CURRENT	Current Number of Logons	Number of Logons
OPEN_CURSORS_SEC	Cumulative Open Cursors (for each second)	Cursors for each Second
OPEN_CURSORS_TXN	Cumulative Open Cursors (for each transaction)	Cursors for each Transaction
OPEN_CURSORS_CURRENT	Current Number of Cursors	Number of Cursors
USER_COMMITS_SEC	User Commits (for each second)	Commits for each Second
USER_COMMITS_TXN	User Commits (for each transaction)	Commits for each Transaction
USER_ROLLBACKS_SEC	User Rollbacks (for each second)	Rollbacks for each Second
USER_ROLLBACKS_TXN	User Rollbacks (for each transaction)	Rollbacks for each Transaction
USER_CALLS_SEC	User Calls (for each second)	Calls for each Second
USER_CALLS_TXN	User Calls (for each transaction)	Calls for each Transaction
RECURSIVE_CALLS_SEC	Recursive Calls (for each second)	Calls for each Second
RECURSIVE_CALLS_TXN	Recursive Calls (for each transaction)	Calls for each Transaction
SESS_LOGICAL_READS_SEC	Session Logical Reads (for each second)	Reads for each Second
SESS_LOGICAL_READS_TXN	Session Logical Reads (for each transaction)	Reads for each Transaction
DBWR_CKPT_SEC	DBWR Checkpoints (for each second)	Checkpoints for each Second
LOG_SWITCH_SEC	Background Checkpoints (for each second)	Checkpoints for each Second
REDO_WRITES_SEC	Redo Writes (for each second)	Writes for each Second
REDO_WRITES_TXN	Redo Writes (for each transaction)	Writes for each Transaction
LONG_TABLE_SCANS_SEC	Scans on Long Tables (for each second)	Scans for each Second
LONG_TABLE_SCANS_TXN	Scans on Long Tables (for each transaction)	Scans for each Transaction
TOTAL_TABLE_SCANS_SEC	Total Table Scans (for each second)	Scans for each Second
TOTAL_TABLE_SCANS_TXN	Total Table Scans (for each transaction)	Scans for each Transaction
FULL_INDEX_SCANS_SEC	Fast Full Index Scans (for each second)	Scans for each Second
FULL_INDEX_SCANS_TXN	Fast Full Index Scans (for each transaction)	Scans for each Transaction
TOTAL_INDEX_SCANS_SEC	Total Index Scans (for each second)	Scans for each Second
TOTAL_INDEX_SCANS_TXN	Total Index Scans (for each transaction)	Scans for each Transaction
TOTAL_PARSES_SEC	Total Parses (for each second)	Parses for each Second

Table 126–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
TOTAL_PARSES_TXN	Total Parses (for each transaction)	Parses for each Transaction
HARD_PARSES_SEC	Hard Parses (for each second)	Parses for each Second
HARD_PARSES_TXN	Hard Parses (for each transaction)	Parses for each Transaction
PARSE_FAILURES_SEC	Parse Failures (for each second)	Parses for each Second
PARSE_FAILURES_TXN	Parse Failures (for each transaction)	Parses for each Transaction
DISK_SORT_SEC	Sorts to Disk (for each second)	Sorts for each Second
DISK_SORT_TXN	Sorts to Disk (for each transaction)	Sorts for each Transaction
ROWS_PER_SORT	Rows Processed for each Sort	Rows for each Sort
EXECUTE_WITHOUT_PARSE	Executes Performed Without Parsing	% of all executes
SOFT_PARSE_PCT	Soft Parse (%)	% of all parses
CURSOR_CACHE_HIT	Cursor Cache Hit (%)	% of soft parses
USER_CALLS_PCT	User Calls (%)	% of all calls
TXN_COMMITTED_PCT	Transactions Committed (%)	% of all transactions
NETWORK_BYTES_SEC	Network Bytes, for each second	Bytes for each Second
RESPONSE_TXN	Response (for each transaction)	Seconds for each Transaction
DATA_DICT_HIT	Data Dictionary Hit (%)	% of dictionary accesses
DATA_DICT_MISS	Data Dictionary Miss (%)	% of dictionary accesses
SHARED_POOL_FREE_PCT	Shared Pool Free(%)	% of shared pool
AVERAGE_FILE_READ_TIME	Average File Read Time	Microseconds
AVERAGE_FILE_WRITE_TIME	Average File Write Time	Microseconds
DISK_IO	Disk I/O	Milliseconds
PROCESS_LIMIT_PCT	Process Limit Usage (%)	% of maximum value
SESSION_LIMIT_PCT	Session Limit Usage (%)	% of maximum value
USER_LIMIT_PCT	User Limit Usage (%)	% of maximum value
AVG_USERS_WAITING	Average Number of Users Waiting on a Class of Wait Events	Count of sessions
DB_TIME_WAITING	Percent of Database Time Spent Waiting on a Class of Wait Events	% of Database Time
APPL_DESGN_WAIT_SCT	Application Design Wait (by session count)	Count of sessions
APPL_DESGN_WAIT_TIME	Application Design Wait (by time)	Microseconds
PHYS_DESGN_WAIT_SCT	Physical Design Wait (by session count)	Count of sessions
PHYS_DESGN_WAIT_TIME	Physical Design Wait (by time)	Microseconds
CONTENTION_WAIT_SCT	Internal Contention Wait (by session count)	Count of sessions
CONTENTION_WAIT_TIME	Internal Contention Wait (by time)	Microseconds
PSERVICE_WAIT_SCT	Process Service Wait (by session count)	Count of sessions

Table 126–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PSERVICE_WAIT_TIME	Process Service Wait (by time)	Microseconds
NETWORK_MSG_WAIT_SCT	Network Message Wait (by session count)	Count of sessions
NETWORK_MSG_WAIT_TIME	Network Message Wait (by time)	Microseconds
DISK_IO_WAIT_SCT	Disk I/O Wait (by session count)	Count of sessions
OS_SERVICE_WAIT_SCT	Operating System Service Wait (by session count)	Count of sessions
OS_SERVICE_WAIT_TIME	Operating System Service Wait (by time)	Microseconds
DBR_IO_LIMIT_WAIT_SCT	Resource Mgr I/O Limit Wait (by session count)	Count of sessions
DBR_IO_LIMIT_WAIT_TIME	Resource Mgr I/O Limit Wait (by time)	Microseconds
DBR_CPU_LIMIT_WAIT_SCT	Resource Mgr CPU Limit Wait (by session count)	Count of sessions
DBR_CPU_LIMIT_WAIT_TIME	Resource Mgr CPU Limit Wait (by time)	Microseconds
DBR_USR_LIMIT_WAIT_SCT	Resource Mgr User Limit Wait (by session count)	Count of sessions
DBR_USR_LIMIT_WAIT_TIME	Resource Mgr User Limit Wait (by time)	Microseconds
OS_SCHED_CPU_WAIT_SCT	Operating System Scheduler CPU Wait (by session count)	Count of sessions
OS_SCHED_CPU__WAIT_TIME	Operating System Scheduler CPU Wait (by time)	Microseconds
CLUSTER_MSG_WAIT_SCT	Cluster Messaging Wait (by session count)	Count of sessions
CLUSTER_MSG_WAIT_TIME	Cluster Messaging Wait (by time)	Microseconds
OTHER_WAIT_SCT	Other Waits (by session count)	Count of sessions
OTHER_WAIT_TIME	Other Waits (by time)	Microseconds
ENQUEUE_TIMEOUTS_SEC	Enqueue Timeouts (for each second)	Timeouts for each Second
ENQUEUE_TIMEOUTS_TXN	Enqueue Timeouts (for each transaction)	Timeouts for each Transaction
ENQUEUE_WAITS_SEC	Enqueue Waits (for each second)	Waits for each Second
ENQUEUE_WAITS_TXN	Enqueue Waits (for each transaction)	Waits for each Transaction
ENQUEUE_DEADLOCKS_SEC	Enqueue Deadlocks (for each second)	Deadlocks for each Second
ENQUEUE_DEADLOCKS_TXN	Enqueue Deadlocks (for each transaction)	Deadlocks for each Transaction
ENQUEUE_REQUESTS_SEC	Enqueue Requests (for each second)	Requests for each Second
ENQUEUE_REQUESTS_TXN	Enqueue Requests (for each transaction)	Requests for each Transaction

Table 126–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
DB_BLKGETS_SEC	DB Block Gets (for each second)	Gets for each Second
DB_BLKGETS_TXN	DB Block Gets (for each transaction)	Gets for each Transaction
CONSISTENT_GETS_SEC	Consistent Gets (for each second)	Gets for each Second
CONSISTENT_GETS_TXN	Consistent Gets (for each transaction)	Gets for each Transaction
DB_BLKCHANGES_SEC	DB Block Changes (for each second)	Changes for each Second
DB_BLKCHANGES_TXN	DB Block Changes (for each transaction)	Changes for each Transaction
CONSISTENT_CHANGES_SEC	Consistent Changes (for each second)	Changes for each Second
CONSISTENT_CHANGES_TXN	Consistent Changes (for each transaction)	Changes for each Transaction
SESSION_CPU_SEC	Database CPU (for each second)	Microseconds for each Second
SESSION_CPU_TXN	Database CPU (for each transaction)	Microseconds for each Transaction
CR_BLOCKS_CREATED_SEC	CR Blocks Created (for each second)	Blocks for each Second
CR_BLOCKS_CREATED_TXN	CR Blocks Created (for each transaction)	Blocks for each Transaction
CR_RECORDS_APPLIED_SEC	CR Undo Records Applied (for each second)	Records for each Second
CR_RECORDS_APPLIED_TXN	CR Undo Records Applied (for each transaction)	Records for each Transaction
RB_RECORDS_APPLIED_SEC	Rollback Undo Records Applied (for each second)	Records for each Second
RB_RECORDS_APPLIED_TXN	Rollback Undo Records Applied (for each transaction)	Records for each Transaction
LEAF_NODE_SPLITS_SEC	Leaf Node Splits (for each second)	Splits for each Second
LEAF_NODE_SPLITS_TXN	Leaf Node Splits (for each transaction)	Splits for each Transaction
BRANCH_NODE_SPLITS_SEC	Branch Node Splits (for each second)	Splits for each Second
BRANCH_NODE_SPLITS_TXN	Branch Node Splits (for each transaction)	Splits for each Transaction
GC_BLOCKS_CORRUPT	Global Cache Blocks Corrupt	Blocks
GC_BLOCKS_LOST	Global Cache Blocks Lost	Blocks
GC_AVG_CR_GET_TIME	Global Cache CR Request	Milliseconds
GC_AVG_CUR_GET_TIME	Global Cache Current Request	Milliseconds
PX_DOWNGRADED_SEC	Downgraded Parallel Operations (for each second)	Operations for each Second
PX_DOWNGRADED_25_SEC	Downgraded to 25% and more (for each second)	Operations for each Second
PX_DOWNGRADED_50_SEC	Downgraded to 50% and more (for each second)	Operations for each Second
PX_DOWNGRADED_75_SEC	Downgraded to 75% and more (for each second)	Operations for each Second

Table 126–3 (Cont.) List of Supported Metrics

Metric Name (Internal)	Metric Name (External)	Units
PX_DOWNGRADED_SER_SEC	Downgraded to serial (for each second)	Operations for each Second
BLOCKED_USERS	Number of Users blocked by some Session	Number of Users
PGA_CACHE_HIT	PGA Cache Hit (%)	% bytes processed in PGA
ELAPSED_TIME_PER_CALL	Elapsed time for each user call for each service	Microseconds for each call
CPU_TIME_PER_CALL	CPU time for each user call for each service	Microseconds for each call
TABLESPACE_PCT_FULL	Tablespace space usage	% full
TABLESPACE_BYT_FREE	Tablespace bytes space usage	Kilobytes free

Summary of DBMS_SERVER_ALERT Subprograms

Table 126–4 DBMS_SERVER_ALERT Package Subprograms

Subprogram	Description
EXPAND_MESSAGE Function on page 126-12	Expands alert messages
GET_THRESHOLD Procedure on page 126-13	Gets the current threshold settings for a specified metric
SET_THRESHOLD Procedure on page 126-14	Sets the warning and critical thresholds for a specified metric

EXPAND_MESSAGE Function

This function expands alert messages.

Syntax

```
DBMS_SERVER_ALERT.EXPAND_MESSAGE(
   user_language            IN   VARCHAR2,
   message_id               IN   NUMBER,
   argument_1               IN   VARCHAR2,
   argument_2               IN   VARCHAR2,
   argument_3               IN   VARCHAR2,
   argument_4               IN   VARCHAR2,
   argument_5               IN   VARCHAR2)
  RETURN VARCHAR2;
```

Parameters

Table 126–5 EXPAND_MESSAGE Function Parameters

Parameter	Description
user_language	The language of the current session.
message_id	Id of the alert message
argument_1	The first argument in the alert message.
argument_2	The second argument in the alert message.
argument_3	The third argument in the alert message.
argument_4	The fourth argument in the alert message.
argument_5	The fifth argument in the alert message.

GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```
DBMS_SERVER_ALERT.GET_THRESHOLD(
   metrics_id               IN   BINARY_INTEGER,
   warning_operator         OUT  BINARY_INTEGER,
   warning_value            OUT  VARCHAR2,
   critical_operator        OUT  BINARY_INTEGER,
   critical_value           OUT  VARCHAR2,
   observation_period       OUT  BINARY_INTEGER,
   consecutive_occurrences  OUT  BINARY_INTEGER,
   instance_name            IN   VARCHAR2,
   object_type              IN   BINARY_INTEGER,
   object_name              IN   VARCHAR2);
```

Parameters

Table 126–6 GET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See "Supported Metrics" on page 126-5.
warning_operator	The operator for the compa3ring the actual value with the warning threshold.
warning_value	The warning threshold value.
critical_operator	The operator for the comparing the actual value with the critical threshold.
critical_value	The critical threshold value.
observation_period	The period at which the metric values are computed and verified against the threshold setting.
consecutive_ occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV$INSTANCE View.
object_type	Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.
object_name	The name of the object.

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid.

SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```
DBMS_SERVER_ALERT.SET_THRESHOLD(
   metrics_id               IN   BINARY_INTEGER,
   warning_operator         IN   BINARY_INTEGER,
   warning_value            IN   VARCHAR2,
   critical_operator        IN   BINARY_INTEGER,
   critical_value           IN   VARCHAR2,
   observation_period       IN   BINARY_INTEGER,
   consecutive_occurrences  IN   BINARY_INTEGER,
   instance_name            IN   VARCHAR2,
   object_type              IN   BINARY_INTEGER,
   object_name              IN   VARCHAR2);
```

Parameters

Table 126–7 SET_THRESHOLD Procedure Parameters

Parameter	Description
metrics_id	The internal name of the metric. See "Supported Metrics" on page 126-5.
warning_operator	The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE). See "Relational Operators" on page 126-4.
warning_value	The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.
critical_operator	The operator for the comparing the actual value with the critical threshold. See "Relational Operators" on page 126-4.
critical_value	The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.
observation_period	The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.
consecutive_ occurrences	The number of observation periods the metric value should violate the threshold value before the alert is issued.
instance_name	The name of the instance for which the threshold is set. This is NULL for database-wide alerts.
object_type	See "Object Types" on page 126-3.
object_name	The name of the object. This is NULL for SYSTEM.

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the DBA_THRESHOLDS view. The exception is the lower-case string 'database_wide' which is semantically equivalent to passing NULL for the instance name, the latter being the preferred usage.

127

DBMS_SERVICE

The `DBMS_SERVICE` package lets you create, delete, activate and deactivate services for a single instance.

The chapter contains the following topics:

- Using DBMS_SERVICE
  - Overview
  - Security Model
  - Constants
  - Exceptions
- Summary of DBMS_SERVICE Subprograms

> **See Also:** *Oracle Real Application Clusters Administration and Deployment Guide* for administering services in Oracle Real Application Clusters.

Using DBMS_SERVICE

This section contains topics which relate to using the `DBMS_SERVICE` package.

- Overview
- Security Model
- Constants
- Exceptions

Overview

DBMS_SERVICE supports the management of services in the RDBMS for the purposes of workload measurement, management, prioritization, and XA/and distributed transaction management.

Oracle Real Application Clusters (RAC) has a functionality to manage service names across instances. This package allows the creation, deletion, starting and stopping of services in both RAC and a single instance. Additionally it provides the ability to disconnect all sessions which connect to the instance with a service name when RAC removes that service name from the instance.

> **See Also:** For more information about Oracle Real Application Clusters, *Oracle Real Application Clusters Administration and Deployment Guide*.

Security Model

Privileges

The client using this package should have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

Schemas

This package should be installed under `SYS` schema.

Roles

The `EXECUTE` privilege of the package is granted to the `DBA` role only.

Deprecated Subprograms

For Oracle Real Applications Clusters (RAC) databases, the following `DBMS_SERVICE` procedures should be deprecated in 11.2, and `srvctl` should be used instead:

- CREATE_SERVICE Procedure
- MODIFY_SERVICE Procedure
- START_SERVICE Procedure
- STOP_SERVICE Procedure

The same is true for single-instance databases managed by Oracle Restart or Oracle Clusterware.

This is because the service attributes are stored in CRS and those attributes overwrite those specified by `DBMS_SERVICE`. The `DBMS_SERVICE` procedures do not update the CRS attributes.

Constants

The DBMS_SERVICE package uses the constants shown in following tables

- Constants used in calling arguments are described in Table 127–1, " Constants used in Calling Arguments"
- Constants used in connection balancing goal arguments are described inTable 127–2, " Constants used in Connection Balancing Goal Arguments"
- Constants used TAF failover attribute arguments are described inTable 127–3, " Constants used in TAF Failover Attribute Arguments"

Table 127–1 Constants used in Calling Arguments

Name	Type	Value	Description
GOAL_NONE	NUMBER	0	Disables Load Balancing Advisory
GOAL_SERVICE_TIME	NUMBER	1	Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service
GOAL_THROUGHPUT	NUMBER	2	Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service

Table 127–2 Constants used in Connection Balancing Goal Arguments

Name	Type	Value	Description
CLB_GOAL_SHORT	NUMBER	1	Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either goal_service_time or goal_throughput). When GOAL=NONE (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.
CLB_GOAL_LONG	NUMBER	2	Balances the number of connections per instance using session count per service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.

Table 127–3 Constants used in TAF Failover Attribute Arguments

Name	Type	Value	Description
FAILOVER_METHOD_NONE	VARCHAR2	0	Server side TAF is not enabled for this service
FAILOVER_METHOD_BASIC	VARCHAR2	1	Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time. It is not possible to pre-establish a backup connection. (which is to say, PRECONNECT is not supported)

Table 127–3 (Cont.) Constants used in TAF Failover Attribute Arguments

Name	Type	Value	Description
FAILOVER_TYPE_NONE	NUMBER		Server side TAF type is NONE
FAILOVER_TYPE_SESSION	NUMBER		Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF will re-connect to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.
FAILOVER_TYPE_SELECT	NUMBER		Server side TAF failover type is SELECT
FAILOVER_RETRIES	NUMBER		Number of retries to use during a failover. Specifies the number of times that TAF should attempt the re-connect and re-authenticate pair. The value must be integral and greater than 0. The maximum value is UB4MAXVAL
FAILOVER_DELAY	NUMBER		Number of seconds delay before trying to failover. Specifies the delay (in seconds) that TAF will incur if the re-connect / re-authentication fails. The value must be integral and greater than 0. The maximum value is UB4MAXVAL.

Usage Notes

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF will continue to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay should be coded into the callback logic
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method will default to BASIC. Delay and retries are optional and may be specified independently.

Exceptions

The following table lists the exceptions raised by DBMS_SERVICE package.

Table 127–4 DBMS_SERVICE Exceptions

Exception	Error Code	Description
NULL_SERVICE_NAME	44301	The service name argument was found to be NULL
NULL_NETWORK_NAME	44302	The network name argument was found to be NULL
SERVICE_EXISTS	44303	This service name was already in existence
SERVICE_DOES_NOT_EXIST	44304	The specified service was not in existence
SERVICE_IN_USE	44305	The specified service was running
SERVICE_NAME_TOO_LONG	44306	The service name was too long
NETWORK_PREFIX_TOO_LONG	44307	The network name, excluding the domain, was too long
NOT_INITIALIZED	44308	The services layer was not yet initialized
GENERAL_FAILURE	44309	There was an unknown failure
MAX_SERVICES_EXCEEDED	44310	The maximum number of services has been reached
SERVICE_NOT_RUNNING	44311	The specified service was not running
DATABASE_CLOSED	44312	The database was closed
INVALID_INSTANCE	44313	The instance name argument was not valid
NETWORK_EXISTS	44314	The network name was already in existence
NULL_ATTRIBUTES	44315	All attributes specified were NULL
INVALID_ARGUMENT	44316	Invalid argument supplied
DATABASE_READONLY	44317	The database is open read-only
MAX_SN_LENGTH	44318	The total length of all running service network names exceeded the maximum allowable length

Summary of DBMS_SERVICE Subprograms

Table 127–5 DBMS_SERVICE Package Subprograms

Subprogram	Description
CREATE_SERVICE Procedure on page 127-10	Creates service
DELETE_SERVICE Procedure on page 127-12	Deletes service
DISCONNECT_SESSION Procedure on page 127-13	Disconnects service
MODIFY_SERVICE Procedure on page 127-14	Modifies service
START_SERVICE Procedure on page 127-16	Activates service
STOP_SERVICE Procedure on page 127-17	Stops service

CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

> **Note:** This procedure is deprecated in databases managed by Oracle Clusterware and Oracle Restart with Release 11.2. While the procedure remains available in the package, Oracle recommends using `srvctl` to manage services. This is because the service attributes are stored in CRS by `srvctl`, and overwrite those specified by `DBMS_SERVICE`. The `DBMS_SERVICE` procedures do not update the CRS attributes and therefore are not persistent, though they do take effect immediately, until the service is next started with `srvctl`.

Syntax

```
DBMS_SERVICE.CREATE_SERVICE(
   service_name        IN VARCHAR2,
   network_name        IN VARCHAR2,
   goal                IN NUMBER DEFAULT NULL,
   dtp                 IN BOOLEAN DEFAULT NULL,
   aq_ha_notifications IN BOOLEAN DEFAULT NULL,
   failover_method     IN VARCHAR2 DEFAULT NULL,
   failover_type       IN VARCHAR2 DEFAULT NULL,
   failover_retries    IN NUMBER DEFAULT NULL,
   failover_delay      IN NUMBER DEFAULT NULL,
   clb_goal            IN NUMBER DEFAULT NULL);
```

Parameters

Table 127–6 CREATE_SERVICE Procedure Parameters

Parameter	Description
`service_name`	Name of the service limited to 64 characters in the Data Dictionary
`network_name`	The network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET `service_names` character set (see *Oracle Database Net Services Reference*).
`goal`	The workload management goal directive for the service. Valid values: ■ `DBMS_SERVICE.GOAL_SERVICE_TIME` ■ `DBMS_SERVICE.GOAL_THROUGHPUT` ■ `DBMS_SERVICE.GOAL_NONE`
`dtp`	Declares the service to be for DTP or distributed transactions including XA transactions
`aq_ha_notifications`	Determines whether HA events are sent through AQ for this service
`failover_method`	The TAF failover method for the service
`failover_type`	The TAF failover type for the service
`failover_retries`	The TAF failover retries for the service

Table 127–6 (Cont.) CREATE_SERVICE Procedure Parameters

Parameter	Description
failover_delay	The TAF failover delay for the service
clb_goal	Method used for Connection Load Balancing (see Table 127–2, " Constants used in Connection Balancing Goal Arguments")

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.us.oracle.com','ernie.us.oracle.com');
```

DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

Syntax

```
DBMS_SERVICE.DELETE_SERVICE(
   service_name   IN VARCHAR2);
```

Parameters

Table 127–7 DELETE_SERVICE Procedure Parameters

Parameter	Description
service_name	Name of the service limited to 64 characters in the Data Dictionary

Examples

```
DBMS_SERVICE.DELETE_SERVICE('ernie.us.oracle.com');
```

DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

```
DBMS_SERVICE.DISCONNECT_SESSION(
   service_name         IN VARCHAR2,
   disconnect_option    IN NUMBER DEFAULT POST_TRANSACTION);
```

Parameters

Table 127–8 DISCONNECT_SESSION Procedure Parameters

Parameter	Description
service_name	Name of the service limited to 64 characters in the Data Dictionary
disconnect_option	There are two options, package constants expressed as NUMBER: ■ POST_TRANSACTION = 0 : the session will disconnect after the current transaction commits or rolls back ■ IMMEDIATE = 1 : sessions will be disconnected immediately **Note**: IMMEDIATE or POST_TRANSACTION will be automatically translated as 1 and 0 respectively. However, passing-in a string literal (quoted using either the ' or " characters, such as "IMMEDIATE" or 'POST_TRANSACTION') will raise an error.

Usage Notes

- This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
- This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the DBMS_JOB package or put the SQL session in background if the caller does not want to wait for all corresponding sessions disconnected.

Examples

This disconnects sessions with service_name 'ernie.us.oracle.com'.

```
DBMS_SERVICE.DISCONNECT_SESSION('ernie.us.oracle.com');
```

MODIFY_SERVICE Procedure

This procedure modifies an existing service.

> **Note:** This procedure is deprecated in databases managed by Oracle Clusterware and Oracle Restart with Release 11.2. While the procedure remains available in the package, Oracle recommends using `srvctl` to manage services. This is because the service attributes are stored in CRS by `srvctl`, and overwrite those specified by `DBMS_SERVICE`. The `DBMS_SERVICE` procedures do not update the CRS attributes and therefore are not persistent, though they do take effect immediately, until the service is next started with `srvctl`.

Syntax

```
DBMS_SERVICE.MODIFY_SERVICE(
   service_name        IN VARCHAR2,
   goal                IN NUMBER DEFAULT NULL,
   dtp                 IN BOOLEAN DEFAULT NULL,
   aq_ha_notifications IN BOOLEAN DEFAULT NULL,
   failover_method     IN VARCHAR2 DEFAULT NULL,
   failover_type       IN VARCHAR2 DEFAULT NULL,
   failover_retries    IN NUMBER DEFAULT NULL,
   failover_delay      IN NUMBER DEFAULT NULL,
   clb_goal            IN NUMBER DEFAULT NULL);
```

Parameters

Table 127–9 MODIFY_SERVICE Procedure Parameters

Parameter	Description
`service_name`	Name of the service limited to 64 characters in the Data Dictionary
`goal`	The workload management goal directive for the service. Valid values: ■ `DBMS_SERVICE.GOAL_SERVICE_TIME` ■ `DBMS_SERVICE.GOAL_THROUGHPUT` ■ `DBMS_SERVICE.GOAL_NONE`
`dtp`	Declares the service to be for DTP or distributed transactions including XA transactions
`aq_ha_notifications`	Determines whether HA events are sent through AQ for this service
`failover_method`	The TAF failover method for the service
`failover_type`	The TAF failover type for the service
`failover_retries`	The TAF failover retries for the service
`failover_delay`	The TAF failover delay for the service
`clb_goal`	Method used for Connection Load Balancing (see Table 127–2, " Constants used in Connection Balancing Goal Arguments")

Usage Notes

If you are using Clustered Managed Services with Oracle Clusterware, or using Oracle Restart with your single instance database, you should modify services using the `srvctl` command rather than `DBMS_SERVICE`. When the service is started by Oracle Clusterware or Oracle Restart, the service will be modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with `DBMS_SERVICE` will be lost unless they are also made with the corresponding `srvctl` command.

START_SERVICE Procedure

This procedure starts a service. This procedure alters the `service_name` IOP to contain this `service_name`. In RAC, implementing this option will act on the instance specified.

> **Note:** This procedure is deprecated in databases managed by Oracle Clusterware and Oracle Restart with Release 11.2. While the procedure remains available in the package, Oracle recommends using `srvctl` to manage services. This is because the service attributes are stored in CRS by `srvctl`, and overwrite those specified by `DBMS_SERVICE`. The `DBMS_SERVICE` procedures do not update the CRS attributes and therefore are not persistent, though they do take effect immediately, until the service is next started with `srvctl`.

Syntax

```
DBMS_SERVICE.START_SERVICE(
   service_name  IN VARCHAR2,
   instance_name IN VARCHAR2);
```

Parameters

Table 127–10 START_SERVICE Procedure Parameters

Parameter	Description
`service_name`	Name of the service limited to 64 characters in the Data Dictionary
`instance_name`	Name of the instance where the service should be activated (optional). The instance on which to start the service. `NULL` results in starting of the service on the local instance. In single instance this can only be the current instance or `NULL`. Specify `DBMS_SERVICE.ALL_INSTANCES` to start the service on all configured instances.

Examples

```
DBMS_SERVICE.START_SERVICE('ernie.us.oracle.com');
```

STOP_SERVICE Procedure

This procedure stops a service, altering the `service_name` IOP to remove this `service_name`.

> **Note:** This procedure is deprecated in databases managed by Oracle Clusterware and Oracle Restart with Release 11.2. While the procedure remains available in the package, Oracle recommends using `srvctl` to manage services. This is because the service attributes are stored in CRS by `srvctl`, and overwrite those specified by `DBMS_SERVICE`. The `DBMS_SERVICE` procedures do not update the CRS attributes and therefore are not persistent, though they do take effect immediately, until the service is next started with `srvctl`.

Syntax

```
DBMS_SERVICE.STOP_SERVICE(
   service_name   IN VARCHAR2,
   instance_name  IN VARCHAR2);
```

Parameters

Table 127–11 STOP_SERVICE Procedure Parameters

Parameter	Description
`service_name`	Name of the service limited to 64 characters in the Data Dictionary
`instance_name`	Name of the instance where the service should be stopped (optional). The instance on which to stop the service. `NULL` results in stopping of the service locally. In single instance this can only be the current instance or `NULL`. The default in RAC and exclusive case is `NULL`. Specify `DBMS_SERVICE.ALL_INSTANCES` to stop the service on all configured instances.

Examples

```
DBMS_SERVICE.STOP_SERVICE('ernie.us.oracle.com');
```

128

DBMS_SESSION

This package provides access to SQL `ALTER SESSION` and `SET ROLE` statements, and other session information, from PL/SQL. You can use `DBMS_SESSION` to set preferences and security levels.

This chapter contains the following topics:

- Using DBMS_SESSION
  - Security Model
  - Operational Notes
- Data Structures
- Summary of DBMS_SESSION Subprograms

Using DBMS_SESSION

- Security Model
- Operational Notes

Security Model

This package runs with the privileges of the calling user, rather than the package owner SYS.

Operational Notes

You should not attempt to turn `close_cached_open_cursors` on or off.

Data Structures

The DBMS_SESSION package defines TABLE types.

Table Types

- INTEGER_ARRAY Table Type
- LNAME_ARRAY Table Type

INTEGER_ARRAY Table Type

A table type of `BINARY_INTEGER`.

Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

LNAME_ARRAY Table Type

A table type of VARCHAR2.

Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_SESSION Subprograms

Table 128–1 DBMS_SESSION Package Subprograms

Subprogram	Description
CLEAR_ALL_CONTEXT Procedure on page 128-9	Clears all context information
CLEAR_CONTEXT Procedure on page 128-10	Clears the context
CLEAR_IDENTIFIER Procedure on page 128-11	Clears the identifier
CLOSE_DATABASE_LINK Procedure on page 128-12	Closes database link
FREE_UNUSED_USER_MEMORY Procedure on page 128-13	Lets you reclaim unused memory after performing operations requiring large amounts of memory
GET_PACKAGE_MEMORY_ UTILIZATION Procedure on page 128-15	Describes static package memory usage
IS_ROLE_ENABLED Function on page 128-16	Determines if the named role is enabled for the session.
IS_SESSION_ALIVE Function on page 128-17	Determines if the specified session is active
LIST_CONTEXT Procedures on page 128-18	Returns a list of active namespace and context for the current session
SESSION _TRACE_DISABLE Procedure on page 128-23	Resets the session-level SQL trace for the session from which it was called.
SESSION _TRACE_ENABLE Procedure on page 128-24	Enables session-level SQL trace for the invoking session
RESET_PACKAGE Procedure on page 128-25	De-instantiates all packages in the session
SET_CONTEXT Procedure on page 128-27	Sets or resets the value of a context attribute
SET_EDITION_DEFERRED Procedure on page 128-29	Requests a switch to the specified edition
SET_IDENTIFIER Procedure on page 128-30	Sets the identifier
SET_NLS Procedure on page 128-31	Sets Globalization Support (NLS)
SET_ROLE Procedure on page 128-32	Sets role
SET_SQL_TRACE Procedure on page 128-33	Turns tracing on or off
SWITCH_CURRENT_ CONSUMER_GROUP Procedure on page 128-34	Facilitates changing the current resource consumer group of a user's current session
UNIQUE_SESSION_ID Function on page 128-36	Returns an identifier that is unique for all sessions currently connected to this database

CLEAR_ALL_CONTEXT Procedure

Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT
   namespace          VARCHAR2);
```

Parameters

Table 128–2 CLEAR_ALL_CONTEXT Procedure Parameters

Parameter	Description
namespace	The namespace where the application context information is to be cleared. Required.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

CLEAR_CONTEXT Procedure

Syntax

```
DBMS_SESSION.CLEAR_CONTEXT
   namespace         VARCHAR2,
   client_identifier VARCHAR2
   attribute         VARCHAR2);
```

Parameters

Table 128–3 CLEAR_CONTEXT Procedure Parameters

Parameter	Description
namespace	Namespace in which the application context is to be cleared. Required. For a session-local context, namespace must be specified. If namespace is defined as Session Local Context, then client_identifier is optional since it is only associated with a globally accessed context. For a globally accessed context, namespace must be specified. NULL is a valid value for client_identifier because a session with no identifier set can see a context that looks like the (namespace, attribute, value, username, null) set using SET_CONTEXT.
client_ identifier	Applies to a global context and is optional for other types of contexts; 64-byte maximum
attribute	Specific attribute in the namespace to be cleared. Optional. the default is NULL. If you specify attribute as NULL, then (namespace, attribute, value) for that namespace are cleared from the session. If attribute is not specified, then all context information that has the namespace and client_ identifier arguments is cleared.

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through SYS_CONTEXT return the most recent value.

CLEAR_IDENTIFIER Procedure

This procedure removes the `set_client_id` in the session.

Syntax

```
DBMS_SESSION.CLEAR_IDENTIFIER;
```

Usage Notes

This procedure is executable by public.

CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement:

```
ALTER SESSION CLOSE DATABASE LINK <name>
```

Syntax

```
DBMS_SESSION.CLOSE_DATABASE_LINK (
   dblink VARCHAR2);
```

Parameters

Table 128–4 CLOSE_DATABASE_LINK Procedure Parameters

Parameter	Description
dblink	Name of the database link to close

FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

- Large sorting where entire `sort_area_size` is used and `sort_area_size` is hundreds of KB.
- Compiling large PL/SQL packages, procedures, or functions.
- Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the `v$sesstat` or `v$statname` fixed views. Monitoring these statistics also shows how much memory this procedure has freed.

> **Note:** This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

Syntax

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

Return Values

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server**: This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server**: This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

Usage Notes

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA

memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared.After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure `FREE_UNUSED_USER_MEMORY`.

```
CREATE PACKAGE foobar
   type number_idx_tbl is table of number indexed by binary_integer;

   store1_table  number_idx_tbl;     --  PL/SQL indexed table
   store2_table  number_idx_tbl;     --  PL/SQL indexed table
   store3_table  number_idx_tbl;     --  PL/SQL indexed table
   ...
END;            --  end of foobar

DECLARE
   ...
   empty_table   number_idx_tbl;     --  uninitialized ("empty") version
BEGIN
   FOR i in 1..1000000 loop
     store1_table(i) := i;           --  load data
   END LOOP;
   ...
   store1_table := empty_table;      --  "truncate" the indexed table
   ...
   -
   dbms_session.free_unused_user_memory;  -- give memory back to system

   store1_table(1) := 100;           --  index tables still declared;
   store2_table(2) := 200;           --  but truncated.
   ...
END;
```

GET_PACKAGE_MEMORY_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the FREE_UNUSED_USER_MEMORY Procedure is invoked.

Syntax

```
DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION (
   owner_names     OUT NOCOPY LNAME_ARRAY,
   unit_names      OUT NOCOPY LNAME_ARRAY,
   unit_types      OUT NOCOPY INTEGER_ARRAY,
   used_amounts    OUT NOCOPY INTEGER_ARRAY,
   free_amounts    OUT NOCOPY INTEGER_ARRAY);
```

Parameters

Table 128–5 GET_PACKAGE_MEMORY_UTILIZATION Function Parameters

Parameter	Description
owner_name	Owner of package
unit_name	Name of package
unit_types	Value of the type# columns of the dictionary table obj$
used_amounts	Amount of allocated memory specified in bytes
free_amounts	Amount of available memory specified in bytes

IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Syntax

```
DBMS_SESSION.IS_ROLE_ENABLED (
   rolename    VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 128–6 IS_ROLE_ENABLED Function Parameters

Parameter	Description
rolename	Name of the role.\

Return Values

Table 128–7 IS_ROLE_ENABLED Function Return Values

Return	Description
is_role_enabled	TRUE or FALSE, depending on whether the role is enabled

IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

```
DBMS_SESSION.IS_SESSION_ALIVE (
   uniqueid VARCHAR2)
  RETURN BOOLEAN;
```

Parameters

Table 128–8 IS_SESSION_ALIVE Function Parameters

Parameter	Description
uniqueid	Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.

Return Values

Table 128–9 IS_SESSION_ALIVE Function Return Values

Return	Description
is_session_alive	TRUE or FALSE, depending on whether the session is active

LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```
TYPE AppCtxRecTyp IS RECORD (
   namespace VARCHAR2(30),
   attribute VARCHAR2(30),
   value     VARCHAR2(256));

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
   list OUT AppCtxTabTyp,
   size OUT NUMBER);
```

Parameters

Table 128–10 LIST_CONTEXT Procedure Parameters

Parameter	Description
`list`	Buffer to store a list of application context set in the current session

Return Values

Table 128–11 LIST_CONTEXT Procedure Return Values

Return	Description
`list`	A list of (namespace, attribute, values) set in current session
`size`	Returns the number of entries in the buffer returned

Usage Notes

The context information in the list appears as a series of <namespace> <attribute> <value>. Because `list` is a table type variable, its size is dynamically adjusted to the size of returned list.

MODIFY_PACKAGE_STATE Procedure

This procedure can be used to perform various actions (as specified by the `action_flags` parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running. The procedure uses the `DBMS_SESSION` constants listed in Table 128–13.

Syntax

```
DBMS_SESSION.MODIFY_PACKAGE_STATE(
   action_flags IN PLS_INTEGER);
```

Parameters

Table 128–12 MODIFY_PACKAGE_STATE Procedure Parameters

Parameter	Description
`action_flags`	Bit flags that determine the action taken on PL/SQL program units: `DBMS_SESSION.FREE_ALL_RESOURCES` (or `1`)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking `MODIFY_PACKAGE_STATE` with the `DBMS_SESSION.FREE_ALL_RESOURCES` parameter provides functionality identical to the `DBMS_SESSION.RESET_PACKAGE()` interface. `DBMS_SESSION.REINITIALIZE` (or `2`)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the `DBMS_SESSION.REINITIALIZE` flag is similar to the `DBMS_SESSION.FREE_ALL_RESOURCES` flag in that both have the effect of reinitializing all packages. However, `DBMS_SESSION.REINITIALIZE` should exhibit better performance than the `DBMS_SESSION.FREE_ALL_RESOURCES` option because: ▪ Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused. ▪ Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use. ▪ The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated.

Usage Notes

See the parameter descriptions in Table 128–14 for the differences between the flags and why DBMS_SESSION.REINITIALIZE exhibits better performance than DBMS_SESSION.FREE_ALL_RESOURCES.

Table 128–13 Action_flags Constants for MODIFY_PACKAGE_STATE

Constant	Description
FREE_ALL_RESOURCES	PLS_INTEGER:= 1
REINITIALIZE	PLS_INTEGER:= 2

- Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```
package P is
  n number;
  m number := P2.foo;
  d date := SYSDATE;
  cursor c is select * from emp;
  procedure bar;
end P;
/
package body P is
  v   varchar2(20) := 'hello';
  procedure bar is
  begin
    ...
  end;
  procedure init_pkg is
  begin
    ....
  end;
begin
  -- initialization block
  init_pkg;
  ...
  ...
end P;
/
```

For the package P, reinitialization involves:

- Setting P.n to NULL
- Invoking function P2.foo and setting P.m to the value returned from P2.foo
- Setting P.d to the return value of SYSDATE built-in
- Closing cursor P.c if it was previously opened
- Setting P.v to 'hello'
- Running the initialization block in the package body
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.

- When using FREE_ALL_RESOURCES or REINITIALIZE, make sure that resetting package variable values does not affect the application.
- Because DBMS_SESSION.REINITIALIZE does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the FREE_ALL_RESOURCES flag or the RESET_PACKAGE procedure had been used. For instance, after performing DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE), if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until DBMS_SESSION.RESET_PACKAGE is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example, DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE) does not compile on the client because it uses the constant DBMS_SESSION.REINITIALIZE.

  Instead, use DBMS_SESSION.MODIFY_PACKAGE_STATE(2) on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of DBMS_SESSION.MODIFY_PACKAGE_STATE. Consider a package P with some global state (a cursor c and a number cnt). When the package is first initialized, the package variable cnt is 0 and the cursor c is CLOSED. Then, in the session, change the value of cnt to 111 and also execute an OPEN operation on the cursor. If you call print_status to display the state of the package, you see that cnt is 111 and that the cursor is OPEN. Next, call DBMS_SESSION.MODIFY_PACKAGE_STATE. If you print the status of the package P again using print_status, you see that cnt is 0 again and the cursor is CLOSED. If the call to DBMS_SESSION.MODIFY_PACKAGE_STATE had not been made, then the second print_status would have printed 111 and OPEN.

```
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
  begin
    dbms_output.put_line('P.cnt = ' || cnt);
    if c%ISOPEN then
      dbms_output.put_line('P.c is OPEN');
    else
      dbms_output.put_line('P.c is CLOSED');
    end if;
  end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2   P.cnt := 111;
  3   open p.c;
```

```
  4   P.print_status;
  5  end;
  6  /
P.cnt = 111
P.c is OPEN

PL/SQL procedure successfully completed.

SQL> begin
  2   dbms_session.modify_package_state(dbms_session.reinitialize);
  3  end;
  4  /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
SQL>
SQL> begin
  2   P.print_status;
  3  end;
  4  /
P.cnt = 0
P.c is CLOSED

PL/SQL procedure successfully completed.
```

SESSION _TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE;
```

SESSION _TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

```
DBMS_SESSION.SESSION_TRACE_ENABLE(
   waits     IN   BOOLEAN DEFAULT TRUE,
   binds     IN   BOOLEAN DEFAULT FALSE,
   plan_stat IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 128–14 SESSION_TRACE_ENABLE Procedure Parameters

Parameter	Description
`waits`	Specifies if wait information is to be traced
`binds`	Specifies if bind information is to be traced
`plan_stat`	Frequency at which we dump row source statistics. Value should be '`NEVER`', '`FIRST_EXECUTION`' (equivalent to `NULL`) or '`ALL_EXECUTIONS`'.

RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

> **Note:** See "SESSION _TRACE_ENABLE Procedure" on page 128-24. The MODIFY_PACKAGE_STATE interface, introduced in Oracle9i, provides an equivalent of the RESET_PACKAGE capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to `RESET_PACKAGE` frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

`RESET_PACKAGE` can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. `RESET_PACKAGE` guarantees that all package variables are reset to their initial values.

Syntax

```
DBMS_SESSION.RESET_PACKAGE;
```

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use `RESET_PACKAGE` to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

`RESET_PACKAGE` does not free the memory, cursors, and package variables immediately when called.

> **Note:** `RESET_PACKAGE` only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure `P1` calls PL/SQL procedure `P2`, and `P2` calls `RESET_PACKAGE`. The `RESET_PACKAGE` effects do not occur until procedure `P1` finishes execution (the PL/SQL call ends).

Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```
EXECUTE large_plsql_program2;
```

SET_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of its five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

Syntax

```
DBMS_SESSION.SET_CONTEXT (
   namespace VARCHAR2,
   attribute VARCHAR2,
   value     VARCHAR2,
   username  VARCHAR2,
   client_id VARCHAR2 );
```

Parameters

Table 128–15 SET_CONTEXT Procedure Parameters

Parameter	Description
namespace	Namespace of the application context to be set, limited to 30 bytes
attribute	Attribute of the application context to be set, limited to 30 bytes
value	Value of the application context to be set, limited to 4 kilobytes.
username	Database username attribute of the application context. Default: NULL
client_id	Application-specific client_id attribute of the application context (64-byte maximum). Default: NULL

Usage Notes

- For 8i compatibility, only the first three parameters are used.
- The first three parameters are required for all types of context.
- The username parameter must be a valid SQL identifier.
- The client_id parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for set_identifier.
- If the namespace parameter is a global context namespace, then the username parameter is matched against the current database user name in the session, and the client_id parameter is matched against the current client_id in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.
- This procedure must be invoked directly or indirectly by the trusted package.
- The caller of SET_CONTEXT must be in the calling stack of a procedure that has been associated to the context namespace through a CREATE CONTEXT statement. The checking of the calling stack does not cross a DBMS boundary.
- No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.

- If the value of the parameter in the namespace has been set, `SET_CONTEXT` overwrites this value.
- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

See Also: *Oracle Database Security Guide* for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"

SET_EDITION_DEFERRED Procedure

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

Syntax

```
DBMS_SESSION.SET_EDITION_DEFERRED (
   edition    IN    VARCHAR2);
```

Parameters

Table 128–16 SET_CONTEXT Procedure Parameters

Parameter	Description
`edition`	Name of the edition to which to switch. The contents of the string are processed as a SQL identifier; double-quotes must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name and, if double-quotes are not used, the contents are set in uppercase. The caller must have `USE` privilege on the named edition.

SET_IDENTIFIER Procedure

This procedure sets the client ID in the session.

Syntax

```
DBMS_SESSION.SET_IDENTIFIER (
   client_id VARCHAR2);
```

Parameters

Table 128–17 SET_IDENTIFIER Procedure Parameters

Parameter	Description
client_id	The application-specific identifier of the current database session

Usage Notes

Note the following:

- SET_IDENTIFIER initializes the current session with a client identifier to identify the associated global application context
- client_id is case sensitive; it must match the client_id parameter in the set_context
- This procedure is executable by public

SET_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the following SQL statement:

```
ALTER SESSION SET <nls_parameter> = <value>
```

Syntax

```
DBMS_SESSION.SET_NLS (
   param VARCHAR2,
   value VARCHAR2);
```

Parameters

Table 128–18 SET_NLS Procedure Parameters

Parameter	Description
`param`	Globalization Support parameter. The parameter name must begin with 'NLS'.
`value`	Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, "`set_nls ('nls_date_format','"DD-MON-YY"')`".

SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the `SET ROLE` SQL statement.

Syntax

```
DBMS_SESSION.SET_ROLE (
   role_cmd VARCHAR2);
```

Parameters

Table 128–19 SET_ROLE Procedure Parameters

Parameter	Description
`role_cmd`	Text is appended to "set role" and then run as SQL

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the following SQL statement:

```
ALTER SESSION SET SQL_TRACE ...
```

Syntax

```
DBMS_SESSION.SET_SQL_TRACE (
   sql_trace boolean);
```

Parameters

Table 128–20 SET_SQL_TRACE Procedure Parameters

Parameter	Description
sql_trace	TRUE turns tracing on, FALSE turns tracing off

SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```
DBMS_SESSION.switch_current_consumer_group (
   new_consumer_group     IN  VARCHAR2,
   old_consumer_group     OUT VARCHAR2,
   initial_group_on_error IN  BOOLEAN);
```

Parameters

Table 128–21 SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters

Parameter	Description
new_consumer_group	Name of consumer group to which you want to switch
old_consumer_group	Name of the consumer group from which you just switched out
initial_group_on_error	If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error

Return Values

This procedure outputs the old consumer group of the user in the parameter old_consumer_group.

Note: You can switch back to the old consumer group later using the value returned in old_consumer_group.

Exceptions

Table 128–22 SWITCH_CURRENT_CONSUMER_GROUP Procedure Exceptions

Exception	Description
29368	Non-existent consumer group
1031	Insufficient privileges
29396	Cannot switch to OTHER_GROUPS consumer group

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched (old_consumer_group) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting initial_group_on_error to TRUE, SWITCH_CURRENT_CONSUMER_GROUP puts the current session into the default group, if it can't put it into the group designated by new_consumer_group. The error associated with the attempt to move

a session into new_consumer_group is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

```
CREATE OR REPLACE PROCEDURE high_priority_task is
   old_group varchar2(30);
   prev_group varchar2(30);
   curr_user varchar2(30);
BEGIN
  -- switch invoker to privileged consumer group. If we fail to do so, an
  -- error is thrown, but the consumer group does not change
  -- because 'initial_group_on_error' is set to FALSE

  dbms_session.switch_current_consumer_group('tkrogrp1', old_group, FALSE);
  -- set up exception handler (in the event of an error, we do not want to
  -- return to caller while leaving the session still in the privileged
  -- group)

  BEGIN
    -- perform some operations while under privileged group

  EXCEPTION
    WHEN OTHERS THEN
     -- It is possible that the procedure owner does not have privileges
     -- on old_group. 'initial_group_on_error' is set to TRUE to make sure
     -- that the user is moved out of the privileged group in such a
     -- situation

     dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
     RAISE;
    END;

  -- we've succeeded. Now switch to old_group, or if cannot do so, switch
  -- to caller's initial consumer group

  dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END high_priority_task;
/
```

UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

```
DBMS_SESSION.UNIQUE_SESSION_ID
  RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);
```

Return Values

Table 128–23 UNIQUE_SESSION_ID Function Return Values

Return	Description
`unique_session_id`	Returns up to 24 bytes

129

DBMS_SHARED_POOL

The DBMS_SHARED_POOL package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. DBMS_SHARED_POOL enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- Using DBMS_SHARED_POOL
  - Overview
  - Operational Notes
- Summary of DBMS_SHARED_POOL Subprograms

Using DBMS_SHARED_POOL

- Overview
- Operational Notes

Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

DBMS_SHARED_POOL is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, DBMS_SHARED_POOL supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. DBMS_SHARED_POOL is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

Operational Notes

To create DBMS_SHARED_POOL, run the DBMSPOOL.SQL script. The PRVTPOOL.PLB script is automatically executed after DBMSPOOL.SQL runs. These scripts are *not* run by as part of standard database creation.

Summary of DBMS_SHARED_POOL Subprograms

Table 129–1 DBMS_SHARED_POOL Package Subprograms

Subprogram	Description
ABORTED_REQUEST_ THRESHOLD Procedure on page 129-6	Sets the aborted request threshold for the shared pool
KEEP Procedure on page 129-7	Keeps an object in the shared pool
PURGE Procedure on page 129-9	Purges the named object or specified heap(s) of the object
SIZES Procedure on page 129-10	Shows objects in the shared pool that are larger than the specified size
UNKEEP Procedure on page 129-11	Unkeeps the named object

ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

Syntax

```
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (
   threshold_size NUMBER);
```

Parameters

Table 129–2 ABORTED_REQUEST_THRESHOLD Procedure Parameters

Parameter	Description
`threshold_size`	Size, in bytes, of a request which does not try to free unpinned (not "unkeep-ed") memory within the shared pool. The range of `threshold_size` is 5000 to ~2 GB inclusive.

Exceptions

An exception is raised if the threshold is not in the valid range.

Usage Notes

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an '`ALTER SYSTEM FLUSH SHARED_POOL`'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than `thresh_hold` size. This user gets the 'out of memory' error without attempting to search the LRU list.

KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

Syntax

```
DBMS_SHARED_POOL.KEEP (
   name VARCHAR2,
   flag CHAR      DEFAULT 'P');
```

Parameters

Table 129–3 KEEP Procedure Parameters

Parameter	Description
name	Name of the object to keep. The value for this identifier is the concatenation of the address and hash_value columns from the v$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be kept.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.

Exceptions

An exception is raised if the named object cannot be found.

Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, and types which are specified by name
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).

For example:

```
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte

names are allowed). A cursor can be kept by `DBMS_SHARED_POOL.KEEP('0034CDFF, 20348871','C'),0034CDFF` being the `ADDRESS` and `20348871` the `HASH_VALUE`. Note that the complete hexadecimal address must be in the first 8 characters.

PURGE Procedure

This procedure purges the named object or specified heap(s) of the object.

Syntax

```
DBMS_SHARED_POOL.PURGE (
   name    VARCHAR2,
   flag    CHAR DEFAULT 'P',
   heaps   NUMBER DEFAULT 1)
```

Parameters

Table 129–4 PURGE Procedure Parameters

Parameter	Description
name	Name of the object to purge. The value for this identifier is the concatenation of the address and hash_value columns from the v$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be purged.
flag	(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.
heaps	Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1<<0 | 1<<6 => hex 0x41 => decimal 65, so specify heaps =>65. Default is 1, that is, heap 0 which means the whole object would be purged

Exceptions

ORA-6570: An exception is raised if the named object cannot be found

ORA-6570: An object cannot be purged it marked as permanently kept

Usage Notes

All objects supported by the KEEP Procedure are supported for PURGE.

SIZES Procedure

This procedure shows objects in the `shared_pool` that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the `KEEP` or `UNKEEP` calls.

Syntax

```
DBMS_SHARED_POOL.SIZES (
   minsize NUMBER);
```

Parameters

Table 129–5 SIZES Procedure Parameters

Parameter	Description
`minsize`	Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.

Usage Notes

Issue the SQLDBA or SQLPLUS `'SET SERVEROUTPUT ON SIZE XXXXX'` command prior to using this procedure so that the results are displayed.

UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

```
DBMS_SHARED_POOL.UNKEEP (
   name VARCHAR2,
   flag CHAR     DEFAULT 'P');
```

Caution: This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

Table 129–6 UNKEEP Procedure Parameters

Parameter	Description
`name`	Name of the object to unkeep. See description of the `name` object for the `KEEP` procedure.
`flag`	See description of the flag parameter for the `KEEP` procedure.

Exceptions

An exception is raised if the named object cannot be found.

130

DBMS_SPACE

The DBMS_SPACE package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- Using DBMS_SPACE
  - Security Model
- Data Structures
- Summary of DBMS_SPACE Subprograms

Using DBMS_SPACE

- Security Model
-

Security Model

This package runs with SYS privileges. The execution privilege is granted to PUBLIC. Subprograms in this package run under the caller security. The user must have ANALYZE privilege on the object.

Data Structures

The DBMS_SPACE package defines an OBJECT type, a RECORD type, and a TABLE type.

OBJECT Types

CREATE_TABLE_COST_COLINFO Object Type

RECORD Types

ASA_RECO_ROW Record Type

TABLE Types

ASA_RECO_ROW_TB Table Type

CREATE_TABLE_COST_COLINFO Object Type

This type describes the data type and size of a column in the table.

Syntax

```
TYPE create_table_cost_colinfo IS OBJECT(
    col_type    VARCHAR(200),
    col_size    NUMBER)
```

Attributes

Table 130–1 CQ_NOTIFICATION$_DESCRIPTOR Object Type

Attribute	Description
col_type	Column type
col_size	Column size

ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the ASA_RECOMMENDATIONS Function.

Syntax

```
TYPE asa_reco_row IS RECORD (
   tablespace_name       VARCHAR2(30),
   segment_owner         VARCHAR2(30),
   segment_name          VARCHAR2(30),
   segment_type          VARCHAR2(18),
   partition_name        VARCHAR2(30),
   allocated_space       NUMBER,
   used_space            NUMBER,
   reclaimable_space     NUMBER,
   chain_rowexcess       NUMBER,
   recommendations       VARCHAR2(1000),
   c1                    VARCHAR2(1000),
   c2                    VARCHAR2(1000),
   c3                    VARCHAR2(1000),
   task_id               NUMBER,
   mesg_id               NUMBER);
```

Attributes

Table 130–2 ASA_RECO_ROW Attributes

Field	Description
tablespace_name	Name of the tablespace containing the object
segment_owner	Name of the schema
segment_name	Name of the object
segment_type	Type of the segment 'TABLE','INDEX' and so on
partition_name	Name of the partition
allocated_space	Space allocated to the segment
used_space	Space actually used by the segment
reclaimable_space	Reclaimable free space in the segment
chain_rowexcess	Percentage of excess chain row pieces that can be eliminated
recommendations	Recommendation or finding for this segment
c1	Command associated with the recommendation
c2	Command associated with the recommendation
c3	Command associated with the recommendation
task_id	Advisor Task that processed this segment
mesg_id	Message ID corresponding to the recommendation

ASA_RECO_ROW_TB Table Type

Syntax

```
TYPE asa_reco_row_tb IS TABLE OF asa_reco_row;
```

Summary of DBMS_SPACE Subprograms

Table 130–3 DBMS_SPACE Package Subprograms

Subprogram	Description
ASA_RECOMMENDATIONS Function on page 130-9	Returns recommendations/findings of segment advisor run automatically by the system or manually invoked by the user
CREATE_INDEX_COST Procedure on page 130-10	Determines the cost of creating an index on an existing table
CREATE_TABLE_COST Procedures on page 130-11	Determines the size of the table given various attributes
FREE_BLOCKS Procedure on page 130-13	Returns information about free blocks in an object (table, index, or cluster)
ISDATAFILEDROPPABLE_NAME Procedure on page 130-15	Checks whether a datafile is droppable
OBJECT_DEPENDENT_SEGMENTS Function on page 130-16	Returns the list of segments that are associated with the object
OBJECT_GROWTH_TREND Function on page 130-18	A table function where each row describes the space usage of the object at a specific point in time
SPACE_USAGE Procedures on page 130-20	Returns information about free blocks in an auto segment space managed segment
UNUSED_SPACE Procedure on page 130-23	Returns information about unused space in an object (table, index, or cluster)

ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```
DBMS_SPACE.ASA_RECOMMENDATIONS (
   all_runs        IN    VARCHAR2 DEFAULT := TRUE,
   show_manual     IN    VARCHAR2 DEFAULT := TRUE,
   show_findings   IN    VARCHAR2 DEFAULT := FALSE)
 RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

Table 130–4 ASA_RECOMMENDATIONS Procedure Parameters

Parameter	Description
`all_runs`	If `TRUE`, returns recommendations/findings for all runs of auto segment advisor. If `FALSE`, returns the results of the `LATEST` run only. `LATEST` does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.
`show_manual`	If `TRUE`, we show the results of manual invocations only. The auto advisor results are excluded. If `FALSE`, results of manual invocation of segment advisor are not returned.
`show_findings`	Show only the findings instead of the recommendations

CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```
DBMS_SPACE.CREATE_INDEX_COST (
   ddl             IN    VARCHAR2,
   used_bytes      OUT   NUMBER,
   alloc_bytes     OUT   NUMBER,
   plan_table      IN    VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(create_index_cost,WNDS);
```

Parameters

Table 130–5 CREATE_INDEX_COST Procedure Parameters

Parameter	Description
`ddl`	The create index DDL statement
`used_bytes`	The number of bytes representing the actual index data
`alloc_bytes`	Size of the index when created in the tablespace
`plan_table`	Which plan table to use, default `NULL`

Usage Notes

- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

Syntax

```
DBMS_SPACE.CREATE_TABLE_COST (
   tablespace_name    IN VARCHAR2,
   avg_row_size       IN NUMBER,
   row_count          IN NUMBER,
   pct_free           IN NUMBER,
   used_bytes         OUT NUMBER,
   alloc_bytes        OUT NUMBER);

DBMS_SPACE.CREATE_TABLE_COST (
   tablespace_name    IN VARCHAR2,
   colinfos           IN CREATE_TABLE_COST_COLUMNS,
   row_count          IN NUMBER,
   pct_free           IN NUMBER,
   used_bytes         OUT NUMBER,
   alloc_bytes        OUT NUMBER);

CREATE TYPE create_table_cost_colinfo IS OBJECT (
   COL_TYPE   VARCHAR(200),
   COL_SIZE   NUMBER);
```

Parameters

Table 130–6 CREATE_TABLE_COST Procedure Parameters

Parameter	Description
tablespace_name	The tablespace in which the object will be created. The default is SYSTEM tablespace.
avg_row_size	The anticipated average row size in the table
colinfos	The description of the columns
row_count	The anticipated number of rows in the table
pct_free	The percentage of free space in each block for future expansion of existing rows due to updates
used_bytes	The space used by user data
alloc_bytes	The size of the object taking into account the tablespace extent characteristics

Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, pctfree etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
 ub NUMBER;
 ab NUMBER;
 cl sys.create_table_cost_columns;
BEGIN
  cl := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
        sys.create_table_cost_colinfo('VARCHAR2',30),
        sys.create_table_cost_colinfo('VARCHAR2',30),
        sys.create_table_cost_colinfo('DATE',NULL));

  DBMS_SPACE.CREATE_TABLE_COST('SYSTEM',cl,100000,0,ub,ab);

  DBMS_OUTPUT.PUT_LINE('Used Bytes: ' || TO_CHAR(ub));
  DBMS_OUTPUT.PUT_LINE('Alloc Bytes: ' || TO_CHAR(ab));
END;
/
```

FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster). See SPACE_USAGE Procedures for returning free block information in an auto segment space managed segment.

Syntax

```
DBMS_SPACE.FREE_BLOCKS (
   segment_owner     IN  VARCHAR2,
   segment_name      IN  VARCHAR2,
   segment_type      IN  VARCHAR2,
   freelist_group_id IN  NUMBER,
   free_blks         OUT NUMBER,
   scan_limit        IN  NUMBER DEFAULT NULL,
   partition_name    IN  VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 130–7 FREE_BLOCKS Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): ■ TABLE ■ TABLE PARTITION ■ TABLE SUBPARTITION ■ INDEX ■ INDEX PARTITION ■ INDEX SUBPARTITION ■ CLUSTER ■ LOB ■ LOB PARTITION ■ LOB SUBPARTITION
freelist_group_id	Freelist group (instance) whose free list size is to be computed
free_blks	Returns count of free blocks for the specified group
scan_limit	Maximum number of free list blocks to read (optional). Use a scan limit of X you are interested only in the question, "Do I have X blocks on the free list?"
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite.

Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

Note: An error is raised if `scan_limit` is not a positive number.

ISDATAFILEDROPPABLE_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

Syntax

```
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (
   filename     IN     VARCHAR2,
   retval       OUT    NUMBER);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 130–8 ISDATAFILEDROPPABLE_NAME Procedure Parameters

Parameter	Description
`filename`	Name of the file
`retval`	Values: `0` if the file is not droppable, `1` if the file is droppable.

Examples

```
DECLARE
   fname    VARCHAR2(100);
   retval   NUMBER;
BEGIN
   SELECT file_name
   INTO fname
   FROM dba_data_files
   WHERE file_name like '%empty%';

DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname, retval);
DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS(
   objowner     IN     VARCHAR2,
   objname      IN     VARCHAR2,
   partname     IN     VARCHAR2,
   objtype      IN     NUMBER)
  RETURN dependent_segments_table PIPELINED;
```

Parameters

Table 130–9 OBJECT_DEPENDENT_SEGMENTS Function Parameters

Parameter	Description
objowner	The schema containing the object
objname	The name of the object
partname	The name of the partition
objtype	Type of the object: ■ OBJECT_TYPE_TABLE constant positive := 1; ■ OBJECT_TYPE_NESTED_TABLE constant positive := 2; ■ OBJECT_TYPE_INDEX constant positive := 3; ■ OBJECT_TYPE_CLUSTER constant positive := 4; ■ OBJECT_TYPE_TABLE_PARTITION constant positive := 7; ■ OBJECT_TYPE_INDEX_PARTITION constant positive := 8; ■ OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9; ■ OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10; ■ OBJECT_TYPE_MV constant positive := 13; ■ OBJECT_TYPE_MVLOG constant positive := 14;

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD (
   segment_owner      VARCHAR2(100),
   segment_name       VARCHAR2(100),
   segment_type       VARCHAR2(100),
   tablespace_name    VARCHAR2(100),
   partition_name     VARCHAR2(100),
```

```
  lob_column_name    VARCHAR2(100));
```

Table 130–10 OBJECT_DEPENDENT_SEGMENT Type Parameters

Parameter	Description
segment_owner	The schema containing the segment
segment_name	The name of the segment
segmemnt_type	The type of the segment, such as table, index or LOB
tablespace_name	The name of the tablespace
partition_name	The name of the partition, if any
lob_column_name	The name of the LOB column, if any

OBJECT_GROWTH_TREND Function

This is a table function. The output will be in the form of one or more rows where each row describes the space usage of the object at a specific point in time. Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```
DBMS_SPACE.OBJECT_GROWTH_TREND (
   object_owner           IN    VARCHAR2,
   object_name            IN    VARCHAR2,
   object_type            IN    VARCHAR2,
   partition_name         IN    VARCHAR2 DEFAULT NULL,
   start_time             IN    TIMESTAMP DEFAULT NULL,
   end_time               IN    TIMESTAMP DEFAULT NULL,
   interval               IN    DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
   skip_interpolated      IN    VARCHAR2 DEFAULT 'FALSE',
   timeout_seconds        IN    NUMBER DEFAULT NULL,
   single_datapoint_flag  IN    VARCHAR2 DEFAULT 'TRUE')
 RETURN object_growth_trend_table PIPELINED;
```

Parameters

Table 130–11 OBJECT_GROWTH_TREND Function Parameters

Parameter	Description
`object_owner`	The schema containing the object
`object_name`	The name of the object
`object_type`	The type of the object
`partition_name`	The name of the partition
`start_time`	Statistics generated after this time will be used in generating the growth trend
`end_time`	Statistics generated until this time will be used in generating the growth trend
`interval`	The interval at which to sample
`skip_interpolated`	Whether interpolation of missing values should be skipped
`timeout_seconds`	The time-out value for the function in seconds
`single_data_point_flag`	Whether in the absence of statistics the segment should be sampled

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```
TYPE object_growth_trend_row IS RECORD(
   timepoint      TIMESTAMP,
   space_usage    NUMBER,
   space_alloc    NUMBER,
   quality        VARCHAR(20));
```

Table 130–12 OBJECT_GROWTH_TREND_ROW Type Parameters

Parameter	Description
`timepoint`	The time at which the statistic was recorded
`space_usage`	The space used by data
`space_alloc`	The size of the segment including overhead and unused space
`quality`	The quality of result: "`GOOD`", "`INTERPOLATED`", "`PROJECTION`"

```
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

SPACE_USAGE Procedures

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBs, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBs.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBs in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBs.

Syntax

```
DBMS_SPACE.SPACE_USAGE(
   segment_owner           IN  VARCHAR2,
   segment_name            IN  VARCHAR2,
   segment_type            IN  VARCHAR2,
   unformatted_blocks      OUT NUMBER,
   unformatted_bytes       OUT NUMBER,
   fs1_blocks              OUT NUMBER,
   fs1_bytes               OUT NUMBER,
   fs2_blocks              OUT NUMBER,
   fs2_bytes               OUT NUMBER,
   fs3_blocks              OUT NUMBER,
   fs3_bytes               OUT NUMBER,
   fs4_blocks              OUT NUMBER,
   fs4_bytes               OUT NUMBER,
   full_blocks             OUT NUMBER,
   full_bytes              OUT NUMBER,
   partition_name          IN  VARCHAR2 DEFAULT NULL);

DBMS_SPACE.SPACE_USAGE(
   segment_owner           IN    VARCHAR2,
   segment_name            IN    VARCHAR2,
   segment_type            IN    VARCHAR2,
   segment_size_blocks     OUT   NUMBER,
   segment_size_bytes      OUT   NUMBER,
   used_blocks             OUT   NUMBER,
   used_bytes              OUT   NUMBER,
   expired_blocks          OUT   NUMBER,
   expired_bytes           OUT   NUMBER,
   unexpired_blocks        OUT   NUMBER,
   unexpired_bytes         OUT   NUMBER,
   partition_name          IN    VARCHAR2 DEFAULT NULL);
```

Parameters

Table 130–13 SPACE_USAGE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Name of the segment to be analyzed
partition_name	Partition name of the segment to be analyzed

Table 130–13 (Cont.) SPACE_USAGE Procedure Parameters

Parameter	Description
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): ■ TABLE ■ TABLE PARTITION ■ TABLE SUBPARTITION ■ INDEX ■ INDEX PARTITION ■ INDEX SUBPARTITION ■ CLUSTER ■ LOB ■ LOB PARTITION ■ LOB SUBPARTITION
unformatted_blocks	Total number of blocks unformatted
unformatted bytes	Total number of bytes unformatted
fs1_blocks	Number of blocks having at least 0 to 25% free space
fs1_bytes	Number of bytes having at least 0 to 25% free space
fs2_blocks	Number of blocks having at least 25 to 50% free space
fs2_bytes	Number of bytes having at least 25 to 50% free space
fs3_blocks	Number of blocks having at least 50 to 75% free space
fs3_bytes	Number of bytes having at least 50 to 75% free space
fs4_blocks	Number of blocks having at least 75 to 100% free space
fs4_bytes	Number of bytes having at least 75 to 100% free space
ful1_blocks	Total number of blocks full in the segment
full_bytes	Total number of bytes full in the segment
segment_size_blocks	Number of blocks allocated to the segment
segment_size_bytes	Number of bytes allocated to the segment
used_blocks	Number blocks allocated to the LOB that contains active data
used_bytes	Number bytes allocated to the LOB that contains active data
expired_blocks	Number of expired blocks used by the LOB to keep version data
expired_bytes	Number of expired bytes used by the LOB to keep version data
unexpired_blocks	Number of unexpired blocks used by the LOB to keep version data
unexpired_bytes	Number of unexpired bytes used by the LOB to keep version data
partition_name	Name of the partition (NULL if not a partition)

Examples

```
variable unf number;
variable unfb number;
variable fs1 number;
```

```
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
dbms_space.space_usage('U1','T',
                       'TABLE',
                       :unf, :unfb,
                       :fs1, :fs1b,
                       :fs2, :fs2b,
                       :fs3, :fs3b,
                       :fs4, :fs4b,
                       :full, :fullb);
end;
/
print unf ;
print unfb ;
print fs4 ;
print fs4b;
print fs3 ;
print fs3b;
print fs2 ;
print fs2b;
print fs1 ;
print fs1b;
print full;
print fullb;
```

UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

```
DBMS_SPACE.UNUSED_SPACE (
   segment_owner              IN  VARCHAR2,
   segment_name               IN  VARCHAR2,
   segment_type               IN  VARCHAR2,
   total_blocks               OUT NUMBER,
   total_bytes                OUT NUMBER,
   unused_blocks              OUT NUMBER,
   unused_bytes               OUT NUMBER,
   last_used_extent_file_id   OUT NUMBER,
   last_used_extent_block_id  OUT NUMBER,
   last_used_block            OUT NUMBER,
   partition_name             IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 130–14 UNUSED_SPACE Procedure Parameters

Parameter	Description
segment_owner	Schema name of the segment to be analyzed
segment_name	Segment name of the segment to be analyzed
segment_type	Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER): ■ TABLE ■ TABLE PARTITION ■ TABLE SUBPARTITION ■ INDEX ■ INDEX PARTITION ■ INDEX SUBPARTITION ■ CLUSTER ■ LOB ■ LOB PARTITION ■ LOB SUBPARTITION
total_blocks	Returns total number of blocks in the segment
total_bytes	Returns total number of blocks in the segment, in bytes
unused_blocks	Returns number of blocks which are not used
unused_bytes	Returns, in bytes, number of blocks which are not used
last_used_extent_file_id	Returns the file ID of the last extent which contains data
last_used_extent_block_id	Returns the starting block ID of the last extent which contains data
last_used_block	Returns the last block within this extent which contains data

Table 130–14 (Cont.) UNUSED_SPACE Procedure Parameters

Parameter	Description
partition_name	Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.

Examples

The following declares the necessary bind variables and executes.

```
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks,
   :total_bytes,:unused_blocks, :unused_bytes, :lastextf,
   :last_extb, :lastusedblock);
```

131

DBMS_SPACE_ADMIN

The DBMS_SPACE_ADMIN package provides functionality for locally managed tablespaces.

> **See Also:** *Oracle Database Administrator's Guide* for an example and description of using DBMS_SPACE_ADMIN.

This chapter contains the following topics:

- Using DBMS_SPACE_ADMIN
  - Security Model
  - Constants
  - Operational Notes
- Summary of DBMS_SPACE_ADMIN Subprograms

Using DBMS_SPACE_ADMIN

This section contains topics which relate to using the `DBMS_SPACE_ADMIN` package.

- Security Model
- Constants
- Operational Notes

Security Model

This package runs with SYS privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

Constants

Table 131–1 DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
SEGMENT_VERIFY_EXTENTS	POSITIVE	1	Verifies that the space owned by segment is appropriately reflected in the bitmap as used
SEGMENT_VERIFY_EXTENTS_GLOBAL	POSITIVE	2	Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it
SEGMENT_MARK_CORRUPT	POSITIVE	3	Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation).
SEGMENT_MARK_VALID	POSITIVE	4	Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.
SEGMENT_DUMP_EXTENT_MAP	POSITIVE	5	Dumps the extent map for a given segment
TABLESPACE_VERIFY_BITMAP	POSITIVE	6	Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent
TABLESPACE_EXTENT_MAKE_FREE	POSITIVE	7	Marks the DBA range (extent) as free in the bitmaps
TABLESPACE_EXTENT_MAKE_USED	POSITIVE	8	Marks the DBA range (extent) as used in the bitmaps
SEGMENT_VERIFY_BASIC	POSITIVE	9	Performs the basic metadata checks
SEGMENT_VERIFY_DEEP	POSITIVE	10	Performs deep verification
SEGMENT_VERIFY_SPECIFIC	POSITIVE	11	Performs a specific check for the segment
HWM_CHECK	POSITIVE	12	Checks HWM
BMB_CHECK	POSITIVE	13	Checks integrity among L1, L2 and L3 BMBs
SEG_DICT_CHECK	POSITIVE	14	Checks consistency of segment header with corresponding SEG entry
EXTENT_TS_BITMAP_CHECK	POSITIVE	15	Checks whether the tablespace bitmaps corresponding to the extent map are marked used
DB_BACKPOINTER_CHECK	POSITIVE	16	Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment
EXTENT_SEGMENT_BITMAP_CHECK	POSITIVE	17	Checks whether the bitmap blocks are consistent with the extent map

Table 131–1 (Cont.) DBMS_SPACE_ADMIN Constants

Constant	Type	Value	Description
BITMAPS_CHECK	POSITIVE	18	Checks from the datablocks that the bitmap states representing the blocks are consistent
TS_VERIFY_BITMAPS	POSITIVE	19	Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace
TS_VERIFY_DEEP	POSITIVE	20	Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option
TS_VERIFY_SEGMENTS	POSITIVE	21	Performs ASSM_SEGMENT_VERIFY on all segments in the tablespace. It will take either the BASIC or the DEEP option.
SEGMENTS_DUMP_BITMAP_SUMMARY	POSITIVE	27	Dumps only bitmap block summaries

Operational Notes

Before migrating the SYSTEM tablespace, the following conditions must be met. These conditions are enforced by the TABLESPACE_MIGRATE_TO_LOCAL procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not SYSTEM.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

Summary of DBMS_SPACE_ADMIN Subprograms

Table 131–2 DBMS_SPACE_ADMIN Package Subprograms

Subprogram	Description
ASSM_SEGMENT_VERIFY Procedure on page 131-8	Verifies segments created in ASSM tablespaces
ASSM_TABLESPACE_VERIFY Procedure on page 131-10	Verifies ASSM tablespaces
SEGMENT_CORRUPT Procedure on page 131-11	Marks the segment corrupt or valid so that appropriate error recovery can be done
SEGMENT_DROP_CORRUPT Procedure on page 131-12	Drops a segment currently marked corrupt (without reclaiming space)
SEGMENT_DUMP Procedure on page 131-13	Dumps the segment header and extent maps of a given segment
SEGMENT_VERIFY Procedure on page 131-14	Verifies the consistency of the extent map of the segment
TABLESPACE_FIX_BITMAPS Procedure on page 131-15	Marks the appropriate DBA range (extent) as free or used in bitmap
TABLESPACE_FIX_SEGMENT_STATES Procedure on page 131-16	Fixes the state of the segments in a tablespace in which migration was aborted
TABLESPACE_MIGRATE_FROM_LOCAL Procedure on page 131-17	Migrates a locally-managed tablespace to dictionary-managed tablespace
TABLESPACE_MIGRATE_TO_LOCAL Procedure on page 131-18	Migrates a tablespace from dictionary managed format to locally managed format
TABLESPACE_REBUILD_BITMAPS Procedure on page 131-19	Rebuilds the appropriate bitmaps
TABLESPACE_REBUILD_QUOTAS Procedure on page 131-20	Rebuilds quotas for given tablespace
TABLESPACE_RELOCATE_BITMAPS Procedure on page 131-21	Relocates the bitmaps to the destination specified
TABLESPACE_VERIFY Procedure on page 131-22	Verifies that the bitmaps and extent maps for the segments in the tablespace are in sync

ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in ASSM (Automatic Segment Space Management) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (
   segment_owner   IN VARCHAR2,
   segment_name    IN VARCHAR2,
   segment_type    IN VARCHAR2,
   partition_name  IN VARCHAR2,
   verify_option   IN POSITIVE  DEFAULT SEGMENT_VERIFY_BASIC,
   attrib          IN POSITIVE  DEFAULT NULL);
```

Parameters

Table 131–3 ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
segment_owner	The schema that owns the segment
segment_name	The name of the segment to be verified
segment_type	The segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER
partition_name	Name of the partition or subpartition
verify_option	■ SEGMENT_VERIFY_DEEP := 9. Performs deep verification ■ SEGMENT_VERIFY_BASIC:= 10. Performs the basic metadata checks (Default)

Table 131–3 (Cont.) ASSM_SEGMENT_VERIFY Procedure Parameters

Parameter	Description
attrib	When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following: ■ HWM_CHECK - CONSTANT POSITIVE := 12; checks whether high water mark information is accurate. ■ BMB_CHECK - CONSTANT POSITIVE := 13; checks whether space bitmap blocks have correct backpointers to the segment header. ■ SEG_DICT_CHECK - CONSTANT POSITIVE := 14; checks whether dictionary information for segment is accurate. ■ EXTENT_TS_BITMAP_CHECK - CONSTANT POSITIVE := 15; checks whether extent maps are consistent with file level bitmaps. ■ DB_BACKPOINTER_CHECK - CONSTANT POSITIVE := 16; checks whether datablocks have correct backpointers to the space metadata blocks. ■ EXTENT_SEGMENT_BITMAP_CHECK - CONSTANT POSITIVE := 17; checks whether extent map in the segment match with the bitnaps in the segment. ■ BITMAPS_CHECK - CONSTANT POSITIVE := 18; checks whether space bitmap blocks are accurate.

Usage Notes

- Using this procedure requires SYSDBA privileges to execute.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_*process_ID*.trc to the location specified in the USER_DUMP_DEST initialization parameter.

ASSM_TABLESPACE_VERIFY Procedure

This procedures verifies all the segments created in an ASSM tablespace. The verification per segment is either basic consistency checks of the space metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
   tablespace_name   IN VARCHAR2,
   ts_option         IN POSITIVE,
   segment_option    IN POSITIVE DEFAULT NULL);
```

Parameters

Table 131–4 ASSM_TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of the tablespace to verify, tablespace should be ASSM
ts_option	■ TS_VERIFY_BITMAPS - CONSTANT POSITIVE := 19; The bitmaps are verified against the extents. This will detect bits that are marked used or free wrongly and will also detect multiple allocation of extents. The file metadata will be validated against file$ and control file. This is the default option (1). ■ TS_VERIFY_DEEP - CONSTANT POSITIVE := 20; This option is used to verify the file bitmaps as well perform checks on all the segments (2). ■ TS_SEGMENTS - CONSTANT POSITIVE := 21; This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally the user can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY (3).
segment_option	When the TABLESPACE_VERIFY_SEGMENTS or TABLESPACE_VERIFY_DEEP is selected, the SEGMENT_OPTION can be specified optionally. When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following: ■ SEGMENT_VERIFY_BASIC - CONSTANT POSITIVE := 9; ■ SEGMENT_VERIFY_DEEP - CONSTANT POSITIVE := 10; The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BASIC is specified.

Usage Notes

Using this procedure requires SYSDBA privileges to execute.

This procedure outputs a dump file named sid_ora_*process_ID*.trc to the location specified in the USER_DUMP_DEST initialization parameter.

SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be done. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    POSITIVE,
   corrupt_option          IN    POSITIVE  DEFAULT SEGMENT_MARK_CORRUPT);
```

Parameters

Table 131–5 SEGMENT_CORRUPT Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
corrupt_option	SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID

Examples

The following example marks the segment as corrupt:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, 3);
```

Alternately, the next example marks a corrupt segment valid:

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, 4);
```

SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space). For this to work, the segment should have been marked *temporary*. To mark a corrupt segment as temporary, issue a `DROP` command on the segment.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    POSITIVE);
```

Parameters

Table 131–6 SEGMENT_DROP_CORRUPT Procedure Parameters

Parameter	Description
`tablespace_name`	Name of tablespace in which segment resides
`header_relative_file`	Relative file number of segment header
`header_block`	Block number of segment header

Usage Notes

The procedure cannot be used on the `SYSTEM` tablespace.

The space for the segment is not released, and it must be fixed by using the TABLESPACE_FIX_BITMAPS Procedure or the TABLESPACE_REBUILD_BITMAPS Procedure.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);
```

SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_DUMP (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    POSITIVE,
   dump_option             IN    POSITIVE  DEFAULT SEGMENT_DUMP_EXTENT_MAP);
```

Parameters

Table 131–7 SEGMENT_DUMP Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace in which segment resides
header_relative_file	Relative file number of segment header
header_block	Block number of segment header
dump_option	SEGMENT_DUMP_EXTENT_MAP SEGMENT_DUMP_BITMAP_SUMMARY.

Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass SEGMENT_DUMP_BITMAP_SUMMARY as the dump_option parameter.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (
   tablespace_name         IN    VARCHAR2,
   header_relative_file    IN    POSITIVE,
   header_block            IN    POSITIVE,
   verify_option           IN    POSITIVE  DEFAULT SEGMENT_VERIFY_EXTENTS);
```

Parameters

Table 131–8 SEGMENT_VERIFY Procedure Parameters

Parameters	Description
`tablespace_name`	Name of tablespace in which segment resides
`header_relative_file`	Relative file number of segment header
`header_block`	Block number of segment header
`verify_option`	What kind of check to do: `SEGMENT_VERIFY_EXTENTS` or `SEGMENT_VERIFY_EXTENTS_GLOBAL`

Usage Notes

Anomalies are output as dba-range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all dba-ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps in sync.

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33, 1);
```

Note: All `DBMS_SPACE_ADMIN` package examples use the tablespace `USERS` which contains `SCOTT.EMP`.

TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate DBA range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
   tablespace_name         IN    VARCHAR2,
   dbarange_relative_file  IN    POSITIVE,
   dbarange_begin_block    IN    POSITIVE,
   dbarange_end_block      IN    POSITIVE,
   fix_option              IN    POSITIVE);
```

Parameters

Table 131–9 TABLESPACE_FIX_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
dbarange_relative_file	Relative file number of DBA range (extent)
dbarange_begin_block	Block number of beginning of extent
dbarange_end_block	Block number (inclusive) of end of extent
fix_option	TABLESPACE_EXTENT_MAKE_FREE or TABLESPACE_EXTENT_MAKE_USED

Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as USED in bitmaps.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83, 7);
```

Alternately, specifying an option of 8 marks the bits FREE in bitmaps. The BEGIN and END blocks should be in extent boundary and should be extent multiple. Otherwise, an error is raised.

TABLESPACE_FIX_SEGMENT_STATES Procedure

Use this procedure to fix the state of the segments in a tablespace in which migration was aborted. During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, the segment states are corrected by SMON when event 10906 is set. Database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (
   tablespace_name     IN    VARCHAR);
```

Parameters

Table 131–10 TABLESPACE_FIX_SEGMENT_STATES Procedure Parameters

Parameter Name	Description
tablespace_name	Name of the tablespace whose segments need to be fixed

Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```

TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally-managed tablespace to a dictionary-managed tablespace. You cannot use this procedure for SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (
   tablespace_name         IN    VARCHAR2);
```

Parameter

Table 131–11 TABLESPACE_MIGRATE_FROM_LOCAL Procedure Parameter

Parameter	Description
tablespace_name	Name of tablespace

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');
```

TABLESPACE_MIGRATE_TO_LOCAL Procedure

Use this procedure to migrate the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (
   tablespace_name     IN     VARCHAR,
   unit_size           IN     POSITIVE DEFAULT NULL,
   rfno                IN     INTGER DEFAULT NULL);
```

Parameters

Table 131–12 TABLESPACE_MIGRATE_TO_LOCAL Procedure Parameters

Parameter Name	Description
`tablespace_name`	Name of the tablespace to be migrated
`unit_size`	Unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace
`rfno`	Relative File Number of the file where the bitmap blocks should be placed (optional)

Usage Notes

Before you migrate the `SYSTEM` tablespace, you should migrate any dictionary-managed tablespaces that you may want to use in read/write mode to locally managed. After the `SYSTEM` tablespace is migrated, you cannot change dictionary-managed tablespaces to read/write.

See Also: *Oracle Database Administrator's Guide*

The tablespace must be kept online and read/write during migration. Note that temporary tablespaces cannot be migrated.

Allocation Unit may be specified optionally. The default is calculated by the system based on the highest common divisor of all extents (used or free) for the tablespace. This number is further trimmed based on the `MINIMUM EXTENT` for the tablespace (5 if `MINIMUM EXTENT`T is not specified). Thus, the calculated value will not be larger than the `MINIMUM EXTENT` for the tablespace. The last free extent in every file will be ignored for GCD calculation. If you specify the unit size, it has to be a factor of the UNIT size calculated by the system, otherwise an error message is returned.

The Relative File Number parameter is used to place the bitmaps in a desired file. If space is not found in the file, an error is issued. The data file specified should be part of the tablespace being migrated. If the dataflow is not specified then the system will choose a dataflow in which to place the initial bitmap blocks. If space is not found for the initial bitmaps, an error will be raised.

Examples

To migrate a tablespace 'TS1' with minimum extent size 1m, use

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);
```

The bitmaps will be placed in file with relative file number 2.

TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block DBA is specified, then it rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (
   tablespace_name         IN    VARCHAR2,
   bitmap_relative_file    IN    POSITIVE   DEFAULT NULL,
   bitmap_block            IN    POSITIVE   DEFAULT NULL);
```

Parameters

Table 131–13 TABLESPACE_REBUILD_BITMAPS Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
bitmap_relative_file	Relative file number of bitmap block to rebuild
bitmap_block	Block number of bitmap block to rebuild

Usage Notes

Note: Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the USERS tablespace.

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS (
   tablespace_name         IN    VARCHAR2);
```

Parameters

Table 131–14 TABLESPACE_REBUILD_QUOTAS Procedure Parameters

Parameter	Description
`tablespace_name`	Name of tablespace

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

TABLESPACE_RELOCATE_BITMAPS Procedure

Use this procedure to relocate the bitmaps to the destination specified.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS (
   tablespace_name    IN      VARCHAR2,
   filno              IN      POSITIVE,
   blkno              IN      POSITIVE);
```

Parameters

Table 131–15 TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

Parameter Name	Description
tablespace_name	Name of Tablespace
filno	Relative File Number of the destination file
blkno	Block Number of the destination DBA

Usage Notes

Migration of a tablespace from dictionary managed to locally managed format could result in the creation of SPACE HEADER segment that contains the bitmap blocks. The SPACE HEADER segment is treated as user data. If the user wishes to explicitly resize a file at or below the space header segment, an error is issued. Use the TABLESPACE_RELOCATE_BITMAPS command to move the control information to a different destination and then resize the file.

This procedure cannot be used on the SYSTEM tablespace.

The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

```
EXECUTE  DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);
```

Moves the bitmaps to file 3, block 4.

Note: The source and the destination addresses should not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location an error is raised.

TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are in sync.

Syntax

```
DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (
   tablespace_name         IN    VARCHAR2,
   verify_option           IN    POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);
```

Parameters

Table 131–16 TABLESPACE_VERIFY Procedure Parameters

Parameter	Description
tablespace_name	Name of tablespace
verify_option	TABLESPACE_VERIFY_BITMAP

Examples

```
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
```

132

DBMS_SPM

The `DBMS_SPM` package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

> **See Also:** For more information about "Using SQL Plan Management" in the *Oracle Database Performance Tuning Guide*

This chapter contains the following topics:

- Using DBMS_SPM
  - Overview
  - Security Model
  - Constants
  - Examples
- Data Structures
- Summary of DBMS_SPM Subprograms

Using DBMS_SPM

- Overview
- Security Model
- Constants
- Examples

Overview

The DBMS_SPM package allows the user to manage SQL execution plans using SQL plan management. SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.
- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.
- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution plans developed under a standard test configuration for the new SQL statements. If the system production configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.

Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS_SPM package.

Constants

The DBMS_SPM package uses the constants shown in Table 132–1, " DBMS_SPM Constants". These constants are defined as standard input for the time_limit parameter of the EVOLVE_SQL_PLAN_BASELINE Function.

Table 132–1 DBMS_SPM Constants

Constant	Type	Value	Description
AUTO_LIMIT	INTEGER	2147483647	Oracle determines the appropriate time spent by the EVOLVE_SQL_PLAN_BASELINE Function.
NO_LIMIT	INTEGER	2147483647 -1	There is no limit to the time spent by the EVOLVE_SQL_PLAN_BASELINE Function.

Examples

Detailed examples are located under the following topics:

- Migrating Stored Outlines to SQL Plan Baselines
- Migrating Outlines to Utilize SQL Plan Management Features
- Migrating Outlines to Preserve Stored Outline Behavior
- Performing Follow-Up Tasks After Stored Outline Migration

Data Structures

The DBMS_SPM package defines a TABLE type.

Table Types

- NAMELIST Table Type

NAMELIST Table Type

This type allows for a list of names as an input parameter.

Syntax

```
TYPE  name_list  IS TABLE OF VARCHAR2(30);
```

Summary of DBMS_SPM Subprograms

This table list the package subprograms in alphabetical order.

Table 132–2 DBMS_SPM Package Subprograms

Subprogram	Description
ALTER_SQL_PLAN_BASELINE Function on page 132-10	Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format
CONFIGURE Procedure on page 132-12	Sets configuration options for SQL management base, in parameter/value format
CREATE_STGTAB_BASELINE Procedure on page 132-13	Creates a staging table that used for transporting SQL plan baselines from one system to another
DROP_SQL_PLAN_BASELINE Function on page 132-14	drops a single plan, or all plans associated with a SQL statement
EVOLVE_SQL_PLAN_BASELINE Function on page 132-15	Evolves SQL plan baselines associated with one or more SQL statements
LOAD_PLANS_FROM_CURSOR_CACHE Functions on page 132-17	Loads one or more plans present in the cursor cache for a SQL statement
LOAD_PLANS_FROM_SQLSET Function on page 132-19	Loads plans stored in a SQL tuning set (STS) into SQL plan baselines
MIGRATE_STORED_OUTLINE Functions on page 132-20	Migrates existing stored outlines to SQL plan baselines
PACK_STGTAB_BASELINE Function on page 132-22	Packs (exports) SQL plan baselines from SQL management base into a staging table
UNPACK_STGTAB_BASELINE Function on page 132-23	Unpacks (imports) SQL plan baselines from a staging table into SQL management base

ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (
   sql_handle        IN VARCHAR2 := NULL,
   plan_name         IN VARCHAR2 := NULL,
   attribute_name    IN VARCHAR2,
   attribute_value   IN VARCHAR2)
 RETURN PLS_INTEGER;
```

Parameters

Table 132–3 ALTER_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
sql_handle	SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.
plan_name	Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.
attribute_name	Name of plan attribute to set (see table below).
attribute_value	Value of plan attribute to use (see table below)

Table 132–4 Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters

Name	Description	Possible Values
enabled	'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status.	'YES' or 'NO'
fixed	'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.	'YES' or 'NO'
autopurge	'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.	'YES' or 'NO'
plan_name	Name of the plan	String of up to 30-characters
description	Plan description.	String of up to 500-characters

Return Values

The number of plans altered.

Usage Notes

When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

CONFIGURE Procedure

This procedure sets configuration options for SQL management base, in parameter/value format. This function can be called numerous times, each time setting a different configuration option.

Syntax

```
DBMS_SPM.CONFIGURE (
   parameter_name    IN VARCHAR2,
   parameter_value   IN NUMBER);
```

Parameters

Table 132–5 CONFIGURE Procedure Parameters

Parameter	Description
parameter_name	Name of parameter to set (see table below)
parameter_value	Value of parameter to use (see table below)

Table 132–6 Names & Values for CONFIGURE Procedure Parameters

Name	Description	Possible Values	Default Value
space_budget_percent	Maximum percent of SYSAUX space that can be used for SQL management base	1,2, …, 50	10
plan_retention_weeks	Number of weeks to retain unused plans before they are purged	5,6, …, 523	53

Usage Notes

- The default space budget for SQL management base is no more than ten percent of the size of SYSAUX tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).
- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

Syntax

```
DBMS_SPM.CREATE_STGTAB_BASELINE (
   table_name        IN VARCHAR2,
   table_owner       IN VARCHAR2 := NULL,
   tablespace_name   IN VARCHAR2 := NULL);
```

Parameters

Table 132–7 CREATE_STGTAB_BASELINE Procedure Parameters

Parameter	Description
`table_name`	Name of staging table to create for the purpose of packing and unpacking SQL plan baselines
`table_owner`	Name of owner of the staging table. Default `NULL` means current schema is the table owner.
`tablespace_name`	Name of tablespace. Default NULL means create staging table in the default tablespace.

Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (
   sql_handle     IN VARCHAR2 := NULL,
   plan_name      IN VARCHAR2 := NULL)
RETURN PLS_INTEGER;
```

Parameters

Table 132–8 DROP_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
`sql_handle`	SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If `NULL` then `plan_name` must be specified.
`plan_name`	Plan name. It identifies a specific plan. Default `NULL` means to drop all plans associated with the SQL statement identified by `sql_handle`.

Return Values

The number of plans dropped

EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans. If interrogated by the user (parameter `verify` = 'YES'), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter `commit` = 'YES').

The second form of the function employs a plan list format.

Syntax

```
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
   sql_handle   IN VARCHAR2 := NULL,
   plan_name    IN VARCHAR2 := NULL,
   time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
   verify       IN VARCHAR2 := 'YES',
   commit       IN VARCHAR2 := 'YES')
  RETURN CLOB;

DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
   plan_list    IN DBMS_SPM.NAME_LIST,
   time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
   verify       IN VARCHAR2 := 'YES',
   commit       IN VARCHAR2 := 'YES')
  RETURN CLOB;
```

Parameters

Table 132–9 EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
`sql_handle`	SQL statement identifier. Unless `plan_name` is specified, `NULL` means to consider all statements with non-accepted plans in their SQL plan baselines.
`plan_name`	Plan identifier. Default `NULL` means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if `sql_handle` is `NULL`.
`plan_list`	A list of plan names. Each plan in the list can belong to same or different SQL statement.
`time_limit`	Time limit in number of minutes. This applies only if `verify` = 'YES'. The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on. ■ `DBMS_SPM.AUTO_LIMIT` (Default) lets the system choose an appropriate time limit based on the number of plan verifications required to be done. ■ `DBMS_SPM.NO_LIMIT` means there is no time limit. ■ A positive integer value represents a user specified time limit.

Table 132–9 (Cont.) EVOLVE_SQL_PLAN_BASELINE Function Parameters

Parameter	Description
verify	Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan. ■ 'YES' (Default) - verifies that a non-accepted plan gives better performance before changing it to an accepted plan ■ 'NO' - directs not to execute plans but only to change non-accepted plans into accepted plans
commit	Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'. ■ 'YES' (Default) - perform updates of qualifying non-accepted plans and generate a report that shows the updates and the result of performance verification when verify = 'YES'. ■ 'NO' - generate a report without any updates. Note that commit = 'NO' together with verify = 'NO' represents a no-op.

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if verify = 'YES' the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using attribute_name and attribute_value pair.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   sql_id            IN  VARCHAR2,
   plan_hash_value   IN  NUMBER   := NULL,
   sql_text          IN  CLOB,
   fixed             IN  VARCHAR2 := 'NO',
   enabled           IN  VARCHAR2 := 'YES')
 RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   sql_id            IN  VARCHAR2,
   plan_hash_value   IN  NUMBER   := NULL,
   sql_handle        IN  VARCHAR2,
   fixed             IN  VARCHAR2 := 'NO',
   enabled           IN  VARCHAR2 := 'YES')
 RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   sql_id            IN  VARCHAR2,
   plan_hash_value   IN  NUMBER   := NULL,
   fixed             IN  VARCHAR2 := 'NO',
   enabled           IN  VARCHAR2 := 'YES')
 RETURN PLS_INTEGER;

DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (
   attribute_name   IN VARCHAR2,
   attribute_value  IN VARCHAR2,
   fixed            IN VARCHAR2 := 'NO',
   enabled          IN VARCHAR2 := 'YES')
  RETURN PLS_INTEGER;
```

Parameters

Table 132–10 LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_id	SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.
plan_hash_value	Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.
sql_text	SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.

Table 132–10 (Cont.) LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

Parameter	Description
sql_handle	SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.
fixed	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
attribute_name	One of possible attribute names: ■ SQL_TEXT" ■ 'PARSING_SCHEMA_NAME' ■ 'MODULE' ■ 'ACTION'
attribute_value	Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying attribute_name => 'SQL_TEXT', and attribute_value => '% HR-123 %' means applying SQL_TEXT LIKE '% HR-123 %' as a selection filter. Similarly, specifying attribute_name => 'MODULE', and attribute_value => 'HR' means applying 'MODULE = 'HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

Syntax

```
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sqlset_owner     IN  VARCHAR2 := NULL,
   basic_filter     IN  VARCHAR2 := NULL,
   fixed            IN  VARCHAR2 := 'NO',
   enabled          IN  VARCHAR2 := 'YES'
   commit_rows      IN  NUMBER   := 1000)
RETURN PLS_INTEGER;
```

Parameters

Table 132–11 LOAD_PLANS_FROM_SQLSET Function Parameters

Parameter	Description
sqlset_name	Name of the STS from where the plans are loaded into SQL plan baselines
sqlset_owner	Owner of STS. NULL means current schema is the owner.
basic_filter	A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any WHERE clause predicate that can specified against the view DBA_SQLSET_STATEMENTS. For example basic_filter => 'sql_text like ''select /*LOAD_STS*/%''' or basic_filter => 'sql_id="b62q7nc33gzwx"'.
fixed	Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.
enabled	Default 'YES' means the loaded plans are enabled for use by the optimizer
commit_rows	Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

MIGRATE_STORED_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (
   attribute_name     IN  VARCHAR2,
   attribute_value    IN  CLOB,
   fixed              IN  VARCHAR2 := 'NO')
 RETURN CLOB;

DBMS_SPM.MIGRATE_STORED_OUTLINE (
   outln_list         IN  DBMS_SPM.NAME_LIST,
   fixed              IN  VARCHAR2 := 'NO')
 RETURN CLOB;
```

Parameters

Table 132–12 MIGRATE_STORED_OUTLINE Function Parameters

Parameter	Description
attribute_name	Specifies the type of parameter used in attribute_value to identify the migrated stored outlines. It is case insensitive. Possible values: ■ outline_name ■ sql_text ■ category ■ all
attribute_value	Based on attribute_name, this can be: ■ Name of stored outline to be migrated ■ SQL text of stored outlines to be migrated ■ Category of stored outlines to be migrated ■ NULL if attribute_name is all
fixed	NO (default) or YES. Specifies the "fixed" status of the plans generated during migration. By default, plans are generated as "non-fixed" plans.
outln_list	List of outline names to be migrated

Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated

- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.
- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to `DEFAULT`. The module name of a plan baseline is set to be the same as the stored outline.
- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.
- When user specifies to migrate `all`, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.

PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```
DBMS_SPM.PACK_STGTAB_BASELINE (
   table_name       IN VARCHAR2,
   table_owner      IN VARCHAR2 := NULL,
   sql_handle       IN VARCHAR2 := NULL,
   plan_name        IN VARCHAR2 := NULL,
   sql_text         IN CLOB     := NULL,
   creator          IN VARCHAR2 := NULL,
   origin           IN VARCHAR2 := NULL,
   enabled          IN VARCHAR2 := NULL,
   accepted         IN VARCHAR2 := NULL,
   fixed            IN VARCHAR2 := NULL,
   module           IN VARCHAR2 := NULL,
   action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 132–13 PACK_STGTAB_BASELINE Function Parameters

Parameter	Description
`table_name`	Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)
`table_owner`	Name of staging table owner.Default `NULL` means current schema is the table owner
`sql_handle`	SQL handle (case sensitive)
`plan_name`	Plan name (case sensitive, % wildcards accepted)
`sql_text`	SQL text string (case sensitive, % wildcards accepted)
`creator`	Creator of SQL plan baseline (case insensitive unless double quoted)
`origin`	Origin of SQL plan baseline, should be `'MANUAL-LOAD'`, `'AUTO-CAPTURE'`, `'MANUAL_SQLTUNE'` or `'AUTO-SQLTUNE'` (case insensitive)
`enabled`	Must be '`YES`' or '`NO`' (case insensitive)
`accepted`	Must be '`YES`' or '`NO`' (case insensitive)
`fixed`	Must be '`YES`' or '`NO`' (case insensitive)
`module`	Module (case sensitive)
`action`	Action (case sensitive)

Return Values

Number of SQL plan baselines packed

UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```
DBMS_SPM.UNPACK_STGTAB_BASELINE (
   table_name       IN VARCHAR2,
   table_owner      IN VARCHAR2 := NULL,
   sql_handle       IN VARCHAR2 := NULL,
   plan_name        IN VARCHAR2 := NULL,
   sql_text         IN CLOB     := NULL,
   creator          IN VARCHAR2 := NULL,
   origin           IN VARCHAR2 := NULL,
   enabled          IN VARCHAR2 := NULL,
   accepted         IN VARCHAR2 := NULL,
   fixed            IN VARCHAR2 := NULL,
   module           IN VARCHAR2 := NULL,
   action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 132–14 UNPACK_STGTAB_BASELINE Function Parameters

Parameter	Description
table_name	Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)
table_owner	Name of staging table owner.Default NULL means current schema is the table owner
sql_handle	SQL handle (case sensitive)
plan_name	Plan name (case sensitive,% wildcards accepted)
sql_text	SQL text string (case sensitive, % wildcards accepted)
creator	Creator of SQL plan baseline (case insensitive unless double quoted)
origin	Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE','MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)
enabled	Must be 'YES' or 'NO' (case insensitive)
accepted	Must be 'YES' or 'NO' (case insensitive)
fixed	Must be 'YES' or 'NO' (case insensitive)
module	Module (case sensitive)
action	Action (case sensitive)

Return Values

Number of plans unpacked

133

DBMS_SQL

The DBMS_SQL package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL. For example, you can enter a DROP TABLE statement from within a stored procedure by using the PARSE procedure supplied with the DBMS_SQL package.

> **See Also:** For more information on native dynamic SQL, see *Oracle Database PL/SQL Language Reference.*

This chapter contains the following topics:

- Using DBMS_SQL
  - Overview
  - Security Model
  - Constants
  - Exceptions
  - Operational Notes

- Data Structures
  - RECORD TYPES
  - TABLE TYPES
- Summary of DBMS_SQL Subprograms

Using DBMS_SQL

- Overview
- Security Model
- Constants
- Exceptions
- Operational Notes
- Examples

Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to `DBMS_SQL` that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than `DBMS_SQL`. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)

Also, there are some tasks that can only be performed using `DBMS_SQL`.

The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

See Also: *Oracle Call Interface Programmer's Guide*

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the `DBMS_SQL` package. These differences include the following:

- The OCI uses bind by address, while the `DBMS_SQL` package uses bind by value.
- With `DBMS_SQL` you must call `VARIABLE_VALUE` to retrieve the value of an `OUT` parameter for an anonymous block, and you must call `COLUMN_VALUE` after fetching rows to actually retrieve the values of the columns in the rows into your program.
- The current release of the `DBMS_SQL` package does not provide `CANCEL` cursor procedures.
- Indicator variables are not required, because `NULL`s are fully supported as values of a PL/SQL variable.

A sample usage of the `DBMS_SQL` package follows. For users of the Oracle Call Interface, this code should seem fairly straightforward.

Security Model

DBMS_SQL is a SYS-owned package compiled with AUTHID CURRENT_USER. Any DBMS_SQL subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

> **See Also:** *Oracle Database PL/SQL Language Reference* for more information about using Invoker Rights or Definer Rights

In Oracle Database 11g, Release 1 (11.1), Oracle introduces a number of enhancements to DBMS_SQL to improve the security of the package.

Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, ORA-29471, is raised when any DBMS_SQL subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and DBMS_SQL becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the IS_OPEN Function denotes a cursor currently open in the session, the return value is TRUE. If the actual value is NULL, then the return value is FALSE. Otherwise, this raises an ORA-29471 error.

Note that the OPEN_CURSOR Function is the only DBMS_SQL subprogram that has no formal parameter for the cursor number; rather, it returns a cursor number. Therefore it is not within the scope of these rules.

Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single DBMS_SQL subprogram call. The check is:

- The current_user is the same on calling the subprogram as it was on calling the most recent parse.
- The enabled roles on calling the subprogram must be a superset of the enabled roles on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, and ORA-29470 error is raised.

The mechanism for defining when checks are performed is a new overload for the OPEN_CURSOR subprogram which takes a formal parameter, security_level, with allowed values NULL, 1 and 2.

- When security_level = 1 (or is NULL), the checks are made only when binding and executing.
- When security_level = 2, the checks are always made.

Upgrade Considerations

This security regime is stricter than those in Oracle Database 10g, Release 2 (10.2) and previous releases. As a consequence, users of DBMS_SQL may encounter runtime errors on upgrade. While these security enhancements make for more secure applications, users may wish to relax the security checks temporarily as they migrate to Oracle Database 11g, Release 1 (11.1). If so, please consult with Oracle Support on steps to relax the above security restrictions.

Constants

The constants described in Table 133–1 are used with the `language_flag` parameter of the PARSE Procedures.

Table 133–1 DBMS_SQL Constants

Name	Type	Value	Description
`V6`	`INTEGER`	`0`	Specifies Oracle database version 6 behavior
NATIVE	`INTEGER`	`1`	Specifies normal behavior for the database to which the program is connected
`V7`	`INTEGER`	2	Specifies Oracle database version 7 behavior

Exceptions

```
inconsistent_type EXCEPTION;
  pragma exception_init(inconsistent_type, -6562);
```

This exception is raised by the COLUMN_VALUE Procedure or the VARIABLE_VALUE Procedures when the type of the given `OUT` parameter (for where to put the requested value) is different from the type of the value.

Operational Notes

- Execution Flow
- Processing Queries
- Processing Updates, Inserts, and Deletes
- Locating Errors

Execution Flow

1. OPEN_CURSOR
2. PARSE
3. BIND_VARIABLE or BIND_ARRAY
4. DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY
5. EXECUTE
6. FETCH_ROWS or EXECUTE_AND_FETCH
7. VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG
8. CLOSE_CURSOR

OPEN_CURSOR

To process a SQL statement, you must have an open cursor. When you call the OPEN_CURSOR Function function, you receive a cursor `ID` number for the data structure representing a valid cursor maintained by Oracle. These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the `DBMS_SQL` package.

PARSE

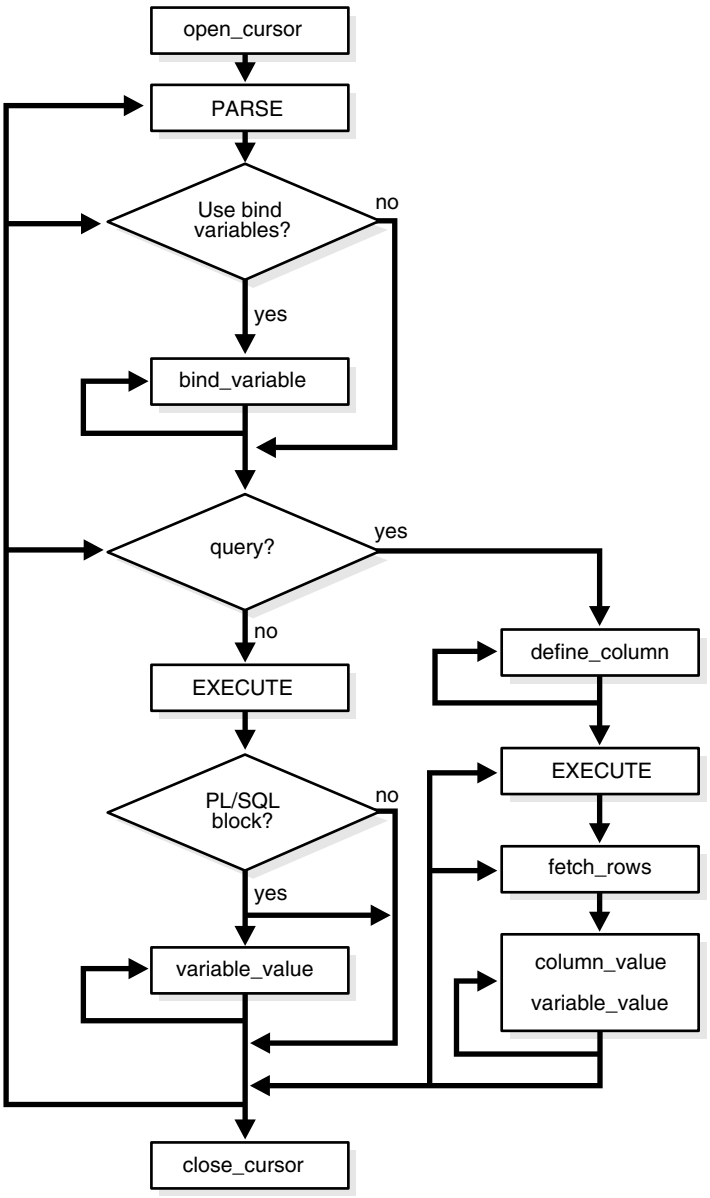
Every SQL statement must be parsed by calling the PARSE Procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

> **Note:** When parsing a DDL statement to drop a package or a procedure, a deadlock can occur if you're still using a procedure in the package. After a call to a procedure, that procedure is considered to be in use until execution has returned to the user side. Any such deadlock times out after five minutes.

The execution flow of `DBMS_SQL` is shown in Figure 133–1.

Figure 133–1 DBMS_SQL Execution Flow



This illustration describes execution flow in DBMS_SQL that begins with "open_cursor" and ends with "close_cursor". Key to the symbols used:

- ... -> denotes "continue to next step", for example "open cursor" -> "PARSE"
- ... material enclosed in double quotation marks denotes an action, for example "PARSE"
- ... material enclosed in single quotation marks denotes a choice point, for example 'Use bind variables': Yes/No

---

"open_cursor" -> "PARSE" -> Choice point: 'Use bind variables': Yes/No

'Use bind variables': Yes/No ...Yes -> "bind variable" (option to repeat) -> Choice point: 'query' ->

'Use bind variables': Yes/No ...No -> Choice point: 'query' ->

Choice point: 'query': Yes/No

- Choice point: 'query': Yes/No ...Yes -> "DEFINE_COLUMN" (option to repeat) -> "EXECUTE" -> "FETCH_ROWS" -> "column_value, variable_value" (option to repeat) -> option to loop back to "EXECUTE", option to loop back to "fetch_rows", option to loop back to "PARSE", option to loop back to 'Use bind variables', option to loop back to 'query' -> "close_cursor"
- Choice point: query Yes/No ...No -> "EXECUTE" -> Choice point: pl/sql block(s): Yes/No
  - Choice point: pl/sql block(s): Yes/No ...Yes -> Choice point: 'Use variable values': Yes/No
    * Choice point: 'Use variable values': Yes/No ... Yes -> "variable_value" (option to repeat) -> option to loop back to "PARSE", option to loop back to 'Use bind variables', option to loop back to 'query' -> close_cursor
    * Choice point: 'Use variable values': Yes/No ... No -> option to loop back to "PARSE", option to loop back to 'Use bind variables', option to loop back to 'query' -> close_cursor
  - Choice point: pl/sql block(s): Yes/No ...No -> option to loop back to "PARSE", option to loop back to 'Use bind variables', option to loop back to 'query' -> close_cursor

****

BIND_VARIABLE or BIND_ARRAY

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the bind procedures, the BIND_ARRAY Procedures on page 133-52 or the BIND_VARIABLE Procedures on page 133-55, to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind, variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The BIND_ARRAY procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each EXECUTE. This is similar to the array interface supported by the OCI.

DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY

The columns of the row being selected in a SELECT statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures (DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY) to specify the variables that are to receive the SELECT values, much the way an INTO clause does for a static query.

Use the DEFINE_COLUMN_LONG procedure to define LONG columns, in the same way that DEFINE_COLUMN is used to define non-LONG columns. You must call DEFINE_COLUMN_LONG before using the COLUMN_VALUE_LONG procedure to fetch from the LONG column.

Use the DEFINE_ARRAY procedure to define a PL/SQL collection into which you want to fetch rows in a single SELECT statement. DEFINE_ARRAY provides an interface to fetch multiple rows at one fetch. You must call DEFINE_ARRAY before using the COLUMN_VALUE procedure to fetch the rows.

EXECUTE

Call the EXECUTE function to run your SQL statement.

FETCH_ROWS or EXECUTE_AND_FETCH

The FETCH_ROWS function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve anymore rows. Instead of calling EXECUTE and then FETCH_ROWS, you may find it more efficient to call EXECUTE_AND_FETCH if you are calling EXECUTE for a single execution.

VARIABLE_VALUE, COLUMN_VALUE, or COLUMN_VALUE_LONG

For queries, call COLUMN_VALUE to determine the value of a column retrieved by the FETCH_ROWS call. For anonymous blocks containing calls to PL/SQL procedures or DML statements with returning clause, call VARIABLE_VALUE to retrieve the values assigned to the output variables when statements were run.

To fetch just part of a LONG database column (which can be up to two gigabytes in size), use the COLUMN_VALUE_LONG procedure. You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

CLOSE_CURSOR

When you no longer need a cursor for a session, close the cursor by calling CLOSE_CURSOR. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your *Oracle Open Gateway* documentation for additional information.

If you neglect to close a cursor, then the memory used by that cursor remains allocated even though it is no longer needed.

Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the SELECT statement by calling the DEFINE_COLUMN Procedures, the DEFINE_COLUMN_LONG Procedure, or the DEFINE_ARRAY Procedure.
2. Run your SELECT statement by calling the EXECUTE Function.
3. Call the FETCH_ROWS Function (or EXECUTE_AND_FETCH) to retrieve the rows that satisfied your query.
4. Call COLUMN_VALUE Procedure or COLUMN_VALUE_LONG Procedure to determine the value of a column retrieved by the FETCH_ROWS Function for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables of these procedures.

Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an INSERT, UPDATE, or DELETE, then you must perform the following steps:

1. You must first run your INSERT, UPDATE, or DELETE statement by calling the EXECUTE Function.
2. If statements have the returning clause, then you must call the VARIABLE_VALUE Procedures to retrieve the values assigned to the output variables.

Locating Errors

There are additional functions in the DBMS_SQL package for obtaining information about the last referenced cursor in the session. The values returned by these functions are only meaningful immediately after a SQL statement is run. In addition, some error-locating functions are only meaningful after certain DBMS_SQL calls. For example, you call the LAST_ERROR_POSITION Function immediately after a PARSE.

Examples

This section provides example procedures that make use of the DBMS_SQL package.

Example 1

This example does not require the use of dynamic SQL because the text of the statement is known at compile time, but it illustrate the basic concept underlying the package.

The DEMO procedure deletes all of the employees from the EMP table whose salaries are greater than the salary that you specify when you run DEMO.

```
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
    cursor_name INTEGER;
    rows_processed INTEGER;
BEGIN
    cursor_name := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x',
                   DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
    rows_processed := DBMS_SQL.EXECUTE(cursor_name);
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
WHEN OTHERS THEN
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Example 2

The following sample procedure is passed a SQL statement, which it then parses and runs:

```
CREATE OR REPLACE PROCEDURE exec(STRING IN varchar2) AS
    cursor_name INTEGER;
    ret INTEGER;
BEGIN
   cursor_name := DBMS_SQL.OPEN_CURSOR;
```

DDL statements are run by the parse call, which performs the implied commit.

```
   DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
   ret := DBMS_SQL.EXECUTE(cursor_name);
   DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

Creating such a procedure enables you to perform the following operations:

- The SQL statement can be dynamically generated at runtime by the calling program.
- The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:

```
exec('create table acct(c1 integer)');
```

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.

```
exec@hq.com('CREATE TABLE acct(c1 INTEGER)');
```

Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

```
id        of type NUMBER
name      of type VARCHAR2(30)
birthdate of type DATE
```

This procedure does not specifically require the use of dynamic SQL; however, it illustrates the concepts of this package.

```
CREATE OR REPLACE PROCEDURE copy (
     source      IN VARCHAR2,
     destination IN VARCHAR2) IS
     id_var             NUMBER;
     name_var           VARCHAR2(30);
     birthdate_var      DATE;
     source_cursor      INTEGER;
     destination_cursor INTEGER;
     ignore             INTEGER;
  BEGIN

  -- Prepare a cursor to select from the source table:
     source_cursor := dbms_sql.open_cursor;
     DBMS_SQL.PARSE(source_cursor,
         'SELECT id, name, birthdate FROM ' || source,
          DBMS_SQL.NATIVE);
     DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
     DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
     DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
     ignore := DBMS_SQL.EXECUTE(source_cursor);

  -- Prepare a cursor to insert into the destination table:
     destination_cursor := DBMS_SQL.OPEN_CURSOR;
     DBMS_SQL.PARSE(destination_cursor,
                 'INSERT INTO ' || destination ||
                 ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
                  DBMS_SQL.NATIVE);

  -- Fetch a row from the source table and insert it into the destination table:
     LOOP
       IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
         -- get column values of the row
         DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
         DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
         DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);

  -- Bind the row into the cursor that inserts into the destination table. You
  -- could alter this example to require the use of dynamic SQL by inserting an
  -- if condition before the bind.
       DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
       DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
       DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
birthdate_var);
       ignore := DBMS_SQL.EXECUTE(destination_cursor);
     ELSE

  -- No more rows to copy:
```

```
        EXIT;
      END IF;
    END LOOP;

  -- Commit and close all cursors:
     COMMIT;
     DBMS_SQL.CLOSE_CURSOR(source_cursor);
     DBMS_SQL.CLOSE_CURSOR(destination_cursor);
   EXCEPTION
     WHEN OTHERS THEN
       IF DBMS_SQL.IS_OPEN(source_cursor) THEN
         DBMS_SQL.CLOSE_CURSOR(source_cursor);
       END IF;
       IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
         DBMS_SQL.CLOSE_CURSOR(destination_cursor);
       END IF;
       RAISE;
  END;
/
```

Examples 3, 4, and 5: Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements `INSERT`, `UPDATE` and `DELETE`.

Here is an example of a bulk `INSERT` statement that demonstrates adding seven new employees to the `emp` table:

```
DECLARE
  stmt VARCHAR2(200);
  empno_array      DBMS_SQL.NUMBER_TABLE;
  empname_array    DBMS_SQL.VARCHAR2_TABLE;
  jobs_array       DBMS_SQL.VARCHAR2_TABLE;
  mgr_array        DBMS_SQL.NUMBER_TABLE;
  hiredate_array   DBMS_SQL.VARCHAR2_TABLE;
  sal_array        DBMS_SQL.NUMBER_TABLE;
  comm_array       DBMS_SQL.NUMBER_TABLE;
  deptno_array     DBMS_SQL.NUMBER_TABLE;
  c                NUMBER;
  dummy            NUMBER;
BEGIN
  empno_array(1):= 9001;
  empno_array(2):= 9002;
  empno_array(3):= 9003;
  empno_array(4):= 9004;
  empno_array(5):= 9005;
  empno_array(6):= 9006;
  empno_array(7):= 9007;

  empname_array(1) := 'Dopey';
  empname_array(2) := 'Grumpy';
  empname_array(3) := 'Doc';
  empname_array(4) := 'Happy';
  empname_array(5) := 'Bashful';
  empname_array(6) := 'Sneezy';
  empname_array(7) := 'Sleepy';

  jobs_array(1) := 'Miner';
  jobs_array(2) := 'Miner';
  jobs_array(3) := 'Miner';
  jobs_array(4) := 'Miner';
```

```
jobs_array(5) := 'Miner';
jobs_array(6) := 'Miner';
jobs_array(7) := 'Miner';

mgr_array(1) := 9003;
mgr_array(2) := 9003;
mgr_array(3) := 9003;
mgr_array(4) := 9003;
mgr_array(5) := 9003;
mgr_array(6) := 9003;
mgr_array(7) := 9003;

hiredate_array(1) := '06-DEC-2006';
hiredate_array(2) := '06-DEC-2006';
hiredate_array(3) := '06-DEC-2006';
hiredate_array(4) := '06-DEC-2006';
hiredate_array(5) := '06-DEC-2006';
hiredate_array(6) := '06-DEC-2006';
hiredate_array(7) := '06-DEC-2006';

sal_array(1):= 1000;
sal_array(2):= 1000;
sal_array(3):= 1000;
sal_array(4):= 1000;
sal_array(5):= 1000;
sal_array(6):= 1000;
sal_array(7):= 1000;

comm_array(1):= 0;
comm_array(2):= 0;
comm_array(3):= 0;
comm_array(4):= 0;
comm_array(5):= 0;
comm_array(6):= 0;
comm_array(7):= 0;

deptno_array(1):= 11;
deptno_array(2):= 11;
deptno_array(3):= 11;
deptno_array(4):= 11;
deptno_array(5):= 11;
deptno_array(6):= 11;
deptno_array(7):= 11;

stmt := 'INSERT INTO emp VALUES(
   :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
   :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
```

```
  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
SHOW ERRORS;
```

Here is an example of a bulk `UPDATE` statement that demonstrates updating salaries for four existing employees in the `emp` table:

```
DECLARE
  stmt VARCHAR2(200);
  empno_array     DBMS_SQL.NUMBER_TABLE;
  salary_array    DBMS_SQL.NUMBER_TABLE;
  c               NUMBER;
  dummy           NUMBER;
BEGIN

  empno_array(1):= 7369;
  empno_array(2):= 7876;
  empno_array(3):= 7900;
  empno_array(4):= 7934;

  salary_array(1) := 10000;
  salary_array(2) := 10000;
  salary_array(3) := 10000;
  salary_array(4) := 10000;

  stmt := 'update emp set sal = :salary_array
    WHERE empno = :num_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
  DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

In a `DELETE` statement, for example, you could bind in an array in the `WHERE` clause and have the statement be run for each element in the array:

```
DECLARE
  stmt VARCHAR2(200);
  dept_no_array DBMS_SQL.NUMBER_TABLE;
  c NUMBER;
  dummy NUMBER;
begin
  dept_no_array(1) := 10; dept_no_array(2) := 20;
  dept_no_array(3) := 30; dept_no_array(4) := 40;
  dept_no_array(5) := 30; dept_no_array(6) := 40;
  stmt := 'delete from emp where deptno = :dept_array';
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
```

```
  DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
  dummy := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

In the preceding example, only elements 1 through 4 are used as specified by the BIND_ARRAY call. Each element of the array potentially deletes a large number of employees from the database.

Examples 6 and 7: Defining an Array

The following examples show how to use the DEFINE_ARRAY procedure:

```
declare
  c       NUMBER;
  d       NUMBER;
  n_tab   DBMS_SQL.NUMBER_TABLE;
  indx    NUMBER := -10;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  dBMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);

  d := DBMS_SQL.EXECUTE(c);
  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);

    EXIT WHEN d != 10;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

  EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

Each time the preceding example does a FETCH_ROWS Function call, it fetches 10 rows that are kept in DBMS_SQL buffers. When the COLUMN_VALUE Procedure call is run, those rows move into the PL/SQL table specified (in this case n_tab), at positions -10 to -1, as specified in the DEFINE statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at EXECUTE and keeps getting updated every time a COLUMN_VALUE call is made. If you re-execute at any point, then the current index for each DEFINE is re-initialized to "indx".

In this way the entire result of the query is fetched into the table. When FETCH_ROWS cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the DEFINE_ARRAY procedure:

Consider a table MULTI_TAB defined as:

```
CREATE TABLE multi_tab (num NUMBER,
                        dat1 DATE,
                        var VARCHAR2(24),
                        dat2 DATE)
```

To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```
declare
  c       NUMBER;
  d       NUMBER;
  n_tab  DBMS_SQL.NUMBER_TABLE;
  d_tab1 DBMS_SQL.DATE_TABLE;
  v_tab  DBMS_SQL.VARCHAR2_TABLE;
  d_tab2 DBMS_SQL.DATE_TABLE;
  indx NUMBER := 10;
BEGIN

  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);

  DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab,  5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab,  5, indx);
  DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);

  d := DBMS_SQL.EXECUTE(c);

  loop
    d := DBMS_SQL.FETCH_ROWS(c);

    DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
    DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
    DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
    DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);

    EXIT WHEN d != 5;
  END LOOP;

  DBMS_SQL.CLOSE_CURSOR(c);

/*
```

The four tables can be used for anything. One usage might be to use BIND_ARRAY to move the rows to another table by using a statement such as 'INSERT into SOME_T values (:a, :b, :c, :d);

```
*/

EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
      DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
```

```
END;
/
```

Example 8: Describe Columns

This can be used as a substitute to the SQL*Plus `DESCRIBE` call by using a `SELECT *` query on the table that you want to describe.

```
DECLARE
  c           NUMBER;
  d           NUMBER;
  col_cnt     INTEGER;
  f           BOOLEAN;
  rec_tab     DBMS_SQL.DESC_TAB;
  col_num    NUMBER;
  PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
  BEGIN
    DBMS_OUTPUT.NEW_LINE;
    DBMS_OUTPUT.PUT_LINE('col_type            =    '
                         || rec.col_type);
    DBMS_OUTPUT.PUT_LINE('col_maxlen          =    '
                         || rec.col_max_len);
    DBMS_OUTPUT.PUT_LINE('col_name            =    '
                         || rec.col_name);
    DBMS_OUTPUT.PUT_LINE('col_name_len        =    '
                         || rec.col_name_len);
    DBMS_OUTPUT.PUT_LINE('col_schema_name     =    '
                         || rec.col_schema_name);
    DBMS_OUTPUT.PUT_LINE('col_schema_name_len =    '
                         || rec.col_schema_name_len);
    DBMS_OUTPUT.PUT_LINE('col_precision       =    '
                         || rec.col_precision);
    DBMS_OUTPUT.PUT_LINE('col_scale           =    '
                         || rec.col_scale);
    DBMS_OUTPUT.PUT('col_null_ok         =    ');
    IF (rec.col_null_ok) THEN
      DBMS_OUTPUT.PUT_LINE('true');
    ELSE
      DBMS_OUTPUT.PUT_LINE('false');
    END IF;
  END;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;

  DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);

  d := DBMS_SQL.EXECUTE(c);

  DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
 * Following loop could simply be for j in 1..col_cnt loop.
 * Here we are simply illustrating some of the PL/SQL table
 * features.
 */
  col_num := rec_tab.first;
  IF (col_num IS NOT NULL) THEN
    LOOP
      print_rec(rec_tab(col_num));
      col_num := rec_tab.next(col_num);
      EXIT WHEN (col_num IS NULL);
```

```
    END LOOP;
  END IF;

  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

Example 9: RETURNING clause

The RETURNING clause was added to DML statements in an earlier Oracle database release. With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions. These values are returned in bind variables.

DBMS_SQL.BIND_VARIABLE is used to bind these outbinds if a single row is inserted, updated, or deleted. If multiple rows are inserted, updated, or deleted, then DBMS_SQL.BIND_ARRAY is used. DBMS_SQL.VARIABLE_VALUE must be called to get the values in these bind variables.

> **Note:** This is similar to DBMS_SQL.VARIABLE_VALUE, which must be called after running a PL/SQL block with an out-bind inside DBMS_SQL.

i) Single row insert

```
CREATE OR REPLACE PROCEDURE single_Row_insert
     (c1 NUMBER, c2 NUMBER, r OUT NUMBER) is
c NUMBER;
n NUMBER;
begin
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

ii) Single row update

```
CREATE OR REPLACE PROCEDURE single_Row_update
     (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
                    'WHERE rownum < 2' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
```

```
/
```

iii) Single row delete

```
CREATE OR REPLACE PROCEDURE single_Row_Delete
     (c1 NUMBER, c2 NUMBER, r OUT NUMBER) is
c NUMBER;
n number;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'delete from tab ' ||
                    'where rownum < 2 ' ||
                   'returning c1*c2 into :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

iv) Multiple row insert

```
CREATE OR REPLACE PROCEDURE multi_Row_insert
     (c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
      r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

v) Multiple row Update.

```
CREATE OR REPLACE PROCEDURE multi_Row_update
     (c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
                    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

Note: bnd1 and bnd2 can be arrays as well. The value of the expression for all the rows updated will be in bnd3. There is no way of differentiating which rows were updated of each value of bnd1 and bnd2.

vi) Multiple row delete

```
CREATE OR REPLACE PROCEDURE multi_row_delete
     (c1 DBMS_SQL.NUMBER_TABLE,
      r OUT DBMS_SQL.NUMBER_TABLE) is
c NUMBER;
n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
                    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/
```

vii) Out-bind in bulk PL/SQL

```
CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
   (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
c NUMBER;
r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/
```

Note: `DBMS_SQL.BIND_ARRAY` of `number_Table` internally binds a number. The number of times statement is run depends on the number of elements in an inbind array.

Example 10: Binds and Defines of User-defined Types in DBMS_SQL

```
CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/

INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
```

```
/
INSERT INTO depts
     VALUES('Asia', dnames_var('Finance','Payroll','Shipping','Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2)
IS
   some_dnames dnames_var;
   c      NUMBER;
   r      NUMBER;
   sql_stmt VARCHAR2(32767) :=
    'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
INTO :b3';

BEGIN

   c := DBMS_SQL.OPEN_CURSOR;

   DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

   DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
   DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
   DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

   r := DBMS_SQL.EXECUTE(c);

   -- Get value of outbind variable
   DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

   DBMS_SQL.CLOSE_CURSOR(c);

   -- select dept_names
   sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';

   c := DBMS_SQL.OPEN_CURSOR;
   DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

   DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
   DBMS_SQL.BIND_VARIABLE(c, 'b1', region);

   r := DBMS_SQL.EXECUTE_AND_FETCH(c);

   DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

   DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through some_dnames collections
    FOR i IN some_dnames.FIRST .. some_dnames.LAST  LOOP
        DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
    END LOOP;
END;
/

DECLARE
  new_dnames dnames_var;
BEGIN
  new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting',
                           'Executive', 'Marketing');
  update_depts(new_dnames, 'Asia');
END;
```

/

Data Structures

The DBMS_SQL package defines the following RECORD types and TABLE types.

RECORD Types

- DESC_REC Record Type
- DESC_REC2 Record Type
- DESC_REC3 Record Type

TABLE Types

- BFILE_TABLE Table Type
- BINARY_DOUBLE_TABLE Table Type
- BINARY_FLOAT_TABLE Table Type
- BLOB_TABLE Table Type
- CLOB_TABLE Table Type
- DATE_TABLE Table Type
- DESC_TAB Table Type
- DESC_TAB2 Table Type
- DESC_TAB3 Table Type
- INTERVAL_DAY_TO_SECOND_TABLE Table Type
- INTERVAL_YEAR_TO_MONTH_TABLE Table Type
- NUMBER_TABLE Table Type
- TIME_TABLE Table Type
- TIME_WITH_TIME_ZONE_TABLE Table Type
- TIMESTAMP_TABLE Table Type
- TIMESTAMP_WITH_LTZ_TABLE Table Type
- TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type
- UROWID_TABLE Table Type
- VARCHAR2_TABLE Table Type
- VARCHAR2A Table Type
- VARCHAR2S Table Type

DESC_REC Record Type

Note: This type has been deprecated in favor of the DESC_REC2 Record Type.

This record type holds the describe information for a single column in a dynamic query. It is the element type of the DESC_TAB table type and the DESCRIBE_COLUMNS Procedure.

Syntax

```
TYPE desc_rec IS RECORD (
      col_type            BINARY_INTEGER := 0,
      col_max_len         BINARY_INTEGER := 0,
      col_name            VARCHAR2(32)   := '',
      col_name_len        BINARY_INTEGER := 0,
      col_schema_name     VARCHAR2(32)   := '',
      col_schema_name_len BINARY_INTEGER := 0,
      col_precision       BINARY_INTEGER := 0,
      col_scale           BINARY_INTEGER := 0,
      col_charsetid       BINARY_INTEGER := 0,
      col_charsetform     BINARY_INTEGER := 0,
      col_null_ok         BOOLEAN        := TRUE);
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

Fields

Table 133–2 DESC_REC Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

Syntax

```
TYPE desc_rec2 IS RECORD (
   col_type            binary_integer := 0,
   col_max_len         binary_integer := 0,
   col_name            varchar2(32767) := '',
   col_name_len        binary_integer := 0,
   col_schema_name     varchar2(32)   := '',
   col_schema_name_len binary_integer := 0,
   col_precision       binary_integer := 0,
   col_scale           binary_integer := 0,
   col_charsetid       binary_integer := 0,
   col_charsetform     binary_integer := 0,
   col_null_ok         boolean        := TRUE);
```

Fields

Table 133–3 DESC_REC2 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set id
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible

DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (type_name) and type name len (type_name_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col_type_name and col_type_name_len fields are only populated when the col_type field's value is 109, the Oracle type number for user-defined types.

Syntax

```
TYPE desc_rec3 IS RECORD (
   col_type              binary_integer := 0,
   col_max_len           binary_integer := 0,
   col_name              varchar2(32767) := '',
   col_name_len          binary_integer := 0,
   col_schema_name       varchar2(32) := '',
   col_schema_name_len   binary_integer := 0,
   col_precision         binary_integer := 0,
   col_scale             binary_integer := 0,
   col_charsetid         binary_integer := 0,
   col_charsetform       binary_integer := 0,
   col_null_ok           boolean := TRUE,
   col_type_name         varchar2(32767)   := '',
   col_type_name_len     binary_integer := 0);
```

Fields

Table 133–4 DESC_REC3 Fields

Field	Description
col_type	Type of column
col_max_len	Maximum column length
col_name	Name of column
col_name_len	Length of column name
col_schema_name	Column schema name
col_schema_name_len	Length of column schema name
col_precision	Precision of column
col_scale	Scale of column
col_charsetid	Column character set ID
col_charsetform	Column character set form
col_null_ok	NULL column flag; TRUE, if NULL possible
col_type_name	User-define type column type name, this field is valid when col_type is 109
col_type_name_len	Length of user-define type column type name, this field is valid when col_type is 109

BFILE_TABLE Table Type

This is a table of `BFILE`.

Syntax

```
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```

BINARY_DOUBLE_TABLE Table Type

This is a table of `BINARY_DOUBLE`.

Syntax

```
TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;
```

BINARY_FLOAT_TABLE Table Type

This is a table of `BINARY_FLOAT`.

Syntax

```
TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;
```

BLOB_TABLE Table Type

This is a table of `BLOB`.

Syntax

```
TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;
```

CLOB_TABLE Table Type

This is a table of CLOB.

Syntax

```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
```

DATE_TABLE Table Type

This is a table of `DATE`.

Syntax

```
type date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
```

DESC_TAB Table Type

This is a table of DESC_REC Record Type.

Syntax

```
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

DESC_TAB2 Table Type

This is a table of DESC_REC2 Record Type.

Syntax

```
TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;
```

DESC_TAB3 Table Type

This is a table of DESC_REC3 Record Type.

Syntax

```
TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;
```

INTERVAL_DAY_TO_SECOND_TABLE Table Type

This is a table of `DSINTERVAL_UNCONSTRAINED`.

Syntax

```
TYPE interval_day_to_second_Table IS TABLE OF
   DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
```

INTERVAL_YEAR_TO_MONTH_TABLE Table Type

This is a table of YMINTERVAL_UNCONSTRAINED.

Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED
   INDEX BY BINARY_INTEGER;
```

NUMBER_TABLE Table Type

This is a table of `NUMBER`.

Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

TIME_TABLE Table Type

This is a table of `TIME_UNCONSTRAINED`.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIME_TZ_UNCONSTRAINED`.

Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED
   INDEX BY BINARY_INTEGER;;
```

TIMESTAMP_TABLE Table Type

This is a table of `TIMESTAMP_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of TIMESTAMP_LTZ_UNCONSTRAINED

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF
    TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```

TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of `TIMESTAMP_TZ_UNCONSTRAINED`.

Syntax

```
TYPE timestamp_with_time_zone_Table IS TABLE OF
    TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

UROWID_TABLE Table Type

This is a table of `UROWID`.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

VARCHAR2_TABLE Table Type

This is table of `VARCHAR2(2000)`.

Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

VARCHAR2A Table Type

This is table of `VARCHAR2(32767)`.

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

VARCHAR2S Table Type

This is table of `VARCHAR2(256)`.

> **Note:** This type has been superseded by the VARCHAR2A Table Type. Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```

Summary of DBMS_SQL Subprograms

Table 133–5 DBMS_SQL Package Subprograms

Subprogram	Description
BIND_ARRAY Procedures on page 133-52	Binds a given value to a given collection
BIND_VARIABLE Procedures on page 133-55	Binds a given value to a given variable
CLOSE_CURSOR Procedure on page 133-57	Closes given cursor and frees memory
COLUMN_VALUE Procedure on page 133-58	Returns value of the cursor element for a given position in a cursor
COLUMN_VALUE_LONG Procedure on page 133-61	Returns a selected part of a `LONG` column, that has been defined using `DEFINE_COLUMN_LONG`
DEFINE_ARRAY Procedure on page 133-62	Defines a collection to be selected from the given cursor, used only with `SELECT` statements
DEFINE_COLUMN Procedures on page 133-65	Defines a column to be selected from the given cursor, used only with `SELECT` statements
DEFINE_COLUMN_CHAR Procedure on page 133-67	Defines a column of type `CHAR` to be selected from the given cursor, used only with `SELECT` statements
DEFINE_COLUMN_LONG Procedure on page 133-68	Defines a `LONG` column to be selected from the given cursor, used only with `SELECT` statements
DEFINE_COLUMN_RAW Procedure on page 133-69	Defines a column of type `RAW` to be selected from the given cursor, used only with `SELECT` statements
DEFINE_COLUMN_ROWID Procedure on page 133-70	Defines a column of type `ROWID` to be selected from the given cursor, used only with `SELECT` statements
DESCRIBE_COLUMNS Procedure on page 133-71	Describes the columns for a cursor opened and parsed through `DBMS_SQL`
DESCRIBE_COLUMNS2 Procedure on page 133-72	Describes describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure
DESCRIBE_COLUMNS3 Procedure on page 133-73	Describes describes the specified column, an alternative to DESCRIBE_COLUMNS Procedure
EXECUTE Function on page 133-75	Executes a given cursor
EXECUTE_AND_FETCH Function on page 133-76	Executes a given cursor and fetch rows
FETCH_ROWS Function on page 133-77	Fetches a row from a given cursor
IS_OPEN Function on page 133-78	Returns `TRUE` if given cursor is open
LAST_ERROR_POSITION Function on page 133-79	Returns byte offset in the SQL statement text where the error occurred
LAST_ROW_COUNT Function on page 133-80	Returns cumulative count of the number of rows fetched
LAST_ROW_ID Function on page 133-81	Returns `ROWID` of last row processed
LAST_SQL_FUNCTION_CODE Function on page 133-82	Returns SQL function code for statement

Table 133–5 (Cont.) DBMS_SQL Package Subprograms

Subprogram	Description
OPEN_CURSOR Function on page 133-83	Returns cursor ID number of new cursor
PARSE Procedures on page 133-84	Parses given statement
TO_CURSOR_NUMBER Function on page 133-84	Takes an `OPEN`ed strongly or weakly-typed ref cursor and transforms it into a `DBMS_SQL` cursor number
TO_REFCURSOR Function on page 133-89	Takes an `OPEN`ed, `PARSE`d, and `EXECUTE`d cursor and transforms/migrates it into a PL/SQL manageable `REF CURSOR` (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL
VARIABLE_VALUE Procedures on page 133-91	Returns value of named variable for given cursor

BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_ARRAY (
   c                   IN INTEGER,
   name                IN VARCHAR2,
   <table_variable>    IN <datatype>
 [,index1              IN INTEGER,
   index2              IN INTEGER)] );
```

Where the <table_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
<clob_tab>     Clob_Table
<bflt_tab>     Binary_Float_Table
<bdbl_tab>     Binary_Double_Table
<blob_tab>     Blob_Table
<bfile_tab>    Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Varchar2_Table
```

Notice that the BIND_ARRAY procedure is overloaded to accept different datatypes.

Parameters

Table 133–6 BIND_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind a value.
name	Name of the collection in the statement.
table_variable	Local variable that has been declared as <datatype>.
index1	Index for the table element that marks the lower bound of the range.
index2	Index for the table element that marks the upper bound of the range.

Usage Notes

The length of the bind variable name should be <=30 bytes.

For binding a range, the table must contain the elements that specify the range — tab(index1) and tab(index2) — but the range does not have to be dense. Index1 must be less than or equal to index2. All elements between tab(index1) and tab(index2) are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

> **See Also:** "Examples 3, 4, and 5: Bulk DML" on page 133-14 for examples of how to bind collections.

Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The DBMS_SQL package lets you work on collections of data using the PL/SQL table type.

Table items are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local DBMS_SQL buffers (the same as for all scalar types) and then the table is manipulated from the local DBMS_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS_SQL.

```
TYPE binary_double_table
                    IS TABLE OF BINARY_DOUBLE  INDEX BY BINARY_INTEGER;
TYPE binary_float_table
                    IS TABLE OF BINARY_FLOAT   INDEX BY BINARY_INTEGER;
TYPE bfile_table    IS TABLE OF BFILE          INDEX BY BINARY_INTEGER;
TYPE blob_table     IS TABLE OF BLOB           INDEX BY BINARY_INTEGER;
TYPE clob_table     IS TABLE OF CLOB           INDEX BY BINARY_INTEGER;
TYPE date_table     IS TABLE OF DATE           INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
                    IS TABLE OF dsinterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
                    IS TABLE OF yminterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE number_table   IS TABLE OF NUMBER         INDEX BY BINARY_INTEGER;
TYPE time_table     IS TABLE OF time_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
                    IS TABLE OF time_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_table
                    IS TABLE OF timestamp_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
```

```
                  IS TABLE OF timestamp_ltz_unconstrained
                                                INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
                  IS TABLE OF timestamp_tz_unconstrained
                                                INDEX BY BINARY_INTEGER;
TYPE urowid_table   IS TABLE OF UROWID         INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

<tm_tab>   Time_Table
<ttz_tab>  Time_With_Time_Zone_Table
<tms_tab>  Timestamp_Table
<tstz_tab> Timestamp_With_ltz_Table;
<tstz_tab> Timestamp_With_Time_Zone_Table
<ids_tab>  Interval_Day_To_Second_Table
<iym_tab>  Interval_Year_To_Month_Table
```

BIND_VARIABLE Procedures

This procedures binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```
DBMS_SQL.BIND_VARIABLE (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN <datatype>)
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

Notice that `BIND_VARIABLE` is overloaded to accept different datatypes.

The following syntax is also supported for `BIND_VARIABLE`. The square brackets [] indicate an optional parameter for the `BIND_VARIABLE` function.

```
DBMS_SQL.BIND_VARIABLE (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);

DBMS_SQL.BIND_VARIABLE_RAW (
   c              IN INTEGER,
   name           IN VARCHAR2,
   value          IN RAW [,out_value_size IN INTEGER]);

DBMS_SQL.BIND_VARIABLE_ROWID (
   c              IN INTEGER,
```

```
   name            IN VARCHAR2,
   value           IN ROWID);
```

See Also: *Oracle Database SecureFiles and Large Objects Developer's Guide*

Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

Parameters

Table 133–7 BIND_VARIABLE Procedure Parameters

Parameter	Description
`c`	ID number of the cursor to which you want to bind a value.
`name`	Name of the variable in the statement.
`value`	Value that you want to bind to the variable in the cursor. For `IN` and `IN/OUT` variables, the value has the same type as the type of the value being passed in for this parameter.
`out_value_size`	Maximum expected `OUT` value size, in bytes, for the `VARCHAR2`, `RAW`, `CHAR` `OUT` or `IN/OUT` variable. If no size is given, then the length of the current value is used. This parameter must be specified if the `value` parameter is not initialized.

Usage Notes

If the variable is an `IN` or `IN/OUT` variable or an `IN` collection, then the given bind value must be valid for the variable or array type. Bind values for `OUT` variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);

or

BIND_VARIABLE (cursor_name, 'X', 3500);
```

The length of the bind variable name should be <=30 bytes.

See Also: "Examples 3, 4, and 5: Bulk DML" on page 133-14 for examples of how to bind collections.

CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

```
DBMS_SQL.CLOSE_CURSOR (
   c    IN OUT INTEGER);
```

Pragmas

```
pragma restrict_references(close_cursor,RNDS,WNDS);
```

Parameters

Table 133–8 CLOSE_CURSOR Procedure Parameters

Parameter	Mode	Description
c	IN	ID number of the cursor that you want to close.
c	OUT	Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.

COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling `FETCH_ROWS`.

Syntax

```
DBMS_SQL.COLUMN_VALUE (
   c                IN  INTEGER,
   position         IN  INTEGER,
   value            OUT <datatype>
 [,column_error     OUT NUMBER]
 [,actual_length    OUT INTEGER]);
```

Where square brackets [ ] indicate optional parameters and `<datatype>` can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.COLUMN_VALUE_CHAR (
   c               IN  INTEGER,
   position        IN  INTEGER,
   value           OUT CHAR CHARACTER SET ANY_CS
 [,column_error    OUT NUMBER]
 [,actual_length   OUT INTEGER]);

DBMS_SQL.COLUMN_VALUE_RAW (
   c               IN  INTEGER,
   position        IN  INTEGER,
   value           OUT RAW
 [,column_error    OUT NUMBER]
 [,actual_length   OUT INTEGER]);

DBMS_SQL.COLUMN_VALUE_ROWID (
   c               IN  INTEGER,
   position        IN  INTEGER,
   value           OUT ROWID
 [,column_error    OUT NUMBER]
```

```
 [,actual_length   OUT INTEGER]);
```

The following syntax enables the COLUMN_VALUE procedure to accommodate bulk operations:

```
DBMS_SQL.COLUMN_VALUE(
   c                IN             INTEGER,
   position         IN             INTEGER,
   <param_name>     IN OUT NOCOPY  <table_type>);
```

Where the <param_name> and its corresponding <table_type> can be any one of these matching pairs:

```
bdbl_tab     Binary_Double_Table
bflt_tab     Binary_Float_Table
bf_tab       Bfile_Table
bl_tab       Blob_Table
cl_tab       Clob_Table
d_tab        Date_Table
ids_tab      Interval_Day_To_Second_Table
iym_tab      Interval_Year_To_Month_Table
n_tab        Number_Table
tm_tab       Time_Table
ttz_tab      Time_With_Time_Zone_Table
tms_tab      Timestamp_Table
tstz_tab     Timestamp_With_ltz_Table;
tstz_tab     Timestamp_With_Time_Zone_Table
ur_tab       Urowid_Table
c_tab        Varchar2_Table
```

Pragmas

```
pragma restrict_references(column_value,RNDS,WNDS);
```

Parameters

Table 133–9 COLUMN_VALUE Procedure Parameters (Single Row)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
value	Returns the value at the specified column. Oracle raises exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to DEFINE_COLUMN.
column_error	Returns any error code for the specified column value.
actual_length	The actual length, before any truncation, of the value in the specified column.

Table 133–10 COLUMN_VALUE Procedure Parameters (Bulk)

Parameter	Description
c	ID number of the cursor from which you are fetching the values.
position	Relative position of the column in the cursor. The first column in a statement has position 1.
<param_name>	Local variable that has been declared <table_type>. <param_name> is an IN OUT NOCOPY parameter for bulk operations. For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing the DEFINE_ARRAY Procedure a batch size (the cnt parameter) of 10 rows was specified and a start index (lower_bound) of 1 was specified, then the first call to this subprogram after calling the FETCH_ROWS Function will populate elements at index 1..10, and the next call will populate elements 11..20, and so on.

Exceptions

INCONSISTENT_TYPE (ORA-06562) is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure DEFINE_COLUMN.

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

```
DBMS_SQL.COLUMN_VALUE_LONG (
   c            IN  INTEGER,
   position     IN  INTEGER,
   length       IN  INTEGER,
   offset       IN  INTEGER,
   value        OUT VARCHAR2,
   value_length OUT INTEGER);
```

Pragmas

```
pragma restrict_references(column_value_long,RNDS,WNDS);
```

Parameters

Table 133–11 COLUMN_VALUE_LONG Procedure Parameters

Parameter	Description
c	Cursor ID number of the cursor from which to get the value.
position	Position of the column of which to get the value.
length	Number of bytes of the long value to fetch.
offset	Offset into the long field for start of fetch.
value	Value of the column as a VARCHAR2.
value_length	Number of bytes actually returned in value.

DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a FETCH_ROWS call). This procedure lets you do batch fetching of rows from a single SELECT statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into DBMS_SQL buffers until you run a COLUMN_VALUE call, at which time the rows are copied into the table that was passed as an argument to the COLUMN_VALUE call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using DBMS_SQL. (These are the same types as you can specify for the BIND_ARRAY procedure.)

```
TYPE binary_double_table
                    IS TABLE OF BINARY_DOUBLE  INDEX BY BINARY_INTEGER;
TYPE binary_float_table
                    IS TABLE OF BINARY_FLOAT   INDEX BY BINARY_INTEGER;
TYPE bfile_table    IS TABLE OF BFILE          INDEX BY BINARY_INTEGER;
TYPE blob_table     IS TABLE OF BLOB           INDEX BY BINARY_INTEGER;
TYPE clob_table     IS TABLE OF CLOB           INDEX BY BINARY_INTEGER;
TYPE date_table     IS TABLE OF DATE           INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_Table
                    IS TABLE OF dsinterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_Table
                    IS TABLE OF yminterval_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE number_table   IS TABLE OF NUMBER         INDEX BY BINARY_INTEGER;
TYPE time_table     IS TABLE OF time_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table
                    IS TABLE OF time_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_table
                    IS TABLE OF timestamp_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_Table
                    IS TABLE OF timestamp_ltz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_Table
                    IS TABLE OF timestamp_tz_unconstrained
                                               INDEX BY BINARY_INTEGER;
TYPE urowid_table   IS TABLE OF UROWID         INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

<tm_tab>   Time_Table
<ttz_tab>  Time_With_Time_Zone_Table
<tms_tab>  Timestamp_Table
<tstz_tab> Timestamp_With_ltz_Table;
<tstz_tab> Timestamp_With_Time_Zone_Table
<ids_tab>  Interval_Day_To_Second_Table
<iym_tab>  Interval_Year_To_Month_Table
```

Syntax

```
DBMS_SQL.DEFINE_ARRAY (
   c           IN INTEGER,
   position    IN INTEGER,
   <table_variable>    IN <datatype>
   cnt         IN INTEGER,
   lower_bnd   IN INTEGER);
```

Where <table_variable> and its corresponding <datatype> can be any one of the following matching pairs:

```
<clob_tab>     Clob_Table
<bflt_tab>     Binary_Float_Table
<bdbl_tab>     Binary_Double_Table
<blob_tab>     Blob_Table
<bfile_tab>    Bfile_Table
<date_tab>     Date_Table
<num_tab>      Number_Table
<urowid_tab>   Urowid_Table
<vchr2_tab>    Varchar2_Table
```

Note that DEFINE_ARRAY is overloaded to accept different datatypes.

Pragmas

```
pragma restrict_references(define_array,RNDS,WNDS);
```

The subsequent FETCH_ROWS call fetch "count" rows. When the COLUMN_VALUE call is made, these rows are placed in positions lower_bnd, lower_bnd+1, lower_bnd+2, and so on. While there are still rows coming, the user keeps issuing FETCH_ROWS/COLUMN_VALUE calls. The rows keep accumulating in the table specified as an argument in the COLUMN_VALUE call.

Parameters

Table 133–12 DEFINE_ARRAY Procedure Parameters

Parameter	Description
c	ID number of the cursor to which you want to bind an array.
position	Relative position of the column in the array being defined. The first column in a statement has position 1.
table_variable	Local variable that has been declared as <datatype>.
cnt	Number of rows that must be fetched.
lower_bnd	Results are copied into the collection, starting at this lower bound index.

Usage Notes

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The lower_bnd can be positive, negative, or zero. A query on which a DEFINE_ARRAY call was issued cannot contain array binds.

Examples

```
PROCEDURE BULK_PLSQL(deptid NUMBER)
    TYPE namelist IS TABLE OF employees.last_name%TYPE;
```

```
    TYPE sallist IS TABLE OF employees.salary%TYPE;
    names    namelist;
    sals     sallist;
    c        NUMBER;
    r        NUMBER;
    sql_stmt VARCHAR2(32767) :=
        'SELECT last_name, salary FROM employees WHERE department_id = :b1';

BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

    DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);

    DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
    DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);

    r := DBMS_SQL.EXECUTE(c);

    LOOP
      r := DBMS_SQL.FETCH_ROWS(c);
      DBMS_SQL.COLUMN_VALUE(c, 1, names);
      DBMS_SQL.COLUMN_VALUE(c, 2, sals);
      EXIT WHEN r != 5;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(c);

    -- loop through the names and sals collections
    FOR i IN names.FIRST .. names.LAST  LOOP
      DBMS_OUTPUT.PUT_LINE('Name = ' || names(i) || ', salary = ' || sals(i));
    END LOOP;
END;
/
```

See Also: "Examples 6 and 7: Defining an Array" on page 133-17 for examples of how to define collections.

DEFINE_COLUMN Procedures

This procedure defines a column to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN <datatype>)
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

Note that DEFINE_COLUMN is overloaded to accept different datatypes.

The following syntax is also supported for the DEFINE_COLUMN procedure:

```
DBMS_SQL.DEFINE_COLUMN (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN VARCHAR2 CHARACTER SET ANY_CS,
   column_size    IN INTEGER),
   urowid         IN INTEGER;
```

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 133–13 DEFINE_COLUMN Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined.The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of type VARCHAR2, and RAW.

Usage Notes

When using character length semantics the maximum number of bytes that can be returned for a column value of type VARCHAR2 is calculated as: column_size * maximum character byte size for the current characterset. For example, specifying the column_size as 10 means that a maximum of 30 (10*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

DEFINE_COLUMN_CHAR Procedure

This procedure defines a column with CHAR data to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_LONG Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_CHAR (
   c             IN INTEGER,
   position      IN INTEGER,
   column        IN CHAR CHARACTER SET ANY_CS,
   column_size   IN INTEGER);
```

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 133–14 DEFINE_COLUMN_CHAR Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined.The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in characters for columns of type CHAR.

DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG (
   c               IN INTEGER,
   position        IN INTEGER);
```

Parameters

Table 133–15 DEFINE_COLUMN_LONG Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected.
position	Relative position of the column in the row being defined. The first column in a statement has position 1.

DEFINE_COLUMN_RAW Procedure

This procedure defines a column of type RAW to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW (
   c              IN INTEGER,
   position       IN INTEGER,
   column         IN RAW,
   column_size    IN INTEGER);
```

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 133–16 DEFINE_COLUMN Procedure Parameters

Parameter	Description
c	ID number of the cursor for the row being defined to be selected
position	Relative position of the column in the row being defined.The first column in a statement has position 1.
column	Value of the column being defined. The type of this value determines the type for the column being defined.
column_size	Maximum expected size of the column value in bytes for columns of and RAW

DEFINE_COLUMN_ROWID Procedure

This procedure defines a column of type `ROWID` to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_RAW Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_ROWID (
   c               IN INTEGER,
   position        IN INTEGER,
   column          IN ROWID);
```

> **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 133–17 DEFINE_COLUMN Procedure Parameters

Parameter	Description
`c`	ID number of the cursor for the row being defined to be selected
`position`	Relative position of the column in the row being defined.The first column in a statement has position 1.
`column`	Value of the column being defined. The type of this value determines the type for the column being defined.

DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS (
   c              IN  INTEGER,
   col_cnt        OUT INTEGER,
   desc_t         OUT DESC_TAB);
```

Parameters

Table 133–18 DESCRIBE_COLUMNS Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described
col_cnt	Number of columns in the select list of the query
desc_t	Describe table to fill in with the description of each of the columns of the query

See Also: "Example 8: Describe Columns" on page 133-19 illustrates how to use DESCRIBE_COLUMNS.

DESCRIBE_COLUMNS2 Procedure

This function describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS2 (
   c              IN  INTEGER,
   col_cnt        OUT INTEGER,
   desc_t         OUT DESC_TAB2);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);
```

Parameters

Table 133–19 DESCRIBE_COLUMNS2 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

DESCRIBE_COLUMNS3 Procedure

This function describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```
DBMS_SQL.DESCRIBE_COLUMNS3 (
   c              IN  INTEGER,
   col_cnt        OUT INTEGER,
   desc_t         OUT DESC_TAB3);
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

Parameters

Table 133–20 DESCRIBE_COLUMNS3 Procedure Parameters

Parameter	Description
c	ID number of the cursor for the columns being described.
col_cnt	Number of columns in the select list of the query.
desc_t	Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.

Usage Notes

The cursor passed in by the cursor ID has to be OPENed and PARSEd, otherwise an "invalid cursor id" error is raised.

Examples

```
CREATE TYPE PROJECT_T AS OBJECT
      ( projname          VARCHAR2(20),
        mgr               VARCHAR2(20))
/

CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/

DECLARE
  curid      NUMBER;
  desctab    DBMS_SQL.DESC_TAB3;
  colcnt     NUMBER;
  sql_stmt   VARCHAR2(200) := 'select * from projecttab';
BEGIN

    curid := DBMS_SQL.OPEN_CURSOR;

    DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

    DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

    FOR i IN 1 .. colcnt LOOP
      IF desctab(i).col_type = 109 THEN
```

```
        DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
        DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
                             desctab(i).col_type_name);
      END IF;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

Output:

PROJECT is user-defined type: HR.PROJECT_T
```

EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed. The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types of statements, including DDL, the return value is undefined and should be ignored.

Syntax

```
DBMS_SQL.EXECUTE (
   c   IN INTEGER)
  RETURN INTEGER;
```

Parameters

Table 133–21 EXECUTE Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to execute.

Usage Notes

The DBMS_SQL cursor that is returned by the TO_CURSOR_NUMBER Function performs in the same way as a DBMS_SQL cursor that has already been executed. Consequently, calling EXECUTE for this cursor will cause an error.

EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows. This function provides the same functionality as calling EXECUTE and then calling FETCH_ROWS. Calling EXECUTE_AND_FETCH instead, however, may reduce the number of network round-trips when used against a remote database.

The EXECUTE_AND_FETCH function returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.EXECUTE_AND_FETCH (
   c              IN INTEGER,
   exact          IN BOOLEAN DEFAULT FALSE)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(execute_and_fetch,WNDS);
```

Parameters

Table 133–22 EXECUTE_AND_FETCH Function Parameters

Parameter	Description
c	ID number of the cursor to execute and fetch.
exact	Set to TRUE to raise an exception if the number of rows actually matching the query differs from one. Note: Oracle does not support the exact fetch TRUE option with LONG columns. Even if an exception is raised, the rows are still fetched and available.

FETCH_ROWS Function

This function fetches a row from a given cursor. You can call FETCH_ROWS repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling COLUMN_VALUE, for each column, after each call to FETCH_ROWS.

The FETCH_ROWS function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

```
DBMS_SQL.FETCH_ROWS (
   c              IN INTEGER)
  RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(fetch_rows,WNDS);
```

Parameters

Table 133–23 FETCH_ROWS Function Parameters

Parameter	Description
c	ID number.

IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

```
DBMS_SQL.IS_OPEN (
   c               IN INTEGER)
  RETURN BOOLEAN;
```

Pragmas

```
pragma restrict_references(is_open,RNDS,WNDS);
```

Parameters

Table 133–24 IS_OPEN Function Parameters

Parameter	Description
c	Cursor ID number of the cursor to check.

Return Values

Returns `TRUE` for any cursor number that has been opened but not closed, and `FALSE` for a `NULL` cursor number. Note that the CLOSE_CURSOR Procedure Procedure `NULL`s out the cursor variable passed to it.

Exceptions

`ORA-29471 DBMS_SQL access denied:` This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent DBMS_SQL call in the same session will raise this error, meaning that DBMS_SQL is non-operational for this session.

LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

```
DBMS_SQL.LAST_ERROR_POSITION
   RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_error_position,RNDS,WNDS);
```

Usage Notes

Call this function after a `PARSE` call, before any other `DBMS_SQL` procedures or functions are called.

LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

```
DBMS_SQL.LAST_ROW_COUNT
   RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_row_count,RNDS,WNDS);
```

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call. If called after an EXECUTE call, then the value returned is zero.

LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

```
DBMS_SQL.LAST_ROW_ID
   RETURN ROWID;
```

Pragmas

```
pragma restrict_references(last_row_id,RNDS,WNDS);
```

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call.

LAST_SQL_FUNCTION_CODE Function

This function returns the SQL function code for the statement. These codes are listed in the *Oracle Call Interface Programmer's Guide.*

Syntax

```
DBMS_SQL.LAST_SQL_FUNCTION_CODE
   RETURN INTEGER;
```

Pragmas

```
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

Usage Notes

You should call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

OPEN_CURSOR Function

This procedure opens a new cursor. The second overload takes a `security_level` parameter to apply fine-grained control to the security of the opened cursor.

When you no longer need this cursor, you must close it explicitly by calling the CLOSE_CURSOR Procedure.

Syntax

```
DBMS_SQL.OPEN_CURSOR
  RETURN INTEGER;

DBMS_SQL.OPEN_CURSOR (
   security_level   IN   INTEGER)
  RETURN INTEGER;
```

Parameters

Table 133–25 OPEN_CURSOR Function Parameters

Parameter	Description
`security_level`	Specifies the level of security protection to enforce on the opened cursor. Valid security level values are `0`, `1`, and `2`. When a `NULL` argument value is provided to this overload, as well as for cursors opened using the overload of open_cursor without the security_level parameter, the default security level value `1` will be enforced on the opened cursor. ▪ `Level 0` - allows all `DBMS_SQL` operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default. ▪ `Level 1` - requires that the effective userid and roles of the caller to `DBMS_SQL` for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor. ▪ `Level 2` - requires that the effective userid and roles of the caller to `DBMS_SQL` for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.

Pragmas

```
pragma restrict_references(open_cursor,RNDS,WNDS);
```

Return Values

This function returns the cursor ID number of the new cursor.

Usage Notes

You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are three versions of the PARSE procedure:

- Taking a VARCHAR2 statement as an argument
- Taking VARCHAR2a, table of VARCHAR2(32767), as an argument. The VARCHAR2A overload version of the procedure concatenates elements of a PL/SQL table statement and parses the resulting string. You can use this procedure to parse a statement that is longer than the limit for a single VARCHAR2 variable by splitting up the statement.
- Taking a CLOB statement as an argument. You can use the CLOB overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

```
DBMS_SQL.PARSE (
   c                           IN   INTEGER,
   statement                   IN   VARCHAR2,
   language_flag               IN   INTEGER,
   edition                     IN   VARCHAR2 DEFAULT NULL,
   apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,
   fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE);

DBMS_SQL.PARSE (
   c                           IN   INTEGER,
   statement                   IN   CLOB,
   language_flag               IN   INTEGER,
   edition                     IN   VARCHAR2 DEFAULT NULL,
   apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,
   fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE);

DBMS_SQL.PARSE (
   c                           IN   INTEGER,
   statement                   IN   VARCHAR2A,
   lb                          IN   INTEGER,
   ub                          IN   INTEGER,
   lfflg                       IN   BOOLEAN,
   language_flag               IN   INTEGER,
   edition                     IN   VARCHAR2 DEFAULT NULL,
   apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,
   fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 133–26 PARSE Procedure Parameters

Parameter	Description
c	ID number of the cursor in which to parse the statement.
statement	SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs. Unlike PL/SQL statements, your SQL statement should not include a final semicolon. For example: DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2); DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);
lb	Lower bound for elements in the statement
ub	Upper bound for elements in the statement
lfflg	If TRUE, then insert a linefeed after each element on concatenation.
language_flag	Determines how Oracle handles the SQL statement. The following options are recognized: ■ V6 (or 0) specifies version 6 behavior. ■ NATIVE (or 1) specifies normal behavior for the database to which the program is connected. ■ V7 (or 2) specifies Oracle database version 7 behavior.
edition	Specifies the edition to run the statement in. Passing NULL indicates the statement should to run in the caller's current edition. The contents of the string are processed as a SQL identifier; double-quotes must surround the remainder of the string if special characters or lower case characters are present in the edition's actual name, and if double-quotes are not used the contents will be uppercased. If the edition is specified with a non-NULL value, the user with which the statement is to be executed must have USE privilege on the named edition.
apply_crossedition_trigger	Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement. If a non-NULL value is specified, the specified crossedition trigger will be executed assuming fire_apply_trigger is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger's dml_event_clause, any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the "crossedition trigger DML rules" applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed. The contents of the string are processed as a SQL identifier; double-quotes must surround the remainder of the string if special characters or lower case characters are present in the trigger's actual name, and if double-quotes are not used, the contents will be uppercased.

Table 133–26 (Cont.) PARSE Procedure Parameters

Parameter	Description
`fire_apply_trigger`	Indicates whether the specified `apply_crossedition_trigger` is itself to be executed, or should only be a guide used in selecting other triggers. This is typically set `FALSE` when the statement is a replacement for the actions the `apply_crossedition_trigger` would itself perform. If `FALSE`, the specified trigger is not executed, but other triggers are still selected for firing as if the specified trigger was doing a DML to the table that is the target of the statement. The `apply_crossedition_trigger` and `fire_apply_trigger` parameters are ignored if the statement is not a DML.

Usage Notes

- Using `DBMS_SQL` to dynamically run DDL statements can result in the program hanging. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, results in a hang.
- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

  For example, the following code does *not* compile on the client:

  ```
  DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant
  DBMS_SQL.NATIVE
  ```

  The following code works on the client, because the argument is explicitly provided:

  ```
  DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client
  ```
- The VARCHAR2S type is currently supported for backward compatibility of legacy code. However, you are advised to use VARCHAR2A both for its superior capability and because VARCHAR2S will be deprecated in a future release.
- To parse SQL statements larger than 32 KB, the new CLOB overload version of the PARSE procedure can be used instead of the VARCHAR2A overload

Exceptions

If you create a type/procedure/function/package using `DBMS_SQL` that has compilation warnings, an `ORA-24344` exception is raised, and the procedure is still created.

TO_CURSOR_NUMBER Function

This function takes an OPENed strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

```
DBMS_SQL.TO_CURSOR_NUMBER(
   rc IN OUT SYS_REFCURSOR)
  RETURN INTEGER;
```

Parameters

Table 133–27 TO_CURSOR_NUMBER Function Parameters

Parameter	Description
rc	REF CURSOR to be transformed into a cursor number

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR

Usage Notes

- The REF CURSOR passed in has to be OPENed, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- Toggle between REF CURSOR and DBMS_SQL cursor number after started to fetch is not allowed, and an error is raised.
- The DBMS_SQL cursor that is returned by this subprogram performs in the same way as a DBMS_SQL cursor that has already been executed.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur         CurType;
  curid           NUMBER;
  desctab         DBMS_SQL.DESC_TAB;
  colcnt          NUMBER;
  namevar         VARCHAR2(50);
  numvar          NUMBER;
  datevar         DATE;
  empno           NUMBER := 100;
BEGIN

    -- sql_stmt := 'select ..... from employees where employee_id = :b1';
    OPEN src_cur FOR sql_stmt USING empno;

    -- Switch from native dynamic SQL to DBMS_SQL
    curid := DBMS_SQL.TO_CURSORID(src_cur);

    DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

    -- Define columns
```

```
    FOR i IN 1 .. colcnt LOOP
        IF desctab(i).col_type = 2 THEN
           DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
        ELSIF desctab(i).col_type = 12 THEN
            DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
.......
         ELSE
            DBMS_SQL.DEFINE_COLUMN(curid, i, namevar);
         END IF;
    END LOOP;

  -- Fetch Rows
    WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
        FOR i IN 1 .. colcnt LOOP
          IF (desctab(i).col_type = 1) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
         ELSIF (desctab(i).col_type = 2) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
          ELSIF (desctab(i).col_type = 12) THEN
            DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
....
          END IF;
        END LOOP;
    END LOOP;

    DBMS_SQL.CLOSE_CURSOR(curid);
END;
/
```

TO_REFCURSOR Function

This function takes an OPENed, PARSEd, and EXECUTEd cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQLswitched to use native dynamic SQL. This subprogram is only used with SELECT cursors.

Syntax

```
DBMS_SQL.TO_REFCURSOR(
   cursor_number IN  INTEGER)
  RETURN SYS_REFCURSOR;
```

Parameters

Table 133–28 TO_REFCURSOR Function Parameters

Parameter	Description
cursor_number	Cursor number of the cursor to be transformed into REF CURSOR

Return Values

Returns a PL/SQL REF CURSOR transformed from a DBMS_SQL cursor number.

Usage Notes

- The cursor passed in by the cursor_number has to be OPENed, PARSEd, and EXECUTEd; otherwise an error is raised.
- Once the cursor_number is transformed into a REF CURSOR, the cursor_number is no longer accessible by any DBMS_SQL operations.
- After a cursor_number is transformed into a REF CURSOR, using DBMS_SQL.IS_OPEN to check to see if the cursor_number is still open results in an error.
- Toggle between REF CURSOR and DBMS_SQL cursor number after started to fetch is not allowed, and an error is raised.

Examples

```
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
  TYPE CurType IS REF CURSOR;
  src_cur         CurType;
  curid           NUMBER;
  sql_stmt        VARCHAR2(200);
  ret             INTEGER;
  empnos          DBMS_SQL.Number_Table;
  depts           DBMS_SQL.Number_Table;
BEGIN

  -- DBMS_SQL.OPEN_CURSOR
  curid := DBMS_SQL.OPEN_CURSOR;

  sql_stmt :=
    'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID = :b1';

  DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
```

```
  ret := DBMS_SQL.EXECUTE(curid);

  -- Switch from DBMS_SQL to native dynamic SQL
  src_cur := DBMS_SQL.TO_REFCURSOR(curid);

  -- Fetch with native dynamic SQL
  FETCH src_cur BULK COLLECT INTO empnos, depts;

  IF empnos.COUNT > 0 THEN
    DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
    DBMS_OUTPUT.PUT_LINE('----- ------');
    -- Loop through the empnos and depts collections
    FOR i IN 1 .. empnos.COUNT LOOP
      DBMS_OUTPUT.PUT_LINE(empnos(i) || '   ' || depts(i));
    END LOOP;
  END IF;

  -- Close cursor
  CLOSE src_cur;
END;
/
```

VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with `returning` clause.

Syntax

```
DBMS_SQL.VARIABLE_VALUE (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT NOCOPY <datatype>);
```

Where <datatype> can be any one of the following types:

```
BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFs
Opaque types
```

For variables containing `CHAR`, `RAW`, and `ROWID` data, you can use the following variations on the syntax:

```
DBMS_SQL.VARIABLE_VALUE_CHAR (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT CHAR CHARACTER SET ANY_CS);

DBMS_SQL.VARIABLE_VALUE_RAW (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT RAW);

DBMS_SQL.VARIABLE_VALUE_ROWID (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT ROWID);
```

The following syntax enables the `VARIABLE_VALUE` procedure to accommodate bulk operations:

```
DBMS_SQL.VARIABLE_VALUE (
   c                 IN   INTEGER,
   name              IN   VARCHAR2,
```

```
   value             OUT NOCOPY <table_type>);
```

For bulk operations, <table_type> can be:

```
Binary_Double_Table
Binary_Float_Table
Bfile_Table
Blob_Table
Clob_Table
Date_Table
Interval_Day_To_Second_Table
Interval_Year_To_Month_Table
Number_Table
Time_Table
Time_With_Time_Zone_Table
Timestamp_Table
Timestamp_With_ltz_Table;
Timestamp_With_Time_Zone_Table
Urowid_Table
Varchar2_Table
```

Pragmas

```
pragma restrict_references(variable_value,RNDS,WNDS);
```

Parameters

Table 133–29 VARIABLE_VALUE Procedure Parameters

Parameter	Description
c	ID number of the cursor from which to get the values.
name	Name of the variable for which you are retrieving the value.
value	■ Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE. ■ Array option: Local variable that has been declared <table_type>. For bulk operations, value is an OUT NOCOPY parameter.

DBMS_SQLDIAG

The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

> **See Also:** *Oracle Database Administrator's Guide* for more information about "Managing Diagnostic Data"

This chapter contains the following topics:

- Using DBMS_SQLDIAG
  - Overview
  - Constants
  - Examples
- Summary of DBMS_SQLDIAG Subprograms

Using DBMS_SQLDIAG

- Overview
- Constants
- Examples

Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement.

This section covers the following topics:

- About the SQL Repair Advisor
- Running the SQL Repair Advisor
- Removing a SQL Patch

About the SQL Repair Advisor

You run the SQL Repair Advisor after a SQL statement fails with a critical error. The advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

Running the SQL Repair Advisor

You run the SQL Repair Advisor by creating and executing a diagnostic task using the `CREATE_DIAGNOSIS_TASK` and `EXECUTE_DIAGNOSIS_TASK` respectively. The SQL Repair Advisor first reproduces the critical error and then tries to produce a workaround in the form of SQL patch.

1. **Identify the problem SQL statement**

   Consider the SQL statement that gives a critical error:

   ```
   DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT MAX(ROWID) FROM t t2
   WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)
   ```

   You use the SQL Repair advisor to repair this critical error.

2. **Create a diagnosis task**

   Invoke `DBMS_SQLDIAG. CREATE_DIAGNOSIS_TASK`. You can specify an optional task name, an optional time limit for the advisor task, and problem type. In the example below, we specify the SQL text, the task name as '`error_task`' and a problem type as '`DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR`'.

   ```
   DECLARE
       rep_out         CLOB;
       t_id            VARCHAR2(50);
     BEGIN
       t_id := DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK(
         sql_text => 'DELETE FROM t t1 WHERE t1.a = ''a'' AND ROWID <> (SELECT
   MAX(ROWID) FROM t t2 WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d)',
         task_name => 'error_task',
         problem_type =>DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR);
   ```

3. **Execute the diagnosis task**

   To execute the workaround generation and analysis phase of the SQL Repair Advisor, you call `DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK` with the task ID returned by the `CREATE_DIAGNOSIS_TASK`. After a short delay, the SQL Repair Advisor returns. As part of its execution, the SQL Repair Advisor keeps a record of its findings which can be accessed through the reporting facilities of SQL Repair Advisor.

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (t_id);
```

4. **Report the diagnosis task**

   The analysis of the diagnosis task is accessed through dbms_sqldiag.report_diagnosis_task. If the SQL Repair Advisor was able to find a workaround, it recommends a SQL Patch. A SQL Patch is similar to a SQL profile but unlike the SQL Profile, it is used to workaround compilation or execution errors.

```
rep_out := DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (t_id, DBMS_SQLDIAG.TYPE_TEXT);

  DBMS_OUTPUT.PUT_LINE ('Report : ' ||  rep_out);

  END;
  /
```

5. **Applying the patch**

   If a patch recommendation is present in the report, you can run the `ACCEPT_SQL_PATCH` command to accept the patch by invoking `DBMS_SQLDIAG.ACCEPT_SQL_PATCH`. This procedure takes the `task_name` as an argument.

```
EXECUTE DBMS_SQLDIAG.ACCEPT_SQL_PATCH(task_name => 'error_task', task_owner =>
'SYS', replace => TRUE);
```

6. **Test the patch**

   Now that you have accepted the patch, you can rerun the SQL statement. This time, it will not give you the critical error. If you run 'explain plan' for this statement, you will see that a SQL patch was used to generate the plan.

```
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (select max(rowid) FROM t t2
WHERE t1.a= t2.a AND t1.b = t2.b AND t1.d=t2.d);
```

Removing a SQL Patch

In a situation where you obtained an official patch from Oracle to fix an error, or upgraded to the next patchset or release of Oracle which included the fix for the error, you call `DBMS_SQLDIAG.DROP_SQL_PATCH` with the patch name to drop the SQL patch. The patch name can be obtained from the explain plan section or by querying the view `DBA_SQL_PATCHES`.

Constants

The DBMS_SQLDIAG package uses the constants shown in the following tables:

- Table 134–1, " DBMS_SQLDIAG Constants - SQLDIAG Advisor Name" describes the name of SQL repair advisor as seen by the advisor framework
- Table 134–2, " DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values" describes SQLDIAG advisor task scope parameter values
- Table 134–3, " DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants" describes SQLDIAG advisor `time_limit` constants
- Table 134–4, " DBMS_SQLDIAG Constants - Report Type (possible values) Constants" describes possible formats for a report
- Table 134–5, " DBMS_SQLDIAG Constants - Report Level (possible values) Constants" describes possible levels of detail in the report
- Table 134–6, " DBMS_SQLDIAG Constants - Report Section (possible values) Constants" describes possible report sections (comma delimited)
- Table 134–7, " DBMS_SQLDIAG Constants - Problem Type Constants" describes possible values for the `problem_type` parameter of the CREATE_DIAGNOSIS_TASK Functions
- Table 134–8, " DBMS_SQLDIAG Constants - Findings Filter Constants" describes possible values for the `_sql_findings_mode` parameter

Table 134–1 DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

Constant	Type	Value	Description
`ADV_SQL_DIAG_NAME`	`VARCHAR2`(18)	'SQL Repair Advisor'	Name of SQL repair advisor as seen by the advisor framework

Table 134–2 DBMS_SQLDIAG Constants - SQLDIAG Advisor Task Scope Parameter Values

Constant	Type	Value	Description
`SCOPE_COMPREHENSIVE`	`VARCHAR2`(13)	`'COMPREHENSIVE'`	Detailed analysis of the problem which may take more time to execute
`SCOPE_LIMITED`	`VARCHAR2`(7)	`'LIMITED'`	Brief analysis of the problem

Table 134–3 DBMS_SQLDIAG Constants - SQLDIAG Advisor time_limit Constants

Constant	Type	Value	Description
`TIME_LIMIT_DEFAULT`	`NUMBER`	1800	Default time limit for analysis of the problem

Table 134–4 DBMS_SQLDIAG Constants - Report Type (possible values) Constants

Constant	Type	Value	Description
TYPE_HTML	VARCHAR2(4)	'HTML'	Report from the REPORT_DIAGNOSIS_TASK Function in HTML form
TYPE_TEXT	VARCHAR2(4)	'TEXT'	Report from the REPORT_DIAGNOSIS_TASK Function in text form
TYPE_XML	VARCHAR2(3)	'XML'	Report from the REPORT_DIAGNOSIS_TASK Function in XML form

Table 134–5 DBMS_SQLDIAG Constants - Report Level (possible values) Constants

Constant	Type	Value	Description
LEVEL_ALL	VARCHAR2(3)	'ALL'	Complete report including annotations about statements skipped over
LEVEL_BASIC	VARCHAR2(5)	'BASIC'	Shows information about every statement analyzed, including recommendations not implemented
LEVEL_TYPICAL	VARCHAR2(7)	'TYPICAL'	Simple report shows only information about the actions taken by the advisor.

Table 134–6 DBMS_SQLDIAG Constants - Report Section (possible values) Constants

Constant	Type	Value	Description
SECTION_ALL	VARCHAR2(3)	'ALL'	All statements
SECTION_ERRORS	VARCHAR2(6)	'ERRORS'	Statements with errors
SECTION_FINDINGS	VARCHAR2(8)	'FINDINGS'	Tuning findings
SECTION_INFORMATION	VARCHAR2(11)	'INFORMATION'	General information
SECTION_PLANS	VARCHAR2(5)	'PLANS'	Explain plans
SECTION_SUMMARY	VARCHAR2(7)	'SUMMARY'	Summary information

Table 134–7 DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_PERFORMANCE	NUMBER	1	User suspects this is a performance problem

Table 134–7 (Cont.) DBMS_SQLDIAG Constants - Problem Type Constants

Constant	Type	Value	Description
PROBLEM_TYPE_WRONG_RESULTS	NUMBER	2	User suspects the query is giving inconsistent results
PROBLEM_TYPE_COMPILATION_ERROR	NUMBER	3	User sees a crash in compilation
PROBLEM_TYPE_EXECUTION_ERROR	NUMBER	4	User sees a crash in execution
PROBLEM_TYPE_ALT_PLAN_GEN	NUMBER	5	User to explore all alternative plans

Table 134–8 DBMS_SQLDIAG Constants - Findings Filter Constants

Constant	Type	Value	Description
SQLDIAG_FINDINGS_ALL	NUMBER	1	Show all possible findings
SQLDIAG_FINDINGS_VALIDATION	NUMBER	2	Show status of validation rules over structures
SQLDIAG_FINDINGS_FEATURES	NUMBER	3	Show only features used by the query
SQLDIAG_FINDINGS_FILTER_PLANS	NUMBER	4	Show the alternative plans generated by the advisor
SQLDIAG_FINDINGS_CR_DIFF	NUMBER	5	Show difference between two plans
SQLDIAG_FINDINGS_MASK_VARIANT	NUMBER	6	Mask info for testing
SQLDIAG_FINDINGS_OBJ_FEATURES	NUMBER	7	Show features usage history
SQLDIAG_FINDINGS_BASIC_INFO	NUMBER	8	Show the alternative plans generated by the advisor

Examples

Patch Pack / Unpack

Patches can be exported out of one system and imported into another by means of a staging table, provided by subprograms in this package. Like with SQL diagnosis sets, the operation of inserting into the staging table is called a "pack", and the operation of creating patches from staging table data is termed the "unpack".

DBAs should perform a pack/unpack as follows:

1. Create a staging table owned by user 'SH' through a call to CREATE_STGTAB_SQLPATCH:

```
EXEC DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH(
    table_name          =>  'STAGING_TABLE',
    schema_name         =>  'SH');
```

2. Call PACK_STGTAB_SQLPATCH one or more times to write SQL patch data into the staging table. In this case, copy data for all SQL patches in the DEFAULT category into a staging table owned by the current schema owner:

```
EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
    staging_table_name  =>  'STAGING_TABLE');
```

3. In this case, only a single SQL patch SP_FIND_EMPLOYEE is copied into a staging table owned by the current schema owner:

```
EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
    patch_name          =>  'SP_FIND_EMPLOYEE',
    staging_table_name  =>  'STAGING_TABLE');
```

   The staging table can then be moved to another system using either datapump, import/export commands or through a databaselink.

4. Call UNPACK_STGTAB_SQLPATCH to create SQL patches on the new system from the patch data in the staging table. In this case, change the name in the data for the SP_FIND_EMPLOYEE patch stored in the staging table to 'SP_FIND_EMP_PROD':

```
exec dbms_sqldiag.remap_stgtab_sqlpatch(
   old_patch_name      =>  'SP_FIND_EMPLOYEE',
   new_patch_name      =>  'SP_FIND_EMP_PROD',
```

Summary of DBMS_SQLDIAG Subprograms

Table 134–9 DBMS_SQLDIAG Package Subprograms

Subprogram	Description
ACCEPT_SQL_PATCH Function & Procedure on page 134-11	Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task
ALTER_SQL_PATCH Procedure on page 134-13	Alters specific attributes of an existing SQL patch object
CANCEL_DIAGNOSIS_TASK Procedure on page 134-14	Cancels a diagnostic task
CREATE_STGTAB_SQLPATCH Procedure on page 134-17	Creates the staging table used for transporting SQL patches from one system to another
DROP_DIAGNOSIS_TASK Procedure on page 134-18	Drops a diagnostic task
DROP_SQL_PATCH Procedure on page 134-19	Drops the named SQL patch from the database
EXECUTE_DIAGNOSIS_TASK Procedure on page 134-20	Executes a diagnostic task
EXPLAIN_SQL_TESTCASE Function on page 134-21	Explains a SQL test case
EXPORT_SQL_TESTCASE Procedures on page 134-22	Exports a SQL test case to a directory
EXPORT_SQL_TESTCASE_DIR_BY_INC Function on page 134-25	Generates a SQL Test Case corresponding to the incident ID passed as an argument.
EXPORT_SQL_TESTCASE_DIR_BY_TXT Function on page 134-26	Generates a SQL Test Case corresponding to the SQL passed as an argument
GET_FIX_CONTROL Function on page 134-27	Returns the value of fix control for a given bug number
GET_SQL Function on page 134-28	Imports a SQL test case
IMPORT_SQL_TESTCASE Procedures on page 134-29	Imports a SQL test case into a schema
INCIDENTID_2_SQL Procedure on page 134-31	Initializes a `sql_setrow` from an incident ID
INTERRUPT_DIAGNOSIS_TASK Procedure on page 134-32	Interrupts a diagnostic task
LOAD_SQLSET_FROM_TCB Function on page 134-33	Loads a `SQLSET` from Test Case Builder (TCB) file
PACK_STGTAB_SQLPATCH Procedure on page 134-34	SQL patches into the staging table created by the CREATE_STGTAB_SQLPATCH Procedure
REPORT_DIAGNOSIS_TASK Function on page 134-35	Reports on a diagnostic task

Table 134–9 (Cont.) DBMS_SQLDIAG Package Subprograms

Subprogram	Description
RESET_DIAGNOSIS_TASK Procedure on page 134-36	Resets a diagnostic task
RESUME_DIAGNOSIS_TASK Procedure on page 134-37	Resumes a diagnostic task
SET_DIAGNOSIS_TASK_ PARAMETER Procedure on page 134-38	Sets a diagnosis task parameter
UNPACK_STGTAB_ SQLPATCH Procedure on page 134-39	Unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure, using the patch data stored in the staging table to create patches on this system

ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
   task_name      IN  VARCHAR2,
   object_id      IN  NUMBER := NULL,
   name           IN  VARCHAR2 := NULL,
   description    IN  VARCHAR2 := NULL,
   category       IN  VARCHAR2 := NULL,
   task_owner     IN  VARCHAR2 := NULL,
   replace        IN  BOOLEAN := FALSE,
   force_match    IN  BOOLEAN := FALSE)
 RETURN VARCHAR2;

DBMS_SQLDIAG.ACCEPT_SQL_PATCH (
   task_name      IN  VARCHAR2,
   object_id      IN  NUMBER := NULL,
   name           IN  VARCHAR2 := NULL,
   description    IN  VARCHAR2 := NULL,
   category       IN  VARCHAR2 := NULL,
   task_owner     IN  VARCHAR2 := NULL,
   replace        IN  BOOLEAN := FALSE,
   force_match    IN  BOOLEAN := FALSE);
```

Parameters

Table 134–10 ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
taskname	Name of the SQL diagnosis task
object_id	Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task
name	Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.
description	User specified string describing the purpose of this SQL patch. Maximum size of description is 500.
category	Category name which must match the value of the SQLDIAGNOSE_CATEGORY parameter in a session for the session to use this patch. It defaults to the value DEFAULT. This is also the default of the SQLDIAGNOSE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.
task_owner	Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.

Table 134–10 (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

Parameter	Description
`replace`	If the patch already exists, it will be replaced if this argument is `TRUE`. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to `TRUE`.
`force_match`	If `TRUE` this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the `FORCE` option of the `CURSOR_SHARING` parameter. If `FALSE`, literals are not transformed. This is analogous to the matching algorithm used by the `EXACT` option of the `CURSOR_SHARING` parameter.

Return Values

Name of the SQL patch

Usage Notes

Requires `CREATE ANY SQL PROFILE` privilege

ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (
   name            IN  VARCHAR2,
   attribute_name  IN  VARCHAR2,
   value           IN  VARCHAR2);
```

Parameters

Table 134–11 ALTER_SQL_PATCH Procedure Parameters

Parameter	Description
`name`	Name of SQL patch to alter.
`attribute_name`	Name of SQL patch to alter. Possible values: ■ `STATUS` -> can be set to `ENABLED` or `DISABLED` ■ `NAME` -> can be reset to a valid name (must be a valid Oracle identifier and must be unique). ■ `DESCRIPTION` -> can be set to any string of size no more than 500 ■ `CATEGORY` -> can be reset to a valid category name (must be valid Oracle identifier and must be unique when combined with normalized SQL text) This parameter is mandatory and is case sensitive.
`value`	New value of the attribute. See `attribute_name` for valid attribute values. This parameter is mandatory.

Usage Notes

Requires `ALTER ANY SQL PATCH` privilege

CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 134–12 CANCEL_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name

Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_text           IN   CLOB,
    bind_list          IN   sql_binds := NULL,
    user_name          IN   VARCHAR2  := NULL,
    scope              IN   VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit         IN   NUMBER    := TIME_LIMIT_DEFAULT,
    task_name          IN   VARCHAR2  := NULL,
    description        IN   VARCHAR2  := NULL,
    problem_type       IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
  RETURN VARCHAR2;
```

Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id             IN   VARCHAR2,
    plan_hash_value    IN   NUMBER    := NULL,
    scope              IN   VARCHAR2  := SCOPE_COMPREHENSIVE,
    time_limit         IN   NUMBER    := TIME_LIMIT_DEFAULT,
    task_name          IN   VARCHAR2  := NULL,
    description        IN   VARCHAR2  := NULL,
    problem_type       IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
  RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sqlset_name       IN VARCHAR2,
    basic_filter      IN VARCHAR2 :=  NULL,
    object_filter     IN VARCHAR2 :=  NULL,
    rank1             IN VARCHAR2 :=  NULL,
    rank2             IN VARCHAR2 :=  NULL,
    rank3             IN VARCHAR2 :=  NULL,
    result_percentage IN NUMBER   :=  NULL,
    result_limit      IN NUMBER   :=  NULL,
    scope             IN VARCHAR2 :=  SCOPE_COMPREHENSIVE,
    time_limit        IN NUMBER   :=  TIME_LIMIT_DEFAULT,
    task_name         IN VARCHAR2 :=  NULL,
    description       IN VARCHAR2 :=  NULL,
    plan_filter       IN VARCHAR2 :=  'MAX_ELAPSED_TIME',
    sqlset_owner      IN VARCHAR2 :=  NULL,
    problem_type      IN NUMBER   := PROBLEM_TYPE_PERFORMANCE)
  RETURN VARCHAR2;
```

Parameters

Table 134–13 CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	Set of bind values

Table 134–13 (Cont.) CREATE_DIAGNOSIS_TASK Function Parameters

Parameter	Description
user_name	Username for who the statement/sqlset will be diagnosed
scope	Diagnosis scope (limited/comprehensive)
time_limit	Maximum duration in seconds for the diagnosis session
task_name	Optional diagnosis task name
description	Maximum of 256 SQL diagnosis session description
problem_type	Determines the goal of the task. Possible values are: ■ PROBLEM_TYPE_WRONG_RESULTS ■ PROBLEM_TYPE_COMPILATION_ERROR ■ PROBLEM_TYPE_EXECUTION_ERROR
sql_id	Identifier of the statement
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	Sqlset name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set (STS)
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from (filtered/ranked) SQL
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are: ■ LAST_GENERATED: plan with most recent timestamp ■ FIRST_GENERATED: opposite to LAST_GENERATED ■ LAST_LOADED: plan with most recent first_load_time stat info ■ FIRST_LOADED: opposite to LAST_LOADED ■ MAX_ELAPSED_TIME: plan with maximum elapsed time ■ MAX_BUFFER_GETS: plan with maximum buffer gets ■ MAX_DISK_READS: plan with maximum disk reads ■ MAX_DIRECT_WRITES: plan with maximum direct writes ■ MAX_OPTIMIZER_COST: plan with maximum optimum cost
sqlset_owner	Owner of the sqlset, or null for current schema owner

CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
   table_name       IN  VARCHAR2,
   schema_name      IN  VARCHAR2 := NULL,
   tablespace_name  IN  VARCHAR2 := NULL);
```

Parameters

Table 134–14 CREATE_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
`table_name`	(Mandatory) Name of the table to create (case-sensitive)
`schema_name`	Schema to create the table in, or `NULL` for current schema (case-sensitive)
`tablespace_name`	Tablespace to store the staging table within, or `NULL` for current user's default tablespace (case-sensitive)

DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 134–15 DROP_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```
DBMS_SQLDIAG.DROP_SQL_PATCH (
   name     IN  VARCHAR2,
   ignore   IN  BOOLEAN := FALSE);
```

Parameters

Table 134–16 DROP_SQL_PATCH Function & Procedure Parameters

Parameter	Description
name	Name of patch to be dropped. The name is case sensitive.
ignore	Ignore errors due to object not existing.

Usage Notes

Requires DROP ANY SQL PATCH privilege

EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 134–17 EXECUTE_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase        IN   CLOB)
  RETURN CLOB;
```

Parameters

Table 134–18 EXPLAIN_SQL_TESTCASE Function Parameters

Parameter	Description
sqlTestCase	XML document describing the SQL test case

EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory                IN              VARCHAR2,
    sql_text                 IN              CLOB,
    user_name                IN              VARCHAR2  :=  NULL,
    bind_list                IN              sql_binds :=  NULL,
    exportEnvironment        IN              BOOLEAN   :=  TRUE,
    exportMetadata           IN              BOOLEAN   :=  TRUE,
    exportData               IN              BOOLEAN   :=  FALSE,
    exportPkgbody            IN              BOOLEAN   :=  FALSE,
    samplingPercent          IN              NUMBER    :=  100,
    ctrlOptions              IN              VARCHAR2  :=  NULL,
    timeLimit                IN              NUMBER    :=  0,
    testcase_name            IN              VARCHAR2  :=  NULL,
    testcase                 IN OUT NOCOPY   CLOB,
    preserveSchemaMapping    IN              BOOLEAN   :=  FALSE);
```

This variant extracts the SQL information from an incident file.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory                IN              VARCHAR2,
    incident_id              IN              VARCHAR2,
    exportEnvironment        IN              BOOLEAN   :=  TRUE,
    exportMetadata           IN              BOOLEAN   :=  TRUE,
    exportData               IN              BOOLEAN   :=  FALSE,
    exportPkgbody            IN              BOOLEAN   :=  FALSE,
    samplingPercent          IN              NUMBER    :=  100,
    ctrlOptions              IN              VARCHAR2  :=  NULL,
    timeLimit                IN              NUMBER    :=
                                                DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
    testcase_name            IN              VARCHAR2  :=  NULL,
    testcase                 IN OUT NOCOPY   CLOB,
    preserveSchemaMapping    IN              BOOLEAN   :=  FALSE);
```

This variant allow the SQL Test case to be generated from a cursor present in the cursor cache. Use `V$SQL` to get the SQL identifier and the SQL hash value.

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory                IN              VARCHAR2,
    sql_id                   IN              VARCHAR2,
    plan_hash_value          IN              NUMBER    := NULL,
    exportEnvironment        IN              BOOLEAN   :=  TRUE,
    exportMetadata           IN              BOOLEAN   :=  TRUE,
    exportData               IN              BOOLEAN   :=  TRUE,
    exportPkgbody            IN              BOOLEAN   :=  FALSE,
    samplingPercent          IN              NUMBER    :=  100,
    ctrlOptions              IN              VARCHAR2  :=  NULL,
    timeLimit                IN              NUMBER    :=
                                                DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
    testcase_name            IN              VARCHAR2  :=  NULL,
    testcase                 IN OUT NOCOPY   CLOB,
    preserveSchemaMapping    IN              BOOLEAN   :=  FALSE);
```

Parameters

Table 134–19 EXPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
directory	Directory to store the various generated files
sql_text	Text of the SQL statement to export
incident_id	Incident ID containing the offending SQL
sql_id	Identifier of the statement in the cursor cache
username	Name of the user schema to use to parse the SQL, defaults to SYS
bind_list	List of bind values associated to the statement
exportEnvironment	TRUE if the compilation environment should be exported
exportMetadata	TRUE if the definition of the objects referenced in the SQL should be exported
exportData	TRUE if the data of the objects referenced in the SQL should be exported
exportPkgbody	TRUE if the body of the packages referenced in the SQL are exported
samplingPercent	If is TRUE, specify the sampling percentage to use to create the dump file
ctrlOptions	Opaque control parameters
timeLimit	How much time should we spend exporting the SQL test case
testcaseName	An optional name for the SQL test case. This is used to prefix all the generated scripts
testcase	Resulting testcase
preservesSchemaMapping	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (xxxxmain.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the SYSDBA privilege
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT_SQL_TESTCASE with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.

- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call `EXPORT_SQL_TESTCASE` with `exportPkgbody=>TRUE`. To import a PL/SQL package body, call IMPORT_SQL_TESTCASE Procedures with `importPkgbody=>TRUE`.

EXPORT_SQL_TESTCASE_DIR_BY_INC Function

This function generates a SQL Test Case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (
    incident_id        IN   NUMBER,
    directory          IN   VARCHAR2,
    exportEnvironment  IN   VARCHAR2 := 'TRUE',
    exportMetadata     IN   VARCHAR2 := 'TRUE',
    exportData         IN   VARCHAR2 := 'FALSE',
    samplingPercent    IN   VARCHAR2 := '100',
    ctrlOptions        IN   VARCHAR2 := NULL)
 RETURN BOOLEAN;
```

Parameters

Table 134–20 EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

Parameter	Description
`incident_id`	Incident ID containing the offending SQL. For more information about Incidents, see *Oracle Database Performance Tuning Guide*.
`directory`	Directory to store the various generated files
`exportEnvironment`	`TRUE` if the compilation environment should be exported
`exportMetadata`	`TRUE` if the definition of the objects referenced in the SQL should be exported
`exportData`	`TRUE` if the data of the objects referenced in the SQL should be exported
`samplingPercent`	If is `TRUE`, specify the sampling percentage to use to create the dump file
`ctrlOptions`	Opaque control parameters

EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (
    incident_id        IN   NUMBER,
    directory          IN   VARCHAR2,
    sql_text           IN   CLOB,
    user_name          IN   VARCHAR2 := 'SYS',
    exportEnvironment  IN   VARCHAR2 := 'TRUE',
    exportMetadata     IN   VARCHAR2 := 'TRUE',
    exportData         IN   VARCHAR2 := 'FALSE',
    samplingPercent    IN   VARCHAR2 := '100',
    ctrlOptions        IN   VARCHAR2 := NULL)
  RETURN BOOLEAN;
```

Parameters

Table 134–21 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

Parameter	Description
`incident_id`	Incident ID containing the offending SQL
`directory`	Directory to store the various generated files
`sql_text`	Text of the SQL statement to explain
`username`	Name of the user schema to use to parse the SQL, defaults to `SYS`
`exportEnvironment`	`TRUE` if the compilation environment should be exported
`exportMetadata`	`TRUE` if the definition of the objects referenced in the SQL should be exported
`exportData`	`TRUE` if the data of the objects referenced in the SQL should be exported
`samplingPercent`	If is `TRUE`, specify the sampling percentage to use to create the dump file
`ctrlOptions`	Opaque control parameters

GET_FIX_CONTROL Function

This function returns the value of fix control for a given bug number.

Syntax

```
DBMS_SQLDIAG.GET_FIX_CONTROL (
    bug_number   IN    NUMBER)
  RETURN NUMBER;
```

Parameters

Table 134–22 GET_FIX_CONTROL Function Parameters

Parameter	Description
bug_number	Bug number

GET_SQL Function

This function loads a `sql_setrow` from the trace file associated to an the given incident ID.

Syntax

```
DBMS_SQLDIAG.GET_SQL (
    incident_id  IN     VARCHAR2)
  RETURN SQLSET_ROW;
```

Parameters

Table 134–23 GET_SQL Function Parameters

Parameter	Description
`incident_id`	Identifier of the incident

IMPORT_SQL_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory                IN   VARCHAR2,
    sqlTestCase              IN   CLOB,
    importEnvironment        IN   BOOLEAN   :=  TRUE,
    importMetadata           IN   BOOLEAN   :=  TRUE,
    importData               IN   BOOLEAN   :=  TRUE,
    importPkgbody            IN   BOOLEAN   :=  FALSE,
    importDiagnosis          IN   BOOLEAN   :=  TRUE,
    ignoreStorage            IN   BOOLEAN   :=  TRUE,
    ctrlOptions              IN   VARCHAR2  :=  NULL,
    preserveSchemaMapping    IN   BOOLEAN   :=  FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (
    directory                IN   VARCHAR2,
    filename                 IN   VARCHAR2,
    importEnvironment        IN   BOOLEAN   :=  TRUE,
    importMetadata           IN   BOOLEAN   :=  TRUE,
    importData               IN   BOOLEAN   :=  TRUE,
    importPkgbody            IN   BOOLEAN   :=  FALSE,
    importDiagnosis          IN   BOOLEAN   :=  TRUE,
    ignoreStorage            IN   BOOLEAN   :=  TRUE,
    ctrlOptions              IN   VARCHAR2  :=  NULL,
    preserveSchemaMapping    IN   BOOLEAN   :=  FALSE);
```

Parameters

Table 134–24 IMPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
`directory`	Directory containing test case files
`filename`	Name of a file containing an XML document describing the SQL test case
`importEnvironment`	`TRUE` if the compilation environment should be imported
`importMetadata`	`TRUE` if the definition of the objects referenced in the SQL should be imported
`importData`	`TRUE` if the data of the objects referenced in the SQL should be imported
`importPkgbody`	`TRUE` if the body of the packages referenced in the SQL are imported
`importDiagnosis`	`TRUE` if the diagnostic information associated to the task should be imported
`ignoreStorage`	`TRUE` if the storage attributes should be ignored
`ctrlOptions`	Opaque control parameters

Table 134–24 (Cont.) IMPORT_SQL_TESTCASE Procedure Parameters

Parameter	Description
preservesSchemaMapping	TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
  - a SQL script to replay system statistics of the source
  - a table of contents file describing the SQL test case
  - metadata. (xxxxmain.xml)
- You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the SYSDBA privilege
- The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT_SQL_TESTCASE Procedures with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.
- TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call EXPORT_SQL_TESTCASE Procedures with exportPkgbody=>TRUE. To import a PL/SQL package body, call IMPORT_SQL_TESTCASE Procedures with importPkgbody=>TRUE.

INCIDENTID_2_SQL Procedure

This procedure initializes a `sql_setrow` from an incident ID.

Syntax

```
DBMS_SQLDIAG.INCIDENTID_2_SQL (
    incident_id   IN     VARCHAR2,
    sql_stmt      OUT    SQLSET_ROW,
    problem_type  OUT    NUMBER,
    err_code      OUT    BINARY_INTEGER,
    err_mesg      OUT    VARCHAR2);
```

Parameters

Table 134–25 INCIDENTID_2_SQL Procedure Parameters

Parameter	Description
`incident_id`	Identifier of the incident
`sql_stmt`	Resulting SQL
`problem_type`	Tentative type of SQL problem (currently among `PROBLEM_TYPE_COMPILATION_ERROR` and `PROBLEM_TYPE_EXECUTION_ERROR`)
`err_code`	Error code if any otherwise it is set to `NULL`
`err_msg`	Error message if any otherwise it is set to `NULL`

INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

Syntax

```
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 134–26 INTERRUPT_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

LOAD_SQLSET_FROM_TCB Function

This function loads a SQLSET from a Test Case Builder file.

Syntax

```
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (
    directory        IN     VARCHAR2,
    filename         IN     VARCHAR2,
    sqlset_name      IN     VARCHAR2 DEFAULT NULL)
  RETURN VARCHAR2;
```

Parameters

Table 134–27 LOAD_SQLSET_FROM_TCB Function Parameters

Parameter	Description
directory	Name of directory
filename	Name of file
sqlset_name	Name of SQLSET

PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
   patch_name            IN  VARCHAR2 := '%',
   patch_category        IN  VARCHAR2 := 'DEFAULT',
   staging_table_name    IN  VARCHAR2,
   staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 134–28 UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
`patch_name`	Name of patch to pack (% wildcards acceptable, case-sensitive)
`patch_category`	Category to which to pack patches (% wildcards acceptable, case-insensitive)
`staging_table_name`	(Mandatory) Name of the table to use (case-sensitive)
`staging_schema_owner`	Schema where the table resides, or `NULL` for current schema (case-sensitive)

Usage Notes

- Requires: `ADMINISTER SQL PLAN MANAGEMENT OBJECT` privilege and `INSERT` privilege on the staging table
- By default, we move all SQL patches in category `DEFAULT`. See the Examples on page 134-8 for details. Note that the subprogram issues a `COMMIT` after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a CLOB containing the desired report.

Syntax

```
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (
    taskname           IN   VARCHAR2,
    type               IN   VARCHAR2  := TYPE_TEXT,
    level              IN   VARCHAR2  := LEVEL_TYPICAL,
    section            IN   VARCHAR2  := SECTION_ALL,
    object_id          IN   NUMBER    := NULL,
    result_limit       IN   NUMBER    := NULL,
    owner_name         IN   VARCHAR2  := NULL)
  RETURN CLOB;
```

Parameters

Table 134–29 REPORT_DIAGNOSIS_TASK Function Parameters

Parameter	Description
taskname	Name of task to report
type	Type of the report. Possible values are: TEXT, HTML, XML (see Table 134–4, " DBMS_SQLDIAG Constants - Report Type (possible values) Constants").
level	Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 134–5, " DBMS_SQLDIAG Constants - Report Level (possible values) Constants").
section	Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 134–6, " DBMS_SQLDIAG Constants - Report Section (possible values) Constants").
object_id	Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).
result_limit	Number of statements in a STS for which the report is generated
owner_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 134–30 RESET_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

Parameters

Table 134–31 RESUME_DIAGNOSIS_TASK Procedure Parameters

Parameter	Description
taskname	Name of task

SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2. The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- MODE: diag scope (comprehensive, limited)
- _SQLDIAG_FINDING_MODE: findings in the report (see " DBMS_SQLDIAG Constants - Findings Filter Constants" on page 134-7 for possible values)

Syntax

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (
    taskname            IN   VARCHAR2,
    parameter           IN   VARCHAR2,
    value               IN   NUMBER);
```

Parameters

Table 134–32 SET_DIAGNOSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
taskname	Identifier of the task to execute
parameter	Name of the parameter to set
value	New value of the specified parameter

UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the ACCEPT_SQL_PATCH Function & Procedure).

Syntax

```
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (
   patch_name            IN  VARCHAR2 := '%',
   patch_category        IN  VARCHAR2 := '%',
   replace               IN  BOOLEAN,
   staging_table_name    IN  VARCHAR2,
   staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 134–33 UPPACK_STGTAB_SQLPATCH Procedure Parameters

Parameter	Description
patch_name	Name of patch to unpack (% wildcards acceptable, case-sensitive)
patch_category	Category from which to unpack patches (% wildcards acceptable, case-insensitive)
replace	Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.
staging_table_name	(Mandatory) Name of the table to use (case-sensitive)
staging_schema_owner	Schema where the table resides, or NULL for current schema (case-sensitive)

Usage Notes

- Requires: ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT privilege on the staging table
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

135

DBMS_SQLPA

The DBMS_SQLPA package provides the interface SQL Performance Analyzer.

The chapter contains the following topics:

- Using DBMS_SQLPA
  - Overview
  - Security Model
- Summary of DBMS_SQLPA Subprograms

Using DBMS_SQLPA

- Overview
- Security Model

Overview

The DBMS_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the CREATE_ANALYSIS_TASK Functions to create an analysis task for a single statement or a group of SQL statements.s
2. The EXECUTE_ANALYSIS_TASK Function & Procedure executes a previously created analysis task.
3. The REPORT_ANALYSIS_TASK Function displays the results of an analysis task.

Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX_ANALYSIS_TASK) require privilege ADVISOR.

Summary of DBMS_SQLPA Subprograms

Table 135–1 DBMS_SQLPA Package Subprograms

Subprogram	Description
CANCEL_ANALYSIS_TASK Procedure on page 135-6	Cancels the currently executing task analysis of one or more SQL statements
CREATE_ANALYSIS_TASK Functions on page 135-7	Creates an advisor task to process and analyze one or more SQL statements
DROP_ANALYSIS_TASK Procedure on page 135-10	Drops a SQL analysis task
EXECUTE_ANALYSIS_TASK Function & Procedure on page 135-11	Executes a previously created analysis task
INTERRUPT_ANALYSIS_TASK Procedure on page 135-14	Interrupts the currently executing analysis task
REPORT_ANALYSIS_TASK Function on page 135-15	Displays the results of an analysis task
RESET_ANALYSIS_TASK Procedure on page 135-17	Resets the currently executing analysis task to its initial state
RESUME_ANALYSIS_TASK Procedure on page 135-18	Resumes a previously interrupted analysis task that was created to process a SQL tuning set.
SET_ANALYSIS_TASK_PARAMETER Procedures on page 135-19	Sets the SQL analysis task parameter value
SET_ANALYSIS_DEFAULT_ PARAMETER Procedures on page 135-21	Sets the SQL analysis task parameter default value

CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

Syntax

```
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 135–2 CANCEL_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Name of the task to cancel

Examples

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements. You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
- Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.
- Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  parsing_schema    IN VARCHAR2  := NULL,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sql_id            IN VARCHAR2,
  plan_hash_value   IN NUMBER    := NULL,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  sql_id            IN VARCHAR2,
  plan_hash_value   IN NUMBER    := NULL,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name        IN VARCHAR2,
  basic_filter       IN VARCHAR2 :=  NULL,
  order_by           IN VARCHAR2 :=  NULL,
  top_sql            IN VARCHAR2 :=  NULL,
  task_name          IN VARCHAR2 :=  NULL,
```

```
  description       IN VARCHAR2 :=  NULL
  sqlset_owner      IN VARCHAR2 :=  NULL)
RETURN VARCHAR2;
```

Parameters

Table 135–3 CREATE_ANALYSIS_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
bind_list	A set of bind values
parsing_schema	Name of the schema where the statement can be compiled
task_name	Optional analysis task name
description	Description of the SQL analysis task to a maximum of 256 characters
sql_id	Identifier of a SQL statement
plan_hash_value	Hash value of the SQL execution plan
begin_snap	Begin snapshot identifier
end_snap	End snapshot identifier
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
order_by	Order-by clause on the selected SQL
top_sql	Top N SQL after filtering and ranking
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).

Examples

```
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
     sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id       => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap  => 1,
    end_snap    => 2,
    sql_id      => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
```

```
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
  sqlset_name    =>   'my_workload', -
  order_by       =>   'BUFFER_GETS', -
  description    =>   'process workload ordered by buffer gets');
```

DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task.The task and all its result data are deleted.

Syntax

```
DBMS_SQLPA.DROP_ANALYSIS_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 135–4 DROP_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	The name of the analysis task to drop

EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

```
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2               := 'test execute',
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL)
 RETURN VARCHAR2;

DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
   task_name         IN VARCHAR2,
   execution_type    IN VARCHAR2               := 'test execute',
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL);
```

Parameters

Table 135–5 EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute
execution_type	Type of the action to perform by the function. If NULL it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. Possible values are: ■ [TEST] EXECUTE - test-execute every SQL statement and collect its execution plans and execution statistics. The resulting plans and statistics will be stored in the advisor framework. This is default. ■ EXPLAIN PLAN - generate explain plan for every statement in the SQL workload. This is similar to the EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task. ■ COMPARE [PERFORMANCE] - analyze and compare two versions of SQL performance data. The performance data is generated by test-executing or generating explain plan of the SQL statements. Use this option when two executions of type EXPLAIN_PLAN or TEST_EXECUTE already exist in the task ■ CONVERT SQLSET - used to read the statistics captured in a SQL Tuning Set and model them as a task execution. This can be used when you wish to avoid executing the SQL statements because valid data for the experiment already exists in the SQL Tuning Set.
execution_name	A name to qualify and identify an execution. If not specified, it will be generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They will override the values for the parameters stored in the task (set through the SET_ANALYSIS_DEFAULT_PARAMETER Procedures).

Table 135–5 (Cont.) EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

Parameter	Description
execution_desc	A 256-length string describing the execution

Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.

Examples

1. Create a task with a purpose of change impact analysis

```
EXEC :tname := DBMS_SQLPA.CREATE_TUNING_TASK(
    sqlset_name     => 'my_sts');
```

2. Make baseline or the before change execution

```
EXEC DBMS_SQLPA.EXECUTE_TUNING_TASK(
    task_name       => :tname,
    execution_type  => 'test execute',
    execution_name  => 'before_change');
```

3. Make change

```
...
```

4. Make the after change version of the workload performance

```
EXEC DBMS_SQLPA.EXECUTE_TUNING_TASK(
   task_name          => :tname, -
   execution_type     => 'test execute ',
   execution_name     => 'after_change')
```

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the `elapsed_time` as a default metric for comparison. Here we are changing it to `buffer_gets` instead.

```
EXEC DBMS_SQLPA.SET_TUNING_TASK_PARAMETER(
   :tname,'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLPA.EXECUTE_TUNING_TASK(
   task_name         => :tname, -
   execution_type    => 'test execute', -
   execution_name    => 'after_change');
```

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

```
EXEC DBMS_SQLPA.EXECUTE_TUNING_TASK(
   task_name        => :tname, -
   execution_type   => 'compare performance',
   execution_params => dbms_advisor.arglist(
```

```
'execution_name1',
'before_change',
'execution_name2',
'after_change',
'comparion_metric',
'buffer_gets'));
```

INTERRUPT_ANALYSIS_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
   task_name         IN VARCHAR2);
```

Parameters

Table 135–6 INTERRUPT_ANALYSIS_TASK Procedure Parameters

Parameter	Description
`task_name`	Identifier of the analysis task to interrupt

Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
   task_name       IN   VARCHAR2,
   type            IN   VARCHAR2   := 'TEXT',
   level           IN   VARCHAR2   := 'TYPICAL',
   section         IN   VARCHAR2   := 'SUMMARY',
   object_id       IN   NUMBER     := NULL,
   top_sql         IN   NUMBER     := 100,
   execution_name  IN   VARCHAR2   := NULL,
   task_owner      IN   VARCHAR2   := NULL,
   order_by        IN   VARCHAR2   := NULL)
RETURN CLOB;
```

Parameters

Table 135–7 REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
task_name	Name of the task to report
type	Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes).
level	Level of detail in the report: ■ ALL - details of all SQL ■ BASIC - currently the same as typical ■ CHANGED - only SQL with changed performance ■ CHANGED_PLANS - only SQL with plan changes ■ ERRORS - SQL with errors only ■ IMPROVED - only improved SQL ■ REGRESSED - only regressed SQL ■ TIMEOUT - only SQL which timed-out during execution ■ TYPICAL (default) - show information about every statement analyzed, including changing and errors ■ UNCHANGED - only SQL with unchanged performance ■ UNCHANGED_PLANS - only SQL with unchanged plans ■ UNSUPPORTED - only SQL not supported by SPAs
section	Optionally limit the report to a single section (ALL for all sections): ■ SUMMARY (default) - workload summary only ■ ALL - summary and details on SQL
object_id	Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)
top_sql	Number of SQL statements in a STS for which the report is generated
execution_name	Name of the task execution to use. If NULL, the report will be generated for the last task execution.

Table 135–7 (Cont.) REPORT_ANALYSIS_TASK Function Parameters

Parameter	Description
task_owner	Owner of the relevant analysis task. Defaults to the current schema owner.
order_by	How to sort SQL statements in the report (summary and body). Possible values: ■ CHANGE_DIFF - sort SQL statements by change difference in SQL performance in terms of the comparison Metric ■ NULL (default) - order SQL statement by impact on workload ■ SQL_IMPACT - order SQL statement by change impact on SQL ■ WORKLOAD_IMPACT - same as NULL ■ METRIC_DELTA - same as CHANGE_DIFF

Return Values

A CLOB containing the desired report.

Usage Notes

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLPA.REPORT_ANALYSIS_TASK(:sts_task, 'TEXT', 'TYPICAL', 'ALL', 5)
from dual;
```

RESET_ANALYSIS_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution. All intermediate result data will be deleted.

Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(
 task_name         IN VARCHAR2);
```

Parameters

Table 135–8 RESET_ANALYSIS_TASK Procedure Parameters

Parameter	Description
task_name	Identifier of the analysis task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);
```

RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or `FAILED` (with a fatal error) task execution.

Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
 task_name         IN VARCHAR2,
 basic_filter      IN VARCHAR2 := NULL);
```

Parameters

Table 135–9 RESUME_ANALYSIS_TASK Procedure Parameters

Parameter	Description
`task_name`	Identifier of the analysis task to resume
`basic_filter`	A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter `basic_filter`) that was specified when calling the CREATE_ANALYSIS_TASK Functions.

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide.  For this example we will just resume.

EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);
```

SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name         IN VARCHAR2,
  parameter         IN VARCHAR2,
  value             IN VARCHAR2);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  task_name         IN VARCHAR2,
  parameter         IN VARCHAR2,
  value             IN NUMBER);
```

Parameters

Table 135–10 SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
task_name	Identifier of the task to execute
parameter	Name of the parameter to set. The possible analysis parameters that can be set by this procedure are: ■ APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). ■ BASIC_FILTER: basic filter for SQL tuning set ■ CELL_SIMULATION_ENABLED: Set it to 'TRUE' to simulate Exadata Cell effect on SQL tuning set. For more details, see the helper script tcellsim.sql in the ADMIN directory. ■ COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10) ■ DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all TEST EXECUTE and EXPLAIN PLAN operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure.

Table 135–10 (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

Parameter	Description
`parameter` (contd.)	■ `DISABLE_MULTI_EXEC`: SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to `'TRUE'` to disable this capability. In this case, each SQL in the SQL tuning set is executed only once. ■ `EXECUTION_DAYS_TO_EXPIRE`: number of days until the tasks's executions will be deleted (without deleting the task) ■ `EXECUTE_FULLDML`: `TRUE` to execute DML statement fully, including acquiring row locks and modifying rows; `FALSE` (default) to execute only the query part of the DML without modifying data. When `TRUE`, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. ■ `EXECUTION_NAME1`: name of the first task execution to analyze ■ `EXECUTION_NAME2`: name of the second task execution to analyze ■ `LOCAL_TIME_LIMIT`: per-statement time out (seconds) ■ `METRIC_DELTA_THRESHOLD`: threshold of the difference between the SQL performance metric before and after the change. The default value is zero. ■ `PLAN_FILTER`: plan filter for SQL tuning set (see `SELECT_SQLSET` for possible values) ■ `RANK_MEASURE1`: first ranking measure for SQL tuning set ■ `RANK_MEASURE2`: second possible ranking measure for SQL tuning set ■ `RANK_MEASURE3`: third possible ranking measure for SQL tuning set ■ `RESUME_FILTER`: a extra filter for SQL tuning sets besides `BASIC_FILTER` ■ `SQL_IMPACT_THRESHOLD`: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. ■ `SQL_LIMIT`: maximum number of SQL statements to process ■ `SQL_PERCENTAGE`: percentage filter of SQL tuning set statements ■ `SQLSET_NAME`: name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly using in comparing two SQL tuning sets using SPA. ■ `SQLSET_OWNER`: owner of the SQL tuning set specified using task parameter `SQLSET_NAME`. ■ `TIME_LIMIT`: global time out (seconds) ■ `WORKLOAD_IMPACT_THRESHOLD`: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.
`value`	New value of the specified parameter

SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  NUMBER);
```

Parameters

Table 135–11 SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
parameter	Name of the parameter to set. The possible analysis parameters that can be set by this procedure are: ■ APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO). ■ BASIC_FILTER: basic filter for SQL tuning set ■ COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10) ■ DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all TEST EXECUTE and EXPLAIN PLAN operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database. ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function & Procedure. ■ EXECUTE_FULLDML: TRUE to execute DML statement fully, including acquiring row locks and modifying rows; FALSE (default) to execute only the query part of the DML without modifying data. When TRUE, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML. ■ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions will be deleted (without deleting the task) ■ EXECUTION_NAME1: name of the first task execution to analyze ■ EXECUTION_NAME2: name of the second task execution to analyze ■ LOCAL_TIME_LIMIT: per-statement time out (seconds)

Table 135–11 (Cont.) SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters

Parameter	Description
parameter (contd.)	■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) ■ RANK_MEASURE1: first ranking measure for SQL tuning set ■ RANK_MEASURE2: second possible ranking measure for SQL tuning set ■ RANK_MEASURE3: third possible ranking measure for SQL tuning set ■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER ■ SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement. ■ SQL_LIMIT: maximum number of SQL statements to process ■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements ■ TIME_LIMIT: global time out (seconds) ■ WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.
value	New value of the specified parameter

DBMS_SQLTUNE

The DBMS_SQLTUNE package provides the interface to tune SQL statements.

The chapter contains the following topics:

- Using DBMS_SQLTUNE
  - Overview
  - Security Model
- Data Structures
- Subprogram Groups
  - SQL Tuning Advisor Subprograms
  - SQL Profile Subprograms
  - SQL Tuning Set Subprograms
  - Real-time SQL Monitoring Subprograms
  - SQL Performance Reporting Subprograms
- Summary of DBMS_SQLTUNE Subprograms

Using DBMS_SQLTUNE

- Overview
- Security Model

Overview

The DBMS_SQLTUNE package provides a number interrelated areas of functionality:

- SQL Tuning Advisor Subprograms
- SQL Profile Subprograms
- SQL Tuning Set Subprograms
- Real-time SQL Monitoring Subprograms

SQL Tuning Advisor

The SQL Tuning Advisor is one of a suite of Advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, the SQL Tuning Advisor automates the tuning process of problematic SQL statements. That is, it takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advice is provided is in the form of precise SQL actions for tuning the SQL along with their expected performance benefit.

The group of SQL Tuning Advisor Subprograms provide a task-oriented interface that lets you access the Advisor. You can call the following subprograms in the order given to use some of the SQL Tuning Advisor's features:

1. You use the CREATE_TUNING_TASK Functions to create a tuning task for tuning a single statement or a group of SQL statements.
2. The EXECUTE_TUNING_TASK Function & Procedure executes a previously created tuning task.
3. The REPORT_TUNING_TASK Function displays the results of a tuning task.
4. You use the SCRIPT_TUNING_TASK Function to create a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations

SQL Profile Subprograms

The SQL Tuning Advisor may recommend the creation of a SQL Profile to improve the performance of a statement. SQL Profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL Profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of SQL Profile Subprograms provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the ACCEPT_SQL_PROFILE Procedure and Function to accept a SQL Profile recommended by the SQL Tuning Advisor.
- You can alter the STATUS, NAME, DESCRIPTION, and CATEGORY attributes of an existing SQL Profile with the ALTER_SQL_PROFILE Procedure.
- You can drop a SQL Profile with the DROP_SQL_PROFILE Procedure.

SQL Tuning Sets

The SQL Tuning Advisor input can be a single SQL statement or a set of statements. When tuning multiple statements in one advisor task, you give the input in the form of a SQL Tuning Set (STS). A SQL Tuning Set is a database object that stores SQL

statements along with their execution context in a system-provided schema. SQL Tuning Sets provide an infrastructure for dealing with SQL workloads and simplify tuning of a large number of SQL statements.

SQL Tuning Sets store SQL statements along with

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans - which are the sequence of operations Oracle performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

SQL Tuning Sets can be created by filtering or ranking SQL statements from several sources:

- The cursor cache using the SELECT_CURSOR_CACHE Function
- Top SQL statements from the Automatic Workload Repository using the SELECT_WORKLOAD_REPOSITORY Functions
- Other SQL Tuning Sets using the SELECT_SQLSET Function
- SQL Trace files using the SELECT_SQL_TRACE Function
- A user-defined workload

The complete group of SQL Tuning Set Subprograms facilitates this functionality. As examples:

- You use the CREATE_SQLSET Procedure and Function to creates a SQL tuning set object in the database
- The LOAD_SQLSET Procedure populates the SQL tuning set with a set of selected SQL
- The CAPTURE_CURSOR_CACHE_SQLSET Procedure collects SQL statements from the cursor cache over a specified time interval, attempting to build a realistic picture of system workload.

Import/Export SQL Tuning Sets and SQL Profiles

You use `DBMS_SQLTUNE` subprograms to move SQL Profiles and SQL Tuning Sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source system and populate that staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as datapump, import/export, or database link), where it is used to reconstitute the objects in their original form. These steps are implemented by means of subprograms included in this package:

1. Call the CREATE_STGTAB_SQLPROF Procedure or the CREATE_STGTAB_SQLSET Procedure to create the staging table on the source system.
2. Call the PACK_STGTAB_SQLPROF Procedure or PACK_STGTAB_SQLSET Procedure to populate the staging table with information from the source system.
3. Once you have moved the staging table to the destination system, you call the UNPACK_STGTAB_SQLPROF Procedure or the UNPACK_STGTAB_SQLSET Procedure to recreate the object on the new system.

> **See Also:** Oracle Database Performance Tuning Guide for more information about programmatic flow.

Automatic Tuning Task Functions

There is a reserved system task "SYS_AUTO_SQL_TUNING_TASK" that performs SQL Tuning in the maintenance window, within the Autotask framework. It automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor upon them. It performs the same comprehensive analysis of any other SQL Tuning Task. In addition, it tests any SQL Profiles it finds by executing both the old and new query plan and implements the ones with a large benefit. SQL Profiles are implemented immediately at the time of tuning so the system can automatically benefit from the new plan. In each maintenance window, the task stores its results as a new execution, so that all results over the lifetime of the task are available, connected to each other through the task name but kept distinct by their execution names. You can use the DBA_ADVISOR_EXECUTIONS views to see information about the task's executions.

The automatic task is created by the system as part of the catalog scripts. It has its own special interface for displaying the report (the REPORT_AUTO_TUNING_TASK Function), and it shares the other interface with the standard tuning tasks. The task has its own report interface for viewing reports that span multiple executions.

To set parameters of the automatic task, use the SET_TUNING_TASK_PARAMETER Procedures. To execute the task immediately, use the function version of the EXECUTE_TUNING_TASK Function & Procedure. Disabling the task is done by means of the DBMS_AUTO_TASK_ADMIN package.

Real-time SQL Monitoring

Real-time SQL Monitoring allows DBAs or performance analysts to monitor the execution of long running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated close to real-time during statement execution. These statistics are exposed by two new fixed views, V$SQL_MONITOR and V$SQL_PLAN_MONITOR. In addition, DBMS_SQLTUNE provides a subprogram REPORT_SQL_MONITOR() to report on monitoring information.

Security Model

This package is available to PUBLIC and performs its own security checking:

- As the SQL Tuning advisor relies on the advisor framework, all tuning task interfaces (XXX_TUNING_TASK) require privilege ADVISOR.
- SQL Tuning Set subprograms (XXX_SQLSET) require either the ADMINISTER SQL TUNING SET or the ADMINISTER ANY SQL TUNING SET privilege. Users having the ADMINISTER SQL TUNING SET privilege can only create and modify a SQL tuning set they own, while the ADMINISTER ANY SQL TUNING SET privilege allows them to operate upon all SQL tuning sets, even those owned by other users. For example, using the CREATE_SQLSET Procedure and Function you can create a SQL tuning set to be owned by another user. In this case, the user need not necessarily have the ADMINISTER SQL TUNING SET privilege to operate upon her tuning set.
- Previously, three different privileges were needed to invoke subprograms concerned with SQL Profiles:
  - CREATE ANY SQL PROFILE
  - ALTER ANY SQL PROFILE
  - DROP ANY SQL PROFILE

  These have now been deprecated in favor of ADMINISTER SQL MANAGEMENT OBJECT

Data Structures

The DBMS_SQLTUNE package defines the following OBJECT type

Object Types

- SQLSET_ROW Object Type

SQLSET_ROW Object Type

The SQLSET_ROW object models the content of a SQL Tuning Set for the user. Logically, a SQL Tuning Set is a collection of SQLSET_ROWs where each SQLSET_ROW contains a single SQL statement along with its execution context, statistics, binds and plan. The SELECT_XXX subprograms each model a data source as a collection of SQLSET_ROWs, unique by (sql_id, plan_hash_value). Similarly, the LOAD_SQLSET procedure takes as input a cursor whose row type is SQLSET_ROW, treating each SQLSET_ROW in isolation according to the policies requested by the user.

Several subprograms in the DBMS_SQLTUNE package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the SQLSET_ROW as defined.

Syntax

```
CREATE TYPE sqlset_row AS object (
  sql_id                   VARCHAR(13),
  force_matching_signature NUMBER,
  sql_text                 CLOB,
  object_list              sql_objects,
  bind_data                RAW(2000),
  parsing_schema_name      VARCHAR2(30),
  module                   VARCHAR2(48),
  action                   VARCHAR2(32),
  elapsed_time             NUMBER,
  cpu_time                 NUMBER,
  buffer_gets              NUMBER,
  disk_reads               NUMBER,
  direct_writes            NUMBER,
  rows_processed           NUMBER,
  fetches                  NUMBER,
  executions               NUMBER,
  end_of_fetch_count       NUMBER,
  optimizer_cost           NUMBER,
  optimizer_env            RAW(2000),
  priority                 NUMBER,
  command_type             NUMBER,
  first_load_time          VARCHAR2(19),
  stat_period              NUMBER,
  active_stat_period       NUMBER,
  other                    CLOB,
  plan_hash_value          NUMBER,
  sql_plan                 sql_plan_table_type,
  bind_list                sql_binds)
```

Attributes

Table 136–1 SQLSET_ROW Attributes

Attribute	Description
sql_id	Unique SQL ID
forcing_matching_signature	Signature with literals, case, and whitespace removed
sql_text	Full text for the statement
object_list	Currently not implemented

Table 136–1 (Cont.) SQLSET_ROW Attributes

Attribute	Description
bind_data	Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for bind_list - they are mutually exclusive.
parsing_schema_name	Schema where the SQL is parsed
module	Last application module for the SQL
action	Last application action for the SQL
elapsed_time	Sum total elapsed time for this SQL statement
cpu_time	Sum total CPU time for this SQL statement
buffer_gets	Sum total number of buffer gets
disk_reads	Sum total number of disk reads
direct_writes	Sum total number of direct writes
rows_processed	Sum total number of rows processed by this SQL
fetches	Sum total number of fetches
executions	Total executions of this SQL
end_of_fetch_count	Number of times the statement was fully executed with all of its rows fetched
optimizer_cost	Optimizer cost for this SQL
optimizer_env	Optimizer environment for this SQL statement
priority	User-defined priority (1,2,3)
command_type	Statement type, such as INSERT or SELECT.
first_load_time	Load time of parent cursor
stat_period	Period of time (seconds) when the statistics of this SQL statement were collected
active_stat_period	Effective period of time (in seconds) during which the SQL statement was active
other	Other column for user defined attributes
plan_hash_value	Plan hash value of the plan
sql_plan	Explain plan
bind_list	List of user specified binds for SQL This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data - they are mutually exclusive.

Subprogram Groups

DBMS_SQLTUNE subprograms are grouped by function:

- SQL Tuning Advisor Subprograms
- SQL Profile Subprograms
- SQL Tuning Set Subprograms
- Real-time SQL Monitoring Subprograms
- SQL Performance Reporting Subprograms

SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 136–2 SQL Tuning Task Subprograms

Subprogram	Description
CANCEL_TUNING_TASK Procedure on page 136-25	Cancels the currently executing tuning task
CREATE_SQL_PLAN_BASELINE Procedure on page 136-28	Creates a SQL plan baseline for an existing plan
CREATE_TUNING_TASK Functions on page 136-33	Creates a tuning of a single statement or SQL tuning set for either the SQL Tuning Advisor
DROP_TUNING_TASK Procedure on page 136-40	Drops a SQL tuning task
EXECUTE_TUNING_TASK Function & Procedure on page 136-41	Executes a previously created tuning task
IMPLEMENT_TUNING_TASK Function on page 136-42	Implements a set of SQL Profile recommendations made by the SQL Tuning Advisor
INTERRUPT_TUNING_TASK Procedure on page 136-43	Interrupts the currently executing tuning task
REPORT_AUTO_TUNING_TASK Function on page 136-54	Displays a report from the automatic tuning task, reporting on a range of executions
REPORT_TUNING_TASK Function on page 136-66	Displays the results of a tuning task
RESET_TUNING_TASK Procedure on page 136-68	Resets the currently executing tuning task to its initial state
RESUME_TUNING_TASK Procedure on page 136-69	Resumes a previously interrupted task that was created to process a SQL tuning set
SET_AUTO_TUNING_TASK_PARAMETER Procedures on page 136-82	Updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER` as used for the reserved auto tuning task
SET_TUNING_TASK_PARAMETER Procedures on page 136-85	Updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`
SCRIPT_TUNING_TASK Function on page 136-70	Creates a SQL*PLUS script which can then be executed to implement a set of SQL Tuning Advisor recommendations
SET_TUNING_TASK_PARAMETER Procedures on page 136-85	Updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`

The Summary of DBMS_SQLTUNE Subprograms contains a complete listing of all subprograms in the package.

SQL Profile Subprograms

This subprogram group provides an interface to manage SQL Profiles.

Table 136–3 SQL Profile Subprograms

Subprogram	Description
ACCEPT_SQL_PROFILE Procedure and Function on page 136-19	Creates a SQL Profile for the specified tuning task
ALTER_SQL_PROFILE Procedure on page 136-23	Alters specific attributes of an existing SQL Profile object
CREATE_STGTAB_SQLPROF Procedure on page 136-30	Creates the staging table used for copying SQL profiles from one system to another
DROP_SQL_PROFILE Procedure on page 136-38	Drops the named SQL Profile from the database
PACK_STGTAB_SQLPROF Procedure on page 136-48	Moves profile data out of the `SYS` schema into the staging table
REMAP_STGTAB_SQLPROF Procedure on page 136-51	Changes the profile data values kept in the staging table prior to performing an unpack operation
SQLTEXT_TO_SIGNATURE Function on page 136-88	Returns a SQL text's signature
UNPACK_STGTAB_SQLPROF Procedure on page 136-89	Uses the profile data stored in the staging table to create profiles on this system

The Summary of DBMS_SQLTUNE Subprograms contains a complete listing of all subprograms in the package.

SQL Tuning Set Subprograms

This subprogram group provides an interface to manage SQL tuning sets.

Table 136–4 SQL Tuning Set Subprograms

Subprogram	Description
ADD_SQLSET_REFERENCE Function on page 136-22	Adds a new reference to an existing SQL tuning set to indicate its use by a client
CAPTURE_CURSOR_CACHE_SQLSET Procedure on page 136-26	Over a specified time interval incrementally captures a workload from the cursor cache into a SQL tuning set
CREATE_SQLSET Procedure and Function on page 136-29	Creates a SQL tuning set object in the database
CREATE_STGTAB_SQLSET Procedure on page 136-31	Creates a staging table through which SQL Tuning Sets are imported and exported
DELETE_SQLSET Procedure on page 136-37	Deletes a set of SQL statements from a SQL tuning set
DROP_SQLSET Procedure on page 136-39	Drops a SQL tuning set if it is not active
LOAD_SQLSET Procedure on page 136-44	Populates the SQL tuning set with a set of selected SQL
PACK_STGTAB_SQLSET Procedure on page 136-49	Copies tuning sets out of the `SYS` schema into the staging table
REMOVE_SQLSET_REFERENCE Procedure on page 136-53	Deactivates a SQL tuning set to indicate it is no longer used by the client
SELECT_CURSOR_CACHE Function on page 136-72	Collects SQL statements from the cursor cache
SELECT_SQL_TRACE Function on page 136-76	Reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`
SELECT_SQLSET Function on page 136-78	Collects SQL statements from an existing SQL tuning set
SELECT_WORKLOAD_REPOSITORY Functions on page 136-80	Collects SQL statements from the workload repository
UNPACK_STGTAB_SQLSET Procedure on page 136-90	Copies one or more SQL tuning sets from the staging table
UPDATE_SQLSET Procedures on page 136-92	Updates whether selected string fields for a SQL statement in a SQL tuning set or the set numerical attributes of a SQL in a SQL tuning set

The Summary of DBMS_SQLTUNE Subprograms contains a complete listing of all subprograms in the package.

Real-time SQL Monitoring Subprograms

This subprogram group provides function to report on monitoring data collected in `V$SQL_MONITOR` and `V$SQL_PLAN_MONITOR`.

Table 136–5 SQL Tuning Set Subprograms

Subprogram	Description
REPORT_SQL_MONITOR Function on page 136-59	Reports on real-time SQL Monitoring
REPORT_SQL_MONITOR_LIST Function on page 136-64	Builds a report for all or a sub-set of statements monitored by Oracle

SQL Performance Reporting Subprograms

This subprogram group provides detailed reports on SQL performance using statistics from the cursor cache and automatic workload repository (AWR).

Table 136–6 SQL Performance Reporting Subprograms

Subprogram	Description
REPORT_SQL_DETAIL Function on page 136-56	Reports on a specific SQLID

Summary of DBMS_SQLTUNE Subprograms

Table 136–7 DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
ACCEPT_SQL_PROFILE Procedure and Function on page 136-19	Create a SQL Profile for the specified tuning task	SQL Profile Subprograms on page 136-12
ADD_SQLSET_REFERENCE Function on page 136-22	Adds a new reference to an existing SQL tuning set to indicate its use by a client	SQL Tuning Set Subprograms on page 136-13
ALTER_SQL_PROFILE Procedure on page 136-23	Alters specific attributes of an existing SQL Profile object	SQL Profile Subprograms on page 136-12
CANCEL_TUNING_TASK Procedure on page 136-25	Cancels the currently executing tuning task	SQL Tuning Advisor Subprograms on page 136-11
CAPTURE_CURSOR_CACHE_SQLSET Procedure on page 136-26	Over a specified time interval incrementally captures a workload from the cursor cache into a SQL tuning set	SQL Tuning Set Subprograms on page 136-13
CREATE_SQL_PLAN_BASELINE Procedure on page 136-28	Creates a SQL plan baseline for an existing plan	SQL Tuning Advisor Subprograms on page 136-11
CREATE_SQLSET Procedure and Function on page 136-29	Creates a SQL tuning set object in the database	SQL Tuning Set Subprograms on page 136-13
CREATE_STGTAB_SQLPROF Procedure on page 136-30	Creates the staging table used for copying SQL profiles from one system to another	SQL Profile Subprograms on page 136-12
CREATE_STGTAB_SQLSET Procedure on page 136-31	Creates a staging table through which SQL Tuning Sets are imported and exported	SQL Tuning Set Subprograms on page 136-13
CREATE_TUNING_TASK Functions on page 136-33	Creates a tuning of a single statement or SQL tuning set for either the SQL Tuning Advisor	SQL Tuning Advisor Subprograms on page 136-11
DELETE_SQLSET Procedure on page 136-37	Deletes a set of SQL statements from a SQL tuning set	SQL Tuning Set Subprograms on page 136-13
DROP_SQL_PROFILE Procedure on page 136-38	Drops the named SQL Profile from the database	SQL Profile Subprograms on page 136-12
DROP_SQLSET Procedure on page 136-39	Drops a SQL tuning set if it is not active	SQL Tuning Set Subprograms on page 136-13
DROP_TUNING_TASK Procedure on page 136-40	Drops a SQL tuning task	SQL Tuning Advisor Subprograms on page 136-11

Table 136–7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
EXECUTE_TUNING_TASK Function & Procedure on page 136-41	Executes a previously created tuning task	SQL Tuning Advisor Subprograms on page 136-11
IMPLEMENT_TUNING_TASK Function on page 136-42	implements a set of SQL Profile recommendations made by the SQL Tuning Advisor	SQL Tuning Advisor Subprograms on page 136-11
INTERRUPT_TUNING_TASK Procedure on page 136-43	Interrupts the currently executing tuning task	SQL Tuning Advisor Subprograms on page 136-11
LOAD_SQLSET Procedure on page 136-44	Populates the SQL tuning set with a set of selected SQL	SQL Tuning Set Subprograms on page 136-13
PACK_STGTAB_SQLPROF Procedure on page 136-48	Moves profile data out of the `SYS` schema into the staging table	SQL Profile Subprograms on page 136-12
PACK_STGTAB_SQLSET Procedure on page 136-49	Moves tuning sets out of the `SYS` schema into the staging table	SQL Tuning Set Subprograms on page 136-13
REMAP_STGTAB_SQLPROF Procedure on page 136-51	Changes the profile data values kept in the staging table prior to performing an unpack operation	SQL Profile Subprograms on page 136-12
REMAP_STGTAB_SQLSET Procedure on page 136-52	Changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system	SQL Tuning Set Subprograms on page 136-13
REMOVE_SQLSET_ REFERENCE Procedure on page 136-53	Deactivates a SQL tuning set to indicate it is no longer used by the client	SQL Tuning Set Subprograms on page 136-13
REPORT_AUTO_TUNING_ TASK Function on page 136-54	Displays a report from the automatic tuning task, reporting on a range of subtasks	SQL Tuning Set Subprograms on page 136-13
REPORT_SQL_DETAIL Function on page 136-56	Reports on a specific SQLID	SQL Performance Reporting Subprograms on page 136-15
REPORT_SQL_MONITOR Function on page 136-59	Displays a report on real-time SQL monitoring	Real-time SQL Monitoring Subprograms on page 136-14
REPORT_SQL_MONITOR_LIST Function on page 136-64	Builds a report for all or a sub-set of statements monitored by Oracle	Real-time SQL Monitoring Subprograms on page 136-14
REPORT_TUNING_TASK Function on page 136-66	Displays the results of a tuning task	SQL Tuning Set Subprograms on page 136-13
RESET_TUNING_TASK Procedure on page 136-68	Resets the currently executing tuning task to its initial state	SQL Tuning Advisor Subprograms on page 136-11

Table 136–7 (Cont.) DBMS_SQLTUNE Package Subprograms

Subprogram	Description	Group
RESUME_TUNING_TASK Procedure on page 136-69	Resumes a previously interrupted task that was created to process a SQL tuning set	SQL Tuning Advisor Subprograms on page 136-11
SCRIPT_TUNING_TASK Function on page 136-70	Creates a SQL*PLUS script which can then be executed to implement a set of SQL Tuning Advisor recommendations	SQL Tuning Advisor Subprograms on page 136-11
SELECT_CURSOR_CACHE Function on page 136-72	Collects SQL statements from the cursor cache	SQL Tuning Set Subprograms on page 136-13
SELECT_SQL_TRACE Function on page 136-76	Reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`	SQL Tuning Set Subprograms on page 136-13
SELECT_SQLSET Function on page 136-78	Collects SQL statements from an existing SQL tuning set	SQL Tuning Set Subprograms on page 136-13
SELECT_WORKLOAD_ REPOSITORY Functions on page 136-80	Collects SQL statements from the workload repository	SQL Tuning Set Subprograms on page 136-13
SET_AUTO_TUNING_TASK_ PARAMETER Procedures on page 136-82	Updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER` as used for the reserved auto tuning task	SQL Tuning Advisor Subprograms on page 136-11
SET_TUNING_TASK_ PARAMETER Procedures on page 136-85	Updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`	SQL Tuning Advisor Subprograms on page 136-11
SQLTEXT_TO_SIGNATURE Function on page 136-88	Returns a SQL text's signature	SQL Profile Subprograms on page 136-12

UNPACK_STGTAB_SQLSET Procedure on page 136-90	Moves one or more SQL tuning sets from the staging table	SQL Tuning Set Subprograms on page 136-13
UPDATE_SQLSET Procedures on page 136-92	Updates selected fields for a SQL statement in a SQL tuning set	SQL Tuning Set Subprograms on page 136-13

ACCEPT_SQL_PROFILE Procedure and Function

This procedure creates a SQL Profile recommended by the SQL Tuning Advisor. The SQL text is normalized for matching purposes though it is stored in the data dictionary in de-normalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement doesn't exist, an error is reported.

> **See Also:** SQL Profile Subprograms on page 136-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name    IN  VARCHAR2,
   object_id    IN  NUMBER   := NULL,
   name         IN  VARCHAR2 := NULL,
   description  IN  VARCHAR2 := NULL,
   category     IN  VARCHAR2 := NULL);
   task_owner   IN VARCHAR2  := NULL,
   replace      IN BOOLEAN   := FALSE,
   force_match  IN BOOLEAN   := FALSE,
   profile_type IN VARCHAR2  := REGULAR_PROFILE);

DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name    IN  VARCHAR2,
   object_id    IN  NUMBER   := NULL,
   name         IN  VARCHAR2 := NULL,
   description  IN  VARCHAR2 := NULL,
   category     IN  VARCHAR2 := NULL;
   task_owner   IN VARCHAR2  := NULL,
   replace      IN BOOLEAN   := FALSE,
   force_match  IN BOOLEAN   := FALSE,
   profile_type IN VARCHAR2  := REGULAR_PROFILE)
 RETURN VARCHAR2;
```

Parameters

Table 136–8 ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
task_name	The (mandatory) name of the SQL tuning task
object_id	The identifier of the advisor framework object representing the SQL statement associated with the tuning task
name	The name of the SQL Profile. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system generates a unique name for the SQL Profile.
description	A user specified string describing the purpose of the SQL Profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.

Table 136–8 (Cont.) ACCEPT_SQL_PROFILE Procedure and Function Parameters

Parameter	Description
category	This is the category name which must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL Profile. It defaults to the value "DEFAULT". This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL Profile. An ACCEPT_SQL_PROFILE fails if this combination is duplicated.
task_owner	Owner of the tuning task. This is an optional parameter that has to be specified to accept a SQL Profile associated to a tuning task owned by another user. The current user is the default value.
replace	If the profile already exists, it is replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.
force_match	If TRUE this causes SQL Profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.
profile_type	Options: ■ REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan. ■ PX_PROFILE - regular profile with a change to parallel execution

Return Values

The name of the SQL profile.

Usage Notes

The CREATE ANY SQL PROFILE privilege is required.

Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement form the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```
variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);

-- create a tuning task tune the statement
```

```
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
   begin_snap  => 1, -
   end_snap    => 2, -
   sql_id      => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);
```

Note that you do not have to specify the ID (that is, `object_id`) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, `TEST`), so that it is not used by default.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name  =>  :stmt_task, -
   category   =>  'TEST');
```

You can use command `ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST'` to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same `force_matching_signature` as the tuned statement.

```
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name   =>  :stmt_task, -
                                      force_match =>  TRUE);
```

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to '5'. Please notice that you must pass an object id to the `ACCEPT_SQL_PROFILE` procedure because there are potentially many SQL profiles for the tuning task. This object id is given along with the report.

```
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK ( -
  sqlset_name   => 'my_workload',  -
  rank1         => 'ELAPSED_TIME', -
  time_limit    => 3600,           -
  description   => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

 -- create the profile for the sql statement corresponding to object_id = 5.
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (
   task_name  =>  :sts_task, -
   object_id  =>  5);
```

ADD_SQLSET_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
   sqlset_name  IN  VARCHAR2,
   description  IN  VARCHAR2 := NULL)
 RETURN NUMBER;
```

Parameters

Table 136–9 ADD_SQLSET_REFERENCE Function Parameters

Parameter	Description
`sqlset_name`	The SQL tuning set name
`description`	The description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.

Return Values

The identifier of the added reference.

Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only.

The function returns a reference ID that is used to remove it later. You use the `REMOVE_SQLSET_REFERENCE Procedure` to delete references to a SQL tuning set.

```
variable rid number;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
                                sqlset_name => 'my_workload', -
                                description => 'my sts reference');
```

You can use the views `USER/DBA_SQLSET_REFERENCES` to find all references on a given SQL tuning set.

ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL Profile object. The following attributes can be altered (using these attribute names):

- "STATUS" can be set to "ENABLED" or "DISABLED"
- "NAME" can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- "DESCRIPTION" can be set to any string of size no more than 500 characters
- "CATEGORY" can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text)

See Also: SQL Profile Subprograms on page 136-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.ALTER_SQL_PROFILE (
   name                 IN  VARCHAR2,
   attribute_name       IN  VARCHAR2,
   value                IN  VARCHAR2);
```

Parameters

Table 136–10 ALTER_SQL_PROFILE Procedure Parameters

Parameter	Description
name	The (mandatory) name of the existing SQL Profile to alter
attribute_name	The (mandatory) attribute name to alter (case insensitive) using valid attribute names
value	The (mandatory) new value of the attribute using valid attribute values

Usage Notes

Requires the "ALTER ANY SQL PROFILE" privilege.

Examples

```
-- Disable a profile, so it is not be used by any sessions.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (name             =>  :pname,   -
                                     attribute_name   =>  'STATUS', -
                                     value            =>  'DISABLED');

-- Enable it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>   :pname,   -
                                      attribute_name  =>   'STATUS', -
                                      value           =>   'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>  :pname,   -
                                      attribute_name  =>  'CATEGORY', -
                                      value           =>  'TEST');
```

```
-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name            =>  :pname,   -
                                      attribute_name  =>  'CATEGORY', -
                                      value           =>  'DEFAULT');
```

CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data is deleted.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CANCEL_TUNING_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 136–11 CANCEL_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the task to cancel

Examples

You cancel a task when you need to stop it executing and do not require to view any already-completed results.

```
EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);
```

CAPTURE_CURSOR_CACHE_SQLSET Procedure

Over a specified time interval this procedure incrementally captures a workload from the cursor cache into a SQL tuning set. The procedure captures a workload from the cursor cache into a SQL tuning set, polling the cache multiple times over a time period and updating the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (
    sqlset_name         IN VARCHAR2,
    time_limit          IN POSITIVE := 1800,
    repeat_interval     IN POSITIVE := 300,
    capture_option      IN VARCHAR2 := 'MERGE',
    capture_mode        IN NUMBER   := MODE_REPLACE_OLD_STATS,
    basic_filter        IN VARCHAR2 := NULL,
    sqlset_owner        IN VARCHAR2 := NULL);
```

Parameters

Table 136–12 CAPTURE_CURSOR_CACHE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
time_limit	The total amount of time, in seconds, to execute
repeat_interval	The amount of time, in seconds, to pause between sampling
capture_option	During capture, either insert new statements, update existing ones, or both. 'INSERT', 'UPDATE', or 'MERGE' just like load_option in load_sqlset
capture_mode	capture mode (UPDATE and MERGE capture options). Possible values: ■ MODE_REPLACE_OLD_STATS - Replace statistics when the number of executions seen is greater than that stored in the SQL tuning set ■ MODE_ACCUMULATE_STATS - Add new values to current values for SQL we already store. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.
basic_filter	Filter to apply to cursor cache on each sampling (see SELECT_XXX subprograms). If basic_filter is not set by the caller, the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.
sqlset_owner	The owner of the SQL tuning set or NULL for current schema owner

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before

or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and cursor cache turnover properties of your system.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                        sqlset_name     => 'my_workload', -
                                        time_limit      =>  30, -
                                        repeat_interval =>  5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                         sqlset_name     => 'my_workload', -
                         time_limit      => 30, -
                         repeat_interval => 5, -
                         capture_mode    => dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set

```
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
                                    sqlset_name     => 'my_workload', -
                                    time_limit      => 30, -
                                    repeat_interval => 5, -
                                    capture_option  => 'INSERT');
```

CREATE_SQL_PLAN_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by the SQL Tuning Advisor.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_SQL_PLAN_BASELINE (
   task_name            IN VARCHAR2,
   object_id            IN NUMBER := NULL,
   plan_hash_value      IN NUMBER,
   owner_name           IN VARCHAR2 := NULL);
```

Parameters

Table 136–13 CREATE_SQL_PLAN_BASELINE Procedure Parameters

Parameter	Description
task_name	Name of the task for which to get a script
object_id	Object ID to which the SQL corresponds
plan_hash_value	Plan to create plan baseline
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.

CREATE_SQLSET Procedure and Function

The procedure creates a SQL tuning set object in the database.

The function causes the system to generate a name for the SQL Tuning Set.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_SQLSET (
   sqlset_name  IN  VARCHAR2,
   description  IN  VARCHAR2 := NULL
   sqlset_owner IN  VARCHAR2 := NULL);

DBMS_SQLTUNE.CREATE_SQLSET (
   sqlset_name  IN  VARCHAR2 := NULL,
   description  IN  VARCHAR2 := NULL,
   sqlset_owner IN  VARCHAR2 := NULL)
 RETURN VARCHAR2;
```

Parameters

Table 136–14 CREATE_SQLSET Procedure Parameters

Parameter	Description
`sqlset_name`	The SQL tuning set name
`description`	The description of the SQL tuning set
`sqlset_owner`	The owner of the SQL tuning set, or `NULL` for the current schema owner

Examples

```
EXEC DBMS_SQLTUNE.CREATE_SQLSET(-
  sqlset_name => 'my_workload', -
  description => 'complete application workload');
```

CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

> **See Also:** SQL Profile Subprograms on page 136-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (
   table_name            IN VARCHAR2,
   schema_name           IN VARCHAR2 := NULL,
   tablespace_name       IN VARCHAR2 := NULL);
```

Parameters

Table 136–15 CREATE_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
`table_name`	The name of the table to create (case-insensitive unless double quoted). Required.
`schema_name`	The schema to create the table in, or `NULL` for current schema (case-insensitive unless double quoted)
`tablespace_name`	The tablespace to store the staging table within, or `NULL` for current user's default tablespace (case-insensitive unless double quoted)

Usage Notes

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLPROF Procedure.
- This procedure can be called multiple times if you would like to have different SQL profiles in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name  => 'PROFILE_STGTAB');
```

CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL Tuning Sets are imported and exported

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
   table_name           IN VARCHAR2,
   schema_name          IN VARCHAR2 := NULL,
   tablespace_name      IN VARCHAR2 := NULL,
   db_version           IN NUMBER   := NULL);
```

Parameters

Table 136–16 CREATE_STGTAB_SQLSET Procedure Parameters

Parameter	Description
table_name	Name of the table to create (case-sensitive)
schema_name	Schema in which to create the table in, or NULL for current schema (case-sensitive)
tablespace_name	Tablespace in which to store the staging table, or NULL for current user's default tablespace (case-sensitive)
db_version	Database (DB) version determining the format of the staging table. User can also create an older DB version staging table to export STS to an older DB version. One of the following values: ■ NULL (default) — current DB version ■ STS_STGTAB_10_2_VERSION — 10.2 DB version ■ STS_STGTAB_11_1_VERSION — 11.1 DB version ■ STS_STGTAB_11_2_VERSION — 11.2 DB version

Usage Notes

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLSET Procedure.
- This procedure can be called multiple times if you would like to have different tuning sets in different staging tables.
- Note that this is a DDL operation, so it does not occur within a transaction.
- Users issuing the call must have permission to CREATE TABLE in the schema provided and the relevant tablespace.
- Please note that the staging table contains nested table columns and indexes, so it should not be renamed.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');
```

Create a staging table to pack a SQL tuning set in 10.2 DB release format

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
   table_name => 'STGTAB_SQLSET',
   db_version => DBMS_SQLTUNE.STS_STGTAB_10_2_VERSION)
```

Create a staging table to pack a SQL tuning set in 11.1 DB release format

```
EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
   table_name => 'STGTAB_SQLSET',
   db_version => DBMS_SQLTUNE.STS_STGTAB_11_1_VERSION)
```

CREATE_TUNING_TASK Functions

You can use different forms of this function to:

- Create a tuning task for a single statement given its text.
- Create a tuning task for a single statement from the Cursor Cache given its identifier.
- Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
- Create a tuning task for a SQL tuning set.
- Create tuning task for a SQL Performance Analyzer

In all cases, the function mainly creates an advisor task and sets its parameters.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

SQL text format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sql_text          IN CLOB,
  bind_list         IN sql_binds := NULL,
  user_name         IN VARCHAR2  := NULL,
  scope             IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQL ID format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sql_id            IN VARCHAR2,
  plan_hash_value   IN NUMBER    := NULL,
  scope             IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

Workload Repository format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  sql_id            IN VARCHAR2,
  plan_hash_value   IN NUMBER    := NULL,
  scope             IN VARCHAR2  := SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER    := TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2  := NULL,
  description       IN VARCHAR2  := NULL)
RETURN VARCHAR2;
```

SQLSET format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
  sqlset_name       IN VARCHAR2,
```

```
  basic_filter      IN VARCHAR2 :=  NULL,
  object_filter     IN VARCHAR2 :=  NULL,
  rank1             IN VARCHAR2 :=  NULL,
  rank2             IN VARCHAR2 :=  NULL,
  rank3             IN VARCHAR2 :=  NULL,
  result_percentage IN NUMBER   :=  NULL,
  result_limit      IN NUMBER   :=  NULL,
  scope             IN VARCHAR2 :=  SCOPE_COMPREHENSIVE,
  time_limit        IN NUMBER   :=  TIME_LIMIT_DEFAULT,
  task_name         IN VARCHAR2 :=  NULL,
  description       IN VARCHAR2 :=  NULL
  plan_filter       IN VARCHAR2 :=  'MAX_ELAPSED_TIME',
  sqlset_owner      IN VARCHAR2 :=  NULL)
RETURN VARCHAR2;
```

SQL Performance Analyzer format:

```
DBMS_SQLTUNE.CREATE_TUNING_TASK(
   spa_task_name     IN VARCHAR2,
   spa_task_owner    IN VARCHAR2 :=  NULL,
   spa_compare_exec  IN VARCHAR2 :=  NULL,
   basic_filter      IN VARCHAR2 :=  NULL,
   time_limit        IN NUMBER   :=  TIME_LIMIT_DEFAULT,
   task_name         IN VARCHAR2 :=  NULL,
   description       IN VARCHAR2 :=  NULL)
 RETURN VARCHAR2;
```

Parameters

Table 136–17 CREATE_TUNING_TASK Function Parameters

Parameter	Description
sql_text	Text of a SQL statement
begin_snap	Begin snapshot identifier
end_snap	End snapshot identifier
sql_id	Identifier of a SQL statement
bind_list	An ordered list of bind values in ANYDATA type
plan_hash_value	Hash value of the SQL execution plan
sqlset_name	SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set
object_filter	Object filter
rank(i)	Order-by clause on the selected SQL
result_percentage	Percentage on the sum of a ranking measure
result_limit	Top L(imit) SQL from the (filtered/ranked) SQL
user_name	Username for whom the statement is to be tuned
scope	Tuning scope (limited/comprehensive)
time_limit	The maximum duration in seconds for the tuning session
task_name	Optional tuning task name
description	Description of the SQL tuning session to a maximum of 256 characters

Table 136–17 (Cont.) CREATE_TUNING_TASK Function Parameters

Parameter	Description
plan_filter	Plan filter. It is applicable in case there are multiple plans (plan_hash_value) associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are: ■ LAST_GENERATED: plan with the most recent timestamp ■ FIRST_GENERATED: plan with the earliest timestamp, the opposite to LAST_GENERATED ■ LAST_LOADED: plan with the most recent first_load_time statistics information ■ FIRST_LOADED: plan with the earliest first_load_time statistics information, the opposite to LAST_LOADED ■ MAX_ELAPSED_TIME: plan with the maximum elapsed time ■ MAX_BUFFER_GETS: plan with the maximum buffer gets ■ MAX_DISK_READS: plan with the maximum disk reads ■ MAX_DIRECT_WRITES: plan with the maximum direct writes ■ MAX_OPTIMIZER_COST: plan with the maximum optimizer cost
sqlset_owner	Owner of the SQL tuning set, or NULL for the current schema owner
spa_task_name	Name of the SQL Performance Analyzer task whose regressions are to be tuned
spa_task_owner	Owner of specified SQL Performance Analyzer task or NULL for current user
spa_compare_exec	Execution name of Compare Performance trial of SQL Performance Analyzer task. If NULL, we use the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE

Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

Usage Notes

With regard to the form of this subprogram that takes a SQL Tuning Set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

Example 1

```
variable stmt_task VARCHAR2(64);
variable sts_task  VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
```

```
  sql_text => 'select quantity_sold from sales s, times t where s.time_id =
t.time_id and s.time_id = TO_DATE(''24-NOV-00'')');

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24');

-- tune in limited scope
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', -
   scope => 'LIMITED');

-- only give 10 minutes for tuning statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'ay1m3ssvtrh24', -
   time_limit => 600);

-- Workload repository format
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
   end_snap => 2, sql_id => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then tune it)
-- Tune our statements in order by buffer gets, time limit of one hour
-- the default ranking measure is elapsed time.
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
  sqlset_name  => 'my_workload', -
  rank1        => 'BUFFER_GETS', -
  time_limit   => 3600, -
  description  => 'tune my workload ordered by buffer gets');

-- SQL Performance Analyzer format
-- Tune the SQLs reported as having regressed from the compare performance
-- execution of the  SQL Performance Analyzer task named task_123
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
   spa_task_name    => 'task_123', -
   spa_task_owner   => 'SCOTT', -
   spa_compare_exec => 'exec1');
```

Create Tuning Task with SPA task format:

```
-- Tune the SQLs that were
-- reported as having
-- regressed from the
-- compare performance
-- execution of the
-- SPA task named task_123
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
   spa_task_name     => 'task_123',
   spa_task_owner    => 'SCOTT',
   spa_compare_exec  => 'exec1');
```

DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DELETE_SQLSET (
   sqlset_name   IN  VARCHAR2,
   basic_filter  IN  VARCHAR2 := NULL,
   sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 136–18 DELETE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
basic_filter	SQL predicate to filter the SQL from the SQL tuning set. This basic filter is used as a where clause on the SQL tuning set content to select a desired subset of SQL from the Tuning Set.
sqlset_owner	The owner of the SQL tuning set, or NULL for current schema owner

Examples

```
-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload', -
                                basic_filter  => 'elapsed_time < 1000000');
```

DROP_SQL_PROFILE Procedure

This procedure drops the named SQL Profile from the database.

> **See Also:** SQL Profile Subprograms on page 136-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQL_PROFILE (
   name          IN  VARCHAR2,
   ignore        IN  BOOLEAN  := FALSE);
```

Parameters

Table 136–19 DROP_SQL_PROFILE Procedure Parameters

Parameter	Description
`name`	The (mandatory) name of SQL Profile to be dropped. The name is case sensitive.
`ignore`	Ignores errors due to object not existing

Usage Notes

Requires the "`DROP ANY SQL PROFILE`" privilege.

Examples

```
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_SQLSET (
   sqlset_name   IN  VARCHAR2,
   sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 136–20 DROP_SQLSET Procedure Parameters

Parameter	Description
`sqlset_name`	The SQL tuning set name
`sqlset_owner`	The owner of the SQL tuning set, or `NULL` for current schema owner

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```
-- Drop the sqlset.
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```

DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.DROP_TUNING_TASK(
 task_name         IN VARCHAR2);
```

Parameters

Table 136–21 DROP_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to drop

EXECUTE_TUNING_TASK Function & Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.EXECUTE_TUNING_TASK(
   task_name         IN VARCHAR2,
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL)
 RETURN VARCHAR2;

DBMS_SQLTUNE.EXECUTE_TUNING_TASK(
   task_name         IN VARCHAR2,
   execution_name    IN VARCHAR2               := NULL,
   execution_params  IN dbms_advisor.argList   := NULL,
   execution_desc    IN VARCHAR2               := NULL);
```

Parameters

Table 136–22 EXECUTE_TUNING_TASK Function & Procedure Parameters

Parameter	Description
task_name	Name of the tuning task to execute
execution_name	A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.
execution_params	List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_TUNING_TASK_PARAMETER Procedures).
execution_desc	A 256-length string describing the execution

Usage Notes

A tuning task can be executed multiples times without having to reset it.

Examples

```
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
```

IMPLEMENT_TUNING_TASK Function

This function implements a set of SQL Profile recommendations made by the SQL Tuning Advisor. Call this subprogram is equivalent to calling the SCRIPT_TUNING_TASK Function and then running the script.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
    task_name      IN VARCHAR2,
    rec_type       IN VARCHAR2 := REC_TYPE_SQL_PROFILES,
    owner_name     IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL);
```

Parameters

Table 136–23 IMPLEMENT_TUNING_TASK Function Parameters

Parameter	Description
`task_name`	Name of the tuning task for which to implement recommendations
rec_type	Filter the types of recommendations to implement. Only '`PROFILES`' is supported.
`owner_name`	Owner of the relevant tuning task or `NULL` for the current user.
`execution_name`	name of the task execution to use. If `NULL`, recommendations from the last task execution are implemented.

INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 136–24 INTERRUPT_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	Name of the tuning task to interrupt

Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (
   sqlset_name       IN  VARCHAR2,
   populate_cursor   IN  sqlset_cursor,
   load_option       IN VARCHAR2 := 'INSERT',
   update_option     IN VARCHAR2 := 'REPLACE',
   update_condition  IN VARCHAR2 :=  NULL,
   update_attributes IN VARCHAR2 :=  NULL,
   ignore_null       IN BOOLEAN  :=  TRUE,
   commit_rows       IN POSITIVE :=  NULL,
   sqlset_owner      IN VARCHAR2 := NULL);
```

Parameters

Table 136–25 LOAD_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name to populate
populate_cursor	The cursor reference from which to populate
load_option	Specifies how the statements are loaded into the SQL tuning set. The possible values are: ■ INSERT (default) - add only new statements ■ UPDATE - update existing the SQL statements and ignores any new statements ■ MERGE - this is a combination of the two other options. This option inserts new statements and updates the information of the existing ones.
update_option	Specifies how the existing statements are updated. This parameter is considered only if load_option is specified with 'UPDATE'/'MERGE' as an option. The possible values are: ■ REPLACE (default) - update the statement using the new statistics, bind list, object list, and so on. ■ ACCUMULATE - when possible combine attributes (for example, statistics like elapsed_time, and so on) otherwise just replace the old values (for example, module, action, and so on) by the new provided ones. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.

Table 136–25 (Cont.) LOAD_SQLSET Procedure Parameters

Parameter	Description
update_condition	Specifies a where clause to execute the update operation. The update is performed only if the specified condition is true. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination: ■ OLD - to refer to statement attributes from the SQL tuning set (destination) ■ NEW - to refer to statements attributes from the input statements (source)
update_attributes	Specifies the list of a SQL statement attributes to update during a merge or update operation.The possible values are: ■ NULL (default) - the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution context like module, action, and so on. ■ BASIC - statistics and binds only ■ TYPICAL - BASIC + SQL plans (without row source statistics) and without object reference list ■ ALL - all attributes including the execution context attributes like module, action, and so on. ■ List of comma separated attribute names to update - EXECUTION_CONTEXT, EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)
ignore_null	If TRUE do not update an attribute if the new value is NULL. That is, do not override with NULL values unless intentional.
commit_rows	If a value is provided, the load commits after each set of that many statements is inserted. If NULL is provided, the load commits only once, at the end of the operation. Providing a value for this argument allows you to monitor the progress of a SQL Tuning Set load operation in the DBA_/USER_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded.
sqlset_owner	The owner of the SQL tuning set, or the current schema owner or NULL for current owner

Exceptions

- This procedure returns an error when sqlset_name is invalid, or a corresponding SQL tuning set does not exist, or the populate_cursor is incorrect and cannot be executed.
- Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in sqlset_row), or because they violate the user's privileges.

Usage Notes

Rows in the input populate_cursor must be of type SQLSET_ROW.

Examples

In this example, you create and populate a SQL tuning set with all cursor cache statements with an elapsed time of 5 seconds or more excluding statements that

belong to SYS schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the cursor cache
DECLARE
 cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
 OPEN cur FOR
   SELECT VALUE(P)
     FROM table(
       DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
         'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
          NULL, NULL, NULL, NULL, 1, NULL,
         'ALL')) P;

DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                         populate_cursor => cur);

END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your update_option because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the elapsed_time filter because it is assumed that any statement captured in AWR is important, but still you throw away the SYS-parsed cursors to avoid recursive SQL.

```
DECLARE
  cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
      FROM table(
        DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2,
                                                'parsing_schema_name <> ''SYS''',
                                                NULL, NULL,NULL,NULL,
                                                1,
                                                NULL,
                                                'ALL')) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                           populate_cursor => cur,
                           Using DBMS_SQLTUNE
                           load_option => 'MERGE',
                           update_option => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the load_option argument of the LOAD_SQLSET procedure.

```
DECLARE
  cur sys_refcursor;
BEGIN
```

```
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
populate_cursor => cur);
END;
/
```

The next example demonstrates a load with `UPDATE` option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

```
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                           populate_cursor => cur,
                           load_option => 'UPDATE');
END;
/
```

PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the SYS. schema into the staging table.

> **See Also:** SQL Profile Subprograms on page 136-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
   profile_name          IN VARCHAR2 := '%',
   profile_category      IN VARCHAR2 := 'DEFAULT',
   staging_table_name    IN VARCHAR2,
   staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 136–26 PACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
profile_name	The name of the profile to pack (% wildcards acceptable, case-sensitive)
profile_category	The category to pack profiles from (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-insensitive unless double quoted). Required.
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)

Usage Notes

- This procedures requires ADMINISTER SQL MANAGEMENT OBJECT privilege and INSERT privilege on the staging table.
- Note that this function issues a COMMIT after packing each SQL profile, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put only those profiles in the DEFAULT category into the staging table. This corresponds to all profiles used by default on this system.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name => 'PROFILE_STGTAB');
```

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
                                       staging_table_name => 'PROFILE_STGTAB');
```

PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB_SQLSET Procedure.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.PACK_STGTAB_SQLSET (
   sqlset_name          IN VARCHAR2,
   sqlset_owner         IN VARCHAR2 := NULL,
   staging_table_name   IN VARCHAR2,
   staging_schema_owner IN VARCHAR2 := NULL,
   db_version           IN NUMBER := NULL);
```

Parameters

Table 136–27 PACK_STGTAB_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The name of the SQL Tuning Set to pack (% wildcards acceptable, case-sensitive)
sqlset_owner	The category from which to pack SQL Tuning Sets (% wildcards acceptable, case-sensitive)
staging_table_name	The name of the table to use (case-sensitive)
staging_schema_owner	The schema where the table resides, or NULL for current schema (case-sensitive)
db_version	Database (DB) version determining the format of the staging table. User can also create an older DB version staging table to export STS to an older DB version. One of the following values: ■ NULL (default) — current DB version ■ STS_STGTAB_10_2_VERSION — 10.2 DB version ■ STS_STGTAB_11_1_VERSION — 11.1 DB version ■ STS_STGTAB_11_2_VERSION — 11.2 DB version

Usage Notes

- This procedure can be called several times to move more than one SQL tuning set. Users can then move the populated staging table to another system using any method, such as database link or datapump. Users can then call the UNPACK_STGTAB_SQLSET Procedure create the SQL tuning set on the other system.
- Note that this function issues a COMMIT after packing each SQL tuning set, so if an error is raised mid-execution, clear the staging table by deleting its rows.

Examples

Put all SQL tuning sets on the system in the staging table

-- to create a staging table, see the CREATE_STGTAB_SQLSET Procedure

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(sqlset_name        => '%', -
                                     sqlset_owner       => '%', -
```

```
                                        staging_table_name => 'STGTAB_SQLSET');
```

Put only those SQL tuning sets owned by the current user in the staging table

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
   sqlset_name          => '%',
   staging_table_name   => 'STGTAB_SQLSET');
```

Pack a specific SQL tuning set

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
   sqlset_name          => 'my_workload', -
   staging_table_name   => 'STGTAB_SQLSET');
```

Pack a second SQL tuning set

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
   sqlset_name          => 'workload_subset', -
   staging_table_name   => 'STGTAB_SQLSET');
```

Pack the STS my_workload to a staging table STGTAB_SQLSET created for 10.2 DB release

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
   sqlset_name          => 'workload_subset',
   staging_table_name   => 'STGTAB_SQLSET',
   db_version           => DBMS_SQLTUNE.STS_STGTAB_10_2_VERSION);
```

Pack the STS my_workload to a staging table STGTAB_SQLSET created for 11.1 DB release

```
EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
   sqlset_name          => 'workload_subset',
   staging_table_name   => 'STGTAB_SQLSET',
   db_version           => DBMS_SQLTUNE.STS_STGTAB_11_1_VERSION);
```

REMAP_STGTAB_SQLPROF Procedure

This procedure allows DBAs to change the profile data values kept in the staging table prior to performing an unpack operation. The procedure can be used to change the category of a profile.It can be used to change the name of a profile if one already exists on the system with the same name.

> **See Also:** SQL Profile Subprograms on page 136-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (
  old_profile_name      IN VARCHAR2,
  new_profile_name      IN VARCHAR2 := NULL,
  new_profile_category  IN VARCHAR2 := NULL,
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 136–28 REMAP_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
`old_profile_name`	The name of the profile to target for a remap operation (case-sensitive)
`new_profile_name`	The new name of the profile, or `NULL` to remain the same (case-sensitive)
`new_profile_category`	The new category for the profile, or `NULL` to remain the same (case-sensitive)
`staging_table_name`	The name of the table on which to perform the remap operation (case-sensitive). Required.
`staging_schema_owner`	The schema where the table resides, or `NULL` for current schema (case-sensitive)

Usage Notes

Using this procedure requires the `UPDATE` privilege on the staging table.

Examples

Change the name of a profile before we unpack, to avoid conflicts

```
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name    => :pname,          -
                                       new_profile_name    => 'IMP' || :pname, -
                                       staging_table_name  => 'PROFILE_STGTAB');
```

Change the SQL profile in the staging table to be `'TEST'` category before we import it. This way users can test the profile on the new system before it is active.

```
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF(old_profile_name     => :pname,       -
                                       new_profile_category => 'TEST',       -
                                       staging_table_name   => 'PROFILE_STGTAB');
```

REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values than they had on the host system.

> **See Also:** SQL Profile Subprograms on page 136-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (
   old_sqlset_name        IN VARCHAR2,
   old_sqlset_owner       IN VARCHAR2 := NULL,
   new_sqlset_name        IN VARCHAR2 := NULL,
   new_sqlset_owner       IN VARCHAR2 := NULL,
   staging_table_name     IN VARCHAR2,
   taging_schema_owner   IN VARCHAR2 := NULL);
```

Parameters

Table 136–29 REMAP_STGTAB_SQLSET Procedure Parameters

Parameter	Description
`old_sqlset_name`	The name of the tuning set to target for a remap operation. Wildcards are not supported.
`old_sqlset_owner`	The new name of the tuning set owner to target for a remap operation. `NULL` for current schema owner
`new_sqlset_name`	The new name for the tuning set, or `NULL` to keep the same tuning set name.
`new_sqlset_owner`	The new owner for the tuning set, or `NULL` to remain the same owner name.
`staging_table_name`	The name of the table on which to perform the remap operation (case-sensitive)
`staging_schema_owner`	The name of staging table owner, or `NULL` for current schema owner (case-sensitive)

Usage Notes

You can call this procedure multiple times to remap more than one tuning set name or owner. Note that this procedure only handles one tuning set per call.

Examples

```
-- Change the name of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name    => 'my_workload', -
                                      old_sqlset_owner   => 'SH', -
                                      new_sqlset_name    => 'imp_workload', -
                                      staging_table_name => 'STGTAB_SQLSET');

-- Change the owner of an STS in the staging table before we unpack it.
EXEC DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(old_sqlset_name    => 'imp_workload', -
                                      old_sqlset_owner   => 'SH', -
                                      new_sqlset_owner   => 'SYS', -
                                      staging_table_name => 'STGTAB_SQLSET');
```

REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate it is no longer used by the client.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (
   sqlset_name   IN  VARCHAR2,
   reference_id  IN  NUMBER);
```

Parameters

Table 136–30 REMOVE_SQLSET_REFERENCE Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
reference_id	The identifier of the reference to remove

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again.

```
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
                                sqlset_name   => 'my_workload', -
                                reference_id  => :rid);
```

Use views USER/DBA_SQLSET_REFERENCES to find all references on a given SQL tuning set.

REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task. This differs from theREPORT_AUTO_TUNING_TASK Function in that it reports on a range of subtasks.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec      IN VARCHAR2  := NULL,
    end_exec        IN VARCHAR2  := NULL,
    type            IN VARCHAR2  := TYPE_TEXT,
    level           IN VARCHAR2  := LEVEL_TYPICAL,
    section         IN VARCHAR2  := SECTION_ALL,
    object_id       IN NUMBER    := NULL,
    result_limit    IN NUMBER    := NULL)
  RETURN CLOB;
```

Parameters

Table 136–31 REPORT_AUTO_TUNING_TASK Function Parameters

Parameter	Description
`begin_exec`	Name of execution from which to begin the report. `NULL` retrieves a report on the most recent run
`end_exec`	Name of execution at which to end the report. `NULL` retrieves a report on the most recent run.
`type`	Type of the report to produce. Possible values are `TYPE_TEXT` which produces a text report
`level`	Level of detail in the report: ▪ `LEVEL_BASIC`: simple version of the report. Just show info about the actions taken by the advisor. ▪ `LEVEL_TYPICAL`: show information about every statement analyzed, including requests not implemented. ▪ `LEVEL_ALL`: highly detailed report level, also provides annotations about statements skipped over.
`section`	Optionally limit the report to a single section (`ALL` for all sections): ▪ `SECTION_SUMMARY` - summary information ▪ `SECTION_FINDINGS` - tuning findings ▪ `SECTION_PLAN` - explain plans ▪ `SECTION_INFORMATION` - general information ▪ `SECTION_ERROR` - statements with errors ▪ `SECTION_ALL` - all statements
`object_id`	Advisor framework object id that represents a single statement to restrict reporting to. `NULL` for all statements. Only valid for reports that target a single execution.
`result_limit`	Maximum number of SQL statements to show in the report

Return Values

A CLOB containing the desired report.

REPORT_SQL_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the V$ views and AWR.

> **See Also:** SQL Performance Reporting Subprograms on page 136-15 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_DETAIL(
   sql_id                  IN  VARCHAR2   DEFAULT NULL,
   sql_plan_hash_value     IN  NUMBER     DEFAULT NULL,
   start_time              IN  DATE       DEFAULT NULL,
   duration                IN  NUMBER     DEFAULT NULL,
   inst_id                 IN  NUMBER     DEFAULT NULL,
   dbid                    IN  NUMBER     DEFAULT NULL,
   event_detail            IN  VARCHAR2   DEFAULT 'YES',
   bucket_max_count        IN  NUMBER     DEFAULT 128,
   bucket_interval         IN  NUMBER     DEFAULT NULL,
   top_n                   IN  NUMBER     DEFAULT 10,
   report_level            IN  VARCHAR2   DEFAULT 'TYPICAL',
   type                    IN  VARCHAR2   DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 136–32 REPORT_SQL_DETAIL Function Parameters

Parameter	Description
sql_id	SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.
sql_plan_hash_value	Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.
start_time	If specified, shows SQL activity (from gv$ACTIVE_SESSION_HISTORY) starting at this time. On RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time.
duration	Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.
inst_id	Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.
dbid	DBID from which to get SQL details. If NULL, uses current DBID.
event_detail	When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name).
bucket_max_count	If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.

Table 136–32 (Cont.) REPORT_SQL_DETAIL Function Parameters

Parameter	Description
bucket_interval	If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
top_n	Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.
report_level	Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below. In addition, individual report sections can also be enabled or disabled by using a +/- *section_name*. Several sections are defined: ■ 'TOP'- Show top values for the ASH dimensions for a SQL statement; ON by default ■ 'SPM'- Show existing plan baselines for a SQL statement; OFF by default ■ 'MISMATCH'- Show reasons for creating new child cursors (sharing criteria violations); OFF by default. ■ 'STATS'- Show SQL execution statistics per plan from GV$SQLAREA_PLAN_HASH; ON by default ■ 'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default ■ 'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default ■ 'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan timeline histogram); ON by default ■ 'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default ■ 'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default ■ 'XPLAN' - Show execution plans; ON by default ■ 'BINDS' - show captured bind data; ON by default In addition, SQL text can be specified at different levels: ■ -SQL_TEXT - No SQL text in report ■ +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV$SQL_MONITOR ■ –SQL_FULLTEXT - No full SQL text (+SQL_TEXT) ■ +SQL_FULLTEXT - Show full SQL text (default value) The meanings of the three top-level report levels are: ■ NONE - minimum possible ■ BASIC - SQL_TEXT+STATS+ACTIVITY+HISTOGRAM ■ TYPICAL - SQL_ FULLTEXT+TOP+STATS+ACTIVITY+HISTOGRAM+XPLAN +MONITOR ■ ALL - everything Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string
type	Report format: 'ACTIVE' by default. Can also be 'XML' (see Usage Notes).

Return Values

A CLOB containing the desired report.

Usage Notes

- ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.
- The invoker needs the SELECT privilege on the following views:
  - V$SESSION
  - DBA_ADVISOR_FINDINGS
  - V$DATABASE
  - GV$ASH_INFO
  - GV$ACTIVE_SESSION_HISTORY
  - GV$SQLAREA_PLAN_HASH
  - GV$SQL
  - DBA_HIST_SNAPSHOT
  - DBA_HIST_WR_CONTROL
  - DBA_HIST_ACTIVE_SESS_HISTORY
  - DBA_HIST_SQLSTAT
  - DBA_HIST_SQL_BIND_METADATA
  - DBA_HIST_SQLTEXT
  - DBA_SQL_PLAN_BASELINES
  - DBA_SQL_PROFILES
  - DBA_ADVISOR_TASKS
  - DBA_SERVICES
  - DBA_USERS
  - DBA_OBJECTS
  - DBA_PROCEDURES
- The invoker needs the EXECUTE privilege on the DBMS_XPLAN package.
- Finally, the invoker requires all privileges required by DBMS_SQLTUNE.REPORT_SQL_MONITOR an DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST as it calls these functions.

REPORT_SQL_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

> **See Also:** Real-time SQL Monitoring Subprograms on page 136-14 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR(
   sql_id                    IN VARCHAR2  DEFAULT  NULL,
   session_id                IN NUMBER    DEFAULT  NULL,
   session_serial            IN NUMBER    DEFAULT  NULL,
   sql_exec_start            IN DATE      DEFAULT  NULL,
   sql_exec_id               IN NUMBER    DEFAULT  NULL,
   inst_id                   IN NUMBER    DEFAULT  NULL,
   start_time_filter         IN DATE      DEFAULT  NULL,
   end_time_filter           IN DATE      DEFAULT  NULL,
   instance_id_filter        IN NUMBER    DEFAULT  NULL,
   parallel_filter           IN VARCHAR2  DEFAULT  NULL,
   plan_line_filter          IN NUMBER    DEFAULT  NULL,
   event_detail              IN VARCHAR2  DEFAULT  'YES',
   bucket_max_count          IN NUMBER    DEFAULT  128,
   bucket_interval           IN NUMBER    DEFAULT  NULL,
   base_path                 IN VARCHAR2  DEFAULT  NULL,
   last_refresh_time         IN DATE      DEFAULT  NULL,
   report_level              IN VARCHAR2  DEFAULT 'TYPICAL',
   type                      IN VARCHAR2  DEFAULT 'TEXT',
   sql_plan_hash_value       IN NUMBER    DEFAULT  NULL)
 RETURN CLOB;
```

Parameters

Table 136–33 REPORT_SQL_MONITOR Function Parameters

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
session_id	If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
sql_exec_start	This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.

Table 136–33 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
sql_exec_id	This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.
inst_id	Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.
start_time_filter	If not NULL, the report considers only the activity (from GV$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started.
end_time_filter	If not NULL, the report shows only the activity (from GV$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.
instance_id_filter	Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.
parallel_filter	Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be: ■ NULL to target all processes ■ [qc][servers(<svr_grp>[,] <svr_set>[,] <srv_num>)]: 'qc' stands for query coordinator and servers() stipulate which PX servers to consider. The following examples show how to target a subset of the parallel processes: ■ qc: targets only the query coordinator ■ servers(1): targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel. ■ servers(,2): targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers) ■ servers(1,1): consider only group 1, set 1 ■ servers(1,2,4): consider only group 1, set 2, server number 4. This reports for a single parallel server process ■ qc servers(1,2,4): same as above by also including the query coordinator
event_detail	When value is 'YES' (the default), reported activity from GV$ACTIVE_SESSION_HISTORY is aggregated by (wait_class, event_name). Use 'NO' to only aggregate by wait_class.
bucket_max_count	If specified, this should be the maximum number of histogram buckets created in the report

Table 136–33 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
bucket_interval	If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.
base_path	URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)
last_refresh_time	If not NULL (default is NULL), the time when the report was last retrieved (see SYSDATE attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized: ■ SQL text is not returned when this option is specified ■ activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket
report_level	Level of detail for the report, either 'NONE', 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below. In addition, individual report sections can also be enabled or disabled by using a +/- *section_name*. Several sections are defined: ■ 'XPLAN'- Show explain plan; ON by default ■ 'PLAN'- Show plan monitoring statistics; ON by default ■ 'SESSIONS'- Show session details. Applies only to parallel queries; ON by default ■ 'INSTANCE'- Show instance details. Applies only to parallel and cross instance; ON by default ■ 'PARALLEL'- An umbrella parameter for specifying sessions+instance details ■ 'ACTIVITY' - Show activity summary at global level, plan line level and session or instance level (if applicable); ON by default ■ 'BINDS' - Show bind information when available; ON by default ■ 'METRICS' - Show metric data (CPU, IOs, ...) over time; ON by default ■ 'ACTIVITY_HISTOGRAM' - Show an histogram of the overall query activity; ON by default ■ 'PLAN_HISTOGRAM' - Show activity histogram at plan line level; OFF by default ■ 'OTHER' - Other info; ON by default In addition, SQL text can be specified at different levels: ■ SQL_TEXT - No SQL text in report ■ +SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV$SQL_MONITOR ■ -SQL_FULLTEXT - No full SQL text (+SQL_TEXT) ■ +SQL_FULLTEXT - Show full SQL text (default value)

Table 136–33 (Cont.) REPORT_SQL_MONITOR Function Parameters

Parameter	Description
report_level (contd.)	The meanings of the three top-level report levels are: ■ NONE - minimum possible ■ +BASIC - SQL_ TEXT-PLAN-XPLAN-SESSIONS-INSTANCE-ACTIVITY_ HISTOGRAM-PLAN_HISTOGRAM-METRICS ■ TYPICAL - everything but PLAN_HISTOGRAM ■ ALL - everything Only one of these 4 levels can be specified and, if it is, it has to be at the start of the REPORT_LEVEL string
type	Report format, 'TEXT' by default. Can be 'TEXT', 'HTML', 'XML' or 'ACTIVE' (see Usage Notes).
sql_plan_hash_value	Target only those SQL executions with the specified plan_ hash_value. Default is NULL.

Return Values

A CLOB containing the desired report.

Usage Notes

- The target SQL statement for this report can be:
  - The last SQL monitored by Oracle (this is the default behavior, so there is no need to specify any parameter)
  - The last SQL executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally it serial number. For example, use session_id => USERENV ('SID') for the current session or session_id=>20, session_serial=>103 for session ID 20, serial number 103.
  - The last execution of a specific statement identified by its sql_id.
  - A specific execution of a SQL statement identified by its execution key (sql_ id, sql_exec_start and sql_exec_id).
- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the SELECT_CATALOG role).
  - GV$SQL_MONITOR
  - GV$SQL_PLAN_MONITOR
  - GV$SQL_PLAN
  - GV$ACTIVE_SESSION_HISTORY
  - GV$SESSION_LONGOPS
  - GV$SQL
- The bucket_max_count and bucket_interval parameters control the activity histogram. By default, the maximum number of buckets is set to 128 and the RDBMS derives the bucket_interval based on this. The bucket_interval (value is in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1s) without exceeding the maximum number of buckets. For example, if the query has executed for 600s, the RDBMS selects a bucket_interval of 8s

(a power of two) given that 600/8 = 74 which is less than 128 buckets maximum. Smaller than 8s would be 4s which would lead to more buckets than the 128 maximum. If bucket_interval is specified, the RDBMS uses that value instead of deriving it from `bucket_max_count`.

- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

  See Also: *Oracle Database Performance Tuning Guide* for more information about SQL real-time monitoring.

REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a sub-set of statements monitored by Oracle. For each statement, the subprogram gives key information and associated global statistics.

Use the REPORT_SQL_MONITOR Functionto get detail monitoring information for a single SQL statement

See Also: SQL Performance Reporting Subprograms on page 136-15 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST(
   sql_id                   IN VARCHAR2  DEFAULT  NULL,
   session_id               IN NUMBER    DEFAULT  NULL,
   session_serial           IN NUMBER    DEFAULT  NULL,
   inst_id                  IN NUMBER    DEFAULT  NULL,
   active_since_date        IN DATE      DEFAULT  NULL,
   active_since_sec         IN NUMBER    DEFAULT  NULL,
   last_refresh_time        IN DATE      DEFAULT  NULL,
   report_level             IN VARCHAR2  DEFAULT  'TYPICAL',
   auto_refresh             IN NUMBER    DEFAULT  NULL,
   base_path                IN VARCHAR2  DEFAULT  NULL,
   type                     IN VARCHAR2  DEFAULT 'TEXT')
 RETURN CLOB;
```

Parameters

Table 136–34 REPORT_SQL_MONITOR_LIST Function Parameters

Parameter	Description
sql_id	SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.
session_id	If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.
session_serial	In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.
inst_id	Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.
active_since_date	If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.
active_since_sec	Same as active_since_date but with the date specified relative to the current sysdate minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.

Table 136–34 (Cont.) REPORT_SQL_MONITOR_LIST Function Parameters

Parameter	Description
last_refresh_time	If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, sql_exec_id). For queries with a first refresh time after the specified date, only the SQL execution key and statistics are returned.
report_level	Level of detail for the report. The level can be either: ■ BASIC - SQL text up to 200 characters ■ TYPICAL - include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters ■ ALL - currently the same as TYPICAL
auto_refresh	Currently non-operational, reserved for future use
base_path	URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)
type	Report format, 'TEXT' by default. Can be 'TEXT', 'HTML' or 'XML'.

Return Values

A report (XML, text, HTML) for the list of SQL statements that have been monitored.

Usage Notes

The user tuning this function needs to have privilege to access the following fixed views: GV$SQL_MONITOR and GV$SQL

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about SQL real-time monitoring.

REPORT_TUNING_TASK Function

This procedure displays the results of a tuning task.

> **See Also:** SQL Performance Reporting Subprograms on page 136-15 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REPORT_TUNING_TASK(
   task_name       IN   VARCHAR2,
   type            IN   VARCHAR2   := TYPE_TEXT,
   level           IN   VARCHAR2   := LEVEL_TYPICAL,
   section         IN   VARCHAR2   := SECTION_ALL,
   object_id       IN   NUMBER     := NULL,
   result_limit    IN   NUMBER     := NULL,
   owner_name      IN    VARCHAR2  := NULL,
   execution_name  IN  VARCHAR2    := NULL))
RETURN CLOB;
```

Parameters

Table 136–35 REPORT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task to report
type	Type of the report to produce. Possible values are TEXT which produces a text report.
level	Level of detail in the report: ■ LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor. ■ LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented. ■ LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.
section	Optionally limit the report to a single section (ALL for all sections): ■ SECTION_SUMMARY - summary information ■ SECTION_FINDINGS - tuning findings ■ SECTION_PLAN - explain plans ■ SECTION_INFORMATION - general information ■ SECTION_ERROR - statements with errors ■ SECTION_ALL - all statements
object_id	Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.
result_limit	Maximum number of SQL statements to show in the report
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner.
execution_name	Name of the task execution to use. If NULL, the report is generated for the last task execution.

Return Values

A CLOB containing the desired report.

Examples

```
-- Get the whole report for the single statement case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task) from dual;

-- Show me the summary for the sts case.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM DUAL;

-- Show me the findings for the statement I'm interested in.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'FINDINGS',
5) from dual;
```

RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESET_TUNING_TASK(
 task_name          IN VARCHAR2);
```

Parameters

Table 136–36 RESET_TUNING_TASK Procedure Parameters

Parameter	Description
task_name	The name of the tuning task to reset

Examples

```
-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
```

RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.RESUME_TUNING_TASK(
 task_name         IN VARCHAR2,
 basic_filter      IN VARCHAR2 := NULL);
```

Parameters

Table 136–37 RESUME_TUNING_TASK Procedure Parameters

Parameter	Description
`task_name`	The name of the tuning task to resume
`basic_filter`	A SQL predicate to filter the SQL from the SQL Tuning Set. Note that this filter is applied in conjunction with the basic filter (i.e., parameter `basic_filter`) when calling CREATE_TUNING_TASK Functions.

Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

```
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check
-- out its results and then decide.  For this example we will just resume.

EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

SCRIPT_TUNING_TASK Function

This function creates a SQL*PLUS script which can then be executed to implement a set of Advisor recommendations.

> **See Also:** SQL Tuning Advisor Subprograms on page 136-11 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
  task_name          IN VARCHAR2,
  rec_type           IN VARCHAR2  := REC_TYPE_ALL,
  object_id          IN NUMBER    := NULL,
  result_limit       IN NUMNBER   := NULL,
  owner_name         IN VARCHAR2  := NULL,
  execution_name     IN VARCHAR2  := NULL)
 RETURN CLOB;
```

Parameters

Table 136–38 SCRIPT_TUNING_TASK Function Parameters

Parameter	Description
task_name	Name of the tuning task for which to apply a script
rec_type	Filter the script by types of recommendations to include. Any subset of the following separated by commas: or 'ALL: ''PROFILES''STATISTICS''INDEXES'. For example, a script with profiles and statistics: 'PROFILES,STATISTICS'
object_id	Optionally filters by a single object ID
result_limit	Optionally shows commands for only top N SQL (ordered by object_id and ignored if an object_id is also specified)
owner_name	Owner of the relevant tuning task. Defaults to the current schema owner
excution_name	Name of the task execution to use. If NULL, the script is generated for the last task execution.

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- Once the script is returned, it should then by checked by the DBA and executed.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of just the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;
```

```
-- get a script of just stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about just one SQL statement when we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;
```

SELECT_CURSOR_CACHE Function

This function collects SQL statements from the SQL Cursor Cache.

See Also: SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_CURSOR_CACHE (
  basic_filter        IN   VARCHAR2 := NULL,
  object_filter       IN   VARCHAR2 := NULL,
  ranking_measure1    IN   VARCHAR2 := NULL,
  ranking_measure2    IN   VARCHAR2 := NULL,
  ranking_measure3    IN   VARCHAR2 := NULL,
  result_percentage   IN   NUMBER   := 1,
  result_limit        IN   NUMBER   := NULL,
  attribute_list      IN   VARCHAR2 := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 136–39 SELECT_CURSOR_CACHE Function Parameters

Parameter	Description
`basic_filter`	The SQL predicate to filter the SQL from the cursor cache defined on attributes of the `SQLSET_ROW`. If `basic_filter` is not set by the caller, the subprogram captures only statements of the type `CREATE TABLE`, `INSERT`, `SELECT`, `UPDATE`, `DELETE`, and `MERGE`.
`object_filter`	Specifies the objects that should exist in the object list of selected SQL from the cursor cache
`ranking_measure(n)`	An order-by clause on the selected SQL
`result_percentage`	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
`result_limit`	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
`attribute_list`	List of SQL statement attributes to return in the result. The possible values are: ■ `TYPICAL` - `BASIC` + SQL plan (without row source statistics) and without object reference list (default) ■ `BASIC` - all attributes (such as execution statistics and binds) are returned except the plans The execution context is always part of the result. ■ `ALL` - return all attributes ■ Comma separated list of attribute names this allows to return only a subset of SQL attributes: `EXECUTION_STATISTICS`, `BIND_LIST`, `OBJECT_LIST`, SQL_PLAN,`SQL_PLAN_STATISTICS`: similar to `SQL_PLAN` + row source statistics

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the cursor cache views.

Examples

```
-- Get sql ids and sql text for statements with 500 buffer gets.
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;

-- Get all the information we have about a particular statement.
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j'''));

-- Notice that some statements can have multiple plans.  The output of the
-- SELECT_XXX table functions is unique by (sql_id, plan_hash_value).  This is
-- because a data source can store multiple plans per sql statement.
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''ay1m3ssvtrh24'''))
ORDER BY sql_id, plan_hash_value;

-- PL/SQL examples: load_sqlset is called after opening a cursor, along the
-- lines given below

-- Select all statements in the cursor cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/

-- Look for statements not parsed by SYS.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(P)
    FROM table(
     DBMS_SQLTUNE.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS''')) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
```

```
end;
/

-- All statements from a particular module/action.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
         'module = ''MY_APPLICATION'' and action = ''MY_ACTION''')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/

-- all statements that ran for at least five seconds
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- select all statements that pass a simple buffer_gets threshold and
-- are coming from an APPS user
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(
      DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'buffer_gets > 100 and parsing_schema_name = ''APPS''''))P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of sqlset_row
-- is NULL)
DECLARE
  cur sys_refcursor;
```

```
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(dbms_sqltune.select_cursor_cache(
      'elapsed_time > 5000000', NULL, NULL, NULL, NULL, 1, NULL,
      'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/

-- Select the top 100 statements in the cursor cache ordering by elapsed_time.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                NULL,
                                                'ELAPSED_TIME', NULL, NULL,
                                                1,
                                                100)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
end;
/

-- Select the set of statements which cumulatively account for 90% of the
-- buffer gets in the cursor cache.  This means that the buffer gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
                                                NULL,
                                                'BUFFER_GETS', NULL, NULL,
                                                .9)) P;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of `sqlset_row`.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQL_TRACE (
  directory              IN VARCHAR2,
  file_name              IN VARCHAR2 := NULL,
  mapping_table_name     IN VARCHAR2 := NULL,
  mapping_table_owner    IN VARCHAR2 := NULL,,
  select_mode            IN POSITIVE := SINGLE_EXECUTION,
  options                IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start          IN VARCHAR2 := NULL,
  pattern_end            IN VARCHAR2 := NULL,
  result_limit           IN POSITIVE := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 136–40 SELECT_SQL_TRACE Function Parameters

Parameter	Description
`directory`	The directory object containing the trace file(s). This field is mandatory.
`file_name`	All or part of name of the trace file(s) to process. If `NULL` then the current or most recent file in the specified location or path is used. `'%'` wildcards are supported for matching trace file names.
`mapping_table_name`	The mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is `NULL`, the mappings in the current database is used.
`mapping_table_owner`	the mapping table owner. If it is `NULL`, the current user is used.
`select_mode`	the mode for selecting SQL from the trace. By default, it is `SINGLE_EXECUTION`. ■ `SINGLE_EXECUTION` - return one execution of a SQL.(default). ■ `ALL_EXECUTIONS` - return all executions.
`options`	The options. By default, it is `LIMITED_COMMAND_TYPE` which can be specified to include SQL statements from all Oracle command types. ■ `LIMITED_COMMAND_TYPE` - returns the SQL statements with the command types `CREATE`, `INSERT`, `SELECT`, `UPDATE`, `DELETE`, `UPSERT`. It is the default. ■ `ALL_COMMAND_TYPE` - returns the SQL statements with all command types.
`pattern_start`	Opening delimiting pattern of the trace file section(s) to consider. CURRENTLY INOPERABLE.
`pattern_end`	closing delimiting pattern of the trace file section(s) to process. CURRENTLY INOPERABLE.

Table 136–40 (Cont.) SELECT_SQL_TRACE Function Parameters

Parameter	Description
result_limit	Top SQL from the (filtered) source. Default to MAXSB4 if NULL.

Return Values

This function returns a SQLSET_ROW object.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL Tuning Set:

```
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
   FROM dba_objects
   WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
                             'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
                             'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
                             'LOB', 'OPERATOR', 'PACKAGE',
                             'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
                             'RESOURCE PLAN', 'TRIGGER', 'TYPE',
                             'TYPE BODY')
UNION ALL
SELECT user_id id, username owner, NULL name
   FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
   cur sys_refcursor;
BEGIN
   OPEN cur FOR
   SELECT value(p)
     FROM TABLE(
        DBMS_SQLTUNE.SELECT_SQL_TRACE(
           directory=>'SQL_TRACE_DIR',
           file_name=>'%trc',
           mapping_table_name=>'mapping')) p;
   DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
   CLOSE cur;
END;
/
```

SELECT_SQLSET Function

This function reads SQLSET contents.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_SQLSET (
  sqlset_name         IN   VARCHAR2,
  basic_filter        IN   VARCHAR2 := NULL,
  object_filter       IN   VARCHAR2 := NULL,
  ranking_measure1    IN   VARCHAR2 := NULL,
  ranking_measure2    IN   VARCHAR2 := NULL,
  ranking_measure3    IN   VARCHAR2 := NULL,
  result_percentage   IN   NUMBER   := 1,
  result_limit        IN   NUMBER   := NULL)
  attribute_list      IN   VARCHAR2 := NULL,
  plan_filter         IN   VARCHAR2 := NULL,
  sqlset_owner        IN   VARCHAR2 := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 136–41 SELECT_SQLSET Function Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
basic_filter	The SQL predicate to filter the SQL from the SQL Tuning Set defined on attributes of the SQLSET_ROW
object_filter	Specifies the objects that should exist in the object list of selected SQL from the cursor cache
ranking_measure(n)	An order-by clause on the selected SQL
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default) ■ BASIC - all attributes (such as execution statistics and binds) are returned except the plans The execution context is always part of the result. ■ ALL - return all attributes ■ Comma separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN,SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)
plan_filter	The plan filter

Table 136–41 (Cont.) SELECT_SQLSET Function Parameters

Parameter	Description
sqlset_owner	The owner of the SQL tuning set, or NULL for the current schema owner

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_sqlset('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

SELECT_WORKLOAD_REPOSITORY Functions

This function collects SQL statements from the workload repository. The overloaded forms let you:

- Collect SQL statements from all snapshots between `begin_snap` and `end_snap`.
- Collect SQL statements from a workload repository baseline.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (
  begin_snap        IN NUMBER,
  end_snap          IN NUMBER,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL
  attribute_list    IN VARCHAR2 := NULL)
 RETURN sys.sqlset PIPELINED;

DBMS_SQLTUNE.SELECT_WORKLAOD REPOSITORY (
  baseline_name     IN VARCHAR2,
  basic_filter      IN VARCHAR2 := NULL,
  object_filter     IN VARCHAR2 := NULL,
  ranking_measure1  IN VARCHAR2 := NULL,
  ranking_measure2  IN VARCHAR2 := NULL,
  ranking_measure3  IN VARCHAR2 := NULL,
  result_percentage IN NUMBER   := 1,
  result_limit      IN NUMBER   := NULL)
  attribute_list    IN VARCHAR2 := NULL)
 RETURN sys.sqlset PIPELINED;
```

Parameters

Table 136–42 SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
`begin_snap`	Begin snapshot (non-inclusive)
`end_snap`	End snapshot (inclusive)
`baseline_name`	The name of the baseline period
`basic_filter`	The SQL predicate to filter the SQL from the workload repository defined on attributes of the `SQLSET_ROW`. If `basic_filter` is not set by the caller, the subprogram captures only statements of the type `CREATE TABLE`, `INSERT`, `SELECT`, `UPDATE`, `DELETE`, and `MERGE`.
`object_filter`	Specifies the objects that should exist in the object list of selected SQL from the SWRF
`ranking_measure(n)`	An order-by clause on the selected SQL

Table 136–42 (Cont.) SELECT_WORKLOAD_REPOSITORY Function Parameters

Parameter	Description
result_percentage	A filter which picks the top N% according to the ranking measure given. Note that this applies only if one ranking measure is given.
result_limit	The top L(imit) SQL from the (filtered) source ranked by the ranking measure
attribute_list	List of SQL statement attributes to return in the result. The possible values are: ■ TYPICAL - BASIC + SQL plan (without row source statistics) and without object reference list (default) ■ BASIC - all attributes (such as execution statistics and binds) are returned except the plans The execution context is always part of the result. ■ ALL - return all attributes ■ Comma separated list of attribute names allowing return of only a subset of SQL attributes: EXECUTION_STATISTICS, BIND_LIST, OBJECT_LIST, SQL_PLAN,SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics)

Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/
```

SET_AUTO_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER` as used for the reserved auto tuning task, `SYS_AUTO_SQL_TUNING_TASK`

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  VARCHAR2);

DBMS_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
   parameter    IN  VARCHAR2,
   value        IN  NUMBER);
```

Parameters

Table 136–43 SET_AUTO_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2: ■ MODE: tuning scope (comprehensive, limited) ■ USERNAME: username under which the statement is parsed ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task) ■ DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function & Procedure. ■ TIME_LIMIT: global time out (seconds) ■ LOCAL_TIME_LIMIT: per-statement time out (seconds) ■ TEST_EXECUTE: FULL/AUTO/OFF. * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute ■ BASIC_FILTER: basic filter for SQL tuning set ■ OBJECT_FILTER: object filter for SQL tuning set ■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) ■ RANK_MEASURE1: first ranking measure for SQL tuning set ■ RANK_MEASURE2: second possible ranking measure for SQL tuning set ■ RANK_MEASURE3: third possible ranking measure for SQL tuning set ■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER ■ SQL_LIMIT: maximum number of SQL statements to tune ■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements The following parameters are supported for the automatic tuning task only: ■ ACCEPT_SQL_PROFILES: TRUE/FALSE: whether the task should accept SQL Profiles automatically ■ MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum ■ MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.
value	New value of the specified parameter

Usage Notes

- Parameter settings impact all future runs of the auto tuning task.
- Using this subprogram, a user with the `ADVISOR` privilege can set the auto tuning task parameters. For the SET_TUNING_TASK_PARAMETER Procedures the user must be operating as `SYS`.

SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER(
   task_name    IN  VARCHAR2,
   parameter    IN  VARCHAR2,
   value        IN  VARCHAR2);

DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER(
   task_name    IN  VARCHAR2,
   parameter    IN  VARCHAR2,
   value        IN  NUMBER);
```

Parameters

Table 136–44 SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
`task_name`	Identifier of the task to execute

Table 136–44 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

Parameter	Description
parameter	Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2: ■ MODE: tuning scope (comprehensive, limited) ■ USERNAME: username under which the statement is parsed ■ DAYS_TO_EXPIRE: number of days until the task is deleted ■ EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions is deleted (without deleting the task) ■ DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_TUNING_TASK Function & Procedure. ■ TIME_LIMIT: global time out (seconds) ■ LOCAL_TIME_LIMIT: per-statement time out (seconds) ■ TEST_EXECUTE: FULL/AUTO/OFF. * FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set) * AUTO - test-execute for an automatically-chosen time proportional to the tuning time * OFF - do not test-execute ■ BASIC_FILTER: basic filter for SQL tuning set ■ OBJECT_FILTER: object filter for SQL tuning set ■ PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values) ■ RANK_MEASURE1: first ranking measure for SQL tuning set ■ RANK_MEASURE2: second possible ranking measure for SQL tuning set ■ RANK_MEASURE3: third possible ranking measure for SQL tuning set ■ RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER ■ SQL_LIMIT: maximum number of SQL statements to tune ■ SQL_PERCENTAGE: percentage filter of SQL tuning set statements The following parameters are supported for the automatic tuning task only: ■ ACCEPT_SQL_PROFILES: TRUE/FALSE: whether the task should accept SQL Profiles automatically ■ MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum ■ MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.
value	New value of the specified parameter

Usage Notes

- Parameter settings impact all future runs of the auto tuning task.
- Using this subprogram, the user must be operating as `SYS` to set the auto tuning task parameters. By contrast, the user requires only the ADVISOR privilege SET_AUTO_TUNING_TASK_PARAMETER Procedures.

SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text's signature. The signature can be used to identify SQL text in `dba_sql_profiles`.

> **See Also:** SQL Profile Subprograms on page 136-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (
  sql_text    IN CLOB,
  force_match IN BOOLEAN  := FALSE)
 RETURN NUMBER;
```

Parameters

Table 136–45 SQLTEXT_TO_SIGNATURE Function Parameters

Parameter	Description
`sql_text`	SQL text whose signature is required. Required.
`force_match`	If `TRUE`, this returns a signature that supports SQL matching with literal values transformed into bind variables. If `FALSE`, returns the signature based on the text with literals not transformed

Return Values

This function returns the signature of the specified SQL text.

UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

> **See Also:** SQL Profile Subprograms on page 136-12 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (
   profile_name          IN VARCHAR2 := '%',
   profile_category      IN VARCHAR2 := 'DEFAULT',
   replace               IN BOOLEAN,
   staging_table_name    IN VARCHAR2,
   staging_schema_owner  IN VARCHAR2 := NULL);
```

Parameters

Table 136–46 UNPACK_STGTAB_SQLPROF Procedure Parameters

Parameter	Description
`profile_name`	The name of the profile to unpack (% wildcards acceptable, case-sensitive)
`profile_category`	The category from which to unpack profiles (% wildcards acceptable, case-sensitive)
`replace`	The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If `FALSE`, this function raises errors if you try to create a profile that already exists
`staging_table_name`	The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.
`staging_schema_owner`	The schema where the table resides, or `NULL` for current schema (case-insensitive unless double quoted)

Usage Notes

Using this procedure requires the `CREATE ANY SQL PROFILE` privilege and the `SELECT` privilege on staging table.

Examples

```
-- Unpack all profiles stored in a staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace            => FALSE, -
                                        staging_table_name => 'PROFILE_STGTAB');

-- If there is a failure during the unpack operation, users can find the profile
-- we failed on and perform a remap_stgtab_sqlprof operation targeting it.  Then
-- they can resume the unpack operation by setting replace to TRUE so that
-- the profiles that were already created are replaced
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(replace            => TRUE, -
                                        staging_table_name => 'PROFILE_STGTAB');
```

UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
   sqlset_name          IN VARCHAR2 := '%',
   sqlset_owner         IN VARCHAR2 := NULL,
   replace              IN BOOLEAN,
   staging_table_name   IN VARCHAR2,
   staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 136–47 UNPACK_STGTAB_SQLSET Procedure Parameters

Parameter	Description
`sqlset_name`	The name of the tuning set to unpack (not NULL). Wildcard characters ('%') are supported to unpack multiple tuning sets in a single call. For example, just specify '%' to unpack all tuning sets from the staging table.
`sqlset_owner`	The name of tuning set owner, or `NULL` for current schema owner. Wildcards supported.
`replace`	Replaces tuning set if they already exist.If `FALSE`, raises errors if you try to create a tuning set that already exists
`staging_table_name`	The name of the staging table, moved after a call to the PACK_STGTAB_SQLSET Procedure (case-sensitive)
`staging_schema_owner`	The name of staging table owner, or `NULL` for current schema owner (case-sensitive)

Usage Notes

- Users can drop the staging table after this procedure completes successfully.
- The unpack procedure commits after successfully loading each SQL tuning set. If it fails with one tuning set, no part of that tuning set will have been unpacked, but those which the subprogram had already apprehended continue to exist.
- When failures occur due to SQL tuning set name or owner conflicts, users should use the REMAP_STGTAB_SQLSET Procedure to patch the staging table, and then call this procedure again to unpack those tuning sets that remain.

Examples

```
 -- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name         => '%', -
                                       sqlset_owner        => '%', -
                                       replace             => FALSE, -
                                       staging_table_name  => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the
-- same name/owner as STS on the system.  In this case, users should call
```

```
-- remap_stgtab_sqlset to patch the staging table and with which to call unpack
-- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name         => '%', -
                                       sqlset_owner        => '%', -
                                       replace             => TRUE, -
                                       staging_table_name  => 'STGTAB_SQLSET');
```

UPDATE_SQLSET Procedures

This procedure updates selected fields for SQL statement in a SQL tuning set.

> **See Also:** SQL Tuning Set Subprograms on page 136-13 for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   attribute_name   IN  VARCHAR2,
   attribute_value  IN  VARCHAR2 := NULL);

DBMS_SQLTUNE.UPDATE_SQLSET (
   sqlset_name      IN  VARCHAR2,
   sql_id           IN  VARCHAR2,
   attribute_name   IN  VARCHAR2,
   attribute_value IN NUMBER := NULL);
```

Parameters

Table 136–48 UPDATE_SQLSET Procedure Parameters

Parameter	Description
sqlset_name	The SQL tuning set name
sql_id	The identifier of the statement to update
attribute_name	The name of the attribute to modify
attribute_value	The new value of the attribute

137

DBMS_STAT_FUNCS

The DBMS_STAT_FUNCS package provides statistical functions.

This chapter contains the following topic:

- Summary of DBMS_STAT_FUNCS Subprograms

Summary of DBMS_STAT_FUNCS Subprograms

Table 137–1 DBMS_STAT_FUNCS Package Subprograms

Subprogram	Description
EXPONENTIAL_DIST_FIT Procedure on page 137-3	Tests how well a sample of values fits an exponential distribution
NORMAL_DIST_FIT Procedure on page 137-4	Tests how well a sample of values fits a normal distribution
POISSON_DIST_FIT Procedure on page 137-5	Tests how well a sample of values fits a Poisson distribution
SUMMARY Procedure on page 137-6	Summarizes a numerical column of a table
UNIFORM_DIST_FIT Procedure on page 137-7	Tests how well a sample of values fits a uniform distribution
WEIBULL_DIST_FIT Procedure on page 137-8	Tests how well a sample of values fits a Weibull distribution

EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

Syntax

```
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   lambda       IN    NUMBER,
   mu           IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 137–2 EXPONENTIAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED','KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The scale parameter.
mu	The location parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.

NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
   mean         IN    NUMBER,
   stdev        IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 137–3 NORMAL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.
mean	The mean of the distribution against which to compare.
stdev	The standard deviation of the distribution against which to compare.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.

POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   lambda       IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 137–4 POISSON_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
lambda	The lambda parameter is the shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.

SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`. The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

Syntax

```
DBMS_STAT_FUNCS.SUMMARY (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   sigma_value  IN    NUMBER DEFAULT 3,
   s           OUT    SummaryType);
```

Parameters

Table 137–5 SUMMARY Procedure Parameters

Parameter	Description
`ownername`	The schema where the table resides.
`tablename`	The table where the column resides.
`columnname`	The column of the table to be summarized.
`sigma_value`	The number of sigmas for the set of extreme values, defaults to 3.
`s`	The Record containing summary information about given column.

Definition of SummaryType

```
TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (
   count             NUMBER,
   min               NUMBER,
   max               NUMBER,
   range             NUMBER,
   mean              NUMBER,
   cmode             num_table,
   variance          NUMBER,
   stddev            NUMBER,
   quantile_5        NUMBER,
   quantile_25       NUMBER,
   median            NUMBER,
   quantile_75       NUMBER,
   quantile_95       NUMBER,
   plus_x_sigma      NUMBER,
   minus_x_sigma     NUMBER,
   extreme_values    num_table,
   top_5_values      n_arr,
   bottom_5_values   n_arr);
```

UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

```
DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   var_type     IN    VARCHAR2 DEFAULT 'CONTINUOUS',
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   paramA       IN    NUMBER,
   paramB       IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 137–6 UNIFORM_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
var_type	The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'
test_type	The type of test to use: 'CHI_SQUARED','KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
paramA	Parameter A estimated from the sample (the location parameter).
paramB	Parameter B estimated from the sample (the scale parameter).
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.

WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT (
   ownername    IN    VARCHAR2,
   tablename    IN    VARCHAR2,
   columnname   IN    VARCHAR2,
   test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
   alpha        IN    NUMBER,
   mu           IN    NUMBER,
   beta         IN    NUMBER,
   sig          OUT   NUMBER);
```

Parameters

Table 137–7 WEIBULL_DIST_FIT Procedure Parameters

Parameter	Description
ownername	The schema where the table resides.
tablename	The table where the column resides.
columnname	The column of the table against which to run the test.
test_type	The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.
alpha	The scale parameter.
mu	The location parameter.
beta	The slope/shape parameter.
sig	The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Weibull distribution. A number close to 1 indicates a close match.

138

DBMS_STATS

With the `DBMS_STATS` package you can view and modify optimizer statistics gathered for database objects.

> **See Also:** *Oracle Database Performance Tuning Guide*

This chapter contains the following topics:

- Using DBMS_STATS
  - Overview
  - Types
  - Constants
  - Operational Notes
  - Deprecated Subprograms
  - Examples
- Summary of DBMS_STATS Subprograms

Using DBMS_STATS

This section contains topics which relate to using the `DBMS_STATS` package.

- Overview
- Types
- Constants
- Operational Notes
- Deprecated Subprograms
- Examples

Overview

The Oracle RDBMS allows you to collect statistics of many different kinds as an aid to improving performance. This package is concerned with optimizer statistics only. Given that Oracle sets automatic statistics collection of this kind on by default, this package is intended for only specialized cases.

The statistics of interest to be viewed or modified can reside in the dictionary or in a table created in the user's schema for this purpose. You can also collect and manage user-defined statistics for tables and domain indexes using this package.

For example, if the `DELETE_COLUMN_STATS` procedure is invoked on a column for which an association is defined, user-defined statistics for that column are deleted in addition to deletion of the standard statistics.

Only statistics stored in the dictionary have an impact on the cost-based optimizer. You can also use `DBMS_STATS` to gather statistics in parallel

> **See Also:** *Oracle Database Performance Tuning Guide* for more information about "Managing Optimizer Statistics".

Types

Types for the minimum and maximum values and histogram endpoints include:

```
TYPE numarray  IS VARRAY(256) OF NUMBER;
TYPE datearray IS VARRAY(256) OF DATE;
TYPE chararray IS VARRAY(256) OF VARCHAR2(4000);
TYPE rawarray  IS VARRAY(256) OF RAW(2000);
TYPE fltarray IS VARRAY(256) OF BINARY_FLOAT;
TYPE dblarray IS VARRAY(256) OF BINARY_DOUBLE;

TYPE StatRec IS RECORD (
  epc    NUMBER,
  minval RAW(2000),
  maxval RAW(2000),
  bkvals NUMARRAY,
  novals NUMARRAY);
```

Types for listing stale tables include:

```
TYPE ObjectElem IS RECORD (
  ownname     VARCHAR2(30),     -- owner
  objtype     VARCHAR2(6),      -- 'TABLE' or 'INDEX'
  objname     VARCHAR2(30),     -- table/index
  partname    VARCHAR2(30),     -- partition
  subpartname VARCHAR2(30));    -- subpartition
type ObjectTab is TABLE of ObjectElem;
```

Type for displaying statistics difference report:

```
TYPE DiffRepElem IS RECORD (
 report     CLOB,              -- stats difference report
 maxdiffpct number);           -- max stats difference (percentage)
type DiffRepTab is table of DiffRepElem;
```

Constants

The DBMS_STATS package uses the constants shown in Table 138–1:

Table 138–1 DBMS_STATS Constants

Name	Type	Value	Description
AUTO_CASCADE	BOOLEAN	NULL	Lets Oracle decide whether to collect statistics for indexes or not
AUTO_DEGREE	NUMBER	32768	Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters
AUTO_INVALIDATE	BOOLEAN	NULL	Lets Oracle decide when to invalidate dependent cursors
AUTO_SAMPLE_ SIZE	NUMBER	0	Indicates that auto-sample size algorithms should be used

Operational Notes

The DBMS_STATS subprograms perform the following general operations:

- Gathering Optimizer Statistics
- Setting or Getting Statistics
- Deleting Statistics
- Transferring Statistics
- Locking or Unlocking Statistics
- Restoring and Purging Statistics History
- User-Defined Statistics
- Pending Statistics
- Comparing Statistics
- Extended Statistics

Most of the DBMS_STATS procedures include the three parameters statown, stattab, and statid. These parameters allow you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with *sets* of statistics.

The stattab parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the statown parameter is specified). You can create multiple tables with different stattab identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single stattab by using the statid parameter, which avoids cluttering the user's schema.

For the SET and GET procedures, if stattab is not provided (that is, NULL), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if stattab is not NULL, then the SET or GET operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of DBMS_STATS procedures using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Most of the procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a parameter, force which allows you to override any lock on statistics.

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the ANALYZE command:

GATHER_DATABASE_STATS Procedures
GATHER_DICTIONARY_STATS Procedure
GATHER_FIXED_OBJECTS_STATS Procedure

GATHER_INDEX_STATS Procedure
GATHER_SCHEMA_STATS Procedures
GATHER_SYSTEM_STATS Procedure
GATHER_TABLE_STATS Procedure

The GATHER_* procedures also collect user-defined statistics for columns and domain indexes.

The statown, stattab, and statid parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

GENERATE_STATS Procedure

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:

PREPARE_COLUMN_VALUES Procedures
PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure
PREPARE_COLUMN_VALUES_ROWID Procedure

SET_COLUMN_STATS Procedures
SET_INDEX_STATS Procedures
SET_SYSTEM_STATS Procedure
SET_TABLE_STATS Procedure

GET_COLUMN_STATS Procedures
GET_INDEX_STATS Procedures
GET_SYSTEM_STATS Procedure
GET_TABLE_STATS Procedure

In the special versions of the SET_*_STATS procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or external statistics table:

- User-defined statistics (extstats)
- The statistics type schema name (statsschema)
- The statistics type name (statsname)

The user-defined statistics and the corresponding statistics type are inserted into the USTATS$ dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the GET_*_STATS procedures return user-defined statistics and the statistics type owner and name as OUT arguments corresponding to the schema object specified. If user-defined statistics are not collected, NULL values are returned.

Deleting Statistics

The DELETE_* procedures delete both user-defined statistics and the standard statistics for the given schema object.

DELETE_COLUMN_STATS Procedure
DELETE_DATABASE_STATS Procedure

DELETE_DICTIONARY_STATS Procedure
DELETE_FIXED_OBJECTS_STATS Procedure
DELETE_INDEX_STATS Procedure
DELETE_SCHEMA_STATS Procedure
DELETE_SYSTEM_STATS Procedure
DELETE_TABLE_STATS Procedure

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

CREATE_STAT_TABLE Procedure
DROP_STAT_TABLE Procedure

Use the following procedures to transfer statistics

- from the dictionary to a user statistics table (`EXPORT_*`)
- from a user statistics table to the dictionary (`IMPORT_*`)

EXPORT_COLUMN_STATS Procedure
EXPORT_DATABASE_STATS Procedure
EXPORT_DICTIONARY_STATS Procedure
EXPORT_FIXED_OBJECTS_STATS Procedure
EXPORT_INDEX_STATS Procedure
EXPORT_SCHEMA_STATS Procedure
EXPORT_SYSTEM_STATS Procedure
EXPORT_TABLE_STATS Procedure

IMPORT_COLUMN_STATS Procedure
IMPORT_DATABASE_STATS Procedure
IMPORT_DICTIONARY_STATS Procedure
IMPORT_FIXED_OBJECTS_STATS Procedure
IMPORT_INDEX_STATS Procedure
IMPORT_SCHEMA_STATS Procedure
IMPORT_SYSTEM_STATS Procedure
IMPORT_TABLE_STATS Procedure

Note: Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

LOCK_SCHEMA_STATS Procedure
LOCK_TABLE_STATS Procedure

UNLOCK_SCHEMA_STATS Procedure
UNLOCK_TABLE_STATS Procedure

The `LOCK_*` procedures either freeze the current set of the statistics or to keep the statistics empty (uncollected).When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

RESET_GLOBAL_PREF_DEFAULTS Procedure
RESTORE_DICTIONARY_STATS Procedure
RESTORE_FIXED_OBJECTS_STATS Procedure
RESTORE_SCHEMA_STATS Procedure
RESTORE_SYSTEM_STATS Procedure
RESTORE_TABLE_STATS Procedure

Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the ALTER_STATS_HISTORY_RETENTION Procedure.

The other `DBMS_STATS` procedures related to restoring statistics are:

- PURGE_STATS Procedure: This procedure lets you manually purge old versions beyond a time stamp.
- GET_STATS_HISTORY_RETENTION Function: This function gets the current statistics history retention value.
- GET_STATS_HISTORY_AVAILABILITY Function: This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

`RESTORE_*` operations are not supported for user defined statistics.

User-Defined Statistics

The `DBMS_STATS` package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the `associate` statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the GET_INDEX_STATS Procedures invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

`SET_*` and `GET_*` operations for user-defined statistics are also supported using a special version of the `SET` and `GET` interfaces for columns and indexes.

`EXPORT_*`, `IMPORT_*` and `RESTORE_*` operations are not supported for user defined statistics.

Pending Statistics

The package gather statistics and stores it in the dictionary by default. User's can store these statistics in the system's private area instead of the dictionary by turning the `PUBLISH` option to `FALSE` using the `SET*PREFS` procedures. The default value for `PUBLISH` is `TRUE`.The statistics stored in private area are not used by Cost Based Optimizer unless parameter `optimizer_use_private_statistics` is set to `TRUE`. The default value of this parameter is `FALSE` and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the EXPORT_PENDING_STATS Procedure) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

Once the performance or query plans have been verified, the pending statistics can be published (run the PUBLISH_PENDING_STATS Procedure) if the performance is acceptable or delete (run the DELETE_PENDING_STATS Procedure) if not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- DELETE_PENDING_STATS Procedure
- EXPORT_PENDING_STATS Procedure
- PUBLISH_PENDING_STATS Procedure

Comparing Statistics

The `DIFF_TABLE_STATS_*` statistics can be used to compare statistics for a table from two different sources. The statistics can be from:

- two different user statistics tables
- a single user statistics table containing two sets of statistics that can be identified using statids
- a user statistics table and dictionary history
- pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function, with a default of 10%. The statistics corresponding to the first source (`stattab1` or `time1`) will be used as basis for computing the differential percentage.

Extended Statistics

This package allows you to collect statistics for column groups and expressions (known as "statistics extensions"). The statistics collected for column groups and expressions are called "extended statistics".

Statistics on Column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates c1=1 and c2=1 and if there are statistics on (c1, c2), the optimizer will use this statistics for estimating the combined selectivity of the predicates.The expression statistics are used by optimizer for estimating selectivity of predicates on those expressions. The extended statistics are similar to column statistics and the procedures that take columns names will accept extension names in place of column names.

Related subprograms:

- CREATE_EXTENDED_STATS Function
- DROP_EXTENDED_STATS Procedure

- SHOW_EXTENDED_STATS_NAME Function

Deprecated Subprograms

The following subprograms are obsolete with Release 11*g*:

- GET_PARAM Function

  Instead, use GET_PREFS Function
- SET_PARAM Procedure

  Instead, use SET_GLOBAL_PREFS Procedure
- RESET_PARAM_DEFAULTS Procedure

  Instead use RESET_GLOBAL_PREF_DEFAULTS Procedure

Examples

- Using Pending Statistics
- Gathering Daytime System Statistics

Using Pending Statistics

Assume many modifications have been made to the `employees` table since the last time statistics were gathered. To ensure that the cost-based optimizer is still picking the best plan, statistics should be gathered once again; however, the user is concerned that new statistics will cause the optimizer to choose bad plans when the current ones are acceptable. The user can do the following:

```
EXEC DBMS_STATS.SET_TABLE_PREFS('hr', 'employees', 'PUBLISH', 'false');
```

By setting the employees tables publish preference to `FALSE`, any statistics gather from now on will not be automatically published. The newly gathered statistics will be marked as pending.

```
EXEC DBMS_STATS.GATHER_TABLE_STATS ('hr', 'employees');
```

To test the newly gathered statistics, set `optimizer_pending_statistics` to `TRUE` in a session and run sample queries.

```
ALTER SESSION SET optimizer_use_pending_statistics = TRUE;
```

If the pending statistics generate sound execution plans, they can be published:

```
EXEC DBMS_STATS.PUBLISH_PENDING_STATS('hr', 'employees');
EXEC DBMS_STATS.SET_TABLE_PREF('hr', 'employees', 'PUBLISH', 'true');
```

Gathering Daytime System Statistics

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the `MYSTATS` table.

```
BEGIN
   DBMS_STATS.GATHER_SYSTEM_STATS (
      interval => 720,
      stattab  => 'mystats',
      statid   => 'OLTP');
END;
```

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the `MYSTATS` table.

```
BEGIN
   DBMS_STATS.GATHER_SYSTEM_STATS (
      interval => 720,
      stattab  => 'mystats',
      statid   => 'OLAP');
END;
```

Update the dictionary with the gathered statistics.

```
VARIABLE   jobno   number;
BEGIN
   DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
```

```
   (''mystats'','''OLTP''');'
   sysdate, 'sysdate + 1');
   COMMIT;
END;

BEGIN
   DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS
   (''mystats'','''OLAP''');'
   sysdate + 0.5, 'sysdate + 1');
   COMMIT;
END;
```

Summary of DBMS_STATS Subprograms

Table 138–2 DBMS_STATS Package Subprograms

Subprogram	Description
ALTER_STATS_HISTORY_RETENTION Procedure on page 138-20	Changes the statistics history retention value
CONVERT_RAW_VALUE Procedures on page 138-21	Convert the internal representation of a minimum or maximum value into a datatype-specific value
CONVERT_RAW_VALUE_NVARCHAR Procedure on page 138-22	Convert the internal representation of a minimum or maximum value into a datatype-specific value
CONVERT_RAW_VALUE_ROWID Procedure on page 138-23	Convert the internal representation of a minimum or maximum value into a datatype-specific value
COPY_TABLE_STATS Procedure on page 138-24	Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling
CREATE_EXTENDED_STATS Function on page 138-25	Creates a virtual column for a user specified column group or an expression in a table
CREATE_STAT_TABLE Procedure on page 138-27	Creates a table with name `stattab` in ownname's schema which is capable of holding statistics
DELETE_COLUMN_STATS Procedure on page 138-28	Deletes column-related statistics
DELETE_DATABASE_PREFS Procedure on page 138-30	Deletes the statistics preferences of all the tables, excluding the tables owned by Oracle.
DELETE_DATABASE_STATS Procedure on page 138-33	Deletes statistics for the entire database
DELETE_DICTIONARY_STATS Procedure on page 138-34	Deletes statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and RDBMS component schemas)
DELETE_FIXED_OBJECTS_STATS Procedure on page 138-33	Deletes statistics of all fixed tables
DELETE_INDEX_STATS Procedure on page 138-36	Deletes index-related statistics
DELETE_PENDING_STATS Procedure on page 138-37	Deletes the private statistics that have been collected but have not been published
DELETE_SCHEMA_PREFS Procedure on page 138-38	Deletes the statistics preferences of all the tables owned by the specified owner name
DELETE_SCHEMA_STATS Procedure on page 138-41	Deletes schema-related statistics
DELETE_SYSTEM_STATS Procedure on page 138-42	Deletes system statistics
DELETE_TABLE_PREFS Procedure on page 138-43	Deletes statistics preferences of the specified table in the specified schema
DELETE_TABLE_STATS Procedure on page 138-46	Deletes table-related statistics
DIFF_TABLE_STATS_IN_HISTORY Function on page 138-48	Compares statistics for a table from two timestamps in past and compare the statistics as of that timestamps

Table 138–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
DIFF_TABLE_STATS_IN_PENDING Function on page 138-49	Compares pending statistics and statistics as of a timestamp or statistics from dictionary.
DIFF_TABLE_STATS_IN_STATTAB Function on page 138-50	Compares statistics for a table from two different sources
DROP_EXTENDED_STATS Procedure on page 138-51	Drops the statistics entry that is created for the user specified extension
DROP_STAT_TABLE Procedure on page 138-52	Drops a user statistics table created by `CREATE_STAT_TABLE`
EXPORT_COLUMN_STATS Procedure on page 138-53	Retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`
EXPORT_DATABASE_PREFS Procedure on page 138-54	Exports the statistics preferences of all the tables, excluding the tables owned by Oracle.
EXPORT_DATABASE_STATS Procedure on page 138-55	Retrieves statistics for all objects in the database and stores them in the user statistics table identified by `statown.stattab`
EXPORT_DICTIONARY_STATS Procedure on page 138-56	Retrieves statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and RDBMS component schemas) and stores them in the user statistics table identified by `stattab`
EXPORT_FIXED_OBJECTS_STATS Procedure on page 138-57	Retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`
EXPORT_INDEX_STATS Procedure on page 138-58	Retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`
EXPORT_PENDING_STATS Procedure on page 138-59	Exports the statistics gathered and stored as pending
EXPORT_SCHEMA_PREFS Procedure on page 138-60	Exports the statistics preferences of all the tables owned by the specified owner name
EXPORT_SCHEMA_STATS Procedure on page 138-61	Retrieves statistics for all objects in the schema identified by ownname and stores them in the user statistics table identified by `stattab`
EXPORT_SYSTEM_STATS Procedure on page 138-62	Retrieves system statistics and stores them in the user statistics table
EXPORT_TABLE_PREFS Procedure on page 138-63	Exports statistics preferences of the specified table in the specified schema into the specified statistics table
EXPORT_TABLE_STATS Procedure on page 138-64	Retrieves statistics for a particular table and stores them in the user statistics table
FLUSH_DATABASE_MONITORING_INFO Procedure on page 138-65	Flushes in-memory monitoring information for all the tables to the dictionary
GATHER_DATABASE_STATS Procedures on page 138-66	Gathers statistics for all objects in the database
GATHER_DICTIONARY_STATS Procedure on page 138-66	Gathers statistics for dictionary schemas '`SYS`', '`SYSTEM`' and schemas of RDBMS components
GATHER_FIXED_OBJECTS_STATS Procedure on page 138-74	Gathers statistics of fixed objects
GATHER_INDEX_STATS Procedure on page 138-75	Gathers index statistics

Table 138–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
GATHER_SCHEMA_STATS Procedures on page 138-77	Gathers statistics for all objects in a schema
GATHER_SYSTEM_STATS Procedure on page 138-81	Gathers system statistics
GATHER_TABLE_STATS Procedure on page 138-83	Gathers table and column (and index) statistics
GENERATE_STATS Procedure on page 138-87	Generates object statistics from previously collected statistics of related objects
GET_COLUMN_STATS Procedures on page 138-88	Gets all column-related information
GET_INDEX_STATS Procedures on page 138-90	Gets all index-related information
GET_PARAM Function on page 138-93	Gets the default value of parameters of `DBMS_STATS` procedures [see Deprecated Subprograms on page 138-12]
GET_STATS_HISTORY_AVAILABILITY Function on page 138-97	Gets the oldest timestamp where statistics history is available
GET_STATS_HISTORY_RETENTION Function on page 138-98	Returns the current retention value
GET_SYSTEM_STATS Procedure on page 138-99	Gets system statistics from stattab, or from the dictionary if stattab is `NULL`
GET_TABLE_STATS Procedure on page 138-101	Gets all table-related information
IMPORT_COLUMN_STATS Procedure on page 138-103	Retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_DATABASE_PREFS Procedure on page 138-105	Imports the statistics preferences of all the tables, excluding the tables owned by Oracle.
IMPORT_DATABASE_STATS Procedure on page 138-106	Retrieves statistics for all objects in the database from the user statistics table and stores them in the dictionary
IMPORT_DICTIONARY_STATS Procedure on page 138-107	Retrieves statistics for all dictionary schemas ('`SYS`', '`SYSTEM`' and RDBMS component schemas) from the user statistics table and stores them in the dictionary
IMPORT_FIXED_OBJECTS_STATS Procedure on page 138-108	Retrieves statistics for fixed tables from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_INDEX_STATS Procedure on page 138-109	Retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary
IMPORT_SCHEMA_PREFS Procedure on page 138-110	Imports the statistics preferences of all the tables owned by the specified owner name
IMPORT_SCHEMA_STATS Procedure on page 138-111	Retrieves statistics for all objects in the schema identified by `ownname` from the user statistics table and stores them in the dictionary
IMPORT_SYSTEM_STATS Procedure on page 138-112	Retrieves system statistics from the user statistics table and stores them in the dictionary

Table 138–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
IMPORT_TABLE_PREFS Procedure on page 138-113	Sets the statistics preferences of the specified table in the specified schema.
IMPORT_TABLE_STATS Procedure on page 138-114	Retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary
LOCK_PARTITION_STATS Procedure on page 138-116	Locks statistics for a partition
LOCK_SCHEMA_STATS Procedure on page 138-117	Locks the statistics of all tables of a schema
LOCK_TABLE_STATS Procedure on page 138-118	Locks the statistics on the table
PREPARE_COLUMN_VALUES Procedures on page 138-119	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures
PREPARE_COLUMN_VALUES_ NVARCHAR2 Procedure on page 138-121	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures
PREPARE_COLUMN_VALUES_ ROWID Procedure on page 138-123	Converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures
PUBLISH_PENDING_STATS Procedure on page 138-125	Publishes the statistics gathered and stored as pending
PURGE_STATS Procedure on page 138-126	Purges old versions of statistics saved in the dictionary
RESET_GLOBAL_PREF_ DEFAULTS Procedure on page 138-127	Resets the default values of all parameters to Oracle recommended values
RESET_PARAM_DEFAULTS Procedure on page 138-128	Resets global preferences to default values [see Deprecated Subprograms on page 138-12]
RESTORE_DICTIONARY_STATS Procedure on page 138-130	Restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp
RESTORE_FIXED_OBJECTS_ STATS Procedure on page 138-131	Restores statistics of all fixed tables as of a specified timestamp
RESTORE_SCHEMA_STATS Procedure on page 138-132	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_SYSTEM_STATS Procedure on page 138-133	Restores statistics of all tables of a schema as of a specified timestamp
RESTORE_TABLE_STATS Procedure on page 138-134	Restores statistics of a table as of a specified timestamp (as_of_timestamp), as well as statistics of associated indexes and columns
SET_COLUMN_STATS Procedures on page 138-135	Sets column-related information
SET_DATABASE_PREFS Procedure on page 138-137	Sets the statistics preferences of all the tables, excluding the tables owned by Oracle

Table 138–2 (Cont.) DBMS_STATS Package Subprograms

Subprogram	Description
SET_GLOBAL_PREFS Procedure on page 138-135	Sets the global statistics preferences
SET_INDEX_STATS Procedures on page 138-143	Sets index-related information
SET_PARAM Procedure on page 138-146	Sets default values for parameters of `DBMS_STATS` procedures [see Deprecated Subprograms on page 138-12]
SET_SCHEMA_PREFS Procedure on page 138-148	Sets the statistics preferences of all the tables owned by the specified owner name
SET_SYSTEM_STATS Procedure on page 138-149	Sets system statistics
SET_TABLE_PREFS Procedure on page 138-151	Sets the statistics preferences of the specified table in the specified schema
SET_TABLE_STATS Procedure on page 138-154	Sets table-related information
SHOW_EXTENDED_STATS_NAME Function on page 138-156	Returns the name of the virtual column that is created for the user-specified extension
UNLOCK_PARTITION_STATS Procedure on page 138-157	Unlocks the statistics for a partition
UNLOCK_SCHEMA_STATS Procedure on page 138-158	Unlocks the statistics on all the table in a schema
UNLOCK_TABLE_STATS Procedure on page 138-159	Unlocks the statistics on the table
UPGRADE_STAT_TABLE Procedure on page 138-160	Upgrades user statistics on an older table

ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value. Statistics history retention is used by both the automatic purge and PURGE_STATS Procedure.

Syntax

```
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
   retention       IN     NUMBER);
```

Parameters

Table 138–3 ALTER_STATS_HISTORY_RETENTION Procedure Parameters

Parameter	Description
`retention`	The retention time in days. The statistics history will be retained for at least these many number of days.The valid range is [1,365000]. Also you can use the following values for special purposes: ■ -1 :statistics history is never purged by automatic purge. ■ 0 : old statistics are never saved. The automatic purge will delete all statistics history ■ `NULL` : change statistics history retention to default value

Usage Notes

To run this procedure, you must have the `SYSDBA` or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY` system privilege.

Exceptions

`ORA-20000`: Insufficient privileges.

CONVERT_RAW_VALUE Procedures

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT BINARY_FLOAT);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT BINARY_DOUBLE);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT DATE);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT NUMBER);

DBMS_STATS.CONVERT_RAW_VALUE (
   rawval     RAW,
   resval OUT VARCHAR2);
```

Pragmas

```
pragma restrict_references(convert_raw_value, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 138–4 CONVERT_RAW_VALUE Procedure Parameters

Parameter	Description
`rawval`	The raw representation of a column minimum or maximum datatype-specific output parameters
`resval`	The converted, type-specific value

CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (
   rawval     RAW,
   resval OUT NVARCHAR2);
```

Pragmas

```
pragma restrict_references(convert_raw_value_nvarchar, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 138–5 CONVERT_RAW_VALUE_NVARCHAR Procedure Parameters

Parameter	Description
`rawval`	The raw representation of a column minimum or maximum datatype-specific output parameters
`resval`	The converted, type-specific value

CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a minimum or maximum value into a datatype-specific value. The minval and maxval fields of the `StatRec` structure as filled in by `GET_COLUMN_STATS` or `PREPARE_COLUMN_VALUES` are appropriate values for input.

Syntax

```
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (
   rawval     RAW,
   resval OUT ROWID);
```

Pragmas

```
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 138–6 CONVERT_RAW_VALUE_ROWID Procedure Parameters

Parameter	Description
`rawval`	The raw representation of a column minimum or maximum datatype-specific output parameters
`resval`	The converted, type-specific value

COPY_TABLE_STATS Procedure

This procedure copies the statistics of the source [sub] partition to the destination [sub] partition after scaling (the number of blks, number of rows). It sets the high bound partitioning value as the maximum value of the first partitioning column and high bound partitioning value of the previous partition as the minimum value of the first partitioning column for a range partitioned table. It finds the maximum and minimum from the list of values for the list partitioned table. It also sets the normalized maximum and minimum values. If the destination partition is the first partition then minimum values are equal to maximum values. If the statistics for source are not available then nothing is copied.

Syntax

```
DBMS_STATS.COPY_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   srcpartname      VARCHAR2,
   dstpartname      VARCHAR2,
   scale_factor     VARCHAR2 DEFAULT 1,
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–7 COPY_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of the table of source and destination [sub] partitions
tabname	Table name of source and destination [sub] partitions
srcpartname	Source [sub] partition
dtspartname	Destination [sub] partition
scale_factor	Scale factor to scale nblks, nrows etc. in dstpartname
force	When value of this argument is TRUE, copy statistics even if locked

Exceptions

ORA-20000: Invalid partition name

ORA-20001: Bad input value

CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user specified column group or an expression in a table. Statistics for this extension will be gathered when user or auto statistics gathering job gathers statistics for the table. We call statistics for such an extension, "extended statistics". This function returns the name of this newly created entry for the extension.

Syntax

```
DBMS_STATS.CREATE_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 138–8 CREATE_EXTENDED_STATS Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Return Values

This function returns the name of this newly created entry for the extension.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported

ORA-20001: Error when processing extension

ORA-20007: Extension already exists

ORA-20008: Reached the upper limit on number of extensions

Usage Notes

There are nine restrictions on the extension:

- The extension cannot contain a virtual column.
- Extensions cannot be created on tables owned by SYS.
- Extensions cannot be created on cluster tables, index organized tables, temporary tables or external tables..
- The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
- The number of columns in a column group must be in the range [2, 32].
- A column can not appear more than once in a column group.
- A column group can not contain expressions.

- An expression must contain at least one column.
- An expression can not contain a subquery.
- The `COMPATIBLE` parameter needs to be 11.0.0.0.0 or greater

CREATE_STAT_TABLE Procedure

This procedure creates a table with name `stattab` in `ownname`'s schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

```
DBMS_STATS.CREATE_STAT_TABLE (
   ownname  VARCHAR2,
   stattab  VARCHAR2,
   tblspace VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–9 CREATE_STAT_TABLE Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`stattab`	Name of the table to create. This value should be passed as the `stattab` parameter to other procedures when the user does not want to modify the dictionary statistics directly.
`tblspace`	Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.

Exceptions

`ORA-20000`: Table already exists or insufficient privileges.

`ORA-20001`: Tablespace does not exist.

DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```
DBMS_STATS.DELETE_COLUMN_STATS (
   ownname         VARCHAR2,
   tabname         VARCHAR2,
   colname         VARCHAR2,
   partname        VARCHAR2 DEFAULT NULL,
   stattab         VARCHAR2 DEFAULT NULL,
   statid          VARCHAR2 DEFAULT NULL,
   cascade_parts   BOOLEAN  DEFAULT TRUE,
   statown         VARCHAR2 DEFAULT NULL,
   no_invalidate   BOOLEAN  DEFAULT to_no_invalidate_type (
                                      get_param('NO_INVALIDATE')),
   force           BOOLEAN  DEFAULT FALSE,
   col_stat_type   VARCHAR2 DEFAULT 'ALL');
```

Parameters

Table 138–10 DELETE_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition for which to delete the statistics. If the table is partitioned and if partname is NULL, then global column statistics are deleted.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to true causes the deletion of statistics for this column for all underlying partitions as well.
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When value of this argument is TRUE, deletes column statistics even if locked

Table 138–10 (Cont.) DELETE_COLUMN_STATS Procedure Parameters

Parameter	Description
col_stat_type	Type of column statistics to be deleted.This argument takes the following values: ■ HISTOGRAM - delete column histogram only ■ ALL - delete base column statistics and histogram

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20005: Object statistics are locked.

DELETE_DATABASE_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–11 DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The default value for following parameters can be deleted: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 138–11 (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column | attribute [size_clause] [,column | attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 138–11 (Cont.) DELETE_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All pname arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT',TRUE);
```

DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```
DBMS_STATS.DELETE_DATABASE_STATS (
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 138–12 DELETE_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```
DBMS_STATS.DELETE_DICTIONARY_STATS (
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 138–13 DELETE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure
force	When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

```
DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   force          BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 138–14 DELETE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	The user statistics table identifier describing from where to delete the current statistics. If stattab is NULL, the statistics will be deleted directly in the dictionary.
statid	The (optional) identifier to associate with these statistics within stattab. This only applies if stattab is not NULL.
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure
force	Ignores the statistics lock on objects and deletes the statistics if set to TRUE

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–15 DELETE_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to delete the statistics. If the index is partitioned and if partname is NULL, then index statistics are deleted at the global level.
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
cascade_parts	If the index is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this index for all underlying partitions as well
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When value of this argument is TRUE, deletes index statistics even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20005: Object statistics are locked.

DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```
DBMS_STATS.DELETE_PENDING_STATS (
    ownname    IN  VARCHAR2  DEFAULT USER,
    tabname    IN  VARCHAR2);
```

Parameters

Table 138–16 DELETE_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter tabname is NULL then delete applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_PREFS (
    ownname    IN   VARCHAR2,
    pname      IN   VARCHAR2);
```

Parameters

Table 138–17 DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. The default value for following parameters can be deleted: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 138–17 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column | attribute [size_clause] [,column | attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension: can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 138–17 (Cont.) DELETE_SCHEMA_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.

Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');
```

DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

```
DBMS_STATS.DELETE_SCHEMA_STATS (
   ownname          VARCHAR2,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–18 DELETE_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When value of this argument is TRUE, deletes statistics of tables in a schema even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges

DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to noworkload statistics (collected using 'NOWORKLOAD' option) if stattab is not specified. If stattab is specified, the subprogram deletes all system statistics with the associated statid from the stattab.

Syntax

```
DBMS_STATS.DELETE_SYSTEM_STATS (
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–19 DELETE_SYSTEM_STATS Procedure Parameters

Parameter	Description
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table; may need to be upgraded.

DELETE_TABLE_PREFS Procedure

This procedure is used to delete the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.DELETE_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2);
```

Parameters

Table 138–20 DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. The default value for following preferences can be deleted: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 138–20 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ▪ FOR COLUMNS [size clause] column | attribute [size_clause] [,column | attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 138–20 (Cont.) DELETE_TABLE_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table, be granted ANALYZE privilege on the table, or ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');
```

DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```
DBMS_STATS.DELETE_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   cascade_parts    BOOLEAN  DEFAULT TRUE,
   cascade_columns  BOOLEAN  DEFAULT TRUE,
   cascade_indexes  BOOLEAN  DEFAULT TRUE,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–21 DELETE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
cascade_parts	If the table is partitioned and if partname is NULL, then setting this to TRUE causes the deletion of statistics for this table for all underlying partitions as well
cascade_columns	Indicates that DELETE_COLUMN_STATS should be called for all underlying columns (passing the cascade_parts parameter)
cascade_indexes	Indicates that DELETE_INDEX_STATS should be called for all underlying indexes (passing the cascade_parts parameter)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	When value of this argument is TRUE, deletes table statistics even if locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it

ORA-20005: Object statistics are locked

DIFF_TABLE_STATS_IN_HISTORY Function

This function can be used to compare statistics for a table from two timestamps in past and compare the statistics as of that timestamps.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
      ownname        IN  VARCHAR2,
      tabname        IN  VARCHAR2,
      time1          IN  TIMESTAMP WITH TIME ZONE,
      time2          IN  TIMESTAMP WITH TIME ZONE DEFAULT NULL,
      pctthreshold   IN  NUMBER  DEFAULT 10)
   RETURN DiffRepTab pipelined;
```

Parameters

Table 138–22 DIFF_TABLE_STATS_IN_HISTORY Function Parameters

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tabname	Table for which statistics are to be compared
time1	First timestamp 1
time2	Second timestamp 2
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics and statistics as of a timestamp or statistics from dictionary.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
      ownname        IN  VARCHAR2,
      tabname        IN  VARCHAR2,
      timestamp      IN  TIMESTAMP WITH TIME ZONE,
      pctthreshold   IN  NUMBER  DEFAULT 10)
   RETURN DiffRepTab pipelined;
```

Parameters

Table 138–23 DIFF_TABLE_STATS_IN_PENDING Function Parameters

Parameter	Description
ownname	Owner of the table. Specify NULL for current schema.
tabname	Table for which statistics are to be compared
timestamp	Time stamp to get statistics from the history
pctthreshold	The function reports difference in statistics only if it exceeds this limit. The default value is 10.

Usage Notes

If the second timestamp is NULL, the function compares the current statistics in dictionary with the statistics as of the other timestamp.

DIFF_TABLE_STATS_IN_STATTAB Function

This function can be used to compare statistics for a table from two different sources. The statistics can be drawn from

- two different user statistics tables
- a single user statistics table containing 2 sets of statistics that can be identified using `statids`
- a user statistics table and dictionary

The function also compares the statistics of the dependent objects (indexes, columns, partitions) as well. It displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function. The statistics corresponding to the first source (`stattab1` or `time1`) will be used as basis for computing the difference percentage.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
      ownname         IN  VARCHAR2,
      tabname         IN  VARCHAR2,
      stattab1        IN  VARCHAR2,
      stattab2        IN  VARCHAR2 DEFAULT NULL,
      pctthreshold    IN  NUMBER  DEFAULT 10,
      statid1         IN  VARCHAR2 DEFAULT NULL,
      statid2         IN  VARCHAR2 DEFAULT NULL,
      stattab1own     IN  VARCHAR2 DEFAULT NULL,
      stattab2own     IN  VARCHAR2 DEFAULT NULL)
   RETURN DiffRepTab pipelined;
```

Parameters

Table 138–24 DIFF_TABLE_STATS_IN_STATTAB Function Parameters

Parameter	Description
`ownname`	Owner of the table. Specify `NULL` for current schema.
`tabname`	Table for which statistics are to be compared
`stattab1`	User statistics table 1
`stattab2`	User statistics table 2. If `NULL`, statistics in `stattab1` is compared with current statistics in dictionary. This is the default. Specify same table as `stattab1` to compare two sets within the statistics table (see `statid` below).
`pctthreshold`	The function reports difference in statistics only if it exceeds this limit. The default value is 10.
`stadid1`	(optional) Identifies statistics set within `stattab1`.
`stadid2`	(optional) Identifies statistics set within `stattab2`
`stattab1own`	Schema containing `stattab1` (if other than `ownname`)
`stattab2own`	Schema containing `stattab2` (if other than `ownname`)

DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension. This cancels the effects of the CREATE_EXTENDED_STATS Function.

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2);
```

Parameters

Table 138–25 DROP_EXTENDED_STATS Procedure Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Usage Notes

If no extended statistics set is created for the extension, this function throws an error.

Exceptions

- ORA-20000: Insufficient privileges or extension does not exist.
- ORA-20001: Error when processing extension

DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

```
DBMS_STATS.DROP_STAT_TABLE (
   ownname VARCHAR2,
   stattab VARCHAR2);
```

Parameters

Table 138–26 DROP_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier

Exceptions

ORA-20000: Table does not exists or insufficient privileges.

EXPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_COLUMN_STATS (
   ownname  VARCHAR2,
   tabname  VARCHAR2,
   colname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–27 EXPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`tabname`	Name of the table to which this column belongs
`colname`	Name of the column or extension
`partname`	Name of the table partition. If the table is partitioned and if `partname` is `NULL`, then global and partition column statistics are exported.
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_PREFS (
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–28 EXPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
stattab	Statistics table name to where statistics should be exported
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

EXPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database and stores them in the user statistics tables identified by `statown.stattab`.

Syntax

```
DBMS_STATS.EXPORT_DATABASE_STATS (
   stattab VARCHAR2,
   statid  VARCHAR2 DEFAULT NULL,
   statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–29 EXPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
   stattab VARCHAR2,
   statid  VARCHAR2 DEFAULT NULL,
   statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–30 EXPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)

Usage Notes

- You must have the SYSDBA or ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table, may need to upgrade it.

EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–31 EXPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20002`: Bad user statistics table, may need to upgrade it.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_INDEX_STATS (
   ownname  VARCHAR2,
   indname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–32 EXPORT_INDEX_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`indname`	Name of the index
`partname`	Name of the index partition. If the index is partitioned and if `partname` is `NULL`, then global and partition index statistics are exported.
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.EXPORT_PENDING_STATS (
    ownname    IN  VARCHAR2  DEFAULT USER,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT USER);
```

Parameters

Table 138–33 EXPORT_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- If the parameter tabname is NULL then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```

EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–34 EXPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name to where to export the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

EXPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by `ownname` and stores them in the user statistics tables identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SCHEMA_STATS (
   ownname VARCHAR2,
   stattab VARCHAR2,
   statid  VARCHAR2 DEFAULT NULL,
   statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–35 EXPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`stattab`	User statistics table identifier describing where to store the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by `stattab`.

Syntax

```
DBMS_STATS.EXPORT_SYSTEM_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–36 EXPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
`stattab`	Identifier of the user statistics table that describes where the statistics will be stored.
`statid`	Optional identifier associated with the statistics stored from the `stattab`
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20002`: Bad user statistics table; may need to be upgraded.

`ORA-20003`: Unable to export system statistics.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```
DBMS_STATS.EXPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–37 EXPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name where to export the statistics
statid	Optional identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

EXPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table and stores them in the user statistics table. Cascade results in all index statistics associated with the specified table being exported as well.

Syntax

```
DBMS_STATS.EXPORT_TABLE_STATS (
   ownname  VARCHAR2,
   tabname  VARCHAR2,
   partname VARCHAR2 DEFAULT NULL,
   stattab  VARCHAR2,
   statid   VARCHAR2 DEFAULT NULL,
   cascade  BOOLEAN  DEFAULT TRUE,
   statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–38 EXPORT_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are exported.
stattab	User statistics table identifier describing where to store the statistics
statid	Identifier (optional) to associate with these statistics within stattab
cascade	If true, then column and index statistics for this table are also exported
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure flushes in-memory monitoring information for all tables in the dictionary. Corresponding entries in the *_TAB_MODIFICATIONS, *_TAB_STATISTICS and *_IND_STATISTICS views are updated immediately, without waiting for the Oracle database to flush them periodically. This procedure is useful when you need up-to-date information in those views. Because the GATHER_*_STATS procedures internally flush monitoring information, it is not necessary to run this procedure before gathering the statistics.

Syntax

```
DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;
```

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

The ANALYZE_ANY system privilege is required to run this procedure.

GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```
DBMS_STATS.GATHER_DATABASE_STATS (
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   objlist          OUT      ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   gather_sys       BOOLEAN  DEFAULT TRUE,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DATABASE_STATS (
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   statown          VARCHAR2 DEFAULT NULL,
   gather_sys       BOOLEAN  DEFAULT TRUE,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);
```

Parameters

Table 138–39 GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 138–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
method_opt	Accepts: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 138–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the database in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics. The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.
statid	Identifier (optional) to associate with these statistics within stattab.
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO. LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views. LIST EMPTY: Returns a list of objects which currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
gather_sys	Gathers statistics on the objects owned by the 'SYS' user
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 138–39 (Cont.) GATHER_DATABASE_STATS Procedure Parameters

Parameter	Description
obj_filter_list	A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Usage Notes

Statistics for external tables are not collected by this procedure.

Exceptions

ORA-20000: Insufficient privileges.

ORA-20001: Bad input value.

GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas 'SYS', 'SYSTEM' and schemas of RDBMS components.

Syntax

```
DBMS_STATS.GATHER_DICTIONARY_STATS (
   comp_id          VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER AUTO',
   objlist    OUT   ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')),
   obj_filter_list ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_DICTIONARY_STATS (
   comp_id           VARCHAR2 DEFAULT NULL,
   estimate_percent  NUMBER DEFAULT
                        to_estimate_percent_type(GET_PARAM('ESTIMATE_PERCENT')),
   block_sample      BOOLEAN DEFAULT FALSE,
   method_opt        VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),
   degree            NUMBER DEFAULT to_degree_type(GET_PARAM('DEGREE')),
   granularity       VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade           BOOLEAN DEFAULT to_cascade_type(GET_PARAM('CASCADE')),
   stattab           VARCHAR2 DEFAULT NULL,
   statid            VARCHAR2 DEFAULT NULL,
   options           VARCHAR2 DEFAULT 'GATHER AUTO',
   statown           VARCHAR2 DEFAULT NULL,
   no_invalidate     BOOLEAN DEFAULT
                             to_no_invalidate_type(get_param('NO_INVALIDATE')),
   obj_filter_list   ObjectTab DEFAULT NULL);
```

Parameters

Table 138–40 GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
comp_id	The component id of the schema to analyze (NULL will result in analyzing schemas of all RDBMS components).Please refer to comp_id column of DBA_REGISTRY view. The procedure always gather statistics on 'SYS' and 'SYSTEM' schemas regardless of this argument.

Table 138–40 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
estimate_percent	Percentage of rows to estimate (NULL means compute). The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
block_sample	Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.
method_opt	Accepts: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use of table default value that was specified by the DEGREE clause in the CREATE or ALTER INDEX statement. Use the constant DBMS_STATS.DEFAULT_DEGREE for the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.

Table 138–40 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.
cascade	Gathers statistics on indexes also.Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	The (optional) identifier to associate with these statistics within stattab
options	Further specification of objects for which to gather statistics: ■ 'GATHER' - gathers statistics on all objects in the schema ■ 'GATHER AUTO' - gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics and determines how to gather those statistics. When 'GATHER AUTO' is specified, the only additional valid parameters are comp_id, stattab, statid and statown; all other parameter settings will be ignored. Also, returns a list of objects processed. ■ 'GATHER STALE' - gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, returns a list of objects found to be stale. ■ 'GATHER EMPTY' - gathers statistics on objects which currently have no statistics. Also, returns a list of objects found to have no statistics. ■ 'LIST AUTO' - returns list of objects to be processed with 'GATHER AUTO' ■ 'LIST STALE' - returns list of stale objects as determined by looking at the *_tab_modifications views ■ 'LIST EMPTY' - returns list of objects which currently have no statistics

Table 138–40 (Cont.) GATHER_DICTIONARY_STATS Procedure Parameters

Parameter	Description
objlist	The list of objects found to be stale or empty
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
obj_filter_list	A list of object filters. When provided, this will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case- insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Index does not exist or insufficient privileges.

ORA-20001: Bad input value.

ORA-20002: Bad user statistics table, may need to upgrade it.

GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

```
DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   statown        VARCHAR2 DEFAULT NULL,
   no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (
                                     get_param('NO_INVALIDATE')));
```

Parameters

Table 138–41 GATHER_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	The user statistics table identifier describing where to save the current statistics
statid	The (optional) identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges.

ORA-20001: Bad input value.

ORA-20002: Bad user statistics table, may need to upgrade it.

GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible. Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The `granularity` and `no_invalidate` arguments are not relevant to these types of indexes.

Syntax

```
DBMS_STATS.GATHER_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                          (GET_PARAM('ESTIMATE_PERCENT')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type
                                        (GET_PARAM('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–42 GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
`ownname`	Schema of index to analyze
`indname`	Name of index
`partname`	Name of partition
`estimate_percent`	Percentage of rows to estimate (`NULL` means compute). The valid range is `[0.000001,100]`. Use the constant `DBMS_STATS.AUTO_SAMPLE_SIZE` to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
`stattab`	User statistics table identifier describing where to save the current statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`statown`	Schema containing `stattab` (if different than `ownname`)

Table 138–42 (Cont.) GATHER_INDEX_STATS Procedure Parameters

Parameter	Description
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use of table default value that was specified by the DEGREE clause in the CREATE/ALTER INDEX statement. Use the constant DBMS_STATS.DEFAULT_DEGREE for the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics on object even if it is locked

Exceptions

ORA-20000: Index does not exist or insufficient privileges.

ORA-20001: Bad input value.

GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (
   ownname          VARCHAR2,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   objlist          OUT      ObjectTab,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
  force             BOOLEAN DEFAULT FALSE,
  obj_filter_list  ObjectTab DEFAULT NULL);

DBMS_STATS.GATHER_SCHEMA_STATS (
   ownname          VARCHAR2,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   options          VARCHAR2 DEFAULT 'GATHER',
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE'),
   force            BOOLEAN DEFAULT FALSE,
   obj_filter_list  ObjectTab DEFAULT NULL);
```

Parameters

Table 138–43 GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Schema to analyze (NULL means current schema)
estimate_percent	Percentage of rows to estimate (NULL means compute): The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Table 138–43 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.
method_opt	Accepts: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters.The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 138–43 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
cascade	Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
options	Further specification of which objects to gather statistics for: GATHER: Gathers statistics on all objects in the schema. GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are ownname, stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects. GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale. GATHER EMPTY: Gathers statistics on objects which currently have no statistics. also, return a list of objects found to have no statistics. LIST AUTO: Returns a list of objects to be processed with GATHER AUTO. LIST STALE: Returns list of stale objects as determined by looking at the *_tab_modifications views. LIST EMPTY: Returns list of objects which currently have no statistics.
objlist	List of objects found to be stale or empty
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics on objects even if they are locked

Table 138–43 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

Parameter	Description
obj_filter_list	A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.

Usage Notes

When you use a specific value for the sampling percentage, DBMS_STATS honors it except for when:

- The result is less than 2500 rows (too small a sample) and
- The specified percentage is more than the certain percentage.

Statistics for external tables are not collected by this procedure.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges.

ORA-20001: Bad input value.

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the SAMPLE schema and any table in the SYS schema, if stale, will have statistics gathered upon it.

```
DECLARE
  filter_lst  DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
  filter_lst.extend(2);
  filter_lst(1).ownname := 'SAMPLE';
  filter_lst(1).objname := 'T%';
  filter_lst(2).ownname := 'SYS';
  DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                 options => 'gather_stale');
END;
```

GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```
DBMS_STATS.GATHER_SYSTEM_STATS (
   gathering_mode   VARCHAR2 DEFAULT 'NOWORKLOAD',
   interval         INTEGER  DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–44 GATHER_SYSTEM_STATS Procedure Parameters

Parameter	Description
gathering_mode	Mode values are: NOWORKLOAD: Will capture characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period Oracle will estimate the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. Oracle recommends to run GATHER_SYSTEM_STATS ('noworkload') after creation of the database and tablespaces. To fine tune system statistics for the workload use 'START' and 'STOP' or 'INTERVAL' options. If you gather both 'NOWORKLOAD' and workload specific (statistics collected using 'INTERVAL' or 'START' and 'STOP'), the workload statistics will be used by optimizer. Collected components: cpuspeednw, ioseektim, iotfrspeed. INTERVAL: Captures system activity during a specified interval. This works in combination with the interval parameter. You should provide an interval value in minutes, after which system statistics are created or updated in the dictionary or stattab. You can use GATHER_SYSTEM_STATS (gathering_mode=>'STOP') to stop gathering earlier than scheduled. Collected components: maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc. START | STOP: Captures system activity during specified start and stop times and refreshes the dictionary or stattab with statistics for the elapsed period. Interval value is ignored. Collected components: maxthr, slavethr, cpuspeed, sreadtim, mreadtim, mbrc.
interval	Time, in minutes, to gather statistics. This parameter applies only when gathering_mode='INTERVAL'
stattab	Identifier of the user statistics table where the statistics will be saved
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid input value.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to gather system statistics.

ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0.

GATHER_TABLE_STATS Procedure

This procedure gathers table and column (and index) statistics. It attempts to parallelize as much of the work as possible, but there are some restrictions as described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                                        (get_param('ESTIMATE_PERCENT')),
   block_sample     BOOLEAN  DEFAULT FALSE,
   method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
   degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
   granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
   cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   no_invalidate    BOOLEAN  DEFAULT  to_no_invalidate_type (
                                 get_param('NO_INVALIDATE')),
   force            BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–45 GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of table to analyze
tabname	Name of table
partname	Name of partition
estimate_percent	Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
block_sample	Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.

Table 138–45 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
method_opt	Accepts either of the following options, or both in combination: ▪ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ▪ FOR COLUMNS [size clause] column | attribute [size_clause] [,column | attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) - integer : Number of histogram buckets. Must be in the range [1,254]. - REPEAT : Collects histograms only on the columns that already have histograms. - AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. - SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
degree	Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is either 1 (serial execution) or DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to size of the object.

Table 138–45 (Cont.) GATHER_TABLE_STATS Procedure Parameters

Parameter	Description
granularity	Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated.The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing). 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.
cascade	Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure .
stattab	User statistics table identifier describing where to save the current statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Gather statistics of table even if it is locked

Usage Notes

Index statistics collection can be parellelized except for cluster, domain and join indexes.

Exceptions

`ORA-20000`: Table does not exist or insufficient privileges.

`ORA-20001`: Bad input value.

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

GENERATE_STATS Procedure

This procedure generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

Syntax

```
DBMS_STATS.GENERATE_STATS (
   ownname    VARCHAR2,
   objname    VARCHAR2,
   organized  NUMBER DEFAULT 7,
   force      BOOLEAN default FALSE);
```

Parameters

Table 138–46 GENERATE_STATS Procedure Parameters

Parameter	Description
ownname	Schema of object
objname	Name of object
organized	Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.
force	If TRUE, generates statistics for the target object even if it is locked

Usage Notes

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist.

ORA-20001: Invalid option or invalid statistics.

GET_COLUMN_STATS Procedures

These procedures gets all column-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_COLUMN_STATS (
   ownname     VARCHAR2,
   tabname     VARCHAR2,
   colname     VARCHAR2,
   partname    VARCHAR2 DEFAULT NULL,
   stattab     VARCHAR2 DEFAULT NULL,
   statid      VARCHAR2 DEFAULT NULL,
   distcnt OUT NUMBER,
   density OUT NUMBER,
   nullcnt OUT NUMBER,
   srec    OUT StatRec,
   avgclen OUT NUMBER,
   statown     VARCHAR2 DEFAULT NULL);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_COLUMN_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   colname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   ext_stats   OUT  RAW,
   stattypown  OUT  VARCHAR2 DEFAULT NULL,
   stattypname OUT  VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–47 GET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table to which this column belongs
colname	Name of the column or extension
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type

Table 138–47 (Cont.) GET_COLUMN_STATS Procedure Parameters

Parameter	Description
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density
nullcnt	Number of NULLs
srec	Structure holding internal representation of column minimum, maximum, and histogram values
avgclen	Average length of the column (in bytes)
statown	Schema containing stattab (if different than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object.

GET_INDEX_STATS Procedures

These procedures get all index-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```
DBMS_STATS.GET_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   numrows    OUT NUMBER,
   numlblks   OUT NUMBER,
   numdist    OUT NUMBER,
   avglblk    OUT NUMBER,
   avgdblk    OUT NUMBER,
   clstfct    OUT NUMBER,
   indlevel   OUT NUMBER,
   statown        VARCHAR2 DEFAULT NULL,
   cachedblk  OUT NUMBER,
   cachehit   OUT NUMBER);

DBMS_STATS.GET_INDEX_STATS (
   ownname        VARCHAR2,
   indname        VARCHAR2,
   partname       VARCHAR2 DEFAULT NULL,
   stattab        VARCHAR2 DEFAULT NULL,
   statid         VARCHAR2 DEFAULT NULL,
   numrows    OUT NUMBER,
   numlblks   OUT NUMBER,
   numdist    OUT NUMBER,
   avglblk    OUT NUMBER,
   avgdblk    OUT NUMBER,
   clstfct    OUT NUMBER,
   indlevel   OUT NUMBER,
   statown        VARCHAR2 DEFAULT NULL,
   guessq     OUT NUMBER,
   cachedblk  OUT NUMBER,
   cachehit   OUT NUMBER);
```

Use the following for user-defined statistics:

```
DBMS_STATS.GET_INDEX_STATS (
   ownname          VARCHAR2,
   indname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   ext_stats   OUT  RAW,
   stattypown  OUT  VARCHAR2 DEFAULT NULL,
   stattypname OUT  VARCHAR2 DEFAULT NULL,
   statown          VARCHAR2 DEFAULT NULL,
   cachedblk        OUT NUMBER,
   cachehit         OUT NUMBER);
```

Parameters

Table 138–48 GET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index
partname	Name of the index partition for which to get the statistics. If the index is partitioned and if partname is NULL, then the statistics are retrieved for the global index level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition)
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)
clstfct	Clustering factor for the index (partition)
indlevel	Height of the index (partition)
statown	Schema containing stattab (if different than ownname)
guessq	Guess quality for the index (partition)
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges or no statistics have been stored for requested object.

GET_PARAM Function

> **Note:** This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the GET_PREFS Function.
>
> See also Deprecated Subprograms on page 138-12.

This function returns the default value of parameters of DBMS_STATS procedures.

Syntax

```
DBMS_STATS.GET_PARAM (
   pname      IN    VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 138–49 GET_PARAM Function Parameters

Parameter	Description
pname	The parameter name

Exceptions

ORA-20001: Invalid input values

GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```
DBMS_STATS.GET_PREFS (
   pname     IN   VARCHAR2,
   ownname   IN   VARCHAR2 DEFAULT NULL,
   tabname   IN   VARCHAR2 DEFAULT NULL)
 RETURN VARCHAR2;
```

Parameters

Table 138–50 GET_PREFS Function Parameters

Parameter	Description
pname	Preference name. The default value for following preferences can be retrieved: ■ AUTOSTATS_TARGET ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT AUTOSTATS_TARGET - This preference is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection. It takes the following values: ■ 'ALL' - statistics collected for all objects in system ■ 'ORACLE' - statistics collected for all Oracle owned objects ■ 'AUTO' - Oracle decides on which objects to collect statistics
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 138–50 (Cont.) GET_PREFS Function Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column | attribute [size_clause] [,column | attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 138–50 (Cont.) GET_PREFS Function Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
ownname	Owner name
tabname	Table name

Exceptions

ORA-20001: Invalid input values

Usage Notes

If the ownname and tabname are provided and a preference has been entered for the table, the function returns the preference as specified for the table. In all other cases it returns the global preference if it has been specified, otherwise the default value is returned.

GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available.Users cannot restore statistics to a timestamp older than this one.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY
 RETURN TIMESTAMP WITH TIMEZONE;
```

GET_STATS_HISTORY_RETENTION Function

This function returns the current retention value.

Syntax

```
DBMS_STATS.GET_STATS_HISTORY_RETENTION
 RETURN NUMBER;
```

GET_SYSTEM_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is `NULL`.

Syntax

```
DBMS_STATS.GET_SYSTEM_STATS (
   status    OUT  VARCHAR2,
   dstart    OUT  DATE,
   dstop     OUT  DATE,
   pname          VARCHAR2,
   pvalue    OUT  NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–51 GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
`status`	Output is one of the following: ■ `COMPLETED:` ■ `AUTOGATHERING:` ■ `MANUALGATHERING:` ■ `BADSTATS:`
`dstart`	Date when statistics gathering started. If `status` = `MANUALGATHERING`, the start date is returned.
`dstop`	Date when statistics gathering stopped. ■ If `status` = `COMPLETE`, the finish date is returned. ■ If `status` = `AUTOGATHERING`, the future finish date is returned. ■ If `status` = `BADSTATS`, the must-finished-by date is returned.

Table 138–51 (Cont.) GET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: ■ iotfrspeed - I/O transfer speed in bytes for each millisecond ■ ioseektim - seek time + latency time + operating system overhead time, in milliseconds ■ sreadtim - average time to read single block (random read), in milliseconds ■ mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds ■ cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) ■ cpuspeednw - average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option. ■ mbrc - average multiblock read count for sequential read, in blocks ■ maxthr - maximum I/O system throughput, in bytes/second ■ slavethr - average slave I/O throughput, in bytes/second
pvalue	The parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to gather system statistics.

ORA-20004: Parameter does not exist.

GET_TABLE_STATS Procedure

This procedure gets all table-related information.

Syntax

```
DBMS_STATS.GET_TABLE_STATS (
   ownname          VARCHAR2,
   tabname          VARCHAR2,
   partname         VARCHAR2 DEFAULT NULL,
   stattab          VARCHAR2 DEFAULT NULL,
   statid           VARCHAR2 DEFAULT NULL,
   numrows      OUT NUMBER,
   numblks      OUT NUMBER,
   avgrlen      OUT NUMBER,
   statown          VARCHAR2 DEFAULT NULL,
   cachedblk    OUT NUMBER,
   cachehit     OUT NUMBER);
```

Parameters

Table 138–52 GET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
partname	Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.
stattab	User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).
numrows	Number of rows in the table (partition).
numblks	Number of blocks the table (partition) occupies.
avgrlen	Average row length for the table (partition).
statown	Schema containing stattab (if different than ownname).
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_

[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by stattab and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–53 IMPORT_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema
tabname	The name of the table to which this column belongs
colname	Name of the column or extension
partname	The name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are imported.
stattab	The user statistics table identifier describing from where to retrieve the statistics
statid	The (optional) identifier to associate with these statistics within stattab
statown	The schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	If set to TRUE, imports statistics even if statistics are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

ORA-20005: Object statistics are locked.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_PREFS (
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–54 IMPORT_DATABASE_PREFS Procedure Parameters

Parameter	Description
stattab	Statistics table name where to import the statistics
statid	Optional identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

IMPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database from the user statistics table(s) and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DATABASE_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–55 IMPORT_DATABASE_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics locked at the object (table) level: ▪ TRUE - Ignores the statistics lock and imports the statistics. ▪ FALSE - The statistics will be imported only if they are not locked.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–56 IMPORT_DICTIONARY_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	The (optional) identifier to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics lock at the object (table) level: ■ TRUE - Ignores the statistics lock and imports the statistics. ■ FALSE - The statistics will be imported only if there is no lock.

Usage Notes

- You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

ORA-20002: Bad user statistics table, may need to upgrade it.

IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables from the user statistics table(s) and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–57 IMPORT_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different from current schema)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics lock: ■ TRUE - Ignores the statistics lock and imports the statistics ■ FALSE - The statistics will be imported only if there is no lock

Usage Notes

- You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

ORA-20002: Bad user statistics table, may need to upgrade it.

IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                   get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–58 IMPORT_INDEX_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`indname`	Name of the index
`partname`	Name of the index partition. If the index is partitioned and if `partname` is `NULL`, then global and partition index statistics are imported.
`stattab`	User statistics table identifier describing from where to retrieve the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`.
`statown`	Schema containing `stattab` (if different than `ownname`)
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
`force`	Imports statistics even if index statistics are locked

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges

`ORA-20001`: Invalid or inconsistent values in the user statistics table

`ORA-20005`: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (
    ownname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–59 IMPORT_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```

IMPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_STATS (
   ownname       VARCHAR2,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULTto_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–60 IMPORT_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	User statistics table identifier describing from where to retrieve the statistics
statid	Identifier (optional) to associate with these statistics within stattab
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Overrides statistics locked at the object (table) level: ■ TRUE - Ignores the statistics lock and imports the statistics. ■ FALSE - The statistics will be imported only if there is no lock.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values in the user statistics table.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_SYSTEM_STATS Procedure

http://usunnab06.us.oracle.com:80/servers/MifChecker/Out/Y10312_01.htm retrieves system statistics from the user statistics table, identified by stattab, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–61 IMPORT_SYSTEM_STATS Procedure Parameters

Parameter	Description
`stattab`	Identifier of the user statistics table where the statistics will be retrieved
`statid`	Optional identifier associated with the statistics retrieved from the stattab
`statown`	Schema containing `stattab` (if different from current schema)

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values in the user statistics table.

`ORA-20002`: Bad user statistics table; may need to be upgraded.

`ORA-20003`: Unable to import system statistics.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.IMPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–62 IMPORT_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
stattab	Statistics table name from where to import the statistics
statid	(Optional) Identifier to associate with these statistics within stattab
statown	Schema containing stattab (if other than ownname)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

IMPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table from the user statistics table identified by `stattab` and stores them in the dictionary. Cascade results in all index statistics associated with the specified table being imported as well.

Syntax

```
DBMS_STATS.IMPORT_TABLE_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2,
   statid        VARCHAR2 DEFAULT NULL,
   cascade       BOOLEAN  DEFAULT TRUE,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                  get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–63 IMPORT_TABLE_STATS Procedure Parameters

Parameter	Description
`ownname`	Name of the schema
`tabname`	Name of the table
`partname`	Name of the table partition. If the table is partitioned and if `partname` is `NULL`, then global and partition table statistics are imported.
`stattab`	User statistics table identifier describing from where to retrieve the statistics
`statid`	Identifier (optional) to associate with these statistics within `stattab`
`cascade`	If true, then column and index statistics for this table are also imported
`statown`	Schema containing `stattab` (if different than `ownname`)
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure
`force`	Imports statistics even if table statistics are locked

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values in the user statistics table.

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

```
DBMS_STATS.LOCK_PARTITION_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    partname   VARCHAR2);
```

Parameters

Table 138–64 LOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to lock
tabname	Name of the table
partname	Partition name

LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

```
DBMS_STATS.LOCK_SCHEMA_STATS (
   ownname     VARCHAR2);
```

Parameters

Table 138–65 LOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema to lock

Usage Notes

See "Usage Notes" for LOCK_TABLE_STATS Procedure.

LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2);
```

Parameters

Table 138–66 LOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema
tabname	The name of the table

Usage Notes

- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use Dynamic Sampling.
- The locked or unlocked state is not exported along with the table statistics when using EXPORT_*_STATS procedures.

PREPARE_COLUMN_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   charvals        CHARARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec      IN OUT StatRec,
   datevals         DATEARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   dblvals         DBLARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   fltvals         FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   numvals         NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (
   srec     IN OUT StatRec,
   rawvals         RAWARRAY);
```

Pragmas

```
pragma restrict_references(prepare_column_values, WNDS, RNDS, WNPS, RNPS);
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS,
RNPS);
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 138–67 PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.

Table 138–67 (Cont.) PREPARE_COLUMN_VALUES Procedure Parameters

Parameter	Description
srec.bkvals	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in Table 138–68.

Table 138–68 Datatype-Specific Input Parameters

Type	Description
charvals	The array of values when the column type is character-based. Up to the first 32 bytes of each string should be provided. Arrays must have between 2 and 256 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
datevals	The array of values when the column type is date-based
dblvals	The array of values when the column type is double-based
fltvals	The array of values when the column type is float-based
numvals	The array of values when the column type is numeric-based
rawvals	The array of values when the column type is RAW. Up to the first 32 bytes of each strings should be provided.
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.
rwmin, rwmax	The minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Output Parameters

Table 138–69 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values.

PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR2 (
   srec     IN OUT StatRec,
   nvmin           NVARCHAR2,
   nvmax           NVARCHAR2);
```

Pragmas

```
pragma restrict_references(prepare_column_values_nvarchar, WNDS, RNDS, WNPS,
RNPS);
```

Parameters

Table 138–70 PREPARE_COLUMN_VALUES_NVARCHAR2 Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in Table 138–68.

Table 138–71 Datatype-Specific Input Parameters

Type	Description
nvmin, nvmax	The minimum and maximum values when the column type is national character set based. No histogram information can be provided for a column of this type. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.

Output Parameters

Table 138–72 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS.
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS

Exceptions

ORA-20001: Invalid or inconsistent input values.

PREPARE_COLUMN_VALUES_ROWID Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint datatype-specific values into Oracle's internal representation for future storage using SET_COLUMN_STATS.

Syntax

```
DBMS_STATS.PREPARE_COLUMN_VALUES_ROWID (
   srec  IN OUT StatRec,
   rwmin        ROWID,
   rwmax        ROWID);
```

Pragmas

```
pragma restrict_references(prepare_column_values_rowid, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 138–73 PREPARE_COLUMN_VALUES_ROWID Procedure Parameters

Parameter	Description
srec.epc	Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 256, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nvarchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.
srec.bkvals	If you want a frequency distribution, then this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.

Datatype-specific input parameters (use one) are shown in Table 138–68.

Table 138–74 Datatype-Specific Input Parameters

Type	Description
rwmin, rwmax	The minimum and maximum values when the column type is rowid. No histogram information is provided for a column of this type.

Output Parameters

Table 138–75 PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.minval	Internal representation of the minimum suitable for use in a call to SET_COLUMN_STATS.

Table 138–75 (Cont.) PREPARE_COLUMN_VALUES Procedure Output Parameters

Parameter	Description
srec.maxval	Internal representation of the maximum suitable for use in a call to SET_COLUMN_STATS.
srec.bkvals	Array suitable for use in a call to SET_COLUMN_STATS.
srec.novals	Array suitable for use in a call to SET_COLUMN_STATS.

Exceptions

ORA-20001: Invalid or inconsistent input values.

PUBLISH_PENDING_STATS Procedure

This procedure is used to publish the statistics gathered and stored as pending.

Syntax

```
DBMS_STATS.PUBLISH_PENDING_STATS (
    ownname          IN  VARCHAR2 DEFAULT USER,
    tabname          IN  VARCHAR2,
    no_invalidate    BOOLEAN DEFAULT
       to_no_invalidate_type(get_param('NO_INVALIDATE')),
    force      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–76 PUBLISH_PENDING_STATS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
no_invalidate	Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	If TRUE, will override the lock

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter tabname is NULL then publish applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Examples

```
DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);
```

PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary. To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Syntax

```
DBMS_STATS.PURGE_STATS(
    before_timestamp       TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 138–77 PURGE_STATS Procedure Parameters

Parameter	Description
before_timestamp	Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure.The default is 31 days.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

RESET_GLOBAL_PREF_DEFAULTS Procedure

This procedures sets global preference, such as `CASCADE`, `ESTIMATE_PERCENT` and `GRANULARITY`, to default values. This reverses the global preferences set by the SET_GLOBAL_PREFS Procedure.

Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

RESET_PARAM_DEFAULTS Procedure

Note: This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the RESET_GLOBAL_PREF_DEFAULTS Procedure.

See also Deprecated Subprograms on page 138-12.

This procedure resets the default values of all parameters to Oracle recommended values.

Syntax

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DATABSE_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 138–78 RESTORE_DATABASE_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_DICTIONARY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_DICTIONARY_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 138–79 RESTORE_DICTIONARY_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (as_of_timestamp).

Syntax

```
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 138–80 RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

Parameter	Description
as_of_timestamp	The timestamp to which to restore statistics
force	Restores statistics even if their statistics are locked
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Usage Notes

To run this procedure, you must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   ownname                VARCHAR2,
   as_of_timestamp        TIMESTAMP WITH TIME ZONE,
   force                  BOOLEAN DEFAULT FALSE,
   no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                                              (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 138–81 RESTORE_SCHEMA_STATS Procedure Parameters

Parameter	Description
`ownname`	The schema of the tables for which the statistics are to be restored
`as_of_timestamp`	The timestamp to which to restore statistics
`force`	Restores statistics even if their statistics are locked
`no_invalidate`	Does not invalidate the dependent cursors if set to `TRUE`. The procedure invalidates the dependent cursors immediately if set to `FALSE`. Use `DBMS_STATS.AUTO_INVALIDATE`. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values.

`ORA-20006`: Unable to restore statistics, statistics history not available.

RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (`as_of_timestamp`).

Syntax

```
DBMS_STATS.RESTORE_SCHEMA_STATS(
   as_of_timestamp        TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 138–82 RESTORE_SYSTEM_STATS Procedure Parameters

Parameter	Description
`as_of_timestamp`	The timestamp to which to restore statistics

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid or inconsistent values.

`ORA-20006`: Unable to restore statistics, statistics history not available.

RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). The procedure will restore statistics of associated indexes and columns as well. If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```
DBMS_STATS.RESTORE_TABLE_STATS (
   ownname                  VARCHAR2,
   tabname                  VARCHAR2,
   as_of_timestamp          TIMESTAMP WITH TIME ZONE,
   restore_cluster_index    BOOLEAN DEFAULT FALSE,
   force                    BOOLEAN DEFAULT FALSE,
   no_invalidate            BOOLEAN DEFAULT to_no_invalidate_type
                                          (GET_PARAM('NO_INVALIDATE')));
```

Parameters

Table 138–83 RESTORE_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The schema of the table for which the statistics are to be restored
tabname	The table name
as_of_timestamp	The timestamp to which to restore statistics
restore_cluster_index	If the table is part of a cluster, restore statistics of the cluster index if set to TRUE
force	Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent values.

ORA-20006: Unable to restore statistics, statistics history not available.

SET_COLUMN_STATS Procedures

This procedure sets column-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   distcnt       NUMBER DEFAULT NULL,
   density       NUMBER DEFAULT NULL,
   nullcnt       NUMBER DEFAULT NULL,
   srec          StatRec DEFAULT NULL,
   avgclen       NUMBER DEFAULT NULL,
   flags         NUMBER DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_COLUMN_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   colname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   force         BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–84 SET_COLUMN_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema.
tabname	Name of the table to which this column belongs.
colname	Name of the column or extension
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.

Table 138–84 (Cont.) SET_COLUMN_STATS Procedure Parameters

Parameter	Description
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
distcnt	Number of distinct values
density	Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.
nullcnt	Number of NULLs
srec	StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS
avgclen	Average length for the column (in bytes)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
force	Sets the values even if statistics of the column are locked

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or inconsistent input values.

ORA-20005: Object statistics are locked.

SET_DATABASE_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can by included by passing TRUE for the add_sys parameter.

Syntax

```
DBMS_STATS.SET_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    pvalue           IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```

Parameters

Table 138–85 SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 138–85 (Cont.) SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column | attribute [size_clause] [,column | attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 138–85 (Cont.) SET_DATABASE_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s
add_sys	Value TRUE will include the Oracle-owned tables

Exceptions

ORA-20000: Insufficient privileges.

ORA-20001: Invalid or illegal input values.

Usage Notes

- To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE','99');
```

SET_GLOBAL_PREFS Procedure

This procedure is used to set the global statistics preferences.

Syntax

```
DBMS_STATS.SET_GLOBAL_PREFS (
    pname     IN   VARCHAR2,
    pvalue    IN   VARCHAR2);
```

Parameters

Table 138–86 SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
pname	Preference name. The default value for the following preferences can be set: ■ AUTOSTATS_TARGET ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT AUTOSTATS_TARGET - This preference is applicable only for auto stats collection. The value of this parameter controls the objects considered for stats collection. It takes the following values: ■ 'ALL' - statistics collected for all objects in system ■ 'ORACLE' - statistics collected for all Oracle owned objects ■ 'AUTO' - Oracle decides on which objects to collect stats
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 138–86 (Cont.) SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column | attribute [size_clause] [,column | attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 138–86 (Cont.) SET_GLOBAL_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only of there is no preference specified for the table to be analyzed.
- To run this procedure, you need to have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_GLOBAL_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_GLOBAL_PREFS('DEGREE','99');
```

SET_INDEX_STATS Procedures

These procedures set index-related information. In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.

Syntax

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   numrows       NUMBER    DEFAULT NULL,
   numlblks      NUMBER    DEFAULT NULL,
   numdist       NUMBER    DEFAULT NULL,
   avglblk       NUMBER    DEFAULT NULL,
   avgdblk       NUMBER    DEFAULT NULL,
   clstfct       NUMBER    DEFAULT NULL,
   indlevel      NUMBER    DEFAULT NULL,
   flags         NUMBER    DEFAULT NULL,
   statown       VARCHAR2  DEFAULT NULL,
   no_invalidate BOOLEAN   DEFAULT to_no_invalidate_type(
                                    get_param('NO_INVALIDATE')),
   guessq        NUMBER    DEFAULT NULL,
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Use the following for user-defined statistics:

```
DBMS_STATS.SET_INDEX_STATS (
   ownname       VARCHAR2,
   indname       VARCHAR2,
   partname      VARCHAR2  DEFAULT NULL,
   stattab       VARCHAR2  DEFAULT NULL,
   statid        VARCHAR2  DEFAULT NULL,
   ext_stats     RAW,
   stattypown    VARCHAR2 DEFAULT NULL,
   stattypname   VARCHAR2 DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
                                     get_param('NO_INVALIDATE')),
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 138–87 SET_INDEX_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
indname	Name of the index

Table 138–87 (Cont.) SET_INDEX_STATS Procedure Parameters

Parameter	Description
partname	Name of the index partition in which to store the statistics. If the index is partitioned and if partname is NULL, then the statistics are stored at the global index level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
ext_stats	The user-defined statistics
stattypown	Schema of the statistics type
stattypname	Name of the statistics type
numrows	Number of rows in the index (partition)
numlblks	Number of leaf blocks in the index (partition)
numdist	Number of distinct keys in the index (partition)
avglblk	Average integral number of leaf blocks in which each distinct key appears for this index (partition). If not provided, then this value is derived from numlblks and numdist.
avgdblk	Average integral number of data blocks in the table pointed to by a distinct key for this index (partition). If not provided, then this value is derived from clstfct and numdist.
clstfct	See clustering_factor column of the all_indexes view for a description
indlevel	Height of the index (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
guessq	Guess quality. See the pct_direct_access column of the all_indexes view for a description.
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)
force	Sets the values even if statistics of the index are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- Oracle maintains `cachedblk` and `cachehit` at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each `cachehit` and a `cachedblk` for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

`ORA-20000`: Object does not exist or insufficient privileges.

`ORA-20001`: Invalid input value.

`ORA-20005`: Object statistics are locked.

SET_PARAM Procedure

Note: This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the SET_GLOBAL_PREFS Procedure.

See also Deprecated Subprograms on page 138-12.

This procedure sets default values for parameters of DBMS_STATS procedures. You can use the GET_PARAM Function to get the current default value of a parameter.

Syntax

```
DBMS_STATS.SET_PARAM (
   pname      IN    VARCHAR2,
   pval       IN    VARCHAR2);
```

Parameters

Table 138–88 SET_PARAM Procedure Parameters

Parameter	Description
pname	The parameter name The default value for following parameters can be set. ■ CASCADE - The default value for CASCADE set by SET_PARAM is not used by export/import procedures.It is used only by gather procedures. ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ AUTOSTATS_TARGET - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see pval)
pval	The parameter value. If NULL is specified, it will set the default value determined by Oracle. When pname is AUTOSTATS_TARGET, the following are valid values: ■ 'ALL' - Statistics are collected for all objects in the system ■ 'ORACLE' - Statistics are collected for all Oracle owned objects ■ 'AUTO' - Oracle decides for which objects to collect statistics

Usage Notes

- To run this procedure, you must have the SYSDBA or both the ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.
- Note also the difference between NULL and 'NULL':

- When NULL is unquoted, this sets the parameter to the value Oracle recommends.
- In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or illegal input value.

Examples

```
DBMS_STATS.SET_PARAM('CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT','5');
DBMS_STATS.SET_PARAM('DEGREE','NULL');
```

SET_SCHEMA_PREFS Procedure

This procedure is used to set the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.SET_SCHEMA_PREFS (
    ownname    IN   VARCHAR2,
    pname      IN   VARCHAR2,
    pvalue     IN   VARCHAR2);
```

Parameters

Table 138–89 SET_SCHEMA_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
pname	Preference name. The default value for following parameters can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.s

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid or illegal input value.

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_SCHEMA_PREFS('SH' 'ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'DEGREE','99');
```

SET_SYSTEM_STATS Procedure

This procedure sets systems statistics.

Syntax

```
DBMS_STATS.SET_SYSTEM_STATS (
   pname          VARCHAR2,
   pvalue         NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 138–90 SET_SYSTEM_STATS Procedure Parameters

Parameter	Description
pname	The parameter name to get, which can have one of the following values: ■ iotfrspeed—I/O transfer speed in bytes for each millisecond ■ ioseektim - seek time + latency time + operating system overhead time, in milliseconds ■ sreadtim - average time to read single block (random read), in milliseconds ■ mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds ■ cpuspeed - average number of CPU cycles for each second, in millions, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options) ■ cpuspeednw - average number of CPU cycles for each second, in millions, captured for the noworkload (statistics collected using 'NOWORKLOAD' option. ■ mbrc - average multiblock read count for sequential read, in blocks ■ maxthr - maximum I/O system throughput, in bytes/second ■ slavethr - average slave I/O throughput, in bytes/second
pvalue	Parameter value to get
stattab	Identifier of the user statistics table where the statistics will be obtained. If stattab is null, the statistics will be obtained from the dictionary.
statid	Optional identifier associated with the statistics saved in the stattab
statown	Schema containing stattab (if different from current schema)

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid input value.

ORA-20002: Bad user statistics table; may need to be upgraded.

ORA-20003: Unable to set system statistics.

ORA-20004: Parameter does not exist.

SET_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```
DBMS_STATS.SET_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2,
    pvalue     IN  VARCHAR2);
```

Parameters

Table 138–91 SET_TABLE_PREFS Procedure Parameters

Parameter	Description
ownname	Owner name
tabname	Table name
pname	Preference name. The default value for following preferences can be set: ■ CASCADE ■ DEGREE ■ ESTIMATE_PERCENT ■ METHOD_OPT ■ NO_INVALIDATE ■ GRANULARITY ■ PUBLISH ■ INCREMENTAL ■ STALE_PERCENT
.	CASCADE - The value determines whether or not index statistics are collected as part of gathering table statistics .
.	DEGREE - The value determines degree of parallelism used for gathering statistics.
.	ESTIMATE_PERCENT - The value determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.

Table 138–91 (Cont.) SET_TABLE_PREFS Procedure Parameters

Parameter	Description
.	METHOD_OPT - The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination: ■ FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] ■ FOR COLUMNS [size clause] column | attribute [size_clause] [,column | attribute [size_clause]...] size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} column is defined as column := column_name | (extension) – integer : Number of histogram buckets. Must be in the range [1,254]. – REPEAT : Collects histograms only on the columns that already have histograms. – AUTO : Oracle determines the columns to collect histograms based on data distribution and the workload of the columns. – SKEWONLY : Oracle determines the columns to collect histograms based on the data distribution of the columns. - column_name : name of a column - extension : can be either a column group in the format of (column_name, colume_name [, ...]) or an expression The default is FOR ALL COLUMNS SIZE AUTO.
.	NO_INVALIDATE - The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.
.	GRANULARITY - The value determines granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - gathers all (subpartition, partition, and global) statistics 'AUTO'- determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - gathers global statistics 'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION'- gathers partition-level statistics 'SUBPARTITION' - gathers subpartition-level statistics.

Table 138–91 (Cont.) SET_TABLE_PREFS Procedure Parameters

Parameter	Description
.	PUBLISH - This value determines whether or not newly gathered statistics will be published once the gather job has completed. Prior to Prior to Oracle Database 11*g*, Release 1 (11.1), once a statistic gathering job completed the new statistics were automatically published into the dictionary tables. The user now has the ability to gather statistics but not publish them immediately. This allows the DBA to test the new statistics before publishing them.
.	INCREMENTAL - This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold: ■ the INCREMENTAL value for the partitioned table is set to TRUE; ■ the PUBLISH value for the partitioned table is set to TRUE; ■ the user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table. If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.
.	STALE_PERCENT - This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The default value is 10%.
pvalue	Preference value. If NULL is specified, it will set the Oracle default value.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- To run this procedure, you need to connect as owner of the table or should have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES','ESTIMATE_PERCENT','9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE','99');
```

SET_TABLE_STATS Procedure

This procedure sets table-related information.

Syntax

```
DBMS_STATS.SET_TABLE_STATS (
   ownname       VARCHAR2,
   tabname       VARCHAR2,
   partname      VARCHAR2 DEFAULT NULL,
   stattab       VARCHAR2 DEFAULT NULL,
   statid        VARCHAR2 DEFAULT NULL,
   numrows       NUMBER   DEFAULT NULL,
   numblks       NUMBER   DEFAULT NULL,
   avgrlen       NUMBER   DEFAULT NULL,
   flags         NUMBER   DEFAULT NULL,
   statown       VARCHAR2 DEFAULT NULL,
   no_invalidate BOOLEAN  DEFAULT to_no_invalidate_type (
                                  get_param('NO_INVALIDATE')),
   cachedblk     NUMBER    DEFAULT NULL,
   cachehit      NUMBER    DEFUALT NULL,
   force         BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 138–92 SET_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema
tabname	Name of the table
partname	Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.
stattab	User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.
statid	Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)
numrows	Number of rows in the table (partition)
numblks	Number of blocks the table (partition) occupies
avgrlen	Average row length for the table (partition)
flags	For internal Oracle use (should be left as NULL)
statown	Schema containing stattab (if different than ownname)
no_invalidate	Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
cachedblk	The average number of blocks in the buffer cache for the segment (index/table/index partition/table partition)

Table 138–92 (Cont.) SET_TABLE_STATS Procedure Parameters

Parameter	Description
cachehit	The average cache hit ratio for the segment (index/table/index partition/table partition)
force	Sets the values even if statistics of the table are locked

Usage Notes

- The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- Oracle maintains cachedblk and cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls DBMS_STATS.GATHER_ [TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a 'confidence factor' for each cachehit and a cachedblk for each object. If the 'confidence factor' for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.
- The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other "minor" workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.
- The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently create
  - When the system does not have one major workload resulting in averages not corresponding to real values.

Exceptions

ORA-20000: Object does not exist or insufficient privileges.

ORA-20001: Invalid input value.

ORA-20005: Object statistics are locked.

SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

```
DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
   ownname    VARCHAR2,
   tabname    VARCHAR2,
   extension  VARCHAR2)
 RETURN VARCHAR2;
```

Parameters

Table 138–93 SHOW_EXTENDED_STATS_NAME Function Parameters

Parameter	Description
ownname	Owner name of a table
tabname	Name of the table
extension	Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be "(c1, c2)" and an example expression can be "(c1 + c2)".

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Error when processing extension

UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (
    ownname    VARCHAR2,
    tabname    VARCHAR2,
    partname   VARCHAR2);
```

Parameters

Table 138–94 UNLOCK_PARTITION_STATS Procedure Parameters

Parameter	Description
ownname	Name of the schema to unlock
tabname	Name of the table
partname	Partition name

UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```
DBMS_STATS.UNLOCK_SCHEMA_STATS (
   ownname    VARCHAR2);
```

Parameters

Table 138–95 UNLOCK_SCHEMA_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema

Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```
DBMS_STATS.UNLOCK_TABLE_STATS (
   ownname    VARCHAR2,
   tabname    VARCHAR2);
```

Parameters

Table 138–96 UNLOCK_TABLE_STATS Procedure Parameters

Parameter	Description
ownname	The name of the schema
tabname	The name of the table

Usage Notes

- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_*, DELETE_*, IMPORT_*, GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

```
DBMS_STATS.UPGRADE_STAT_TABLE (
   ownname    VARCHAR2,
   stattab    VARCHAR2);
```

Parameters

Table 138–97 UPGRADE_STAT_TABLE Procedure Parameters

Parameter	Description
ownname	Name of the schema
stattab	Name of the table

Exceptions

ORA-20000: Unable to upgrade table.

139

DBMS_STORAGE_MAP

With the DBMS_STORAGE_MAP package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- Using DBMS_STORAGE_MAP
  - Overview
  - Operational Notes
- Summary of DBMS_STORAGE_MAP Subprograms

Using DBMS_STORAGE_MAP

- Overview
- Operational Notes

Overview

The following terminology and descriptions will help you understand the DBMS_STORAGE_MAP API:

- Mapping libraries

  Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- Mapping files

  A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- Mapping elements and sub-elements

  A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack

- Mapping file extents

  A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

  See Also:

  - *Oracle Database Administrator's Guide* for more information
  - *Oracle Database Reference* for V$MAP views, including V$MAP_FILE, V$MAP_ELEMENT, V$MAP_SUBELEMENT, V$MAP_FILE_EXTENT

Operational Notes

For `MAP_ELEMENT`, `MAP_FILE`, and `MAP_ALL`: Invoking these functions when mapping information already exists will refresh the mapping if configuration IDs are supported. If configuration IDs are not supported, then invoking these functions again will rebuild the mapping.

> **See Also:** *Oracle Database Administrator's Guide* for a discussion of the configuration ID, an attribute of the element or file that is changed.

Summary of DBMS_STORAGE_MAP Subprograms

Table 139–1 DBMS_STORAGE_MAP Package Subprograms

Subprogram	Description
DROP_ALL Function on page 139-6	Drops all mapping information in the shared memory of the instance
DROP_ELEMENT Function on page 139-7	Drops the mapping information for the element defined by `elemname`
DROP_FILE Function on page 139-8	Drops the file mapping information defined by `filename`
LOCK_MAP Procedure on page 139-9	Locks the mapping information in the shared memory of the instance
MAP_ALL Function on page 139-10	Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements
MAP_ELEMENT Function on page 139-11	Builds mapping information for the element identified by `elemname`
MAP_FILE Function on page 139-12	Builds mapping information for the file identified by `filename`
MAP_OBJECT Function on page 139-13	Builds the mapping information for the Oracle object identified by the object name, owner, and type
RESTORE Function on page 139-14	Loads the entire mapping information from the data dictionary into the shared memory of the instance
SAVE Function on page 139-15	Saves information needed to regenerate the entire mapping into the data dictionary
UNLOCK_MAP Procedure on page 139-16	Unlocks the mapping information in the shared memory of the instance.

DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
      dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 139–2 DROP_ALL Function Parameters

Parameter	Description
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

DROP_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 139–3 DROP_ELEMENT Function Parameters

Parameter	Description
`elemname`	The element for which mapping information is dropped.
`cascade`	If `TRUE`, then `DROP_ELEMENT` is invoked recursively on all elements of the DAG defined by `elemname`, if possible.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
   filename          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 139–4 DROP_FILE Function Parameters

Parameter	Description
`filename`	The file for which file mapping information is dropped.
`cascade`	If `TRUE`, then the mapping DAGs for the elements where the file resides are also dropped, if possible.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance. This is useful when you need a consistent snapshot of the V$MAP tables. Without locking the mapping information, `V$MAP_ELEMENT` and `V$MAP_SUBELEMENT`, for example, may be inconsistent.

Syntax

```
DBMS_STORAGE_MAP.LOCK_MAP;
```

MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

```
DBMS_STORAGE_MAP.MAP_ALL(
   max_num_fileext   IN NUMBER DEFAULT 100,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 139–5 MAP_ALL Function Parameters

Parameter	Description
`max_num_fileext`	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is `100`; `max_num_fileextent` is an overloaded argument.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

Usage Notes

You must explicitly call `MAP_ALL` in a cold startup scenario.

MAP_ELEMENT Function

This function builds mapping information for the element identified by `elemname`. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

Syntax

```
DBMS_STORAGE_MAP.MAP_ELEMENT(
   elemname          IN VARCHAR2,
   cascade           IN BOOLEAN,
   dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 139–6 MAP_ELEMENT Function Parameters

Parameter	Description
`elemname`	The element for which mapping information is built.
`cascade`	If `TRUE`, all elements within the elemname I/O stack DAG are mapped.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

MAP_FILE Function

This function builds mapping information for the file identified by `filename`. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```
DBMS_STORAGE_MAP.MAP_FILE(
   filename           IN VARCHAR2,
   filetype           IN VARCHAR2,
   cascade            IN BOOLEAN,
   max_num_fileextent IN NUMBER DEFAULT 100,
   dictionary_update  IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 139–7 MAP_FILE Function Parameters

Parameter	Description
`filename`	The file for which mapping information is built.
`filetype`	Defines the type of the file to be mapped. It can be "`DATAFILE`", "`SPFILE`", "`TEMPFILE`", "`CONTROLFILE`", "`LOGFILE`", or "`ARCHIVEFILE`".
`cascade`	Should be `TRUE` only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an `ALTER SYSTEM` command or DML operations on extended files), `cascade` can be set to `FALSE` because the mapping changes are limited to the file extents only. If `TRUE`, mapping DAGs are also built for the elements where the file resides.
`max_num_fileextent`	Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is `100`; `max_num_fileextent` is an overloaded argument.
`dictionary_update`	If `TRUE`, mapping information in the data dictionary is updated to reflect the changes. The default value is `TRUE`; `dictionary_update` is an overloaded argument.

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if `cascade` is `TRUE`), is owned by a library that must be explicitly synchronized.

MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```
DBMS_STORAGE_MAP.MAP_OBJECT(
   objname  IN  VARCHAR2,
   owner    IN  VARCHAR2,
   objtype  IN  VARCHAR2);
```

Parameters

Table 139–8 MAP_OBJECT Function Parameters

Parameter	Description
objname	The name of the object.
owner	The owner of the object.
objtype	The type of the object.

RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance. You can invoke `RESTORE` only after a `SAVE` operation. You must explicitly call `RESTORE` in a warm startup scenario.

Syntax

```
DBMS_STORAGE_MAP.RESTORE;
```

SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

```
DBMS_STORAGE_MAP.SAVE;
```

UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.UNLOCK_MAP;
```

140

DBMS_STREAMS

The DBMS_STREAMS package, one of a set of Oracle Streams packages, provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag. This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

> **See Also:** *Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams

This chapter contains the following topics:

- Using DBMS_STREAMS
  - Security Model
- Summary of DBMS_STREAMS Subprograms

Using DBMS_STREAMS

This section contains topics which relate to using the `DBMS_STREAMS` package.

- Security Model

Security Model

User group PUBLIC is granted EXECUTE privilege on this package.

See Also: *Oracle Database Security Guide* for more information about user group PUBLIC

Summary of DBMS_STREAMS Subprograms

Table 140–1 DBMS_STREAMS Package Subprograms

Subprogram	Description
COMPATIBLE_11_2 Function on page 140-5	Returns the `DBMS_STREAMS.COMPATIBLE_11_2` constant
COMPATIBLE_11_1 Function on page 140-6	Returns the `DBMS_STREAMS.COMPATIBLE_11_1` constant
COMPATIBLE_10_2 Function on page 140-7	Returns the `DBMS_STREAMS.COMPATIBLE_10_2` constant
COMPATIBLE_10_1 Function on page 140-8	Returns the `DBMS_STREAMS.COMPATIBLE_10_1` constant
COMPATIBLE_9_2 Function on page 140-9	Returns the `DBMS_STREAMS.COMPATIBLE_9_2` constant
CONVERT_ANYDATA_TO_LCR_DDL Function on page 140-10	Converts a `ANYDATA` object to a `SYS.LCR$_DDL_RECORD` object
CONVERT_ANYDATA_TO_LCR_ROW Function on page 140-11	Converts a `ANYDATA` object to a `SYS.LCR$_ROW_RECORD` object
CONVERT_LCR_TO_XML Function on page 140-12	Converts a logical change record (LCR) encapsulated in a `ANYDATA` object into an XML object that conforms to the XML schema for LCRs
CONVERT_XML_TO_LCR Function on page 140-13	Converts an XML object that conforms to the XML schema for LCRs into a logical change record (LCR) encapsulated in a `ANYDATA` object
GET_INFORMATION Function on page 140-14	Returns information about various Oracle Streams attributes
GET_STREAMS_NAME Function on page 140-15	Returns the name of the invoker
GET_STREAMS_TYPE Function on page 140-16	Returns the type of the invoker
GET_TAG Function on page 140-17	Gets the binary tag for all redo entries generated by the current session
MAX_COMPATIBLE Function on page 140-18	Returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database
SET_TAG Procedure on page 140-19	Sets the binary tag for all redo entries subsequently generated by the current session

Note: The subprograms in this package do not commit.

COMPATIBLE_11_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_11_2 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_11_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 245-34
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_11_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_11_1 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_11_1
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 245-34
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_10_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_2 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_10_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 245-34
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_10_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_1 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_10_1
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 245-34
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

COMPATIBLE_9_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_9_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 9.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function on page 245-34
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the COMPATIBLE initialization parameter

CONVERT_ANYDATA_TO_LCR_DDL Function

This function converts a ANYDATA object into a SYS.LCR$_DDL_RECORD object.

Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_DDL(
   source  IN  ANYDATA)
RETURN SYS.LCR$_DDL_RECORD;
```

Parameters

Table 140–2 CONVERT_ANYDATA_TO_LCR_DDL Function Parameters

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a DDL logical change record (DDL LCR), then the function raises an exception.

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of DDL LCRs from a ANYDATA queue to a SYS.LCR$_DDL_RECORD typed queue.

See Also: *Oracle Streams Advanced Queuing User's Guide*

CONVERT_ANYDATA_TO_LCR_ROW Function

This function converts a ANYDATA object into a SYS.LCR$_ROW_RECORD object.

Syntax

```
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_ROW(
   source  IN  ANYDATA)
RETURN SYS.LCR$_ROW_RECORD;
```

Parameters

Table 140–3 CONVERT_ANYDATA_TO_LCR_ROW Function Parameters

Parameter	Description
source	The ANYDATA object to be converted. If this object is not a row logical change record (row LCR), then the function raises an exception.

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of row LCRs from a ANYDATA queue to a SYS.LCR$_ROW_RECORD typed queue.

See Also: *Oracle Streams Advanced Queuing User's Guide*

CONVERT_LCR_TO_XML Function

This function converts a logical change record (LCR) encapsulated in a ANYDATA object into an XML object that conforms to the XML schema for LCRs. The LCR can be a row LCR or a DDL LCR.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

Syntax

```
DBMS_STREAMS.CONVERT_LCR_TO_XML(
   anylcr  IN  ANYDATA)
RETURN SYS.XMLTYPE;
```

Parameters

Table 140–4 CONVERT_LCR_TO_XML Function Parameters

Parameter	Description
anylcr	The ANYDATA encapsulated LCR to be converted. If this object is not a ANYDATA encapsulated LCR, then the function raises an exception.

CONVERT_XML_TO_LCR Function

This function converts an XML object that conforms to the XML schema for logical change records (LCRs) into an LCR encapsulated in a `ANYDATA` object. The LCR can be a row or DDL LCR.

> **See Also:** *Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

Syntax

```
DBMS_STREAMS.CONVERT_XML_TO_LCR(
   xmldat  IN  SYS.XMLTYPE)
RETURN ANYDATA;
```

Parameters

Table 140–5 CONVERT_XML_TO_LCR Function Parameters

Parameter	Description
`xmldat`	The XML LCR object to be converted. If this object does not conform to XML schema for LCRs, then the function raises an exception.

GET_INFORMATION Function

This function returns information about various Oracle Streams attributes.

Syntax

```
DBMS_STREAMS.GET_INFORMATION(
   name  IN  VARCHAR2)
RETURN ANYDATA;
```

Parameters

Table 140–6 GET_INFORMATION Function Parameters

Parameter	Description
name	The type of information you want to retrieve. Currently, the following names are available: ■ SENDER: Returns the name of the sender for the current logical change record (LCR) from its AQ message properties. This function is called inside a procedure DML handler, a DDL handler, an error handler, or a message handler. Returns NULL if called outside of an apply handler. The return value is to be interpreted as a VARCHAR2. ■ CONSTRAINT_NAME: Returns the name of the constraint that was violated for an LCR that raised an error. This function is called inside a procedure DML handler or error handler for an apply process. Returns NULL if called outside of a procedure DML handler or error handler. The return value is to be interpreted as a VARCHAR2.

GET_STREAMS_NAME Function

This function gets the Oracle Streams name of the invoker if the invoker is one of the following Oracle Streams types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_NAME
RETURN VARCHAR2;
```

Usage Notes

You can use this function in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, if you use one error handler for multiple apply processes, then you can use the GET_STREAMS_NAME function to determine the name of the apply process that raised the error.

GET_STREAMS_TYPE Function

This function gets the Oracle Streams type of the invoker and returns one of the following types:

- CAPTURE
- APPLY
- ERROR_EXECUTION

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_TYPE
RETURN VARCHAR2;
```

Usage Notes

This function can be used in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, you can use the GET_STREAMS_TYPE function to instruct a procedure DML handler to operate differently if it is processing messages from the error queue (ERROR_EXECUTION type) instead of the apply process's queue (APPLY type).

GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

Note:

- To execute this function, a user must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- The DBMS_STREAMS.GET_TAG function might be deprecated in a future release of Oracle Database. Oracle recommends that you use the DBMS_STREAMS_ADM.GET_TAG function. See "GET_TAG Function" on page 141-82.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS.GET_TAG
RETURN RAW;
```

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

```
SET SERVEROUTPUT ON
DECLARE
   raw_tag RAW(2000);
BEGIN
   raw_tag := DBMS_STREAMS.GET_TAG();
   DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/
```

You can also display the value by querying the DUAL view:

```
SELECT DBMS_STREAMS.GET_TAG FROM DUAL;
```

MAX_COMPATIBLE Function

This function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

Syntax

```
DBMS_STREAMS.MAX_COMPATIBLE
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The `MAX_COMPATIBLE` function always returns the maximum compatibility for the release of Oracle Database on which it is run. Therefore, when you use this function in rule conditions, the rule conditions do not need to be changed when you upgrade to a later release of Oracle Database.

See Also:

- GET_COMPATIBLE Member Function on page 245-34
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session. Each redo entry generated by DML or DDL statements in the current session will have this tag. This procedure affects only the current session.

Note:

- To execute this procedure, a user must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- The DBMS_STREAMS.SET_TAG procedure might be deprecated in a future release of Oracle Database. Oracle recommends that you use the DBMS_STREAMS_ADM.SET_TAG procedure. See "SET_TAG Procedure" on page 141-167.

See Also: *Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```
DBMS_STREAMS.SET_TAG(
   tag  IN RAW  DEFAULT NULL);
```

Parameters

Table 140–7 SET_TAG Procedure Parameters

Parameter	Description
tag	The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```
EXEC DBMS_STREAMS.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also: BUILD Procedure on page 30-15

141

DBMS_STREAMS_ADM

The DBMS_STREAMS_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring Oracle Streams environments. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level.

See Also:

- *Oracle Streams Concepts and Administration*, *Oracle Streams Replication Administrator's Guide*, and *Oracle Database 2 Day + Data Replication and Integration Guide* for more information about this package and Oracle Streams
- Chapter 123, "DBMS_RULE"

This chapter contains the following topics:

- Using DBMS_STREAMS_ADM
  - Overview
  - Deprecated Subprograms
  - Security Model
  - Operational Notes
- Summary of DBMS_STREAMS_ADM Subprograms

Using DBMS_STREAMS_ADM

This section contains topics that relate to using the `DBMS_STREAMS_ADM` package.

- Overview
- Deprecated Subprograms
- Security Model
- Operational Notes

Overview

The DBMS_STREAMS_ADM package, one of a set of Oracle Streams packages, provides subprograms for configuring an Oracle Streams environment. This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. These rules support logical change records (LCRs), which include row LCRs and data definition language (DDL) LCRs. This package also contains subprograms for creating message rules for specific message types. This package also contains subprograms for creating queues, and for managing Oracle Streams metadata, such as data dictionary information.

If you require more sophisticated rules, then refer to Chapter 123, "DBMS_RULE" package.

Deprecated Subprograms

Note: Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 10*g* Release 2 and later:

- `MAINTAIN_SIMPLE_TABLESPACE`

  This procedure is replaced by the `MAINTAIN_SIMPLE_TTS` procedure.

  See Also: MAINTAIN_SIMPLE_TTS Procedure on page 141-107

- `MAINTAIN_TABLESPACES`

  This procedure is replaced by the `MAINTAIN_TTS` procedure.

  See Also: MAINTAIN_TTS Procedure on page 141-122

Security Model

A user is associated with each Oracle Streams client. The following sections describe these users:

- Oracle Streams Administrator
- Capture User
- Propagation User
- Apply User
- Messaging Client User

Oracle Streams Administrator

To ensure that the user who runs the subprograms in this package has the necessary privileges, you should configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package. The Oracle Streams administrator must be granted the `DBA` role to create or alter capture processes, synchronous captures, or apply processes. When the user does not need to perform these tasks, `DBA` role can be revoked from the user.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Capture User

The following procedures can create a capture process:

- ADD_GLOBAL_RULES Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

The following procedures can create a synchronous capture:

- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates a capture process or a synchronous capture, then it configures the current user as the capture user. The capture user is the user in whose security domain a capture process or synchronous capture captures changes that satisfy its rule set(s) and runs custom rule-based transformations configured for these rules. This user must have the necessary privileges to capture changes. The procedure grants the capture user `ENQUEUE` privilege on the queue used by the capture process or synchronous capture and configures the user as a secure queue user of the queue.

> **See Also:** CREATE_CAPTURE Procedure on page 30-16 and CREATE_SYNC_CAPTURE Procedure on page 30-26 for information about the privileges required to capture changes (refer to the `capture_user` parameter)

Propagation User

The following procedures can create a propagation:

- ADD_GLOBAL_PROPAGATION_RULES Procedure

- ADD_MESSAGE_PROPAGATION_RULE Procedure
- ADD_SCHEMA_PROPAGATION_RULES Procedure
- ADD_SUBSET_PROPAGATION_RULES Procedure
- ADD_TABLE_PROPAGATION_RULES Procedure

When a propagation is created, a propagation job also might be created. If a propagation job is created when one of these procedures is run, then the user who runs the procedure owns the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

Note:

- The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users might or might not be the same.
- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate messages.

See Also:

- CREATE_PROPAGATION Procedure on page 104-5 for more information about the required privileges
- "Propagation Rules for LCRs" on page 141-10 for information about when a propagation job is created

Apply User

The following procedures can create an apply process:

- ADD_GLOBAL_RULES Procedure
- ADD_MESSAGE_RULE Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates an apply process, then it configures the current user as the apply user. For an apply process, the apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets.

An apply user applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. The procedure grants the apply user `DEQUEUE` privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

See Also: CREATE_APPLY Procedure on page 20-16 for information about the privileges required to apply changes (refer to the `apply_user` parameter)

Messaging Client User

The following procedures can create a messaging client:

- ADD_GLOBAL_RULES Procedure
- ADD_MESSAGE_RULE Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates a messaging client, then the user who runs this procedure is granted the privileges to dequeue from the queue using the messaging client. The procedure configures this user as a secure queue user of the queue, and only this user can use the messaging client.

Operational Notes

Several procedures in this package create rules for Oracle Streams clients, and several procedures configure an Oracle Streams environment. The following sections provide information about using these procedures:

- Procedures That Create Rules and Oracle Streams Clients
- Procedures That Configure an Oracle Streams Environment

Procedures That Create Rules and Oracle Streams Clients

Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. Some of the procedures in the `DBMS_STREAMS_ADM` package add rules to the rule sets of Oracle Streams clients. The rules can pertain to changes in the redo log, to data manipulation language (DML) changes made to a table, to logical change records (LCRs), or to user messages.

An LCR represents either a row change that results from a DML operation or a data definition language (DDL) change. An LCR that represents a row change is a row LCR, and an LCR that represents a DDL change is a DDL LCR. LCRs can either represent changes that were captured by a capture process or a synchronous capture, or they can represent changes created by a user or application. A user message is a custom message that is based on a user-defined type and created by users or applications.

A capture process, propagation, apply process, or messaging client can have both positive and negative rule sets. A synchronous capture can have only a positive rule set.

For all of the procedures except the ones that create subset rules, and for all Oracle Streams clients except for synchronous captures, you use the `inclusion_rule` parameter to specify the type of rule set (either positive or negative) for the created rules. If the Oracle Streams client does not have a rule set of the specified type, then a rule set is created automatically, and the rules are added to the rule set. Other rules in an existing rule set for the Oracle Streams client are not affected. Additional rules can be added to a rule set using either the `DBMS_STREAMS_ADM` package or the `DBMS_RULE_ADM` package. If an Oracle Streams client has both a positive and a negative rule set, then the negative rule set is always evaluated first.

The following sections describe each type of rule in detail:

- Capture Process Rules for Changes in the Redo Log
- Synchronous Capture Rules for DML Changes to Tables
- Propagation Rules for LCRs
- Propagation Rules for User Messages
- Apply Process Rules for LCRs
- Apply Process Rules for User Messages
- Messaging Client Rules for LCRs
- Messaging Client Rules for User Messages

> **See Also:** *Oracle Streams Concepts and Administration* for more information about how rules are used in Oracle Streams

Capture Process Rules for Changes in the Redo Log

The following procedures add rules to a rule set of a capture process when you specify `capture` for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all changes made to a source database. See ADD_GLOBAL_RULES Procedure on page 141-31.
- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified schema. See ADD_SCHEMA_RULES Procedure on page 141-47.
- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure on page 141-56.
- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified table. See ADD_TABLE_RULES Procedure on page 141-66.

If one of these procedures adds rules to the positive rule set for a capture process, then the capture process captures row changes resulting from DML changes, or DDL changes, or both from a source database and enqueues these changes into the specified queue. If one of these procedures adds rules to the negative rule set for a capture process, then the capture process discards row changes, or DDL changes, or both from a source database.

A capture process can capture changes locally at a source database or remotely at a downstream database. Therefore, for capture process rules, you should execute the procedure either at the source database or at a downstream database.

If the capture process is a local capture process, or if the capture process is a downstream capture process that uses a database link to the source database, then these procedures automatically prepare the appropriate database objects for instantiation:

- `ADD_GLOBAL_RULES` invokes the `PREPARE_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SCHEMA_RULES` invokes the `PREPARE_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.
- `ADD_SUBSET_RULES` and `ADD_TABLE_RULES` invoke the `PREPARE_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

These procedures also enable supplemental logging for the primary key, unique key, foreign key, and bitmap index columns in the tables prepared for instantiation. The primary key columns are unconditionally logged. The unique key, foreign key, and bitmap index columns are conditionally logged.

If the capture process is a downstream capture process that does not use a database link to the source database, then you must prepare the appropriate objects for instantiation and specify the necessary supplemental logging manually at the source database.

If one of these procedures is executed at a downstream database, then you specify the source database using the `source_database` parameter, and the specified capture process must exist. The procedure cannot create a capture process if it is run at a downstream database. You can create a capture process at a downstream database using the `CREATE_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

See Also: Chapter , "Summary of DBMS_CAPTURE_ADM Subprograms" on page 30-2 for more information about the CREATE_CAPTURE procedure and the procedures that prepare database objects for instantiation

Synchronous Capture Rules for DML Changes to Tables

The following procedures add rules to the rule set of a synchronous capture when you specify sync_capture for the streams_type parameter:

- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure on page 141-56.
- The ADD_TABLE_RULES procedure adds a rule whose rule condition evaluates to TRUE for DML changes made to a specified table. See ADD_TABLE_RULES Procedure on page 141-66.

If one of these procedures adds rules to the positive rule set for a synchronous capture, then the synchronous capture captures row changes resulting from DML changes to the table at the source database and enqueues these changes into the specified queue. A synchronous capture cannot have a negative rule set.

A synchronous capture captures changes locally at the database where it is configured. This database is the source database for changes captured by the synchronous capture. Therefore, for synchronous capture rules, you should execute the procedure at the source database.

These procedures automatically prepare the appropriate tables for instantiation by invoking the PREPARE_SYNC_INSTANTIATION function in the DBMS_CAPTURE_ADM package at the source database.

Note:

- A synchronous capture ignores rules in its rule set that were created by a procedure other than ADD_SUBSET_RULES or ADD_TABLE_RULES.
- When the ADD_TABLE_RULES or the ADD_SUBSET_RULES procedure adds rules to a synchronous capture rule set, the procedure must obtain an exclusive lock on the specified table. If there are outstanding transactions on the specified table, then the procedure waits until it can obtain a lock.

Propagation Rules for LCRs

The following procedures add propagation rules for LCRs to a rule set of a propagation:

- The ADD_GLOBAL_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in a source queue. See ADD_GLOBAL_PROPAGATION_RULES Procedure on page 141-27.
- The ADD_SCHEMA_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in a source queue containing changes made to a specified schema. See ADD_SCHEMA_PROPAGATION_RULES Procedure on page 141-43.
- The ADD_SUBSET_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in a source queue containing the results

of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_PROPAGATION_RULES Procedure" on page 141-52.

- The ADD_TABLE_PROPAGATION_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in a source queue containing changes made to a specified table. See "ADD_TABLE_PROPAGATION_RULES Procedure" on page 141-61.

If one of these procedures adds rules to the positive rule set for the propagation, then the rules specify that the propagation propagates LCRs in a source queue to a destination queue. If one of these procedures adds rules to the negative rule set for the propagation, then the rules specify that the propagation discards LCRs in a source queue. When you create rules with one of these procedures, and you specify a value for the source_databse parameter, then the rules include conditions for the specified source database.

Propagation Rules for User Messages

The ADD_MESSAGE_PROPAGATION_RULE procedure adds a message rule to a rule set of a propagation. If this procedure adds a rule to the positive rule set for the propagation, then the rule specifies that the propagation propagates the user messages of a specific message type that evaluate to TRUE for the rule condition from a source queue to a destination queue. If this procedure adds a rule to the negative rule set for the propagation, then the rule specifies that the propagation discards the user messages in a source queue of a specific message type that evaluate to TRUE for the rule condition. This procedure generates a rule name for the rule.

> **See Also:** "ADD_MESSAGE_PROPAGATION_RULE Procedure" on page 141-36

Apply Process Rules for LCRs

The following procedures add rules to a rule set of an apply process when you specify apply for the streams_type parameter and an apply process for the streams_name parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in the apply process's queue. See "ADD_GLOBAL_RULES Procedure" on page 141-31.
- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process's queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure" on page 141-47.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in the apply process's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure" on page 141-56.
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process's queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure" on page 141-66.

If one of these procedures adds rules to the positive rule set for the apply process, then the rules specify that the apply process applies LCRs in its queue. If one of these procedures adds rules to the negative rule set for the apply process, then the rules specify that the apply process discards LCRs in its queue. For apply process rules, you should execute these procedures at the destination database.

Changes applied by an apply process created by one of these procedures generate tags in the redo log at the destination database with a value of '00' (double zero). You can

use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to alter the tag value after the apply process is created, if necessary.

An apply process can apply captured LCRs from only one source database. If one of these procedures creates an apply process, then specify the source database for the apply process using the source_database parameter. If the source_database parameter is NULL, and one of these procedures creates an apply process, then the source database name of the first LCR received by the apply process is used for the source database.

The rules in the apply process rule sets determine which messages are dequeued by the apply process. When you create rules with one of these procedures, and you specify a value for the source_database parameter, then the rules include conditions for the specified source database. If the apply process dequeues an LCR with a source database that is different than the source database for the apply process, then an error is raised. In addition, when adding rules to an existing apply process, the database specified in the source_database parameter cannot be different than the source database for the apply process. You can determine the source database for an apply process by querying the DBA_APPLY_PROGRESS data dictionary view.

An apply process created by one of these procedures can apply messages only at the local database and can apply only captured messages. To create an apply process that applies messages at a remote database or an apply process that applies user messages, use the CREATE_APPLY procedure in the DBMS_APPLY_ADM package.

You can also use the DBMS_APPLY_ADM.CREATE_APPLY procedure to specify nondefault values for the apply_captured, apply_user, apply_database_link, and apply_tag parameters when you run that procedure. You can use one of the procedures in the DBMS_STREAMS_ADM package to add rules to a rule set used by the apply process after you create it.

See Also:

- "ALTER_APPLY Procedure" on page 20-9
- "CREATE_APPLY Procedure" on page 20-16

Apply Process Rules for User Messages

The ADD_MESSAGE_RULE procedure adds a message rule to a rule set of an apply process when you specify apply for the streams_type parameter. For an apply process rule, you should execute this procedure at the destination database.

If this procedure adds a rule to the positive rule set for an apply process, then the apply process dequeues user messages of a specific message type that satisfy the apply process rule and sends these messages to its message handler. If no message handler is specified for the apply process, then use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to set the message handler. If this procedure adds a rule to the negative rule set for an apply process, then the apply process discards user messages of a specific message type that satisfy the apply process rule.

See Also:

- ADD_MESSAGE_RULE Procedure on page 141-40
- ALTER_APPLY Procedure on page 20-9

Messaging Client Rules for LCRs

The following procedures add rules to a rule set of a messaging client when you specify dequeue for the streams_type parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in the messaging client's queue. See "ADD_GLOBAL_RULES Procedure" on page 141-31.
- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the messaging client's queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure" on page 141-47.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in the messaging client's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure" on page 141-56.
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the messaging client's queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure" on page 141-66.

If one of these procedures adds rules to the positive rule set for a messaging client, then the messaging client can dequeue persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the source_database parameter. If one of these procedures adds rules to the negative rule set for a messaging client, then the messaging client discards persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the source_database parameter. You should execute these procedures at the database where you want to dequeue the messages with the messaging client.

Messaging Client Rules for User Messages

The ADD_MESSAGE_RULE procedure adds a message rule to a rule set of a messaging client when you specify dequeue for the streams_type parameter. You should execute this procedure at the database that will dequeue messages.

If this procedure adds a rule to the positive rule set for a messaging client, then the messaging client dequeues user messages of a specific message type that satisfy the message rule. If this procedure adds a rule to the negative rule set for a messaging client, then the messaging client discards user messages of a specific message type that satisfy the message rule.

See Also: "ADD_MESSAGE_RULE Procedure" on page 141-40

Procedures That Configure an Oracle Streams Environment

The following procedures in this package configure an environment that is maintained by Oracle Streams:

- MAINTAIN_CHANGE_TABLE Procedure configures an Oracle Streams environment that records in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database.
- MAINTAIN_GLOBAL Procedure configures an Oracle Streams environment that replicates changes at the database level between two databases.
- MAINTAIN_SCHEMAS Procedure configures an Oracle Streams environment that replicates changes to specified schemas between two databases.
- MAINTAIN_SIMPLE_TTS Procedure clones a simple tablespace from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespace between these two databases.

- MAINTAIN_TABLES Procedure configures an Oracle Streams environment that replicates changes to specified tables between two databases.
- MAINTAIN_TTS Procedure clones a set of tablespaces from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespaces between these two databases.
- PRE_INSTANTIATION_SETUP Procedure and POST_INSTANTIATION_SETUP Procedure

The `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures must be used together to complete the Oracle Streams replication configuration. Typically, the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures are used to perform database maintenance operations with little or no down time. See *Oracle Streams Concepts and Administration* for more information.

The following sections contain information about using these procedures:

- Automatic Platform Conversion
- Actions Performed by These Procedures
- Configuration Progress and Recoverability
- Requirements for Running These Procedures
- Common Parameters for the Configuration Procedures

> **See Also:** *Oracle Streams Replication Administrator's Guide* for more information about using these procedures

Automatic Platform Conversion

If the source and destination databases are running on different platforms, then these procedures, or the scripts generated by these procedures, convert transferred datafiles to the appropriate platform automatically.

Actions Performed by These Procedures

To view all of the actions performed by one of these procedures in detail, use the procedure to generate a script, and view the script in a text editor.

Configuration Progress and Recoverability

When one of these procedures is run with the `perform_actions` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

Note: When one of these procedures is run with the `perform_actions` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by one of these procedures is run.

> **See Also:** "RECOVER_OPERATION Procedure" on page 141-143

Requirements for Running These Procedures

Meet the following requirements when you use one of these procedures:

- Run the procedure at the capture database. The capture database is the database that will contain the capture process that captures changes made to the source database. If the capture database is the same as the source database, then a local capture process is configured. If the capture database is not the same as the source database, then a downstream capture process is configured. See *Oracle Streams Replication Administrator's Guide* for more information about the capture database.
- The user who runs the procedure must be able to use a database link from the source database to the destination database. This database link should have the same name as the global name of the destination database.
- If the procedure configures downstream capture, then the corresponding user at the capture database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.
- If the procedure configures downstream capture, and the capture database is not the same as the destination database, then the corresponding user at the capture database must be able to use a database link to access the destination database. This database link should have the same name as the global name of the destination database.
- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
- The user who runs the procedure should be granted `DBA` role. This user must have the necessary privileges to complete the following actions:
  - Create `ANYDATA` queues, capture processes, propagations, and apply processes.
  - Specify supplemental logging
  - Run subprograms in the `DBMS_STREAMS_ADM` and `DBMS_AQADM` packages.
  - Access the database specified in the `destination_database` parameter through a database link. This database link should have the same name as the global name of the destination database.
- The procedure, or the scripts generated by these procedure, must be run at an Oracle Database 10*g* Release 2 or later database.
- If the `perform_actions` parameter is set to `TRUE` in the procedure to configure the Oracle Streams environment directly, then all of the databases configured by the procedure must be Oracle Database 10*g* Release 2 or later databases.
- If the `perform_actions` parameter is set to `FALSE` in the procedure, and the environment is configured with a generated script, then the databases configured by the script must be Oracle Database 10*g* Release 1 or later databases. If the script configures an Oracle Database 10*g* Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10*g* Release 2 or later, such as queue-to-queue propagation.
- Each specified directory object must be created using the SQL statement `CREATE DIRECTORY`, and the user who invokes the procedure must have `READ` and `WRITE` privilege on each one.

- For procedures that include the `bi_directional` parameter, if the `bi_directional` parameter is set to `TRUE`, or if the source database is not the capture database, then the `source_database` parameter must specify a database that contains the database objects to be shared. The database specified in the `destination_database` parameter might or might not contain these database objects. If the destination database does not contain the shared database objects, then the procedure instantiates the database objects at the destination database (excluding the `PRE_INSTANTIATION_SETUP` and `POST_INSTANTIATION_SETUP` procedures).
- For procedures that include the `bi_directional` parameter, if the `bi_directional` parameter is set to `TRUE` or if a network instantiation will be performed, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

To ensure that the user who runs these procedures has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be should be created in the Oracle Streams administrator's schema.

> **See Also:** *Oracle Streams Replication Administrator's Guide* for information about configuring an Oracle Streams administrator

Common Parameters for the Configuration Procedures

Table 141–1 describes the common parameters for the procedures in this package that configure an Oracle Streams environment. Some of the procedures do not include all of the parameters in Table 141–1.

Table 141–1 Common Parameters for Configuration Procedures

Parameter	Description
`perform_actions`	If `TRUE`, then the procedure performs the necessary actions to configure the environment directly. If `FALSE`, then the procedure does not perform the necessary actions to configure the environment directly. Specify `FALSE` when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify `FALSE` and either of the following parameters is `NULL`: ▪ `script_name` ▪ `script_directory_object`

Table 141–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
script_name	If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the environment directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the environment directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error.
script_directory_object	The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. **Note:** The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.
capture_name	The name of each capture process configured to capture changes. Do not specify an owner. If the bi_directional parameter is set to TRUE, then each capture process created by this procedure has the specified name. If the specified name matches the name of an existing capture process, then the procedure uses the existing capture process and adds the rules for capturing changes to the database to the positive capture process rule set. If NULL, then the system generates a name for each capture process it creates. **Note:** The capture process name cannot be altered after the capture process is created.
capture_queue_table	The name of the queue table for each queue used by a capture process, specified as [*schema_name.*]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by a capture process, and the current user is the owner of each queue table.

Table 141–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
capture_queue_name	The name of each queue used by a capture process, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the system generates a name for each queue used by a capture process.
capture_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the source database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
propagation_name	The name of each propagation configured to propagate changes. Do not specify an owner. If the specified name matches the name of an existing propagation, then the procedure uses the existing propagation and adds the rules for propagating changes to the positive propagation rule set. If NULL, then the system generates a name for each propagation it creates. **Note:** The propagation name cannot be altered after the propagation is created.
apply_name	The name of each apply process configured to apply changes. Do not specify an owner. If the specified name matches the name of an existing apply process, then the procedure uses the existing apply process and adds the rules for applying changes to the positive apply process rule set. The specified name must not match the name of an existing messaging client at the destination database. If NULL, then the system generates a name for each apply process it creates. When set to NULL, no apply process that applies changes from the source database can exist on the destination database. If an apply process that applies changes from the source database exists at the destination database, then specify a non-NULL value for this parameter. **Note:** The apply process name cannot be altered after the apply process is created.
apply_queue_table	The name of the queue table for each queue used by an apply process, specified as [*schema_name*.]*queue_table_name*. For example, strmadmin.streams_queue_table. If the schema is not specified, then the current user is the default. If NULL, then the system generates a name for the queue table of each queue used by an apply process, and the current user is the owner of each queue table.

Table 141–1 (Cont.) Common Parameters for Configuration Procedures

Parameter	Description
apply_queue_name	The name of each queue used by an apply process, specified as [*schema_name*.]*queue_name*. For example, strmadmin.streams_queue. If the schema is not specified, then the queue table owner is the default. The queue owner automatically has privileges to perform all queue operations on the queue. If NULL, then the system generates a name for each queue used by an apply process.
apply_queue_user	The name of the user who requires ENQUEUE and DEQUEUE privileges for the queue at the destination database. This user also is configured as a secure queue user of the queue. The queue user cannot grant these privileges to other users because they are not granted with the GRANT option. If NULL, then the procedure does not grant any privileges. You can also grant queue privileges to the appropriate users using the DBMS_AQADM package.
bi_directional	Specify TRUE to configure bi-directional replication between the database specified in source_database and the database specified in destination_database. Both databases are configured as source and destination databases, a capture and apply process is configured to capture changes to both databases, and propagations are configured to propagate these changes. If TRUE, then a database link from the destination database to the source database with the same global name as the source database must exist. Specify FALSE to configure one way replication from the database specified in source_database and the database specified in destination_database. A capture process is configured at the current database and an apply process is configured at the destination database. A propagation is configured if necessary. **See Also:** *Oracle Streams Replication Administrator's Guide* for information about when propagations are configured
include_ddl	Specify TRUE to configure an Oracle Streams replication environment that maintains both DML and DDL changes. Specify FALSE to configure an Oracle Streams replication environment that maintains DML changes only. When this parameter is set to FALSE, DDL changes, such as ALTER TABLE, are not replicated.

Summary of DBMS_STREAMS_ADM Subprograms

Table 141–2 DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
ADD_COLUMN Procedure on page 141-24	Either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule
ADD_GLOBAL_PROPAGATION_RULES Procedure on page 141-27	Either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_GLOBAL_RULES Procedure on page 141-31	Adds global rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
ADD_MESSAGE_PROPAGATION_RULE Procedure on page 141-36	Either adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_MESSAGE_RULE Procedure on page 141-40	Adds a message rule to either the positive or negative rule set of an apply process or messaging client, and creates the specified apply process or messaging client if it does not exist
ADD_SCHEMA_PROPAGATION_RULES Procedure on page 141-43	Either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SCHEMA_RULES Procedure on page 141-47	Adds schema rules to either the positive or negative rule set of a capture process, apply process, or messaging client, and creates the specified capture process, apply process, or messaging client if it does not exist
ADD_SUBSET_PROPAGATION_RULES Procedure on page 141-52	Adds subset rules to the positive rule set for a propagation, and creates the specified propagation if it does not exist
ADD_SUBSET_RULES Procedure on page 141-56	Adds subset rules to the positive rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist
ADD_TABLE_PROPAGATION_RULES Procedure on page 141-61	Either adds table rules to the positive rule set for a propagation, or adds table rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist
ADD_TABLE_RULES Procedure on page 141-66	Adds table rules to the rule set of a capture process, synchronous capture, apply process, or messaging client, and creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist

Table 141–2 (Cont.) DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
CLEANUP_INSTANTIATION_SETUP Procedure on page 141-72	Removes an Oracle Streams replication configuration that was set up by the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures in this package
DELETE_COLUMN Procedure on page 141-76	Either adds or removes a declarative rule-based transformation which deletes a column from a row LCR that satisfies the specified rule
GET_MESSAGE_TRACKING Function on page 141-79	Returns the tracking label for the current session
GET_SCN_MAPPING Procedure on page 141-80	Gets information about the system change number (SCN) values to use for Oracle Streams capture and apply processes in an Oracle Streams replication environment
GET_TAG Function on page 141-82	Gets the binary tag for all redo entries generated by the current session
KEEP_COLUMNS Procedure on page 141-83	Either adds or removes a declarative rule-based transformation which keeps a list of columns in a row LCR that satisfies the specified rule
MAINTAIN_CHANGE_TABLE Procedure on page 141-86	Configures an Oracle Streams environment that records in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database
MAINTAIN_GLOBAL Procedure on page 141-93	Configures an Oracle Streams environment that replicates changes at the database level between two databases
MAINTAIN_SCHEMAS Procedure on page 141-97	Configures an Oracle Streams environment that replicates changes to specified schemas between two databases
MAINTAIN_SIMPLE_TABLESPACE Procedure on page 141-102	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases. This procedure is deprecated.
MAINTAIN_SIMPLE_TTS Procedure on page 141-107	Clones a simple tablespace from a source database at a destination database and uses Oracle Streams to maintain this tablespace at both databases
MAINTAIN_TABLES Procedure on page 141-110	Configures an Oracle Streams environment that replicates changes to specified tables between two databases
MAINTAIN_TABLESPACES Procedure on page 141-115	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases. This procedure is deprecated.
MAINTAIN_TTS Procedure on page 141-122	Clones a set of tablespaces from a source database at a destination database and uses Oracle Streams to maintain these tablespaces at both databases
MERGE_STREAMS Procedure on page 141-126	Merges a stream flowing from one capture process with a stream flowing from another capture process

Table 141–2 (Cont.) DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
MERGE_STREAMS_JOB Procedure on page 141-129	Determines whether the original capture process and the cloned capture are within the specified merge threshold and, if they are, runs the `MERGE_STREAMS` procedure to merge the two streams
POST_INSTANTIATION_SETUP Procedure on page 141-132	Performs the actions required after instantiation to configure an Oracle Streams replication environment
PRE_INSTANTIATION_SETUP Procedure on page 141-137	Performs the actions required before instantiation to configure an Oracle Streams replication environment
PURGE_SOURCE_CATALOG Procedure on page 141-142	Removes all Oracle Streams data dictionary information at the local database for the specified object
RECOVER_OPERATION Procedure on page 141-143	Provides options for an Oracle Streams replication configuration operation that stopped because it encountered an error. This procedure either rolls forward the operation, rolls back the operation, or purges all of the metadata about the operation.
REMOVE_QUEUE Procedure on page 141-145	Removes the specified `ANYDATA` queue
REMOVE_RULE Procedure on page 141-146	Removes the specified rule or all rules from the rule set associated with the specified capture process, synchronous capture, propagation, apply process, or messaging client.
REMOVE_STREAMS_CONFIGURATION Procedure on page 141-148	Removes the Oracle Streams configuration at the local database
RENAME_COLUMN Procedure on page 141-150	Either adds or removes a declarative rule-based transformation which renames a column in a row LCR that satisfies the specified rule
RENAME_SCHEMA Procedure on page 141-153	Either adds or removes a declarative rule-based transformation which renames a schema in a row LCR that satisfies the specified rule
RENAME_TABLE Procedure on page 141-155	Either adds or removes a declarative rule-based transformation which renames a table in a row LCR that satisfies the specified rule
SET_MESSAGE_NOTIFICATION Procedure on page 141-157	Sets a notification for messages that can be dequeued by a specified Oracle Streams messaging client from a specified queue
SET_MESSAGE_TRACKING Procedure on page 141-162	Sets the tracking label for logical change records (LCRs) produced by the current session
SET_RULE_TRANSFORM_FUNCTION Procedure on page 141-163	Sets or removes the transformation function name for a rule-based transformation
SET_TAG Procedure on page 141-167	Sets the binary tag for all redo entries subsequently generated by the current session
SET_UP_QUEUE Procedure on page 141-168	Creates a queue table and a queue for use with the capture, propagate, and apply functionality of Oracle Streams

Table 141–2 (Cont.) DBMS_STREAMS_ADM Package Subprograms

Subprogram	Description
SPLIT_STREAMS Procedure on page 141-171	Splits one stream flowing from a capture process off from all of the other streams flowing from the capture process

Note: All subprograms commit unless specified otherwise.

ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to `TRUE`, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The `column_value` and `column_function` parameters are mutually exclusive.

Note:

- `ADD_COLUMN` transformations cannot add columns of the following data types: `BLOB`, `CLOB`, `NCLOB`, `BFILE`, `LONG`, `LONG RAW`, `ROWID`, user-defined types (including object types, `REF`s, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).
- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also: *Oracle Streams Concepts and Administration* for more information about declarative rule-based transformations

Syntax

```
DBMS_STREAMS_ADM.ADD_COLUMN(
   rule_name     IN  VARCHAR2,
   table_name    IN  VARCHAR2,
   column_name   IN  VARCHAR2,
   column_value  IN  ANYDATA,
   value_type    IN  VARCHAR2     DEFAULT 'NEW',
   step_number   IN  NUMBER       DEFAULT 0,
   operation     IN  VARCHAR2     DEFAULT 'ADD');

DBMS_STREAMS_ADM.ADD_COLUMN(
   rule_name        IN  VARCHAR2,
   table_name       IN  VARCHAR2,
   column_name      IN  VARCHAR2,
   column_function  IN  VARCHAR2,
   value_type       IN  VARCHAR2     DEFAULT 'NEW',
   step_number      IN  NUMBER       DEFAULT 0,
   operation        IN  VARCHAR2     DEFAULT 'ADD');
```

Parameters

Table 141–3 ADD_COLUMN Procedure Parameters

Parameter	Description
rule_name	The name of the rule, specified as [*schema_name.*]*rule_name*. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.
table_name	The name of the table to which the column is added in the row LCR, specified as [*schema_name.*]*object_name*. For example, hr.employees. If the schema is not specified, then the current user is the default.
column_name	The name of the column added to each row LCR that satisfies the rule.
column_value	The value of the added column. Specify the appropriate ANYDATA function for the column data type and the column value. For example, if the data type of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.
column_function	Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function. The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The data type of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE. The function executes when the rule evaluates to TRUE. This parameter cannot be specified if the column_value parameter is specified.
value_type	Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.
step_number	The order of execution of the transformation. **See Also:** *Oracle Streams Concepts and Administration* for more information about transformation ordering
operation	Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL:

table_name	column_name	step_number	Result
NULL	NULL	NULL	Remove all add column transformations for the specified rule.

table_name	column_name	step_number	Result
NULL	NULL	non-NULL	Remove all add column transformations with the specified step_number for the specified rule.
NULL	non-NULL	non-NULL	Remove all add column transformations with the specified column_name and step_number for the specified rule.
non-NULL	NULL	non-NULL	Remove all add column transformations with the specified table_name and step_number for the specified rule.
NULL	non-NULL	NULL	Remove all add column transformations with the specified column_name for the specified rule.
non-NULL	non-NULL	NULL	Remove all add column transformations with the specified table_name and column_name for the specified rule.
non-NULL	NULL	NULL	Remove all add column transformations with the specified table_name for the specified rule.
non-NULL	non-NULL	non-NULL	Remove all add column transformations with the specified table_name, column_name, and step_number for the specified rule.

ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   dml_rule_name           OUT  VARCHAR2,
   ddl_rule_name           OUT  VARCHAR2,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
   streams_name            IN   VARCHAR2  DEFAULT NULL,
   source_queue_name       IN   VARCHAR2,
   destination_queue_name  IN   VARCHAR2,
   include_dml             IN   BOOLEAN   DEFAULT TRUE,
   include_ddl             IN   BOOLEAN   DEFAULT FALSE,
   include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
   source_database         IN   VARCHAR2  DEFAULT NULL,
   inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
   and_condition           IN   VARCHAR2  DEFAULT NULL,
   queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

Parameters

Table 141–4 ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

Parameter	Description
